2300. **[FERSCHT, M. S.]** ФЕРШТ, М. С. Цвет и форма волос и цвет глаз у населения Харьковского округа. **[Color and shape of hair, and eye color in the population of the Kharkov District.]** [French résumé.] Материалы по Антропологии Украины (*Anthrop. Ukraine*) 2: 129-141. 1926.—About 7000 recruits (Ukrainian, Russian, and Jewish) from the Kharkov district were examined as to eye color, color and form of hair. Dark hair prevails: in about 80% of Ukrainians and Russians, and 95% of Jews. Pure blonds are rare, not over .21% in any group. Red is more common, especially among the Jews (.63%). Straight hair is rare, while wavy hair prevails in all classes, especially the Jews, among whom alone tightly curled hair is found (about 1%). Light eyes are found in 66.82% of Russians, 63.00% of Ukrainians, and 37.50% of Jews. When Ukrainians and Russians are classified on the basis of their social levels it is found that dark eyes appear less often among the peasants, more commonly among the working class and most frequently among the intellectuals. The percentages of dark eyes in these classes are respectively 35.06, 38.12, and 41.19 for Ukrainians and 28.34, 34.02, and 36.66 for Russians. Parallel distributions of light and dark complexions are observed, the frequency of dark coloration increasing as one ascends the social scale. As between Ukrainians and Russians the latter are slightly more blond. The class differences so clearly shown in Ukrainians and Russians are not apparent in the Jews, probably because of the ethnic homogeneity of different social groups among them. The correlation between eye and hair color is slight in all groups (less than .2). The various data are summarized in a series of tables.—*C. H. Danforth (from French résumé).*

2301. **[HERSTEIN, F. E.]** ГЕРШТЕЙН, Ф. Е. Возраст появления менструаций и начала половой жизни у работниц г. Харькова в связи с влиянием периода недоедания. **[Age of onset of the menses and of the beginning of sexual life among the female workers of Kharkov, in connection with periods of famine.]** [French résumé.] Материалы по Антропологии Украины (*Anthrop. Ukraine*) 2: 170-181. 1926.—Statistical tables and discussion based on replies of 1764 Ukrainian, 1056 Russian (Great Russia), and 578 Jewish women; all workers in Kharkov and living in the same social environment. The median age for onset of menstruation was found to be 14 yrs., 11 mos. for Ukrainian, 14 yrs., 8 mos. for Russian, and 14 yrs., 1 mo. for Jewish subjects. At 14 yrs., 6 mos., menstruation had appeared in 44% of the Ukrainians, 51% of the White Russians, and 63% of the Jewesses. There is scarcely any correlation between age at onset of menstruation and age of beginning of sexual life. The median age of the latter was 19 yrs., 3 mos. for the White Russians; 19 yrs., 9 mos. for the Ukrainians; and 20 yrs., 10 mos. for Jewesses. The median age of mothers at birth of the 1st child was 20 yrs., 9 mos. for Russians; 21 yrs., 1 mo. for Ukrainians; and 21 yrs., 10 mos. for Jewesses. During the famine years, onset of menstruation was retarded 9 mos. in Ukrainians and 15 mos. in White Russians and Jewesses. In the same period the delay in the beginning of sexual life was 11 mos. for Russians and 13 mos. for Jewesses.—*C. H. Danforth (from French résumé).*

2302. **KLIMEK, STANISŁAW. Studja nad Kranjologja Azji północnej, środkowey i wschodniej. [Craniology of north, central and east Asia.]** [German summary.] *Kosmos* [*Lwow*] 52(3/4): 665-758. 1928.—256 skulls of 9 different recent Mongoloid groups, including 13 Ainu skulls, were studied according to Czekanowski's differential and associative methods. This gave rise to the establishment of 5 racial components which in the order of their enumeration are the following: paleoasiatic, pacific, central asiatic, laponoid, arctic. Their craniologic characteristics are summarized in the German résumé.—*B. Oetteking.*

2304. [NIKOLAEV, L. P.] НИКОЛАЕВ, Л. П. Национальные и социальные различия в размерах головы и в некоторых соматоскопических признаках у населения Харьковского округа. **[National and social differences in dimensions of the head and in certain morphologic characters of the population of the Kharkov district.]** [French résumé.] Материалы по Антропологии Украины (*Anthrop. Ukraine*) 2: 5-52. 1926.—Author gives results of anthropometric studies on 7235 conscripts (4502 Ukrainians, 1735 Great Russians and 998 Jews). The Ukrainians and Great Russians are divided into 5 social groups: (1) peasants; (2) unskilled laborers; (3) skilled laborers; (4) semi-professional class whose duties require a certain minimum of education; and (5) professional class embracing those who have an average or superior education. The author concludes that: Horizontal circumference of head increases with rise in social status. Differences according to nationality were also observed, the Great Russians having a larger cephalic circumference than Jews or Ukrainians, but differences according to social status were more pronounced. Moreover students originating from peasant class had a smaller cephalic circumference than students from laboring class. Antero-posterior diam. (glabella-opisthocranian) increases with rise of social group. Transverse diam. shows less difference. Hence cephalic index decreases with rise in social group. Ukrainians have higher index than Great Russians. The index increases among Jews, however, with rise of social rank. Cephalic arc antero-posterior and transverse: the mean values of these are higher among the educated or professional group than among labor group, and higher in the latter than among peasants. Physiognomic height (trichion-gnathion) increases with status of social group but bizygomatic diam. remains about the same. Morphologic height (nasion-gnathion) increases somewhat with status of social group. The frontal part increases with rank of social group. Only slight differences exist in frontal minimum diam. and bigonial diam. but the mandibulo-frontal index is lower in group 5 than in laborers and lower in laborers than in peasants. The Jews have smallest index due to their asthenic build, a characteristic of which is a weak development of lower jaw. Nasal height increases with social status, while breadth is about same in all groups; hence nasal index is lower in group 5 than in group 1. Frontal height shows most significant differences in the social groups. Jews of the professional group differ less in physical characters from general Slav population than they do in the labor group, intermarriage with Ukrainians and Great Russians being more common in professional class than in labor class. The cerebral and respiratory types of Sigaud are more numerous as the social status rises, while muscular and digestive types decrease. Sigaud's types appear unequally in the different national groups. The respiratory type especially is more numerous among Jews than the muscular and digestive. Author regards differences in mean value of dimensions and indices of head according to social status as due to professional selection, according to which each individual tends to choose the profession corresponding best to his physical and intellectual abilities. The unequal distribution of Sigaud's type in the social groups may also be explained by selection.—*C. J. Connolly.*

2305. [NIKOLAEV, L. P., and G. I. CHUCHUKALO.] НИКОЛАЕВ, Л. П., и Г. И. ЧУЧУКАЛО. Национальные и соуиальные различия в физическом типе преступников. **[National and social differences in the physical type of criminals.]** [French résumé.] Материалы по Антропологии Украины (*Anthrop. Ukraine*) 2: 108-128. 1926.—In anthropometric studies on 640 criminals (487 Ukrainians, 104 Great Russians, and 47 of other nationalities), subjects were divided into 2 age groups: 20-25, and above 25. The Ukrainians were further divided into 2 groups according to social origin: peasants, and laborers. Comparisons were made with conscripts. The authors conclude that: There exist national differences in physical type of Ukrainian and Great Russian criminals. As in case of conscripts, the latter have a larger head circumference, and antero-posterior diam. of head, a smaller cephalic and physiognomic index, and a higher facial index than the Ukrainians. Differences in physical characteristics of the social groups are seen among criminals. As among conscripts, laborers have a mean head circumference and antero-posterior head diam. greater than peasants. The latter have a smaller physiognomic height, greater breadth of face, higher cephalic and physiognomic index, lower facial index and a higher mandibulo-frontal index than laborers. The cerebral type of Sigaud is less frequently found among peasants than among criminals of laboring class. Average dimensions of cranial part of head, in criminals do not show any considerable differences from those of conscripts. Hence if any correlation exists between intelligence and head size, the criminals are not intellectually inferior. Between criminals and conscripts of same nationality and same social group, there exists differences in average values of certain dimensions,—criminals are more brachymorph. But the authors do not regard this as evidence of a criminal type as opposed to the normal. Differences are due to selection, the criminal class being recruited among robust individuals who are brachymorph.—*C. J. Connolly.*

2306. **PALMIERI, VINCENZO MARIO. Verteilung der morphologisch-konstitutionnellen Typen unter den geisteskranken Verbrechern.** *Deutsche Zeitschr. Ges. Gerichtl. Med.* 12(6): 592-601. 1928.—In the group of criminal insane studied according to the method of Viola the microsplanchnic (leptosome) type prevails with 69%; the normal (athletic) type follows with 20% and the macrosplanchnic (pyknic) with 6.36%. Studied according to the nature of the crime, the microsplanchnics lead in homicides with 78.6% and progressively diminish in the lesser crimes, as in crimes against property 55.5%, sexual crimes 42.8%. The author also studied the constitutional types, ages, psychopathy, and blood groups in the habitual criminals. In this class as well as in the normal Italian people and the criminal insane, the group O and A are greater than the groups B and AB but in a totally different way. While the groups B and AB are relatively of greater proportion, this greater proportion is especially noted in the homicides and the habitual criminals, while in the crimes against property the relative prevalence of only the group AB is noted.—*V. M. Palmieri (transl. by J. DeCarlo).*

2307. **RAUTMANN, HERMANN. Probleme der klinischen Variationsforschung.** *Zeitschr. Ges. Anat. Abt. 2. Zeitschr. Konstitutionsl.* 13(4/5): 417-449. 4 fig. 1928.—The problem of constitution can be dealt with as a problem of variation. The constitution of a person can be considered only by comparing it with that of other persons; only the average behavior of a person under varied conditions gives an index of his constitution. The concept of the norm (which cannot be abolished) is best defined as "the most frequently found" without biologic evaluation. "Normal" is not necessarily identical with "physiologic" or with "healthy." The norm for a single property generally can be determined only in relation to one or more other properties. That means that norms generally are correlative, and thus the special methods of collective measuring are required for their determination. The frequency of asymmetrical distribution is still not sufficiently recognized. It has not been proven that with larger material the distribution becomes more regular. Collective measuring should be continued on the lines given by Fechner. The asthenic and pyknic types probably represent the ends of a series in the middle of which the athletic type is found. There seems to be a definite relation between body length and chest circumference; tall people generally have a relatively smaller chest circumference. The relation between body length and the measurements of the head is much more complicated. It varies with the complexion and thus seems to depend on race also. The importance

of external physical habitus for clinical medicine is well illustrated by the differences of the heart in pyknic and leptosomic persons. The relations between physical habitus and muscular efficiency are manifold and can by no means be gauged through simple measuring of muscle volume. Indices should be simple and mathematically correct. Symmetry and asymmetry of distribution may vary with age as is the case for body length.—*A. Plaut.*

2308. **SCHWARZ, M. Die Formverhältnisse der Nasenscheidewand bei 84 Zwillingspaaren (53 eineiigen und 31 zweieiigen).** *Arch. Ohren-, Nasen-, u. Kehlkopfheilk.* 119(3/4): 291-300. 4 fig. 1928.—Research carried on during 4 yrs. led to the discovery of great similarity in the form of nasal septa of twins as compared with great variety in other persons even of the same family. The method chiefly employed was anterior rhinoscopy and occasionally x-ray. In 52.8% of the monoövular twins similarities of septum occurred. Of these 41.5% showed a nearly identical condition; in 11.3% the condition in the 2 members of the pair formed a mirror image. Of the diovular twins, similarity of septum occurred in only 9.6%. Among other members of families, similarity was practically non-existent. An insufficient number of these were examined, however. It is concluded that the final form of the septum is predetermined in the anlage unless disturbed during development.—*H. M. Allyn.*

DESCRIPTIVE

2311. **BOENIG, HORST. Studien zur Morphologie und Entwicklungsgeschichte des Pankreas beim Bachneunauge [Lampetra (Petromyzon) planeri]. III. Teil. Die Histologie und Histogenese des Pankreas.** *Jahrb. Morph. u. Mikrosk. Anat. 2. Abt. Zeitschr. Mikrosk. Anat. Forsch.* 17(1/2): 125-184. 39 fig. 1929.—The origin of the pancreatic anlage from the epithelium at the juncture of the fore- and midguts is described. Usually the midgut contributes the anlage although the foregut may do so in some instances. The pancreatic buds are solid and at a very early stage become surrounded by collagenic connective tissue. The protoplasm of the cells derived from the midgut epithelium may be either dense or clear, depending upon their activity. The lumina of these buds become filled with blood and cylindrical cells densely packed with granules. It is impossible at this stage to distinguish between pancreatic and islet cells. During the last half of metamorphosis the epithelium of the ductus choledochus gives rise to pancreatic anlage which corresponds to the ventral pancreas of the higher vertebrates. Capillaries develop at the time of the formation of the epithelial buds. The epithelium of the ductus choledochus gives rise to pancreatic anlage, the buds of which are indistinguishable from those formed from the midgut epithelium. The solid epithelial buds acquire lumina and the epithelium becomes columnar. The pancreatic buds of this newly formed ventral pancreas acquire lumina later. The blood vessels are sparse but continue to increase.—*S. P. Miller.*

2312. **BULSIEWICZ, H. Die Entwicklung der Blutsinus in den Tasthaaren.** *Bull. Acad. Polonaise Sci. et Lett. Cl. Sci. Math. Nat. Sér. B. Sci. Nat. (II).* 1929: 249-261. 2 pl. 1929.—The material consisted of pig embryos 8-35 cm. long. The adult cat and rat were used for comparison of the vascular supply of the "sinushairs" or vibrissæ. The anlagen of the sinushairs appear in very early stages, earlier than those of the ordinary hairs. The special vascular network of the sinushair can not be recognized in the earliest stage of the embryo. The differentiation of the vessels of the nourishing network into an inner and an outer network first appears in embryos 10.4 cm. long. The corpus cavernosum begins to develop immediately after the development of the hair is completed. The artery supplying the hair divides immediately under the hair into a papillary branch, and 2 other branches which form the outer network. From this network 2 arteries, a major and a minor, with the nerves pass to the surface of the hair follicle. The veins of the c. cavernosum arise at the bottom of the follicle. The papilla receives its blood through the papillary artery. In the mature pig there is a well developed annular sinus. The cat and rat present differences in the general form of the sinushairs, and the blood is supplied on 1 side.—*H. F. Nachtrieb.*

[Development of the primitive streak, cloacal membrane and allantois in man.]** [German summary.] *Spisy Lékarské Fakulty Masarykovy Univ. Brno. (Publ. Fac. Med. Brno.)* 6(60): 1-24. 4 pl. 1928.—The development of the primitive streak, cloacal membrane and allantois, based on a study of 15 early human embryos (Peters, v. Mollendorf, Fetzer, Strahl-Beneke, etc.), is presented; also appeared in *Zeitschr. Mikrosk.-Anat. Forsch.*—*From German summary* by *A. E. Adams.*

2315. **FREISE, GÜNTHER. Über die Langerhansschen Inseln des Pankreas beim Kaninchen unter besonderer Berücksichtigung ihrer Entwicklung.** *Jahrb. Morph. u. Mikrosk. Anat. Abt. 2, Zeitschr. Mikrosk. Anat. Forsch.* 17(1/2): 185-228. 12 fig. 1929.—At about the middle of embryonic life there appear in the pancreas, well marked areas of epithelial cells unrelated to the ducts or the remaining pancreatic cells. These are embryonic islets. During the latter part of embryonic life the epithelium of the ducts and the gland gives rise to the islet cells. Usually there is a distinct connective tissue capsule. Transitional stages of epithelium between acinus cells and islet cells were not found. The islet cells are structures sui generis. After castration there was an atrophy

of the islet groups with hypertrophy of the blood capillary systems. Two types of islet cells were not noticed. —*S. P. Miller.*

2316. **GRÄPER, LUDWIG. Die Methodik der stereokinematographischen Untersuchung des lebenden vitalgefärbten Hühnerembryos.** *Zeitschr. Wiss. Biol. Abt. D. Roux' Arch. Entwicklungsmech. Organ.* 115(3): 523-541. 5 fig. 1929.—This paper contains a description of the method for study of living embryos by means of stereoscopic motion pictures. It includes discussions of the principles of stereoscopic photography and the various pieces of apparatus used. Complete descriptions with figures are given of the latter. Methods of preparation of the embryos for study are also presented. It is a complete outline of the method, and the practical and disadvantageous values are briefly presented.—*P. L. Risley.*

2317. **HOCHSTETTER, FERDINAND. Beiträge zur Entwicklungsgeschichte des menschlichen Gehirns. Band 11, Teil 2: Die Entwicklung des Mittel- und Rautenhirns.** p. 83-206. 25 pl., 21 fig. Franz Deuticke: Wien & Leipzig, 1929. Pr. 42 M.—The present paper forms the final part of the author's study on the developmental history of the human brain. The first portion deals with the development of the outer form of the midbrain under the headings: limits of the midbrain, aqueduct of Sylvius, reduction of the ventricular cavity. The second portion deals with the development of the medulla oblongata, under the headings: form changes in embryos between 27 and 75 mm. in length, disappearance of the sulcus medianus, formation of the subependymal system, the velum medullare, appearance of sulci on the surface of the cerebellum, relation of hemispheres to vermis, development of the choroid plexus of the fourth ventricle, development of the median and lateral apertures, the taenia, modifications of the floor of the fourth ventricle. The observations are based on serial sections from 102 specimens 6-250 mm. in length. The figures and plates are excellent and a page index (for both parts) is given.—*H. H. Donaldson.*

2318. **HOLMDAHL, D. E. Ein rätselhaftes, zirbelähnliches, embryonales Organ im mittleren Teile des Daches des Rhombencephalon.** *Anat. Anzeiger* 65(23/24): 428-433. 4 fig. 1928.—In a 5 mm. cat embryo with 22 somites is a vesicle 70 μ in length between the roof plate of the rhombencephalon and the ectoderm; with the former it is connected by a pedicle and its cells resemble those of the neural tube; its median location and structure suggest a comparison with the parietal organ. Its extreme caudal position in the plane of the otocysts constitutes the singularity of this observation.—*H. von W. Schulte.*

2320. **LAGUESSE, E. Développement de la cornée chez le poulet; rôle du mésostroma; son importance générale; les membranes basales.** *Arch. Anat. Microscop.* 22(2): 216-265. 2 pl. 1926.—The substantia propria of the cornea first appears as an acellular sheet (mesostroma) between the anterior epithelium and the crystalline lens. New exoplasmic lamellae are added to it from the deeper surface of the anterior epithelium. It is thus entirely of mesostromal ecto-ectodermal origin. Mesenchyme cells migrate (beginning at the 5th day) back of the substantia propria to form the posterior epithelium. Mesenchyme cells (7th day) also invade the substantia propria and annex it to the rest of the mesenchyme by modifying its appearance and properties. Two groups of lamellae remain uninvaded, however, the one, posterior, which will become the membrane of Descemet, and the other, anterior, which, united to the primitive basal membrane (after the 10th day), will become the membrane of Bowman. Thus epithelia may play at least the initial rôle in the formation of certain basal membranes, mesenchymatous elements being added secondarily. The mesostroma also gives rise to the vitreous body and the pecten. The idea of the mesostroma should be valuable in explanation of many facts of normal and pathologic development. The mesostroma should be considered as a sort of primitive acellular supporting tissue, a primitive form of the fundamental substance due to the temporary collaboration of the cells of different blastodermic layers or of the first organs which are formed from them.—*P. A. Moody (from author's conclusions).*

2322. **MERKEL, FR., und ERICH KALLIUS. Die Anatomie des Menschen. Abt. I: Einleitung, allgemeine Gewebelehre, Grundzüge der Entwicklungslehre. [Human anatomy. I. Introduction, general histology, outlines of development.]** 2nd ed. 288p. 295 fig. J. F. Bergmann: München, 1927.

2323. **SZANTROCH, Z. L'histogénèse des ganglions nerveux du coeur. [Histogenesis of nerve ganglia of the heart.]** *Bull. Internat. Acad. Polonaise Sci. et Lett. Cl. Sci. Math. et Nat. Sér. B (II)* [*Zool.*] 1929(8/10): 417-431. 5 pl. 1929.—According to the author's former studies the nervous elements of the digestive tube develop from the same material as its muscle layer, namely the splanchnopleure. Do the nerve ganglia of the heart arise similarly? It was found: (1) Hrs. 80 and 140: the material produced by the splanchnopleure (cardiopleure) gives rise to the ganglia of the sinus venosus and the muscles of its walls, i.e., to the muscles of the venae cavae and pulmonariae. (Ganglea sino-venosa.) (2) Hrs. 100-160: from the same material come the ganglia connected with the muscle wall of the truncus arteriosus (*G. aortico-pulmonalia*). (3) Hrs. 150-240: The outlines of the coronary arteries and accompanying ganglia differentiate from the cardiopleural mass and appear as diverticula on the wall of the base of the aorta (*G. vaso-coronaria*). The outlines of the ganglia move away from the muscle layer as development progresses and finally are fixed in the surrounding connective tissue. There is no visible formation of ganglia in connection with the muscle layer of the ventricles or the auricles proper. If the common origin of these ganglia is taken into account, and their simultaneous differentiation with the wall of the heart vessels, especially of the muscle layer, one must consider them as the nervous mechanism of these vessels and not of the cardiac muscle. Thus the rôle of the sympathetic ganglia would be to act upon the muscles of the heart vessels and cause their contraction or dilation regulating the blood-flow both in the general and the coronary circulation.—*E. W. Count.*

2324. **VERSLUYS, J. J. Bijdrage tot de tweelingenpathologie in verband met de erfelijkheidsleer. [Pathology of twins as related to science of heredity.]** 95p. Eduard Ijdo: London, 1928.—The records of the Women's clinic at the University, Amsterdam and the schools for midwives at Amsterdam and Rotterdam were studied for twin births and especial attention was given to the placenta. The % of twin births was 1.4, with 27% monochorionic. Mothers of bichorionic twins were older than the mothers of monovular twins; 30% were primiparae. Of 313 pairs of twins where the sex was mentioned, 220 were of the same sex, 115 of them boys. Both duplicate and fraternal twins may occur not only in the same mother, but in the same pregnancy. There is no parallel between the number of placentas and the number of chorions. In the majority of cases the monozygotes lie in the same chorion. The aim must be to ascertain how many chorions are found with the placenta. It is proposed to speak of monozygotes and dizygotes, monozygotes being monovular twins with the same idioplasm and dizygotes being bi-ovular twins with different idioplasm. Some anthropologic and pathologic histories of the author's cases are given; the deductions are mainly based on similarity of diseases contracted by twins.—*B. Bickel.*

2325. **WITSCHI, EMIL. Studies on sex differentiation and sex determination in amphibians. I. Development and sexual differentiation of the gonads of Rana sylvatica.** *Jour. Exp. Zool.* 52(2): 235-265. 5 pl., 4 fig.

1928.—In *R. sylvatica* all germ cells derive from the primary gonia which separate from the entoderm and migrate toward their final position near the inner edge of the mesonephros during the larval stages with free external gills and growing gill sacs. Neither in young nor in adult specimens has any formation of secondary germ cells been observed, but undifferentiated gonia were always present. The sexes differentiate during the 4th week. This species shows no hermaphroditic tendencies, but ovaries and testes develop rapidly and directly their typical characters. At the time of metamorphosis (7th-8th week) the sexes are more distinct than in any other species with a short larval period, so far studied. The young gonads of both sexes show a segmentation due to the metameroid arrangement of the rete cords. This gonomery persists more distinctly in the ovary than in the testis. As a consequence of the reduction of the body length and of the position of the liver on the right side, the primordial gonad of this side is shorter than the left one. This asymmetry later persists in the fat-bodies, which are much smaller on the right side than on the left.—*Author (courtesy of Wistar Bibl. Serv.).*

EXPERIMENTAL

2326. CHAMPY, CH., et J. MORITA. Recherches sur les cultures de tissu. Observation sur les cultures de testicule et d'ovaire chez les mammifères, les oiseaux et les batraciens. *Arch. Exp. Zellforsch.* 5(3/4): 308-340. 2 pl., 12 fig. 1928.—The morphology of the various elements was studied in prolonged culture of the gonads of many vertebrates (testes of rabbit, fowl, tortoise and *Triton;* and ovaries of rabbit). Particles vitally stained by neutral red are not identical with the Golgi apparatus (studies chiefly on ovarian epithelium). The "bouisson de cactus" is nothing but a group of epithelial cells proliferated in the depth of plasma (testes of fowl). Testis (and other organs) of *Triton* kept for some time in the laboratory contains some symbiotic microbes which do not hinder but rather favor growth of the culture. Conclusions: Some trace of spermatogenesis occurs in the unopened seminiferous tubule implanted in plasma but never on the surface of the plasma. Cytological characters of the cultured cells are not exactly the same as in the natural state i.e., they regress more or less completely, although they retain some of their original function. The form of the cultured cells depends rather on the condition of medium than on their origin. Thus the essential facts of the de-differentiation affirmed by Champy in 1912 are verified.—*J. Morita.*

2327. DETWILER, S. R. The development of the spinal cord in Amblystoma embryos following unilateral myotomectomy. *Jour. Exp. Zool.* 52(2): 325-349. 26 fig. 1928.—Complete removal of the right 6th, 7th, and 8th somites of *Amblystoma* embryos in the tail-bud stage has no effect upon the proliferation of cells in the spinal cord on the demuscularized side. The volume of the right half of the cord is also as great as the normal left. The results bear out former conclusions that, in *Amblystoma* embryos, the proliferation of cells in the motor areas of the cord is not under the influence of the presence of differentiating or functioning musculature. There is no indication that, after the medullary tube is closed, the surrounding structures have any influence on its morphology. Spinal ganglia segment and differentiate in the complete absence of axial musculature, but in all cases some axial cartilage is present. Segmentation of motor roots takes place in the complete absence of sensory ganglia and adjacent myotomes. The presence of aggregated primary motor-root fibers in the absence of muscle shows that their outgrowth is not dependent upon influences exerted by the differentiation and early contraction of the muscle as implied in Kappers' ('21) analysis of the collateral offshoots from longitudinal motor tracts as observed by Herrick and Coghill ('15) and by Coghill ('24). A discussion of sensory and motor segmentation is given in relation to Lehmann's ('27) findings upon *Pleurodeles.—Author (courtesy Wistar Bibl. Serv.).*

2328. DETWILER, S. R. Further experiments upon the transplantation of embryonic spinal-cord segments. *Jour. Exp. Zool.* 52(2): 351-366. 1928.—When the 2nd, 3rd, and 4th segments of the embryonic spinal cord of *Amblystoma* are replaced by the 4th, 5th, and 6th, there is only a slight hyperplasia (6%) of the cells in the 4th segment. The 5th segment undergoes a hyperplasia of 20%, and the 6th segment a hyperplasia of 25-30%. The failure of the 4th segment to undergo a marked cellular increase, such as occurs in the 5th and 6th, is attributed to the fact that it is substituted for a region which has been shown previously (Detwiler, '25, '28) to possess a greater inherent potentiality for high proliferation than in succeeding segments. The results bear out former indications that, below the 2nd spinal segment, the final production of cells in any given segment from the 3rd to the 9th is not so much limited by local inherent potentialities for development as by the position which it occupies with respect to the spinal cord as a whole.—*Author (courtesy Wistar Bibl. Serv.).*

2329. DETWILER, S. R. Experimental alteration of the direction of growth in amphibian spinal nerves. *Xe. Congrès Internation. Zool. à Budapest,* 1927. Part 1. 557-567. 11 fig. 1929.—The exercising of an attractive force upon spinal nerves by rapidly differentiating tissues of *Amblystoma* embryos was demonstrated in experiments in which the right anterior limb bud was removed and transplanted 1-7 segments caudally or several segments cranially. In both cases, all or some of the normal brachial nerves often grew posteriorly or anteriorly to supply the grafted limb, and where this occurred, typical coordinated muscular movements resulted. Sometimes only nerves caudal to the brachial nerves entered the limb. That such attractive centers operate only for a limited time was evident when limb grafts were made some time after the brachial nerves had been allowed to grow into the region of the excised limb, the grafts in these cases receiving only nerves at their level. Where a regenerant from the normal limb area and a grafted limb posterior to it formed 2 centers of attraction the brachial nerves were redistributed to both, and synchronous movements of homologous muscle groups typically followed. The non-specific nature of such attractive forces was suggested by the posterior extension of brachial nerves toward grafts of eye and nasal placodes caudal to the excised limb. Failure of tail bud grafts to attract spinal nerves is attributed to the early innervation of tail muscles by spinal cord present in the graft. The author postulates 2 sets of forces active in the growth of nerves: one, possibly electrical, influencing the general direction of growth; the other, perhaps chemotactic, accomplishing the union of axones with end-organs.—*B. L. Maclean.*

2330. DÜRKEN, BERNHARD. Grundriss der Entwicklungsmechanik. 208p. 120 fig. Gebr. Bornträger; Berlin, 1929.—A smaller outline of morphologic mechanics, which the author thinks are not sufficiently appreciated by the medical science, except in detached details. (More is contained in his textbook on experimental zoology.) It deals mainly with the biology of fertilization, primary forms, germ preformation, effect of environment, and germinal reactions. In a sense, the basic developmental factors are contained in the nucleus, especially in the chromosomes. They are passed on from generation to generation, but the hypothesis of unchanging chromosomes in the germ plasma is not upheld. The primary foundation of reactions is not a mosaic of discrete parts. Development is epigenesis. The Mendelian hereditary principles may be correlated with results of the morphologic mechanics, which, paradoxically, lead away from mechanistic conceptions to actual organic valuation of the living.—*B. Bickel.*

2331. HUZELLA, TH. Über histologische Gerüstbildung im Vergleich der Organisation der Gewebekultur mit der des Tierkörpers. *Verhandl. Anat. Ges.* 38: 36-48. 8 fig. 1929.—The origin, development, mechanism, histogenetic and organizatory significance of the elastic system of argyrophil reticulated tissue in the body are

discussed in comparison with the vital unit of the embryonal tissue culture. Stretched hair, silk or rubber threads were inserted into the tissue culture; alterations were produced arbitrarily in the structure and cell-communication, and the relations between elastic tension, tissue growth, mechanism of cell-migration, extracellular formation of fibrils were shown. The physiological and developmental significance of the reticulated tissue is discussed.—*T. Huzella.*

2332. **PASQUINI, PASQUALE, e GIUSEPPE REVERBERI. Studi sulla determinazione nello sviluppo degli Anfibi. (Analisi sperimentale degli effetti della centrifugazione sui primi stadi embrionali di Rana esculenta.)** *Boll. Ist. Zool.* [*Roma*] 7: 1-55. 3 pl. 1929.—By centrifuging the eggs of *Rana esculenta* in different stages of development it has been possible to analyze the differential susceptibility of the embryos on basis of resulting abnormalities: defects, supplementary parts, and faulty organ-differentiation. It has been shown that the regions of the embryo which chiefly react to the centrifugal force are the medullary tube, the head and the regions in relation with the blastopore. But the neural tube may or may not be related to supplementary nervous tissue contained in dermal excrescences which are typical in the embryos derived from centrifuged eggs. The described abnormalities are not specific for centrifuging and the mechanism of their origin has been found in the action of this factor on organizing faculties of organ anlage and in changes of physiological equilibria in embryonic cells.—*P. Pasquini.*

2333. **PASQUINI, PASQUALE. A proposito di trapianti embrionali.** *Monitore Zool. Ital.* 40(10): 263-269. 1929. —By means of embryonic transplantation, the fusion of 2 optic vesicles, in *Pleurodeles, Axolotl, Triton, Rana,* is possible, and in several degrees, when the complete optic vesicle is transplanted dorsally, ventrally, caudally, cranially, or externally to the optic vesicle of the host, previously partially removed in the corresponding positions. The equipotentiality of the primary vesicle and the high regulative capacity, are definitely shown by the differentiation of double, partially fused eyes with 2 lenses or with 1 lens only, larger than normal, and derived from the fusion of 2 lens placodes. The fused eyes are then able to regulate and acquire normal dimensions. They show very interesting relations with the nerve centers. Similar conditions have been found by Detwiler (1929) in *Rana fusca.*—*P. Pasquini.*

2334. **RICHARDSON, K. C., and E. S. HORNING. On tethelin as a tissue-culture medium.** *Australian Jour. Exp. Biol. and Med. Sci.* 6(3): 137-142. 5 pl. 1929.—Explants of intestinal epithelium from chick embryos were made in a medium containing tethelin or a mixture of tethelin and chick embryo extract. After 28 hours' incubation the growth and membrane formation in these cultures was compared with that in explants of intestinal epithelium grown in a normal medium of plasma and embryonic extract. A much more extensive proliferation was observed in the cultures containing tethelin and in those without embryonic extract membrane formation was very pronounced, whereas the growth in the control cultures in embryonic extract was scanty and no membranes of epithelium could be detected. These experiments confirm the growth promoting qualities of tethelin in vitro.—*K. C. Richardson.*

2335. **SPIRITO, ALDO. Osservazioni sui processi regolativi in relazione allo sviluppo degli emisferi cerebrali negli embrioni di Anuri. Nota 2. [Regulative processes in relation to the development of the cerebral hemispheres in the embryos of frogs.]** *Atti R. Accad. Naz. Lincei Rend. Cl. Sci. Fis. Mat. e Nat.* 9(9): 797-799. 2 fig. 1929.—In embryos of *Rana esculenta* and *Bufo vulgaris,* at the stage of their development known as caudal button and prosencephalic vesicle, a part of the brain was removed so that a new cerebral wall was obtained without changing the form or position of the remaining wall. The new wall may undergo such changes as to induce the formation of encephalic parts similar to the hemispheres, at the expense of regenerated walls, and so replace those which were biologically predetermined for those parts. It is concluded that some external biologic-mechanical actions can interfere with the development of the cerebral hemispheres.—*Z. Piotrowski and C. Landis.*

2336. **STONE, LEON STANSFIELD. Experiments on the transplantation of placodes of the cranial ganglia in the amphibian embryo. IV. Heterotopic transplantations of the postauditory placodal material upon the head and body of Amblystoma punctatum.** *Jour. Comp. Neurol.* 48(2): 311-330. 14 fig. 1929.—When the postauditory placode (stained in Nile-blue sulphate) was transplanted upon the ventrolateral surface of the body, a ganglion developed from pole of the graft, while at the opposite pole the lateral-line primordium at first became a prominent ectodermal thickening and later gradually disappeared. It never migrated from the site of the transplant. This was due to the fact that it never came under the influence of a migratory lateral-line primordium of the host. When the postauditory placode was rotated 180° on its dorsoventral axis (reversing its anterior and posterior poles) and was transplanted above the optic vesicle in place of the ophthalmic placode, it formed a lateralis ganglion at the proper pole. The nerve fibers issuing from it innervated lateral-line sense organs, and therefore the ganglion gave no indication of assuming the rôle of a general cutaneous for which it was exchanged. The lateral-line primordium of the graft above the optic vesicle lay in the pathway normally followed by the host migratory supra-orbital primordium, and when the latter reached it, and not until then, the primordium of the transplant migrated anteriorly and laid down normal sense organs. Occasionally the primordium of the host followed the one of the graft a short distance, also laying down sense organs, but usually the ganglion-forming pole of the transplant partially blocked the host primordium from further migration. This interference, however, was not sufficient to prevent host and graft primordia from touching each other and producing the migratory effect upon the tissue of the transplant.—*Author (courtesy Wistar Bibl. Serv.).*

[Experiments on regulative capacity of the blastula of T. taeniatus and B. pachypus.]** *Zeitschr. Wiss. Biol. Abt. D. Roux' Arch. Entwicklungsmech. Organ.* 122(3): 667-669. 1930.—A brief summary of results of about 180 experiments, 1928-1929.

2339. **WITSCHI, EMIL. Studies on sex differentiation and sex determination in amphibians. II. Sex reversal in female tadpoles of Rana sylvatica following the application of high temperature.** *Jour. Exp. Zool.* 52(2): 267-291. 5 pl. 1928.—Two groups of tadpoles have been obtained from artificially fertilized eggs. The first one (normal group) was kept at a temp. starting with 16°C. and slowly raised during the first 2 weeks to 20°C. The sexes differentiate at the end of the 3rd week, and the animals metamorphose at the end of the 7th week. This group consists of 100 ♀♀ and 96 ♂♂. The 2nd group was raised under the same conditions up to the 5th week. Then the temp. was raised to 32° (heat group). Under such a condition, the tadpoles grow and metamorphose more slowly than at 20°C. The gonads of the ♂♂ develop normally, while the ovaries of the ♀♀ gradually transform into testes. This is effected by the following successive processes: (1) Disintegration of the germinal epithelium (cortex); (2) excessive growth of the medulla and formation of seminiferous tubules, and, (3) migration of some undifferentiated germ cells (oogonia) into the medulla, where they multiply and thus give rise to the spermatogonia. From this experi-

ment is inferred that in the normal ovary the germinal epithelium inhibits the development of the medulla. Destruction of the germinal epithelium removes this control. The medulla starts to grow and produces seminiferous tubules. Thus the cortex proves to be the seat of the ♀ sex differentiator, while the medulla is the seat of the ♂ sex differentiator.—*Author (courtesy Wistar Bibl. Serv.).*

2340. YAMAMOTO, T. Effects of roentgen rays on the development of the embryo of the hen. *Japan Med. World* 9(2): 45-52. 1929.—Exposure to roentgen rays previous to incubation exerted no influence on the development of the embryo. Weak irradiation in the early stages of incubation had no effect. The resistance to irradiation was lowest in the 32nd hour of incubation and gradually increased to the 241st hour. The injurious effects of irradiation at any stage of embryonic development, in producing death and abnormalities, increased with the "strength" of the rays and the period of exposure. No abnormal post-embryonic effects were observed in the birds which were hatched, reared and allowed to reproduce.—*J. E. Dougherty.*

2341. **BEERS, C. DALE. Some effects of conjugation in the ciliate Didinium nasutum.** *Jour. Exp. Zool.* 58 (1): 455-470. 1930.—A group of lines of *Didinium* was fed inadequately on 9 paramecia per line daily (group B). The group suffered a gradual decline, as shown by decreased fission rate and increased encystment rate, and underwent complete encystment after 72 days with the production of 132 generations. The inadequacy of the diet in group B was demonstrated by culturing in parallel on unlimited food a second group of lines (A) of identical ancestry. This group gave no evidence of decline as generations passed. Conjugation occurred in B after 96 generations. Additional groups of lines were established with the exconjugants and were maintained on the same inadequate diet. Six exconjugant groups outlived the parent non-conjugant group (B) by margins which varied from 36 to 56 generations, and exhibited, following conjugation, an increase in the fission rate and a decrease in the encystment rate. Two groups were not observably affected by conjugation. The results adduced from 6 of the 8 cases indicate that conjugation in *Didinium* may result in increased vitality when the animals are in a state of depression as a result of inadequate cultural conditions.—*Author (courtesy Wistar Bibl. Serv.).*

2342. **BÖHM, A. Die Adriatischen Ceratien (nach dem Materiale der österreichischen Adriaforschung in den Jahren 1911-1914).** [English summary.] *Bot. Arch.* 31 (3/4): 349-385. 3 maps. 34 fig. 1931.—The present publication presents a complete description of the distribution of the Ceratia in the Adriatic Sea. The material originates from the journeys of the research-ship "Najade," from the years 1911-1914. Forty-two spp. (with vars.) are described and figured for the most part. The systematic account includes distributional records and notes on vegetative season, sociological relations, and the range of temp. and salinity. *Ceratium candelabrum* f. **commune** (p. 351); *C. c.* f. **eucandelabrum*** (p. 351); *C. c.* f. **hiemale*** (p. 351); *C. extensum* f. **strictoides** (p. 355); *C. tripos* forms **nobile*, longissimum*** and **patulum*** (all p. 356); *C.* **pulchellum** f. **tenuicorne*** (p. 357); *C. declinatum* f. **orthoceras*** (p. 359); *C. massiliense* f. **elliptiçum*** (p. 363); *C. carriense* f. **eucarriense** (p. 363). The following are recorded as new to the Adriatic: *C. digitatum, C. teres, C. setaceum, C. longirostrum*, C. lunula, C. palmatum,* and *C. pavillardii.* As to the region of distribution of the Ceratia, the Adriatic Sea is divided into 3 parts: (a) the northern shallow sea with depths of 30-40 m., (b) the Pomo basin, situated in the middle (190 m.), and (c) the southern deep sea with more than 1000 m. Through the principal current along the Jugo-Slavia coast as far as Pola, the vegetation mostly shows the Mediterranean character. The following 3 zones for the distribution of the Ceratia have been ascertained: (1) The indigenous Adriatic zone, comprising the northern shallow sea; this zone is independent of the immigration from the Mediterranean Sea. (2) The intermediate zone, comprising the remaining region of the northern and the whole of the middle Adriatic. This zone during the whole year harbors varieties from the Mediterranean Sea which, however, do not endure too low temperatures. (3) The allogenous Mediterranean zone, comprising the southern part of the Adriatic which is characterised by the occurrence of tropical and subtropical forms of migration. The vegetation of these zones is thoroughly treated, with special reference to the vertical occurrence of the spp. and their quantitative relations. Phylogenetic relationships are also discussed.

2343. **BOUNHIOL, J. Sur la pseudo-immortalité des Protozoaires.** *Congrès Internat. Xe Zool. à Budapest 1927.* Part 1: 371-376. 1929.—The literature on the so-called immortality of the Protozoa and the physiological processes of their senescence is reviewed. Their small size, relatively large surface, movements, and the relative vastness of their environments tend to dissipate the degenerating effects of their oxidative processes. Their senescence is thus attenuated.—*C. A. Kofoid.*

2344. **BROWN, GEORG V. E. The morphology of Spironympha, with a description of a new species from Reticulitermes hesperus Banks.** *Jour. Morph. & Physiol.* 51(1): 291-307. 2 pl. 1931.—*Spironympha* is discussed as a valid genus. It was described by Koidzumi ('16); later it was redescribed by the same author as *Microspironympha* ('21). Therefore, according to the rules of nomenclature, it is *Spironympha.* The genus is compared with the related genera: *Spirotrichonympha, Holomastigotes,* and *Microjoenia. Spironympha* is characterized by 4 flagellar bands which are spirally wound around the anterior part of the body; these bands occur only in the anterior end, whereas in *Spirotrichonympha* they extend almost to the posterior end. The parabasals are few in number, and they are attached to the basal granules of the flagellar bands; the anterior end is clear and almost free from cytoplasmic granules; and there are 20-30 anterior flagella which are attached to the base of the centroblepharoplast or to the basal granules of the flagellar bands. An axostyle is present. No centrosome occurs within the nucleus, but the centroblepharoplast has this kinetic function. *Spironympha* **ovalis** is ovoid; the average size is 38μ-44μ. An axostyle is present. The host is *Reticulitermes hesperus* Banks.—*Author (courtesy Wistar Bibl. Serv.).*

2345. **CHAPMAN, FREDERICK.** A report on samples obtained by boring into Michaelmas Reef, about 22 miles N. E. of Cairns, Queensland. *Rept. Great Barrier Reef Committee* 3: 32-42. 2 pl. 1931.—A list of numerous Foraminifera (and a few other animals) found at various depths from 32 to 600 ft.

2346. **KAHL, A.** Urtiere oder Protozoa I: Wimpertiere oder Ciliata (Infusoria). Eine Bearbeitung der freilebenden und ectocommensalen Infusorien der Erde, unter Ausschluss der marinen Tintinnidae. 1. Allgemeiner Teil und Prostomata. In: **FRIEDRICH DAHL.** *Die Tierwelt Deutschlands, etc.* Teil 18. 180p. 25 fig. Gustav Fischer: Jena, 1930.—This is the first part of a monograph that will treat not only the Infusoria of Germany, but those of the entire world. All the categories of the subclass Infusoria Lędermüller emend. (Ciliata Perty) are to be defined and provided with keys. Every species is being illustrated by 1 or more figs. Part I deals with the general morphology and biology of the Infusoria and the systematics of the first tribe of Gymnostomata, the Prostomata. The following new spp. and varieties are described: *Urotricha* **saprophila*** (p. 59), *U.* **discolor*** (p. 59), *Plagiocampa* **metabolica*** (p. 62), *P.* **chaetophorae*** (p. 62), *P. minima** described, *P.* **posticeconica*** (p. 63), *P.* **margaritata*** (p. 63), *P.* **multiseta*** (p. 63), *P.* **marina*** (p. 64), *Platyophrya* **lata*** (p. 65), *Pseudoprorodon* **ellipticus*** (p. 70), *P.* **armatus*** (p. 70), *P.* **halophilus*** (p. 71), *Prorodon* **luteus*** (p. 74), *P.* **nucleolatus*** (p. 74), *P.* **dubius*** (p. 77), *P.* **morgani*** (p. 77), *P.* **moebiusi*** (p. 79), *P.* **mimeticus*** (p. 82), *Lagynophrya* **conifera*** (p. 85), *L.* **halophila*** (p. 85), *Lacrymaria* **urnula*** (p. 90), *Enchelys* **pectinata*** (p. 99), *Chaenea* **sapropelica*** (p. 103), *C.* **robusta*** (p. 103), *C.* **simulans*** (p. 105), *Rhopalophrya* **sulcata*** (p. 109), *Enchelyodon elegans* v. **striatus*** (p. 112), *E.* **sulcatus*** (p. 112), *E.* **fusidens*** (p. 113), *E.* **monilatus*** (p. 113), *Trachelocerca phoenicopterus* v. **margaritata*** (p. 119), *T.* **conifera*** (p. 121), *Didinium* **faurei*** (p. 125), *D. balbianii* v. **nanum*** (p. 126), *D. b.* v. **rostratum** (*D. nasutum r.* Kahl) (p. 126), *D.* **alveolatum*** (p. 126), *Askenasia* **faurei*** (p. 129), *Coleps hirtus* v. **minor*** (p. 134), *Vasicola* **lutea*** (p. 143), **PELATRACTUS** (p. 143) (Metacystidae), with *P.* **lacrymariaeformis*** (p. 144), *Metacystis* **megapterae*** (p. 147), *Spathidium* **ascicola*** (p. 155), *S.* **capitulum*** (p. 155), *S.* **gibbum*** (p. 155), *S.* **lagyniforme*** (p. 155), *S.* **cylindricum*** (p. 156), *S.* **modestum*** (p. 156), *S.* **breve*** (p. 157), *S.* **simulans*** (p. 157), *S.* **lucidum*** (p. 158), *S.* **serpens*** (p. 158), *S.* **luteum*** (p. 159), *S.* **puteolagri*** Baumeister (p. 159), *S.* **cucumis*** Baumeister (p. 159), *S.* **lionotiforme*** (p. 165). 2347. **MORELLE, LEON.** Une myxosporidie nouvelle de la grenouille rousse: Leptotheca ranae nov. sp. *Ann. Soc. Sci. Bruxelles* 49(2/3): 146-148. 1 fig. 1929.—*L. ranae** (p. 146), in the kidney of *Rana temporaria*, Belgium.

2348. **PHISALIX, Mme.** Haemogregarina cenchridis, nov. sp., parasite d'un serpent boïdé, Epicrates cenchris Lin. *Bull. Soc. Path. Exotique* 24(3): 187-190. 1931.—The same parasite, *Haemogregarina* cenchridis (p. 188) was found with cysts, in each of 3 snakes, *Epicrates cenchris* Lin.; on the largest specimen were ticks which also contained cysts with merozoites.

2349. **PHISALIX, Mme.** Les hémogrégarines de Crotalus terrificus, Lam. *Bull. Soc. Path. Exotique* 24(3): 190-194. 1931.—In 3 out of 4 specimens of a Colombian snake, *Crotalus terrificus* Lam., were found a mixed infection with *Haemogregarina* romani (p. 191) in 2 forms (one 19.8μ long and about 8.4μ in diameter, found free in the plasma; the other an immature form found in the erythrocytes), and *H.* capsulata (p. 192) (also found free and in the erythrocytes). The form within the erythrocyte has a transparent capsule.

2350. **STRELKOW, A.** Über die Fauna des Colons beim Zebra. *Zool. Anz.* 94(1/2): 37-54. 7 fig. 1931.—The material of this study, listed below, came from the colon of a zebra (*Equus böhmi*?) shot in Kenya Colony. Oligotrichous Infusoria: *Tripalmaria dogieli* f. zebrae* (p. 38); TRIFASCICULARIA (p. 40), near *Tripalmaria*, erected for *Trifascicularia* cycloposthium* (p. 40); *Triadinium caudatum; T.* elongatum* (p. 42); *T. galea; Cochliatoxum periachtum; Ditoxum* hamulus* (p. 45); *D.* brevinucleatum* (p. 47); *Spirodinium* nanum* (p. 49); *S.* ferrum-equinum* (p. 50). Holotrichous Infusoria: *Bundleia postciliata; Blepharosphaera intestinalis; Blepharocorys curvigula; B. angusta; B. jubata.* Suctoria: *Allantosoma intestinalis.* All the foregoing appear to constitute new host records. The high percentage of new forms suggests a certain specificity of the fauna. There is a noteworthy tendency toward diminution in size of the organisms, in comparison with the fauna of the horse's colon.

2351. **TAYLOR, MONICA.** The nucleus of Amoeba proteus Pallas (Leidy) [=Chaos diffluens (Schaeffer)]. *Nature* [*London*] 126(3170): 167. 1930.—It is pointed out that 2 distinct species have been confused under the name *Amoeba proteus. A. proteus* (Pallas) Leidy and *A. dubia* (Schaeffer). The nucleus of *A. proteus* is redescribed and differentiated from that of *A. dubia.*

2352. **VALKANOV, A.** Beitrag zur Kenntnis der parasitischen Mikrofauna der bulgarischen Tricladen. *Zool. Anzeiger* 93(7/10): 262-263. 1931.—*Trypanoplasma dendrocoeli* Gelei, *Trichodina steinii* Cl. & L., and *Lankesteria arndti* n. sp. (p. 263) [undescribed] are recorded from *Planaria albissima; Balantidium* sp. from *Planaria gonocephala;* and *Lankesteria planariae* (Ming) from *Planaria polychroa* and *Dendrocoelum lacteum.*

2353. **VALKANOV, A.** Eine neue begeisselte Rhizopode. *Zool. Anz.* 94(3/4): 118-119. 1 fig. 1931.—PATEVIA (p. 119) [incertae sedis], related to the Testacea, erected for *P.* bistadialis* (p. 119), Bulgaria.

2354. **WERMEL, JULIUS.** Über die Variabilität der Anurea aculeata v. serrulata Ehrbg. und Arcella vulgaris Ehrbg. in einem Moortümpel. *Internat. Rev. Ges. Hydrobiol. u. Hydrograph.* 24(1/2): 140-146. 1 fig. 1930.—From 2 different regions of a peat marsh, widely differing in acidity, samples of the above mentioned organisms were taken and their dimensions studied. The averages of these measurements differ for specimens taken from various parts of the bog. Tables were made for *Arcella,* showing the correlation between acidity and diameter of the shell, a non-linear dependence of these 2 variables being thus discovered.—*J. Wermel.*

2355. **ZELIFF, C. C.** Polymastix, a flagellate from the Asiatic beetle. *Trans. Amer. Microsc. Soc.* 49(3): 269-272. 1 fig. 1930.—*Polymastix* occurs in large numbers in the intestine of the Asiatic beetle (*Anomala orientalis*) from Connecticut. No axostyle or parabasal body has been found in the specimens and except for the difference in host and locality where found the organisms are very much like *P. melolonthae* and *P. nitidus.* No previous record of *Polymastix* from the larvae of insects in U. S. A. has been found and the presence of bacteria on the body, including the lack of a parabasal body, distinguishes the present forms from *P. bufonis* from California, placed in the genus by Swezy (1915).—*C. C. Zeliff.*

2356. **ARNDT, WALTHER.** Ueber die Zusammensetzung der Spongien. II. *Sitzungsber. Ges. Naturforsch. Freunde Berlin* 1929(8/10): 307-309. 1930.—Note, chiefly as to the arsenic content of *Spongilla lacustris, Ephydatia fluviatilis,* et al.

2357. **BIDDER, G. P.** On the attitude of a hexactinellid at the bottom of the sea, as compared with that assumed in museum jars and monographs. *Proc. Linnean Soc. London* No. 142. 69-71. 1 fig. 1929/30 (1931).—Hexactinellid sponges are known only from dredged specimens since they occur exclusively in deep ocean. It has been assumed they stand upright, but it may be noted they usually have a sharp bend near the point of attachment. They have no hydraulic efficiency because of very open-work structure yet show exhalent and inhalent surfaces. The ocean bottom is known to be usually nearly level and to have steady currents. All these items may be harmonized if we picture these sponges as bending during growth so that their bulk lies parallel to the bottom with the exhalent face down stream. This shape can be accounted for by more rapid growth on the side against which the current impinges, an hypothesis helpful also in explaining certain growth forms of shallow water sponges.—*M. W. de Laubenfels.*

2366. **SCHRÖDER, KURT. Haltung und Aufzucht von Süsswasserschwämmen.** In: **EMIL ABDERHALDEN'S Handbuch der biologischen Arbeitsmethoden. Abt. IX. Methoden zur Erforschung der Leistungen des tierischen Organismus.** Teil 2, 2 Hälfte, Heft 4, Lief. 338. pp. 1563-1576. 2 fig. Urban & Schwarzenberg: Berlin, 1930.—Instructions are given for collection and transportation of fresh-water sponges and their larvae. The gemmules may also be collected and easily transported, remaining viable after being dry for 6 to 9 months. 7 species have been reared in aquaria. The specimens must be provided with running water, well supplied with oxygen, and fairly pure,—for example, there must be no noticeable taint of iron. The best temperature is 20 to 25°C. and indirect, rather dim light is most favorable. The aquarium sponges were provided in spring and summer with the plankton haul of a fine meshed net; in fall and winter decaying leaves were provided to support a microbe infusion. Other investigators report various methods for sponge nourishment, some even favoring pure water only. Numerous sorts of insect larvae eat fresh-water sponges and one case of their destruction by ostracods is cited. A method is illustrated for rearing sponges from gemmules on cover slips, so that the small, living sponges may be studied under the microscope.—*M. W. de Laubenfels.*

Parasitol.* 17(2): 74-79. 1 pl. 1930.—*D.* **intermedius*** (p. 74); generic characters of *Diplodiscus* and *Opisthodiscus,* emended; *D. ranophilus* (Millzner 1924) reduced to synonymy with *D. temperatus* Stafford 1905.—*G. W. Hunter, III.*

2368. **KENK, ROMAN. Euplanaria cretica Meixner, eine Triklade mit eigentümlichem Drüsenorgan.** *Zool. Anz.* 92(9/10): 247-253. 2 fig. 1930.—A description of this sp. from Crete, especially of the taxonomically important characters, and anatomy of the pharynx and the auricular sense organs are given. These are "sensitive spots" similar to those of *Euplanaria gonocephala,* which are described. The copulatory apparatus resembles that of *E. gonocephala,* but has a peculiar hollow adenodactyl arising from the penial bulb.—*R. Kenk.*

2369. **KORKHAUS, R. Mitteilung über Befall von Leberegelschnecken mit Tetracotylelarven und monostomen Cercarien.** *Sitzungsber. Ges. Naturforsch. Freunde Berlin* 1929(8/10): 268-269. 1930.—Eighty of 124 *Limnaea truncatula* and all of *L. peregra* dissected

contained *Tetracotyle* larvae (*T. typica* Dies.)—a somewhat unusual finding; 2 *L. truncatula* contained *Cercaria* and their redia, previously unknown in these mollusks. They are probably *C. monostomi* v. Linst.

2370. **LIN, SHAO-WEN.** A new technique for Planaria. *Peking Soc. Nat. Hist. Bull.* 4(4): 99-101. 1930.—This consists of starving the worms 2 days in fresh water and then feeding a 5 cc. mixture of egg yolk and, for example, India ink. They are then starved again in fresh water for 12-24 hrs., and killed with a solution of 40% formaldehyde, 10 cc., glacial acetic acid, 2 cc., distilled water, 30 cc.; and immediately covered with cover glass. They are fixed in 50%, 70% and 80% alcohol, and stained and mounted as desired.

2371. **NYBELIN, O.** Zwei neue Cestoden aus Bartenwalen. *Zool. Anz.* 78(11/12): 309-314. 6 fig. 1928.—*Priapocephalus* **minor*** (p. 309), in small intestine of *Balaenoptera borealis*, and *Tetrabothrius* **ruudi*** (p. 312), in small intestine of *B. physalus*, both from W. coast of Norway. Types in Naturhist. Mus. Gothenburg.

2372. **PETRUSCHEWSKY, G. K.** Über die Verbreitung der Plerocercoide von Diphyllobothrium latum in den Fischen des Newabucht. (Vorläufige Mitteilung.) *Zool. Anz.* 94(5/8): 139-147. 1 fig. 1931.—The plerocercoid stage of *D. latum** was found in the fishes *Abramis brama*, *Anguilla anguilla*, *Esox lucius*, *Lucioperca lucioperca*, *Perca fluviatilis*, *Acerina cernua*, *Cottus gobio*, *Pygosteus pungitius*, and *Lota lota*, but was not found in 16 other spp. This cestode has become one of the most numerous intestinal parasites of man in N. W. Russia. The specimens found in each sp. are fully described, and their location in the host is given.

2373. **PRICE, EMMETT W.** Redescription of two species of trematode worms from the MacCallum collection, with a note on the family Pronocephalidae. *Proc. U. S. Nation. Mus.* 78(22): 1-10. 2 fig. 1931.—This paper is essentially a revision of the Pronocephalidae. *Pleurogonius* **pomacanthi*** (*Monostomum p.* MacCallum), (p. 2), recorded from the Pisces *Angelichthys ciliaris*, *A. isabelita*, *Pomacanthus arcuatus*, and *P. paru*; *Opisthoporus*, emended diagnosis; *O. aspidonectes** (MacCallum), emended description, recorded from *Amyda ferox* and *A. spinifera*; *Diaschistorchis* Johnston (=*Synechorchis* Barker, *Wilderia* Pratt); *D. pandus* [author?] (=*Synechorchis megas* [author?]); *Hippocrepis* Trav. is removed from the Pronocephalidae and returned to the Notocotylidae (subfam. Notocotylinae); *Astrorchis renicapite* (Leidy) (=*Monostomum sphargidis* MacC.); *Barisomum* Linton (=*Himasomum* Linton) is referred to the Pronocephalidae; this family retains *Pronocephalus* Looss as the type genus in spite of Looss's attempt to designate *Glyphicephalus* as such. An emended diagnosis is given of the family Pronocephalidae (=Opisthoporidae), and a key is given to the 3 subfamilies: Pronocephalinae, type *Pronocephalus*, including also *Diaschistorchis*, *Cricocephalus*, *Pleurogonius*, *Adenogaster*, *Pyelosomum*, *Astrorchis*, *Barisomum*, *Epibathra*, and *Glyphicephalus*; **CHARAXICEPHALINAE** (p. 9), type *Charaxicephalus* Looss, including also *Desmogonius*; and **OPISTHOPORINAE** (p. 10), type *Opisthoporus* Fukui. Keys are given to the genera of the Pronocephalinae and Charaxicephalinae.

2374. **TRAVASSOS, LAURO.** Alguns trematodeos da familia Heterophyidae observados no Brasil. *Ann. Acad. Brasileira Sci.* 1(1): 14-16. 1 pl. 1929.—*Pygidiopsis pindoramensis** and *Maritrema pulchrerrima**, emended descriptions.

2375. **WITENBERG, G.** Beiträge zur Kenntnis des Sinaigebiets. Parasitische Würmer von Puffinus kuhli. In: **BODENHEIMER, FRIEDRICH SIMON, Editor.** *Ergeb. Sinai-Expedition Hebräis. Univ. Jerusalem* 1927. 118-124. 2 fig. 1929.—The following parasitic worms were found in a single specimen: *Stictodora sawakinensis*, **CERCARIOIDES aharonii** (p. 119); *Renicola* **glandoloba*** (p. 119); *Contracoecum* **bodenheimeri*** (p. 122); *Ornithobilharzia intermedia* Odhner. —*G. Witenberg.*

NEMATHELMINTHES AND NEMATOMORPHA

M. C. HALL, *Editor*

B. G. CHITWOOD, *Associate Editor*

(See also in this issue Entries 118, 1665, 1671, 1680, 1697, 1700, 1708, 1713, 1716, 1719, 1725, 1730, 1733, 1738, 1739, 2375, 2974)

2376. **ALLGÉN, CARL.** Über einen merkwürdigen Fall von Hermaphroditismus beim Halichoanolaimus microspiculum Allgén (Nematodes; Chromadoridae; Choanolaiminae). [A noteworthy case of hermaphroditism in H. microspiculum.] *Zool. Anz.* 80(5/6): 139-143. 2 fig. 1929.

2377. **BAYLIS, H. A.** Some parasitic nematodes from the Uluguru and Usambara Mountains, Tanganyika Territory. *Ann. & Mag. Nat. Hist.* 4(22): 372-381. 3 fig. 1929.—Annotated list of parasite, host, and locality. *Oxysomatium* **chamaeleonis*** (p. 375), from *Chamaeleo fischeri matschiei*; *Rhabdias* **bdellophis*** (p. 377), from lung of *Bdellophis vittatus* (first member of genus from a coecilian); and *Procamallanus* **xenopodis*** (p. 378), from *Xenopus muelleri*. *Raillietnema* Trav. is a synonym of *Oxysomatium* Raill. & Henry, 1913; *Oxysomatium* **loveridgei** (*Aplectana l.* Sandg.) (p. 373). Co-types in British Mus. and Mus. Comp. Zool., Cambridge, Massachusetts.—*M. P. Sarles.*

2378. **BAYLIS, H. A.** A species of the nematode genus Hedruris occurring in the trout in New Zealand. *Ann. & Mag. Nat. Hist.* 7(37): 105-114. 4 fig. 1931.—*H.* **spinigera*** (p. 106). Of the 8 species of *Hedruris* hitherto known, only one, *H. orestiae*, has been recorded from fish. Eggs are described and notes given on the life history of the genus.

2379. **BAYLIS, H. A.** Mission Saharienne Augiéras-Draper, 1927-1928. Parasitic nematodes. *Bull. Mus. Nat. Hist. Nat.* 2(1): 117-130. 8 fig. 1930.—This paper deals with a collection of nematodes made by this expedition to the central Sahara and Niger valley. Ascaridae, Anisakinae (4); Heterakidae, Heterakinae (1); Subulurinae (3), including *Numidica* **monodi*** (p. 119), on the Niger, occurring in the ceca of *Numida* sp.; *Numidica*, *Oxynema* and *Subulura*, taxonomic notes. **QUIMPERIIDAE** (p. 125), is proposed to replace Gendre's Quimperinae and to include *Quimperia* Gendre and **GENDRIA** (p. 126), with type *G.* **tilapiae*** (p. 122), Niger, from fish *Tilapia galilaea*. Oxyuridae, Oxyurinae (2), including *Thelandros* **sahariensis*** (p. 126), central Sahara, from intestine of *Uromastix* sp. Cosmocercinae (1); Spiruridae, Spirurinae (1); Physalopterinae (2); Thelaziinae (1). In conclusion a list of references is given. Cotypes will be deposited in Mus. Nat. Hist. Nat., Paris, and in the British Mus.

2380. **BOULENGER, C. L.** Report on a collection of parasitic nematodes, mainly from Egypt. Part V. Filaroidea. *Parasitology* 20(1): 32-55. 51 fig. 1928.—Comprises a list of determinations of unnamed material from the Cairo Medical School with comprehensive descriptions of many previously known forms, including: *Dipetalonema australe* from *Halmaturus* sp.; *Monopetalonema physalarum* from *Ceryle torquata*; *Setaria equina* from horse and mule; *S. cornuta* from *Cephalophus monticola*; *Hamatospiculum quadridens* from *Asio accipitrinus*; *Dicheilonema nodulosum* from *Lanius excubitor*; *Diplotriaena tricuspis* from *Corvus cornix*, *C. umbrinus* and *Varanus niloticus*; *D. obtusa* from *Hirundo savignyi*; *D. pungens* from *Turdus saxatilis*; *D. artemisiana* from *Coracias garrula*; *D. tridens* from *Lanius col-*

lurio; D. monticelliana from *Silvia arundinacea; Squamofilaria coronata* from *Coracias garrula; Lissonema rotundatum* from *Centropus* sp.; *Dracunculus medinensis* from *Putorius communis.*—*J. H. Sandground.*

2381. CHITWOOD, B. G. The structure of the esophagus in the Trichuroidea. *Jour. Parasitol.* 17(1): 35-42. 2 pl., 1 fig. 1930.—The esophagus of *Trichinella spiralis* was studied in cross section as well as in whole mount preparations. It was found that the posterior portion is not a hollow tube running through the center of a series of large cells, the cell body, as is commonly supposed. The esophagus is triradiate throughout its length, and preserves the structure seen in other nematodes. It is never completely surrounded by the cell body in which it is embedded, except at its junction with the intestine. The esophagus of *Trichuris ovis* and *T. vulpis* is more deeply embedded in the cell body and may be completely surrounded by it. The muscular wall is more or less degenerate. The inner, cuticular lining approximates a cylindrical tube in some regions but also shows evidences of its earlier triradiate character. The esophagus is separated from the cell body, in which it lies, by a basal membrane. The origin of the cell body and its function remain uncertain.—*B. G. Chitwood.*

2382. COBB, N. A. Tylenchus alatus n. sp. In: **The African Republic of Liberia and the Belgian Congo, based on the observations made and material collected during the Harvard African Expedition 1926-27.** Vol. 1. (*Contr. Dept. Trop. Med. & Inst. Trop. Biol. & Med.* no. 5.) Part 3. p. 487-489. Harvard University Press: Cambridge, 1930.—*Tylenchus* **alatus** (p. 487), Cinchona, Africa.

2383. IHLE, J. E. W. Ueber die Gattungen Gaigeria R. et H., Eumonodontus R. et H. und Monodontella Y. et M. *Centralbl. Bakt. Abt. I.* (*Orig.*) 115(3/4): 195-196. 1930.—The author believes that the genera *Gaigeria* and *Eumonodontus* cannot be united into one genus since there are distinct differences in the bursae. He points out also that *Eumonodontus* is primarily a parasite of a non-ruminant (*Dicotyles torquatus*) in South America and *Gaigeria* is a parasite of ruminants in the old world. The genus name *Monodontus* is older than *Bunostomum* and should be used for the species *B. trigonocephalum.*

2384. KREIS, HANS A. Die freilebenden marinen Nematoden der Spitzbergen-Expedition von F. Roemer und F. Schaudinn im Jahre 1898. *Mitteil. Zool. Mus. Berlin* 14(1): 133-188. 7 pl. 1928.—*Anticoma* **longicaudata*** (p. 138), *Thoracostoma* with a key to species, including: *T.* (*Pseudocella*) **conicaudatum*** (p. 143); *T.* (*P.*) **filipjevi*** (p. 145); *Nemanema* **recto-resectum*** (p. 147); *Phanodermopsis* **cylindrocaudatum*** (p. 150); **PHANODERMELLA** (p. 150), near *Phanoderma* and *Phanodermopsis,* based on *P.* **longicaudata*** (p. 151); *Enoplus* **medius*** (p. 153); *E.* **sphaericus*** (p. 154); *Enoplolaimus* **abnormis*** (p. 156); **FILIPJEVIA** (p. 158), near *Enoplolaimus* and *Saveljevia,* based on *F.* **macrolabiatus*** (p. 159); *Pelagonema* **tenue*** (p. 161); *P.* **angusticavatum*** (p. 162); **VASCULONEMA** (p. 163), near *Enoplus,* type *V.* **caeruleum** (*Enoplus caeruleus* Eberth.), also *V.* **conicaudatum*** (p. 164); *Paroncholaimus* **arcticus*** (p. 165); *Oncholaimus* **medius*** (p. 171); **CONVEXOLAIMUS** (p. 171), near *Oncholaimus,* based on *C.* **filicaudatus*** (p. 172); **PSEUDODILAIMUS** (p. 172), near *Dilaimus,* type *P.* **pilosus*** (p. 173); *Paracanthonchus* **bipapillatus*** (p. 174); *Paracyatholaimus* **major*** (p. 176); **DENTATONEMA** (p. 177), resembling *Eurystomina* and *Symplocostroma,* based on *D.* **crassum*** (p. 178); *Desmodora* **gracilis*** (p. 180); **FUSONEMA** (p. 181), related to the Enoplidae and the Spilipherini, based on *F.* **multilabiatum*** (p. 182); *Chromadora* **abnormis*** (p. 183); *Araeolaimus* **macrocirculus*** (p. 185); *Diplopeltis* **longisetosa*** (p. 186). Types in Zool. Inst., Basel.

2385. KREIS, HANS A. Die Entwicklung von Actinolaimus tripapillatus (v. Daday). Ein Beitrag zur postembryonalen Entwicklung der freilebenden Nematoden. [The development of A. tripapillatus.] *Zeitschr. Wiss. Biol. Abt. A. Morph. u. Ökol. Tiere* 18(1/2): 322-346. 36 fig. 1930.—*A. tripapillatus* is redescribed and its development discussed in relation to the conditions of its habitat, i.e., pools which dry out in the dry season. For preserving the species, the nema develops a large number of eggs (48-50) in an elongated oviduct; only the reflexed parts of the sex organs are ovaries. The egg is a modified ovary cell, which has at first a row of food-cells. The first division in the egg occurs in the oviduct. The eggs have thick walls. The young agamic nema has a long tail, which disappears when it develops into a ♂. It probably molts 5 times. While molting the nema develops 3 spears.—*H. A. Kreis.*

2386. OUBOTER, M. P. de BRUYN. Tylenchus devastatrix Kühn uit narcis en hyacinth. [T. devastatrix from the daffodil and the hyacinth.] 104p. Dissertation, University of Leiden: Leiden, 1930.—Minute anatomical investigation of the entire adult nema with new methods (modified differentiator of Cobb, etc.). Differences between the two races in the rostral aspect of the head only. An extensive biometric investigation, based on 13-15 measurements each of 400 specimens; also of 200 eggs. Minute statistical calculations. A number of measures in which both races differ. Thus these are "ecological," not "physiological" races. Attempt to give an explanation of the development of such races, not by gradual adaptation, but by selection, taking these races as genotypically different.—*C. J. van der Klaauw.*

2387. RADEMACHER, BERNHARD. Reizphysiologische Beobachtungen an dem Rübennematoden Heterodera schachtii Schmidt. [Physiological observations of the beet-nematode, H. schachtii.] *Wiss. Arch. Landw. Abt. A: Pflanzenbau* 3(5): 750-787. 4 fig. 1930.—The effect of numerous chemical substances upon the encysted larva of this nematode has been the subject of discussion for years. Effective preparations belong particularly to the following groups: (1) Distillation products of organic substances; (2) dyes and their derivatives; (3) unsaturated compounds, especially allyl-compounds; (4) etheric oils; and (5) oxidizing and reducing substances. Most of these preparations have a two-fold effect in that they both activate the cystic contents and exhibit a paralyzing or lethal tendency. This effect has for practical purposes long been held to be the greatest in those substances of which the culmination points lie within the limits of low concentration and near the death-point. Either simultaneous or progressive application of more than one activating substance tends to increase the effect; progressive application alone heightens the effect of negative substances. The effect of an individual substance upon the life-cycle of activated larvae is specific and depends largely upon the earlier treatment of the larvae.—*B. Rademacher* (*transl. by C. A. Hannum*).

2388. SCHWARTZ, BENJAMIN, and JOSEPH E. ALICATA. Species of the nematode genus Strongyloides parasitic in domestic swine. *Jour. Agric. Res.* 40(1): 11-23. 12 fig. 1930.—*S. suis,* of swine, is distinguished from *S. papillosus* of sheep; *S.* **ransomi*** (p. 15), from small intestine of *Sus scrofa domestica,* Maryland, type in U. S. Nation. Mus.—*J. E. Alicata.*

2389. WÜLKER, G. Die Entstehung des Parasitismus bei den Nematoden. *Arch. Schiffs- u. Tropen-Hyg.* 33 (Beih. 3): 188-200. 3 fig. 1929.—The free-living nematodes are possibly more numerous than the parasitic, and are now considered to be the primitive forms. A comparative survey of nematodes and the forms of their parasitism suggests that there is no single origin of the parasitic habit of life; only within single groups can the evolution of infectious processes be traced.

ROTATORIA, GASTROTRICHA, ECHINODERA, AND CHAETOGNATHA

Africa.

2394. **[KALITA, S. R.]** КАЛИТА, С. Р. Материалы к познанию зоопланктона водоема "Старая Кубань" близ г. Краснодара. **[Zooplankton of the "Old Kuban" basin near Krasnodar, North Caucasus.]** [German summary.] Работы Северо-Кавказской Гидробиологической Станции (*Trav. Sta. Biol. Caucase du Nord*) 3 (1/3): 91-109. Map, 1 pl., 4 fig. 1930.—The greater part of the shore zone of this basin is covered with *Phragmites communis, Vallisneria spiralis, Potamogeton crispus, Myriophyllum* sp., and *Ceratophyllum demersum.* During 2 years' work 48 Rotatoria, 23 Cladocera, and 7 Copepoda were recorded and are here listed. A table shows their seasonal occurrence. There is a periodic fluctuation in abundance, the maximum for most spp. occurring in July and August, and the minimum in Jan. and Feb.; for a few spp. these conditions are reversed. Also a few of the organisms attain the maximum body size in winter, and the minimum in summer. Bibliography.

2395. **[TARNOGRADSKIĬ, D. A.]** ТАРНОГРАДСКИЙ, Д. А. К фауне коловраток Сев. Кавказа из родов **Lecane, Monostyla** и **Colurella. 2405. DONS, CARL. Zoologiska Notizer IX. *Kgl. Norske Vidensk. Selsk. Forhandl.* 3(paper 2): 3-5. 6 fig. 1930(1931).—**MIROSERPULA** (p. 3), near *Chitinopoma* and *Hyalopomatus*, based on *M.* **inflata*** (p. 3), Hammerfest, Norway. Possibly an arctic form, as the species does not occur in the neighboring district, Tröndelag.

2406. GAVRILOV, KONSTANTIN. Selbstbefruchtung bei Limnodrilus. Vorläufige Mitteilung. *Biol. Zentralbl.* 51(4): 199-206. 1931.—Facultative self-fertilization, after self-impregnation, occurs in *L. udekemianus* Clap. In self-impregnation, the body is bent at the boundary between the X and XI segments, admitting of the sexual act. In *L. hoffmeisteri* Clap. and *L. claparedeianus* Ratzel there is no self-impregnation [Selbstbegattung], but the eggs may develop, in the absence of a second individual, probably indicating a facultative self-fertilization by ejaculation of sperm from the ♂ sex-organs into the cocoon.

2407. HERTER, KONRAD. Fang, Pflege und Zucht der deutschen Süsswasseregel. In: EMIL ABDERHALDEN. Handbuch der biologischen Arbeitsmethoden Abt. IX, Methoden zur Erforschung der Leistungen des tierischen Organismus. Teil 2, 2. Hälfte, Heft 4, Lief. 338. Pp. 1577-1618. 8 fig. Urban & Schwarzenberg: Berlin, 1930.—A list of freshwater leeches occurring in Germany with notes on their ecology. Detailed instructions for collecting, transporting, caring for and breeding in captivity, and notes on diseases are given for each species. A considerable bibliography is appended.—*A. L. Treadwell.*

2408. [MALEVICH, I. I.] МАЛЕВИЧ, И. И. К фауне пресноводных **Oligochaeta** Кавказа. **[Oligochaete fresh-water fauna of the Caucasus.]** [German summary.] Работы Северо-Кавказской Гидробиологической Станции (*Trav. Sta. Biol. Caucase du Nord*) 3 (1/3): 81-84. 1930.—A list, with locality and date records, of 17 spp. Their known distribution in various water basins of the Caucasus is summarized in a table.—*From author's summary.*

2409. THOMAS, J. ANDRÉ. Sur les pigments vert et brun de Nereis diversicolor O. F. M. *Bull. Soc. Zool. France* 55(2): 97-103. 1930.—In the integument are 2 pigments, brown and green; the former resembles melanins, the latter is dark green, reversible in the presence of some reagents, especially concentrated acids, and is very resistant to organic solvents. It is possibly a transformation product of chlorophyll.—*J. A. Thomas* (*transl. by A. L. Treadwell*).

2410. TREADWELL, AARON L. Three new species of polychaetous annelids from Chesapeake Bay. *Proc. U. S. Nation. Mus.* 79(1): 1-5. 3 fig. 1931.—*Pionosyllis* **manca*** ♀ (p. 1), off Cape Henry, Virginia, and *Myriana* **cirrata*** (p. 2), near mouth of Chesapeake Bay; *Prionospio* **plumosa*** (p. 3). Types in U. S. Nat. Mus.

BRACHIOPODA, BRYOZOA, PHORONIDEA

R. C. OSBURN, *Editor*

(See also in this issue Entries 2177, 2178, 2179, 2180, 2182, 2183, 2185, 2186, 2188, 2192, 2426, 2478)

2411. CANU, F., et R. S. BASSLER. Bryozoaires marins de Tunisie. *Stat. Océanographique de Salammbô, Ann.* 5. 1-91. Map, 13 pl., 1 fig. 1930.—This report is based upon material collected in 1904 by P. Pallary, not only in Tunisia but also in Algeria. Special attention is paid to the correction of false synonymy; also to biological data, such as color variations, habitat, geographical distribution and biological limits, the rôle of adventive organs, reproduction, and habits. The determination of the number of cells in a certain area (1 or 4 sq. mm.) is a new feature. A bibliography and a glossary are given. The systematic account of about 65 spp. and varieties includes synonymies, descriptions, biological and taxonomic notes, and statements of local and general distribution. The new spp. are from Tunisia unless otherwise stated; types are in Mus. d'Hist. Nat. Paris. *Nitscheina* **pulchella** (p. 13); *Rectonychocella* **disjuncta*** (p. 21); *Onychocella antiqua* (Busk), *O. marioni* Jullien, and *O. parisiensis* D'Orb. are removed from the synonymy of *O. angulosa* (Reuss); *O.* **americana** (p. 22), American Jacksonian; *O.* **falunica** (p. 22), French and Egyptian Helvetian; *Eschara andegavensis* Michelin, *Cellepora gracilis* Reuss, *C. minuta* Reuss, and *Membranipora bifoveolata* Heller (which is referred to the genus *Thalamoporella*) are removed from the synonymy of *Calpensia nobilis* (Esper); *Hemiseptella* **africana*** (p. 29); *Schizomavella auriculata* v. **ornata*** (p. 35); *S. a.* var. **inordinata*** (p. 35); *Schizopodrella* **erectorostris*** (p. 38); *S.* **violacea*** (p. 40), Tunisia and Algeria; *S.* **elliptica*** (p. 42); *S.* **grandicella*** (p. 46); Algeria; *Calloporina* **parvicella** (p. 48); *Hippoporina* **simplex*** (p. 49); *Smittina* **baccata*** (p. 51); *S.* **porosa*** (p. 52); *Schizellozoon* **aviculiferum*** (p. 60); *S.* **granulosum*** (p. 62); *Tubucellaria* **cereoides*** (Solander) is distinguished from *T. opuntioides* (Pallas); *T.* **levinseni** (p. 64), S. Africa; *T.* **watersi** (p. 64), Australia; *Adeonella* **calveti** (p. 68); *Hippopodinella* **strophiae*** (p. 72); *Schismopora* **truncatorostris*** (p. 79); *Cellepora boryi* Audouin and *C. hassallii* (Johnston) are removed from the synonymy of *C. costazii* Audouin; *Diastopora* **rugosa*** (p. 86), Algeria; *Frondipora* **gracilis*** (p. 87), Algeria.

2412. GRAVE, BENJAMIN H. The natural history of

Bugula flabellata at Woods Hole, Massachusetts, including the behavior and attachment of the larva. *Jour. Morph. & Physiol.* 49(2): 355-384. 2 pl., 2 fig. 1930.—The breeding season of *B. flabellata* extends from June 10th to Nov. 15th. The young embryos develop in brood pouches (ovicells) and are finally expelled from the colony as swimming embryos. They come from the colonies at dawn or early morning. After a free-swimming period of 4-6 hrs., each larva becomes attached and after a profound metamorphosis which involves the loss of larval organs, it develops into the Bryozoan colony by budding. The larvae at first are positive to light, but become negative before attachment. Their behavior is described in detail and the mode of attachment is explained. After the larva has become attached a period of rapid growth by budding ensues. The rate of growth is given in a table in which it is shown that the first individual of the colony is completed in 2 days and that a new series of buds is formed every 2 days. There are 8-10 individuals after 1 week and over 100 in 2 weeks. In one month the colony is half-grown and becomes sexually mature. A colony becomes senescent in 3 months, when it measures 1½-1¾ inches in diam. Younger colonies hibernate successfully and resume growth in early May, when new polypides are formed.—*Author (courtesy Wistar Bibl. Serv.).*

2413. **[NALIVKIN, D.]** НАЛИВКИН, Д. Семилукские и воронежские слои. **(The Semiluk and the Voroneje beds of the Upper Devonian of Voroneje region.)** [English summary.] Известия Главного Геолого-Разведочного Управления (*Bull. Geol. & Prospecting Service, USSR. [Leningrad]*) 49(1): 53-93. 3. pl. 1930.—The author describes the Semiluki, Petino, and Voroneje beds, lists the large faunas, compares the section with that of Western Europe, and discusses the Devonian paleogeography of the region. A number of previously described forms are figured. From the Similuki beds the following new forms are described: *Productus* **petini*** (p. 71); *Pentamerus* (*Gypidula*) *biplicatus* v. **nana*** (p. 72); *Leiorhynchus* **pavlovi*** Müfke (p. 72), type in Geol. Mus. Univ. Moscow; *Hypothyris cuboides* v. **semilukiana*** (p. 73); *Pugnax* **voroni*** (p. 73); *Atrypa* **uralica*** (p. 74); *Spirifer disjunctus* v. **supradisjunctoidea*** (p. 75); *S.* (*Cyrtospirifer*) **lictor*** (p. 76); *S.* **perlevis** (p. 76); *Bellerophon* **petinensis*** (p. 80); *Trochus* **tanaicus*** (p. 81); *Orthoceras* **asser** (p. 82). From the Voroneje beds: *Cryptonella* **davidsoni*** (p. 78) and *Cyrtoceras* **commodus** (p. 83).

2414. **NEKHOROSHEV, B. P. On certain Palaeozoic Bryozoa in the British Museum (Natural History).** *Geol. Mag.* 67(790): 178-189. 1930.—Examination of Palaeozoic bryozoans in the Brit. Mus. shows some forms to be of cosmopolitan distribution, thus emphasizing the stratigraphic importance of the phylum, stressed by American authors. There is need for microscopic examination, both to establish stratigraphic ranges of species and to establish priority of many names first given by European authors, but commonly overlooked in American paleontology. Until such microscopic study is made, old identifications are of value only in those localities from which types were derived, and will produce uncertainty and confusion if applied to Bryozoa of other localities.—*C. L. Fenton.*

2415. **RAO, H. SRINIVASA. Sponges and Polyzoa of the Indawgyi Lake, Burma.** *Rec. Indian Mus.* 31(4): 269-271. 1929.—In the fauna of the lake sponges and Polyzoa are very poorly represented; only 1 species of sponge and 3 of Polyzoa were found in the marginal zone of the lake. Discussion and distributional notes are given for *Trochospongilla latouchiana* (sponge), and for the polyzoans, *Hislopia lacustris*, *Plumatella tanganyikae*, and *Lophopodella carteri*.—*S. B. Setna.*

MOLLUSCA

H. A. PILSBRY, *Editor*

H. B. BAKER, *Associate Editor*

J. B. REESIDE, *Associate Editor,* Mesozoic and Paleozoic Mollusca

(See also in this issue Entries 1040, 1119, 1365, 1676, 1703, 1705, 1978, 2158, 2177, 2178, 2179, 2180, 2181, 2182, 2183, 2184, 2185, 2186, 2188, 2189, 2190, 2192, 2193, 2413, 2489)

2416. **ABEL, OTHENIO. Die Fährten der Strandschnecke Bullia rhodostoma an der Küste Südafrikas und die Kriechspuren aus dem Greifensteiner Sandstein bei Kierling im Wienerwalde.** *Verhandl. Zool.-Bot. Ges. Wien* 79(2/4): (75)-(79). 1929(1930).—The author describes the trails of *B.* **rhodostoma** on sandy beaches in Cape Province, and compares them with the trails in the Greifenstein sandstone described under the name of *Phyllochorda*. It is extremely probable that the latter were made by fossil forms of *Bullia*.

2417. **ADENSAMER, WOLFGANG. Wissenschaftliche Ergebnisse der Expedition R. Grauer nach Zentralafrika. Dezember 1909 bis Februar 1911. Mollusca.** *Ann. Naturhist. Mus. Wien* 42: 87-98. 4 fig. 1928.—The expedition to eastern Belgian Congo brought back 31 mollusks, all but 1 (*Melania* (*Potadoma*) **graueri*** (p. 97) of which have since been described from this material. Systematic relationships and measurements are given for all the species.—*M. W. Kamm.*

2418. **ARKELL, W. J. The generic position and phylogeny of some Jurassic Arcidae.** (To be cont.) *Geol. Mag.* 67(793): 297-310. 3 pl., 14 fig. 1930.—The confused nomenclature of *Arca, Cucullaea, Grammatodon, Beushausenia, Parallelodon,* and their synonyms are reviewed, with the conclusion that *Parallelodon* should be accepted as a genus with *Grammatodon* and *Beushausenia* as subgenera. The origin of *Parallelodon* is to be sought in the early Paleozoic, perhaps in the genus *Cypricardites*, thus suggesting closer relationship between the Pteriidae and Taxodonta than commonly is supposed. *Barbatia, Nemodon* and other Cretaceous and Tertiary genera are discussed or illustrated; *Barbatia* seems to be ancestral to *Nemodon* and *Cucullaria*.—*C. L. Fenton.*

2419. **ASHBY, EDWIN. Contributions to the fauna of Rottnest Island [Western Australia]. No. II. Polyplacophora.** *Jour. Roy. Soc. Western Australia* 15: 47-54. 7 fig. 1928/1929.—The author lists 14 forms, including *Notoplax* **rottnestensis*** (p. 47) and *Lepidopleurus* **glauerti*** (p. 50). *Ischnochiton virgatus* Reeve (=*Autochiton v. exaggeratus* Iredale & Hull). A brief revised classification of Polyplacophora is appended.

2420. **ATANASIU, ION S. Études géologiques dans les environs de Tulghes (District Neamțu).** *Anuar. Inst. Geol. Românіei* 13: 373-508. 78 fig. 1928(1929).—Twelve species are recorded from the Aptian (L. Cretaceous) of this district in Rumania. The U. Cretaceous is rich in the gastropods **TRANSILVANELLA** (p. 484), erected for *T.* **abbreviata*** (*Tornatella a.* Philippi) (p. 484), including also *Transilvanella* **lamarcki*** (*Actaeonella l.* Z·ck.) (p. 484).

2421. **BAKER, H. BURRINGTON. Mexican mollusks collected for Dr. Bryant Walker in 1926. Part II.** *Occas. Papers Mus. Zoöl. Univ. Mich.* 220: 1-45. 5 pl. 1930.—Pupillidae: *Pupisoma* **comicolense*** (p. 3). Endodontidae: A key to N. Amer. spp. of *Punctum* is given; *P.* **vitreum*** (p. 9), Texas; *Rotadiscus hermanni* **nivatus** (p. 12); *Radiodiscus* **proameri*** (p. 13). Philomycidae: The anatomy of *Pallifera costaricensis* ssp. **alticola*** (p. 15) and *crosseana* is studied and the possible identity of all the tropical American "species" is discussed. Zonitidae: *Guppya sterkii* **punctum*** (p. 21) and a subgenus of *Mesomphix,* **OMPHALINELLA** (p. 25), tod. *Helix veracruzensis* Pfr. are proposed; a key to the

groups in *Mesomphix* and anatomy of *M. lucubratus, M. bilineatus, M. veracruzensis,* and *M. carinatus* are included; *Pseudovitrea* is made a synonym of *Hawaiia* because dissections of *Helix kawaiensis* (from Hawaiian Isls.) show that it is a form of *H. minuscula;* a key to the species of *Striatura* is given; and the anatomy of *S. meridionalis* (from Mexico and Pennsylvania) and *S. pugetensis* (from Washington) is described. Species of Systrophiidae and of European Limacidae are reported, and the anatomy and synonymy of the palearctic *Deroceras laeve* (+*Agriolimax campestris*) are discussed. Type of *Punctum vitreum* in Acad. Nat. Sci. Philadelphia; other types in Walker coll.—*H. B. Baker.*

2422. **BAKER, H. BURRINGTON. The North American Retinellae.** *Proc. Acad. Nat. Sci. Philadelphia* 82: 193-219. 6 pl. 1930.—An attempt is made to classify the N. Amer. land snails of the genus *Retinella* (Pulmonata, Zonitidae) with the aid of studies of the anatomy of most of the species. In the subgenus *Perpolita,* notes are given on the anatomy of *R. electrina, R. binneyana,* and *R. subhyalina;* in *Glyphyalus,* on that of *R. burringtoni, R. cumberlandiana, R. wheatleyi,* and *R. vanattai;* in **GLYPHYALOIDES** (p. 194), on *R. roemeri* (genotype) and *R. lewisiana;* in *Glyphyalops,* on *R. rhoadsi;* in *Glyphyalinia,* on *R. indentata, R. carolinensis* and *R. cryptomphala;* in **GLYPHOGNOMON** (p. 194), on *R. praecox* and *R. sculptilis* (genotype). *R. binneyana* **occidentalis*** (p. 198), Washington; *R. cumberlandiana* **roanensis*** (p. 203), North Carolina; *R. rhoadsi* **austrina*** (p. 208), *R. cryptomphala* **solida*** (p. 213), *R.* **praecox*** (p. 214), and *R. sculptilis* **subdola*** (p. 217), Tennessee. Types in Acad. Nat. Sci. Philadelphia.—*H. B. Baker.*

2423. **BAKER, H. BURRINGTON. The land snail genus Haplotrema.** *Proc. Acad. Nat. Sci. Philadelphia* 82: 405-425. 3 pl. 1930(1931).—This paper attempts a revision of the genus *Haplotrema,* which constitutes the family Haplotrematidae. In the subg. *Haplotrema* s.s., notes are given on the anatomy of *H. duranti* and ssp. **continentis*** (p. 410), California, type in Acad. Nat. Sci. Philadelphia; in subg. *Geomene,* on that of *H. concavum;* in subg. **ANCOMENA** (p. 406) on *H. keepi, H. alameda,* and *H. minimum* from California, and on *H. vancouverense* (tod. of subgenus) from Washington; in subg. **ANCOTREMA** (p. 406) on *H. sportella* (tod. of subg.) from Washington; in subg. **HAPLOMENA** (p. 406) on *H. paucispira* (tod. of subg.) from Cuba; and in subg. *Zophos,* on *H. concolor* from Porto Rico. Keys to the groups and species are included. On the basis of their anatomy, the Haplotrematidae are thought to be most closely related to the Rhytididae and Streptaxidae.—*H. B. Baker.*

2424. **BARTSCH, PAUL. New and old land shells from the Island of Luzon, Philippines.** *Proc. U. S. Nation. Mus.* 78(5): 1-20. 9 pl. 1930.—This paper deals chiefly with a revision of the subspecies of *Cochlostyla dubiosa* Pfeiffer, *C. submirabilis* Möllendorff, *C. mirabilis* Férussac, and *C. persimilis* Fér. The synonymy of previously described and of some of the new subspecies of species of *Cochlostyla* is cited under each and their known distribution is given. Types of new forms in U. S. Nat. Mus. *Cochlostyla dubiosa* **capulensis*** (p. 5), *C. submirabilis* **banosana*** (p. 6), *C. s.* **majayjayana*** (p. 7), *C. s.* **lucbana*** (p. 7), *C. s.* **tayabasana*** (p. 8), *C. s.* **antimonana*** (p. 8), *C. s.* **daragana*** (p. 9), *C. persimilis* **callipepla*** (p. 13), *C. p.* **pharcida*** (p. 14), *C. p.* **callimorpha*** (p. 15), *C. p.* **podagra*** (p. 15), *C. p.* **acrybia*** (p. 16), *C. p.* **boacana*** (p. 16), *Obba gallinula* **majayjayana*** (p. 17), *Leptopoma* **mcgregori*** (p. 17), *Sulfurina citrinella* **banahaoana*** (p. 18).—*P. Bartsch.*

2425. **BATALLER, J. R., and M. GUERIN. Notes sobre el triàsic de Barcelona i Tarragona.** *Butl. Inst. Catalana Hist. Nat.* 10(6): 81-84. 3 pl. 1930.—Includes an emended description of *Protrachyceras vilanovae** E. Mojs. and figures of *Ceratites guerini* Bataller, *C. catalaunicus* Batal., and *C. almerai* Batal.

2426. **[BOULE, MARCELLIN.] Types du Prodrome de Paléontologie stratigraphique Universelle de d'Orbigny.** [Conclusion.] *Ann. Paléontol.* [*Paris*] 18(4): 97-132. 6 pl. 1929.—Original description, new discussion, and new figures of the following d'Orbigny species of pelecypods: *Lavignon subrugosa*, Leda corallina*, Venus corallina*, Corbula neptuni*, Opis cotteausia*, O. thais*, O. radisensis*, O. rupellensis*, Astarte cotteausia*, A. nysa*, A. eudora*, A. bicostata*, A. papyracea*, A. nicias*, Hippopodium corallinum*, H. cottaldinum*, Cyprina elea*, C. corallina*, C. hersilia*, C. erato*, C. eucharis*, C. bernardina*, Trigonia aculeata*, T. corallina*, T. rupellensis*, T. bicostata*, Lucina athleta*, L. delia*, L. mosae*, L. rupellensis*, L. neptuni*, Corbis cottaldina*, Unicardium callirhoe*, U. subregulare*, Isocardia brevis*, I. rupellensis*, Cardium sublamellosum*, C. semiseptiferum*, Nucula feronia*, Limopsis moreausiana*, Arca janthe*, A. idalia*, A. janias*, A. idmone*, A. janassa*, Myoconcha compressa*, M. auricula*, Mytilus petasus*, M. leda*, M. lagus*, M. lynceus*, M. leilus*, M. lassus*, M. lombricalis*, Lithodomus corallinus*, L. rupellensis*, Lima corallina*, L. rupellensis*, Avicula mimas*, A. mysis*, A. corallina*, Perna corallina*, Pinnigena rugosa*, Pecten subarticulatus*, P. corallinus*, P. nisus*, P. nothus*, P. niso*, P. nireus*, P. nicaeus*, Hinnites ostreiformis*, Plicatula rustica*, Diceras bernardina*,* and *Ostrea clytia**. The pelecypod, *Pulvinites rupellensis** d'Orbigny and the brachiopods, *Terebratula rupellensis** d'Orb. and *T. equestris** d'Orb. are also figured. All of the species are said to be Corallian (NeoJurassic), according to d'Orbigny, and localities are given.—*B. F. Howell.*

2427. **BUCKMAN, S. S. Jurassic Ammonoidea. In Mesozoic paleontology of Blairmore region, Alberta.** *Canada Dept. Mines, Nation. Mus. Bull. Geol. Ser.* 58. 1-27. 1 fig. 3 pl. 1929.—Ammonites of the Macrocephalitidae from the early Up. Jurassic Fernie formation of the southern Rocky Mts. of Canada, including: **PARACEPHALITES** (p. 8), type *P.* **jucundus*** (p. 8), *P.* **glabrescens*** (p. 10); **METACEPHALITES** (p. 11), type *M.* **metastatus*** (p. 11); **MICCOCEPHALITES** (p. 14), type *M.* **miccus*** (p. 15), *M.* **laminatus*** (p. 14), *M.* **concinnus*** (p. 15). Types in Victoria Memorial Mus., Ottawa. Comparative analyses of the characters of these and other macrocephalitid, and even "cadoceratid," genera are given. It is concluded that the Alaskan *Cadoceras grewingki* series does not belong to "Cadoceratidae" but to Macrocephalitidae, being akin to *Miccocephalites.* Geographic distribution of related species is briefly given. Chronology of deposits bearing macrocephalitids, etc., is discussed. It is suggested that the Ferne macrocephalitids are of early Up. Jurassic, Proplanulitan, *Catacephalites,* date.—*C. H. Crickmay.*

2428. **CHAMBERLIN, RALPH V., and ELMER BERRY. Mollusca from the Henry Mountains and some neighboring points in Utah.** *Bull. Univ. Utah.* 21(2): 1-7. 1930.—An annotated list of species, collected chiefly in Sept. 1929, including *Aplexa* **microstriata** (p. 7), and some *Gastrocopta* spp. new to Utah.

2429. **CHAMBERLIN, RALPH V., and ELMER BERRY. A new mollusk of the genus Pupoides from southern Utah.** *Proc. Biol. Soc. Washington* 44: 7-8. 1 fig. 1931.—*Pupoides* **eupleura*** (p. 7), type in Univ. of Utah Zool. Mus.

2430. **COTTON, BERNARD C. Contributions to the fauna of Rottnest Island. no. IV. Western Australian Sepiidae.** *Jour. Roy. Soc. Western Australia* 15: 87-94. 3 pl., 1 fig. 1928/1929.—Fifteen spp. are recorded from various parts of W. Australia, including Rottnest Isl. Five are new: *Solitosepia* **glauerti*** (p. 87); *S.* **hendryae*** (p. 87); *S.* **occidua*** (p. 88); *Decorisepia* **cottesloensis*** (p. 90); *Crumenasepia* **ursulae*** (p. 90). All new forms from W. Australia; types presumably in W. Australian Mus.

2431. **COTTON, BERNARD C. Pelecypoda of the "Flindersian" region, Southern Australia.** *Rec. S. Australian Mus.* 4(2): 223-240. 15 fig. 1930.—This paper is based upon material dredged by Joseph Verco in South and Western Australia. The systematic list of about 84 forms includes distributional and depth records and taxonomic remarks. **PROTONUCULA** (p. 223), resembling *Pronucula,* proposed for *Protonucula* **verconis*** (p. 223), 130-300 fm., W. Australia (type) and S. Australia;

Pronucula **cancellata** (p. 224), 9-62 fm., S. Australia; *P.* **concentrica*** (p. 224), 20 fm., S. Australia; *P.* **flindersi** (p. 225), 300 fm., W. Australia; *Comitileda* **curtior** (p. 226), 72-300 fm., W. Australia; **LAMELLILEDA** (p. 227), near *Poroleda*, erected for *L.* **typica*** (p. 227), 300 fm., W. Australia; *Glycymeris striatularis* **penelevis*** (p. 229), 12 fm., S. Australia; *G. flabellatus* Ten. Woods (=*G. broadfooti* Iredale); *Limopsis vixornata* **occidentalis** (p. 230), 22 fm., W. Australia; *L. tenisoni* **forteradiatus** (p. 231), 35 fm., S. Australia (type) and W. Australia; *L. t.* **tenuiradiatus** (p. 231), 81 fm., S. Australia (type) and W. Australia; *Atrina tasmanica* Ten. Woods (=*A. t.* var. *dumosa* Hedley); *Malleus* **meridianus** (p. 232), S. Australia and W. Australia, type depository not given; *Mimachlamys fumigerator*, new to the Flindersian region; **NOTOCHLAMYS** (p. 233), erected for *N.* **anguineus** (*Chlamys a.* Finlay) (p. 233); *N.* **tasmanicus** (*Pecten t.* Ads & Angas) (p. 234); *Cuspidaria* **levifrons*** (p. 235), 300 fm., W. Australia; *Cuna* **subrotunda*** (p. 235), 62 fm., S. Australia (type) and W. Australia; *Venericardia amabilis* Deshayes (=*Cardita gemulifera* Tate); *V.* **propelutea*** (p. 236), 14 fm., S. Australia; *Condylocardia* **crassidentata** (p. 236), 40-130 fm., S. Australia; *C.* **rectangularis*** (p. 237), 40-200 fm., S. Australia; *C.* **isosceles*** (p. 238), 35-49 fm., S. Australia; *C.* **limaeformis*** (p. 238), 62 fm., S. Australia; *C.* **notoaustralis*** (p. 239), 150-200 fm., S. Australia (type) and Tasmania; **AUSTROTURQUETIA** (p. 239), erected for *A.* **integra** (*Turquetia i.* Hedley) (p. 239); *Corbula* **iredalei*** (p. 239), 20 fm., S. Australia; *C.* **flindersi*** (p. 240), 17 fm., S. Australia. Types in S. Australian Mus. unless otherwise stated.

2432. **COX, L. R. The fossil fauna of the Samana Range and some neighbouring areas: Part VIII. The Mollusca of the Hangu shales.** *Mem. Geol. Surv. India, Palaeont. Indica* 15: 129-222. 6 pl. 1930.—A well preserved molluscan fauna is recorded from the earliest Tertiary horizon (Paleocene), at all rich in fossils, yet discovered in Asia. The stratigraphic position and paleontological evidence as to the age (Landenian or possibly Montian) of the Hangu shales, as well as the broad paleogeographical relations of the fauna, are discussed at length. Genera reported from so low a horizon for the first time include *Strepsidura, Streptochetus,* and *Voluta* s. str. from the Hangu shales; and *"Cassidaria," Cassis, Harpa,* and *Sigaretus* from the Up. Ranikot beds. The long-range species *Lambis goniophora, Mesalia fasciata,* and *Corbula exarata* occur in the Cretaceous-Tertiary transitional beds of India, though not known below the Lutetian of Europe. *Globularia brevispira* and a *Terebellopsis* are reported for the first time from India. Of 63 definitely identified gastropod genera of the Hangu shales or Up. Ranikot beds, only 33 have been found in the Paleocene of northwestern Europe. Gastropoda: *Pirena* **torta*** (p. 144); *Batillaria* **coronata*** ("? *melius* Clavidae") (p. 146); *Campanile* **brookmani*** (p. 149); *Pyrazus* **octogonus*** (p. 150); *Vermetus* **hanguensis*** (p. 151); *Turritella* **daviesi*** (p. 152); *T.* **lahirii*** (p. 153); *T. ranikoti** Vredenburg; *T.* **cf.** *hollandi** Cossmann & Pissarro; *Mesalia fasciata** (Lamarck); *M.* **pagoda*** (p. 160); *Tibia* **samanaensis*** (p. 161); *Lambis* **goniophora*** (*Rostellaria g.* Bellardi) (p. 162); *Rimella* **levis*** (p. 166); *Euspira* **roei*** (p. 169); **AMPULLOSPIRIDAE** (p. 170), n. name for Euspiridae Cossmann; *Globularia* **brevispira** (*Natica b.* Leymerie) (p. 171); *G.* **sulcata*** (p. 172); *Euspirocrommium* **conicum*** (p. 174); *Pachycrommium* **indicum*** (p. 175); *Crommium* **rouaulti*** (*Natica r.* d'Archiac & Haime) (p. 175); *Eocypraea* **cotteri*** (p. 177); *Protocypraea* **kohatica*** (p. 178); *Architectonica* **mainwaringi*** (p. 179); *Streptochetus* **foxi*** (p. 181); *Dolicholatirus* **indicus*** (p. 182); *Hemifusus* **montensis*** (p. 184); *Eovasum* **haimei*** (d'Archiac), emended description; *Murex* (*Phyllonotus*) **wadiae*** (p. 189); *M.* **sandersoni*** (p. 190); *Strepsidura* **tipperi*** (p. 191); *S.* **scobina*** (p. 192); *Turricula* (*Pleurofusia*) **hanguensis*** (p. 193); *T.* (*Ancistrosyrinx*) **hayden*** (p. 195); *Voluta* **vredenburgi*** (p. 196); *Athleta* (*Volutocorbis*) **daviesi*** (p. 198); *A.* (*Volutospina*) **wynnei*** (p. 199); *Lyria* **samanaensis*** (p. 201). Scaphopoda: *Dentalium* **hanguense*** (p. 203). Lamellibranchia; *Cardium inaequiconvexum** Cossmann & Pissarro; *Cardita* **hanguensis*** (p. 206); *Meretrix* **indica*** (p. 207); *Chama oblonga* L. is designated as type of *Trapezium; Trapezium* **daviesi*** (p. 209); *Crassatellites* **exiguus*** (p. 210); *Corbula* **samanaensis*** (p. 211); *C.* (*Bicorbula*) **praeexarata*** (p. 212). Types in Geol. Surv. India. Bibliography of 140 titles.

2433. **DAVIES, JOHN H. Non-marine shells of Upper Carboniferous rocks of North America.** *Proc. and Colls. Wyoming* [*Pennsylvania*] *Hist. and Geol. Soc.* 21: 98-106. 11 fig. 1930.—Representatives of *Anthracomya, Carbonicola,* and *Naiadites* from various localities in the Appalachians are noted and figured, and the author suggests that detailed study of their distribution might aid in correlation of the coal beds.

2434. **[EMEL'ÏANTSEV, TIKHON.]** ЕМЕЛЬЯНЦЕВ, ТИХОН. Артинские головоногия из района Полюдовского Камня на Урале. [**Gastrioceras and Paragastrioceras in the Poliudovsky Stone region, Ural Mts.**] Известия Геологического Комитета, Ленинград (*Bull. Com. Géol.* [*Leningrad*]) 48(8): 145-152. 1 pl., 8 fig. 1929.—A critical study of the following forms, found for the first time in the Artinsk formation in the lower Vishera River region (Cherdynsk Ural), is made: *Orthoceras siphocentralis** Krotow., *Parapronorites urmensis* Tschern., *Paragastrioceras jossae** Verneuil., *P. karpinskii* Fredericks, *P. suessi* Karpinsky, *Gastrioceras fedorovi** Karp., and *Adrianites* **fredericksi*** (p. 150).

2435. **ENDO, RIUJI. The presence of Nybyoceras in south Manchuria.** *Jour. Sci. Lab. Denison Univ.* 25(6/7): 297-299. 1 pl. 1930.—Notes the occurrence of actinoceroid cephalopod *Nybyoceras* Troedsson, in the Up. Chazyan, Wuting formation of Manchuria. The genus, heretofore known only from the Lyckholm (F^1)=Richmond of the Baltic region, has also been found in Lr. Chazyan strata of Oklahoma. *Nybyoceras* **foerstei*** (p. 298), Lr. Ordovician.—*J. Bridge.*

2436. **FELIKSIAK, STANISŁAW. Über riesige Exemplare der Teichmuschel, Anodonta cygnea (L.). [Giant specimens of A. cygnea.]** *Fragmenta Faunistica Mus. Zool. Polonici* 1(6): 135-142. 1 pl. 1930.—A detailed study of 2 specimens of unusual size, from Poland, one (26 cm. long) with 10 annual rings, the other (21.5 cm. long) with 8. Four stages of development are described.

2437. **FINLAY, H. J. Invalid molluscan names. No. 1.** *Trans. & Proc. New Zealand Inst.* 61(1): 37-48. 1930.—*Cucullaea* **whiteavesi** (*C. ponderosa* Whiteaves, not Hutton) (p. 37); *Limopsis* **solicola** (*L. compressus* Dall, not G. & H. Neville) (p. 37); *Lima crassa* Hutton, 1873, is discarded as unidentifiable and as preoccupied by Forbes, 1844; *Salaputium* **aldingensis** (*Crassatella corrugata* Tate, not Adams & Reeve) (p. 38); *Lucina minima* Ten.-Woods, 1876, is preoccupied by Roemer, 1836; *Tellina donaciformis* Deshayes, 1855, is preoccupied by Nyst, 1835; **MARWICKIA** (*Finlaya* Marwick, not Theobald) (p. 38); *Dosinula elegans* Hutton, 1873, is preoccupied by *Callistus elegans* Boheman, 1848; *Lutraria* **porrecta** (*L. elongata* Gray, not Muenster) (p. 39); *Patella aculeata* Reeve, 1855, is preoccupied by Gmelin, 1791; *Diodora* **philippiana** (*Fissurella elongata* Philippi, not M'Coy) (p. 39); *Calliostoma* **dautzenbergi** (*C. hedleyi* Dautzenberg, not Pritchard & Gatliff) (p. 39); *C.* **amazonica** (*C. iheringi* Dall, not Ortmann) (p. 40); *Liotina* **infensa** (*Delphinula crenata* Kiener, not Sowerby) (p. 40); *Brookesena* Finlay (=*Vindex* Powell, not Kaup); *Crepidula* **yokoyamai** (*C. convexa* Yokoyama, not Say) (p. 40); **SULCERATO** (p. 40), type *Erato illota* Tate; *Eratotrivia* Sacco, 1894, replaces *Eratopsis* H. & A., 1880, which is preoccupied by R. L., 1817, and should be used for the European spp.; **BADENIA** (*Powellia* Finlay, not Maskell) (p. 41) is transferred from the Rissoidea to the Melanellidae and placed near *Melanella* and *Eulima; Fusinus* **dampieri** (*Fusus exilis* Menke, not Conrad) (p. 41); *Aeneator* **huttoni** (*Buccinum inflatum* Hutton, not Shaw) (p. 42), emended description; *Neptunaea costatus* Hutton is preoccupied

by *N. costata* Link, and is synonymized with, and replaced by, [*Austrofusus*, gen. ?], *Nassicola* [section ?] *contracta* Finlay; *Siphonalia compacta* Suter is transferred to "this genus" [*Austrofusus* (*Nassicola*) ?]; *Austrofusus* (*Nassicola*) *magnificus* Finlay is transferred to *Austrofusus* s. str.; **ATKINSONELLA** (p. 43), erected for *Buccinum fragile* Ten.-Woods; *Eucominia* **filholi** (*Buccinum veneris* Filhol, not Basterot) (p. 44); *Thais* **demissa** (*Purpura depressa* Martin, not Link) (p. 44); *Columbella* **conella** (*C. coniformis* Martin, not Sowerby) (p. 44); *Volutoconus* **ralphi** (*Voluta conoidea* Tate, not *Bulla conoidea* L.) (p. 44); *Voluta lirata* Johnston is preoccupied by *V. lyrata* Brocchi; *Notopeplum* **saginatum** (p. 45), Tasmania (Janjukian, Neogene), type in author's coll.; *N.* **balcombensis** (p. 46), Victoria, Australia (Balcombian), type in author's coll.; *Phenatoma novae-zelandiae* (Reeve) (=*Pleurotoma plicatella* Hutton); *Bathytoma* **murdochi** (*Pleurotoma nodilirata* Murdoch & Suter, not E. A. Smith) (p. 46); *Gemmula* **thielei** (*Pleurotoma* (*Gemmula*) *fusiformis* Thiele not Sowerby) (p. 47); *Splendrillia* **aoteana** (*Pleurotoma laevis* Hutton, not Bellardi) (p. 47); *Terebra* **vredenburgi** (*T. martini* Vredenburg, not Tesch) (p. 47); *T.* **teschi** (*T. martini* Tesch, not English) (p. 47); **ZEACUMINIA** (p. 47), type *Z.* **tahuia** (*Terebra sulcata* Marshall, not *T. swainsoni* var. *s.* Pease) (p. 47); *T. flexicostata* Suter is transferred to *Pervicacia; Actaeon* **ambiguus** (*Admete* ? *ambigua* Hutton) (= *Actaeon praestitus* Finlay) (p. 48).

2438. FOERSTE, AUGUST F. Three studies of cephalopods. *Denison Univ. Bull. Jour. Sci. Lab.* 24 (10/13): 265-381. 23 pl. 1930.—Pt. I.—A few European cephalopods: Discusses scope of the family Lituitidae and of genera *Ancistroceras* (Ordovician); *Rhynchorthoceras* (Ordov.); *Orthoceras* (Ordov.); *Loxoceras* (Carboniferous); **EIFELOCERAS** (p. 283), type *E.* **kayseri*** (p. 283) (Devonian), Germany; **BREYNIOCERAS** (p. 284), type *Orthoceratites breynii* Martin, (Carboniferous); *Palaeonautilus* (Ordov.); *Cyrtoceras* and *Archiacoceras* (Devonian). Describes and figures species under foregoing genera. Pt. II.—Ordovician cephalopods from north-central states: Discusses genera *Nanno, Suecoceras, Tripteroceras, Westonoceras, Diestoceras, Gonioceras, Lambeoceras,* and *Trocholites*. Describes and figures species, including *Cameroceras*(?) **faberi*** (p. 302), Indiana; *Tripteroceras* **planoconvexum*** (*Orthoceras p.* Hall) (p. 306), *T.* **scofieldi*** (p. 309), Minnesota; *Westonoceras*(?) **minnesotense*** (*Oncoceras m.* Clarke) (p. 312); *Diestoceras* **clarkei*** (for *Poterioceras apertum* Clarke not Whiteaves) (p. 314), Minnesota; *Gonioceras occidentale* v. **homerense*** (for *G. o.* Whitfield not Hall) (p. 317), Illinois; *G.* **kayi*** (p. 319), Iowa; *Lambeoceras* cf. *lambi** (a discussion of Clarke's material assigned to *Tripteroceras l.*); *Trocholites* **faberi*** (p. 323), Kentucky; *Armenoceras* **saxosum*** (p. 325), Manitoba. Pt. III.—American phragmoceroids and gomphoceroids: A restudy of previously named species. Discusses the Silurian genera *Phragmoceras; Tubiferoceras; Gomphoceras;* **STENOGOMPHOCERAS** (p. 367), type *S.* **chadwicki*** (p. 367), Illinois; *Mandaloceras; Hexameroceras; Octameroceras; Eotrimeroceras; Pentameroceras. Septameroceras* is dropped as a synonym of *Hexameroceras*. Describes and figures many species, including *Phragmoceras* **altidorsatum*** (p. 329), and *P.* **auroraense*** (p. 333), Ohio; *P.* **canadense*** (*P. nestor c.* Whiteaves) (p. 336); *P.* **carmani*** (p. 337), Ohio; *P.* **chicagoense*** (p. 339), Illinois; *P.* **colliciare*** (p. 339) and *P.* **cuneiforme*** (p. 342), Ohio; *P.* **hedstroemi** (for *P. ellipticum* Hedström not H. & W.) (p. 344), Sweden; *P.* **hespelerense*** (for *P. nestor canadense* Whiteaves, nontypical part) (p. 345), Ontario; *P.* **hillsboroense*** (p. 345), Ohio; *P.* **ontarioense*** (for *P. parvum* Whiteaves not H & W.) (p. 349), Ontario; *P.* **procerum*** (p. 352), Wisconsin; *P.* **projectum** (*Gomphoceras p.* Newell) (p. 354), *P.* **raymondi*** (p. 354), Wisconsin; *P.* **ruedemanni** (for *P. parvum* Clarke & Ruedemann not H. & W.) (p. 355), New York; *P.* **slocomi*** (p. 356), Wisconsin; *P.* **wilmingtonense*** (p. 359), Ohio; *Tubiferoceras* **labiatum*** (*Phragmoceras l.* Whitfield) (p. 362), *T.*(?) **lineare** (*Gomphoceras l.* Newell) (p. 363), *Gomphoceras* **hector** (*Phragmoceras h.* Billings) (p. 365), *G.* **ruedemanni*** (for *Phragmoceras accola* Ruedemann nontypical part) (p. 365), New York; *G.*(?) **cameroni** (*Phragmoceras c.* Foerste & Savage) (p. 366); *Mandaloceras* **wabashense** (*Gomphoceras wabashensis* Newell) (p. 370); *M.* **scrinium*** (*Gomphoceras s.* Hall) (p. 370); *M.* **marcyae** (*Gomphoceras m.* Winchell & Marcy) (p. 371); *M.* **subgracile*** (*Gomphoceras s.* Billings) (p. 372); *M.* **parvulum** (*Gomphoceras p.* Whiteaves) (p. 373); *Hexameroceras* **septore*** (*Gomphoceras septoris* Hall) (p. 376); *H.* **inflatum** (*Gomphoceras i.* Billings) (p. 381).—*J. B. Reeside, Jr.*

2439. GABRIEL, C. J. Catalogue of the land shells of Victoria. *Proc. Roy. Soc. Victoria* 43(1): 62-88. 2 pl. 1930.—This catalogue records 47 forms of native mollusks, with synonymies, locality records, taxonomic remarks, and type localities. *Bifidaria* **bannertonensis*** (p. 64). *Thersites fodinalis,* new to Victoria. *Rhytida lampra, R. lamproides,* and *R. gawleri,* new to Victoria. *Charopa funerea* (Cox) (=*Endodonta murrayana* v. *submurrayana* Cox & Hedley); *C. sericatula* and *C. diemenensis,* new to Victoria; *C.* **elenescens** (*Flammulina e.* Cox & Hedley) (p. 75); *C.* **erskinensis*** (p. 76); *C.* **gatliffi*** (p. 76); *C.* **tarravillensis*** (p. 77); *C.* **scindocataracta** (p. 77); *C.* **bairnsdalensis*** (p. 78); *Laoma minima,* new to Victoria; *L.* **turbinuloidea*** (p. 81); *L.* **sinistra*** (p. 81). *Microcystis circumcincta,* new to Victoria. All new spp. from Victoria. In addition to the foregoing, 11 spp. naturalized in Victoria are listed, with brief descriptions.

2440. GATLIFF, J. H., and F. A. SINGLETON. On the relationship between "Pecten" asperrimus Lamarck and "Pecten" antiaustralis Tate, with a description of an allied fossil form. *Proc. Roy. Soc. Victoria* 42(2): 71-77. 3 pl. 1930.—*Chlamys asperrimus* **antiaustralis*** (*Pecten antiaustralis* Tate) (p. 71), emended description; *C. a. asperrimus** is recorded as both Recent and fossil; *C. a.* **dennanti*** (p. 73), Werrikooian (Upper Pliocene or Pleistocene ?), Victoria, type in Nat. Mus., Melbourne.

2441. GEORGE, T. NEVILLE. The ontogeny of certain arietidan oxycones. *Geol. Mag.* 67(794): 352-361. 5 fig. 1930.—Oxycones of *Victoriceras victoris** (Dumortier) and *Oxynoticeras oxynotum** (Quenstedt) give evidence of descent from evolute, costate Arietidae, as was supposed by Buckman. Both groups show lipopalingenesis, and both represent distinct stocks which have reached the oxycone stage by different evolutionary stages.—*C. L. Fenton.*

2442. GRABAU, A. W. Terms for the shell-elements in the Holochoanites. *Bull. Geol. Soc. China.* 8(2): 115-123. 1929.—The author accepts Schindewolf's conclusion that *Volborthella* is an orthoceroid type, and not a direct ancestor of the Holochoanites. He suggests a "hypothetical Protochoanite" from which both may have been derived. The structural units of the Holochoanite shell are redefined to exclude terms implying homologies with other forms which may or may not exist. The ontogeny of the Holochoanites is discussed as a basis for phylogenetic conclusions, and the generic name **TEILHARDOCERAS** (p. 121) (Aseoceratidae), is suggested for certain fragmentary Cambrian shells that seem to show the structures he postulates for the primitive ancestral form. The Indian Ocean is suggested as the probable center of radiation for the Holochoanites, the Boreal Sea for the Orthochoanites.

2443. HAAS, F. Über nord- und mittelamerikanische Najaden. *Senckenbergiana* 12(6): 317-330. 1 pl. 1930.—**CONCHODROMUS** (*Dromus* Simpson, not Selby) (p. 317). *Diplidon quadrans* (Lea) (=*D. fontainianus* (Orb.)). *Unio famelicus* Gould, ostensibly from Oregon, is considered an Australian sp., close to or identical with *Hyridella lessoni* (Küster). *Psoronaias plexoideus* Frierson is transferred to the genus *Elliptio,* subg. *Barynaias.* **PSORULA** (p. 319), n. subg. of *Amblema,* type *Quadrula rudis* Simpson; to this subg. are also transferred *Rotundaria quadrata* (Simpson), *R. profunda* (Simp.), *R.*

guatemalensis (Simp.), *R. percompressa* (Martens), *R. usumasintae* (Crosse & Fischer), and *R. salinarum* Haas. Paratypes of *Anodonta cornea** Phil., *A. atrovirens** Phil., and *A. nicaragua** Phil., discovered in the Rouen Mus., are designated as lectotypes; *Anodontites trigonus montezuma* (Lea) (=*Anodonta atrovirens* Phil., *A. cornea* Phil., *A. grandensis* Lea); *Anodontites trapesialis* nicaragua (*Anodonta n.* Phil.=*A. ciconia* Gould), A series of Say's own specimens of 29 Naiades, received from him by the Senckenberg Mus. about 1834, and representing various spp. of Rafinesque, Green, Hildreth, and Barnes, as well as some of his own, are listed, with their most important characters and the locality data. Since Say's original types are lost, neotypes of the following of his spp. are designated: *Anodonta grandis, A. imbecillis, Unio cicatricosus, U. cylindricus, U. verricosus, U. plicata**, *U. heros, U. ovatus, U. subrostratus,* and *U. alatus. Pleurobema cicatricosum* (Say) (=*Unio varicosus* Lea, *U. detectus* Frierson).

2444. HAAS, F. Versuch einer kritischen Sichtung der südamerikanischen Najaden, hauptsächlich an Hand der Sammlung des Senckenberg-Museums. II. *Senckenbergiana* 13(1): 30-52. 9 fig. 1931.—*Diplodon granosus granosus** (Bruguière) (=*Unio psammactinus* Philippi, *U. granuliferus* Dunker, *U. coriaceus* Dunker); *D. g. ellypticus* Spix (=*D. wagnerianus* Simpson, *D. jacksoni* Marshall); *D. g. multistriatus** (Lea) (=*D. minus* Simp., *D. semigranosus* Simp., *Unio firmus* v. *boettgeri* Ihering); *D. paranensis paranensis* (Lea) (=*Unio paraguayanus* Martens); *D. p. funebralis* (Lea) (=*Unio nocturnus* Lea, *U. gratus* Lea, *U. peraeformis* Lea, *U. disculus* Lea, *U. prunoides* Lea, *Diplodon fontainianus* v. *deceptus* Simp., *D. felipponei* Marsh., *D. subquadratus* Marsh., *D. arcuatus* Marsh.); *D. fontainianus** (Orb.) (=*U. rufofuscus* Lea); *Bulloideus* Simp., originally proposed as a section of the subg. *Cyclomya,* is here elevated to the rank of a subgenus, and includes *Diplodon variabilis* (Maton) (=*Unio bulloides* Lea) and *D. solisianus* (Orb.); *Castalia* **stevensi** (*Tetraplodon s.* H. B. Baker) (p. 40); *C. ecarinata** Mousson, redescribed; *Prisodon* Schumacher (=subg. *Hyriana* Simp.); *P. syrmatophorus* **complanatus** (*Hyria complanata* Hupé) (p. 43); *P. obliquus Schum.* (=*Hyria castelnaudi* Hupé, *Unio ortonii* Lea); *Hyria jamauchimensis* F. Baker (=*H. amazonia* Frierson, *H. wheatleyi* Marsh.); *Monocondylaea p. paraguayana* Orb. (=*M. corrientesensis* Orb., *M. pazii* Lea, *M. orbignyana* Doello-Jurado); *M. p. jaspidea** (Hupé) (=*Unio reticulata* Moricand, *Plagiodon rotundatus* Mousson, *Monocondylaea obesa* Ortmann); *M. l. lentiformis* Lea (=*M. feliponci* Marsh.); *M. l.* **hollandi** (*M. h.* Ortm.) (p. 47); *M. l.* **franciscana** (*Unio f.* Moricand) (p. 48); (*M. minuana* Orb. (=*M. parchappii* Orb.); *M. costulata** (Moric.), emended description; *Fossula fossiculifera* **balzani** (*F. b.* Iher.=*F. b. mattogrossensis* Iher.) (p. 49); *F. fossiculifera* **braziliensis** (*F. b.* Iher.) (p. 50); **MARSHALLIELLA** (p. 50), type *M.* **balzani*** (*Plagiodon b.* Iher.) (p. 51).

2445. HEINZ, RUDOLF. Das Inoceramen-Profil der Oberen Kreide Lüneburgs. Mit Anführung der neuen Formen und deren Kennzeichnung. (Beiträge zur Kenntnis der oberkretazischen Inoceramen 1.) *Jahresber. Niedersächs. Geol. Ver.* [*Hannover*] 21: 64-81. 2 pl. 1928.—Exposures of the Up. Cretaceous at Lüneburg (south of Hamburg) furnish an excellent standard section extending from Lr. Cenomanian (Tourtia) to the *Scaphites constrictus* zone of the Senonian (Mucronaten Senon). The sedimentation record is unbroken through the entire thickness of 424.65 meters in this section. *Inoceramus* zones have been established which closely correspond in nearly every case with the generally recognized subdivisions of the Up. Cretaceous in northern Europe. There is a diagrammatic section, showing the exact range of the various species. *Inoceramus inaequivalvis* **falcata** (p. 72); *I. latus* **stümckei** (p. 72); *I.* **stillei*** (p. 72); *I.* **ernesti** (p. 73); *I. humboldti* **zeltbergensis** (p. 74); *I.* **stolleyi** (p. 74); *I. brongniarti* **wysogorskii** (p. 74); *I.* **dankeri** (p. 75); *I.* **gürichi*** (p. 75); *I. undulato-plicatus* **michaeli** (p. 76); *I. undabundus, I. digitatus,* and *I. patootensis* are discussed. Types of the new forms are in Mineralogisch-Geologisc. Staatsinst., Hamburg. Bibliography.—*J. R. Sandidge.*

2446. HERITSCH, FRANZ. Über einige cyrtochoanitische Nautiloideen aus dem Obersilur von Kryszczatek bei Zaleszczyki am Dniester. *Bull. Serv. Géol. Pologne.* 5(3/4): 557-564. 1 pl., 3 fig. 1930.—Description of *Oocerina* **brevis*** (*Cyrtoceras breve* Siemiradzki) and of *Oocerina* **amabilis*** (p. 558).—*F. Heritsch* (*transl.*).

2447. HULL, A. F. BASSET, and JEAN RISBEC. The loricates of the New Caledonian region. (Class Mollusca—order Loricata). II. *Australian Zoologist* 6 (4): 372-386. 1 pl., 41 fig. 1931.—*Parachiton* **lifuensis*** (p. 373), Loyalty Isls. *Loboplax triduena** is redescribed, with detailed anatomical observations, synonymy, distributional records, and taxonomic discussion. Four additional spp. are more briefly noticed.

2448. IREDALE, TOM. Queensland molluscan notes, no. 2. *Mem. Queensland Mus.* 10(1): 75-88. 1 pl. 1930.—**MELAXINAEA** (p. 73), near *Glycymeris,* type *M.* **labyrintha*** (p. 73), 9-12 fms.; *Macalia bruguièri* **refecta** (p. 74); **LEPORIMETIS** (p. 74), type *Tellina spectabilis* Hanley; **PROPHETILORA** (p. 75) (Tellinidae), compared with *Monitilora,* type *P.* **arizela*** (p. 75); **FALLARTEMIS** (p. 75) (Dosinidae), type *F.* **amina*** (p. 75); **SEMELARTEMIS** (p. 76) (Dosinidae), compared with *Semele,* type *S.* **aetha*** (p. 76); **CORALASTELE** (Trochoidae), type *C.* **allanae*** (p. 76); *Cerithium adansonii* Bruguière is named as the type of *Aluco* Link; *Pseudovertagus* **excelsior*** (p. 78), 11 fms.; *Cerithium philippinense* Cossmann (=*C. problema* Iredale); **DARIOCONUS** (p. 79), type *Conus omaria* Brug.; **REGICONUS** (p. 79), type *Conus auratus* Brug.; **LEPORICONUS** (p. 79), type *Conus glans* Brug.; **CLEOBULA** (p. 79), type *Conus figulinus* L.; *Leptoconus ammiralis* **temnes** (p. 80); **VIRROCONUS** (p. 80), type *Conus ebraeus* L.; **FLORACONUS** (p. 80), type *Conus anemone* Lamarck; **CANCELLAPHERA** (p. 80) (Conidae?), type *C.* **amasia*** (p. 80), 9-11 fms.; the type of *Cypraea* must be *C. tigris* L., not *C. mappa* L.; **ARESTORIDES** (p. 82), type *Cypraea argus* L.; **EVENARIA** (p. 82), type *Cypraea asellus* L., including also *C. hirundo* L., *C. punctata* L., and *C. contaminata* Sowerby; **RAVITRONA** (p. 82), type *Cypraea caputserpentis* L., including also *C. helvola* L.; **PALMADUSTA** (p. 82), type *Cypraea clandestina* L., including also *C. lutea* Gronov. and *C. ziczac* L.; **GRATIADUSTA** (p. 82), n. subg. of *Palmadusta,* type *Cypraea pyriformis* Gray, including also *C. xanthodon* Sow., *C. walkeri* Gray, and *C. subviridis* Reeve; **PALANGEROSA** (p. 82), type *Cypraea cylindrica* Born., including also *C. subcylindrica* Sow., and *C. quadrimaculata* Gray; **BASILITRONA** (p. 83), type *Cypraea isabella* L.; **LEPORICYPRAEA** (p. 83), type *Cypraea mappa* L., including also *C. valentia* Perry; **PAULONARIA** (p. 83), type *Cypraea beckii* Gaskoin; **CLEOTRIVIA** (p. 83), type *Cypraea pilula* Kiener; **DOLICHUPIS** (p. 83), type *Cypraea producta* Gaskoin; **MYSTAPONDA** (p. 83), new subg. of *Lyncina,* type *Cypraea vitellus* L.; **MELICERONA** (p. 83), n. subg. of *Erronea,* type *Cypraea listeri* Gray; **BLASICRURA** (p. 84), n. subg. of *Evenaria* [?], type *Cypraea rhinoceros* Sowerby, new to Queensland; **ECLOGLAVENA** (p. 84), n. subg. of *Erronea* [?], type *Cypraea coxeni* Cox.; **PERISSEROSA** (p. 84) (Cypraeidae), type *P.* **brocktoni** (p. 84), based upon a specimen figured by Sowerby in 1880 under the name *Cypraea guttata* Gray, type in coll. of J. R. le Brockton Tomlin. **NIVIGENA** (p. 84) (Cypraeidae), resembling *Stolida,* type *N.* **melwardi*** (p. 84). Amphiperatidae: *Prosimnia* **renovata** ([*Limnia?*] *dentata* Adams & Reeve, preocc.) (p. 85); *P.* **angasi** (*Ovulum a.* Reeve) (p. 85); **PRIONOVOLVA** (p. 85), type *Ovulum breve* Sowerby; **DIMINOVULA** (p. 85), type *D.* **verepunctata** (p. 85), Australia; **PHENACOVOLVA** (p. 85), related to *Prosimnia,* type *Phenacovolva* **nectarea*** (p. 85), 9-12 fms.; *Colus* **boardmani*** (p. 86), 9-11 fms.; *Pleuroploca* **altimasta*** (p. 86); *Cirsotrema* **kelea*** (p. 87), 9-12 fms. New forms from Queensland unless otherwise specified.

2449. IREDALE, TOM. More notes on the marine

Mollusca of New South Wales. *Rec. Australian Mus.* 17(9): 384-407. 4 pl. 1930.—*Pronucula* mayi (p. 384), Tasmania, based upon a figure published by May under the name of *P. decorosa* (*Proc. Roy. Soc. Tasmania*, 1915, p. 81, pl. viii, fig. 42); *Cucullaea* vaga (p. 385), 25-30 fm.; DENTICOSA (p. 385), type *Philobrya cuboides* Verco; the complicated nomenclature of the genus *Laternula* is discussed; PENDALOMA (p. 387), type *Periploma micans* Hedley; OFFADESMA (p. 387), type *Periploma angasi* Crosse & Fischer; FRENAMYA (p. 387), type *Coelodon patulus* Tate; VERTISPHAERA p. 388) (*Verticordiidae*), type *V.* cambrica (p. 387), based upon a specimen figured by Hedley (Rec. Austr. Mus., vi, p. 303, pl. lvi, figs. 38-39, 1907); VERTAMBITUS (p. 388), type *Verticordia vadosa* Hedley; SPINOSIPELLA (p. 388), type *Verticordia ericia* Hedley, SETALIRIS (p. 388), type *Verticordia setosa* Hedley; *S.* accessa (p. 388), PROAGORINA (p. 388), type *Lyonsiella quadrata* Hedley; *Ectorisma granulata* Tate (=*Poromya illevis* Hedley) is revived; QUESTIMYA (p. 389), type *Poromya undosa* Hedley & Petterd; PEXOCODAKIA (p. 389), type *Lucina rugifera* Reeve; EPICODAKIA (p. 389) (*Lucinidae*), type *E.* consettiana ("introduced for *Lucina minima* Ten. Woods") (p. 391); *E.* gunnamatta* (p. 391); SYDLORINA (p. 390) (Lucinidae), type *S.* symbolica (p. 390), based on the species figured by Hedley (Proc. Linn. Soc. N. S. W., xxxix, 1914 (1915), p. 699, pl. lxxix, figs. 25-28) as *Codakia pisidium* Dunker; MONITILORA (p. 390), type *Lucina ramsayi* Smith; WALLUCINA (p. 390), type *Lucina jacksoniensis* Smith.; NEVENULORA (p. 390), type *Lucinida hilaira* Hedley; CAVATIDENS (p. 391) (Lucinidae), type *C.* omissa* (p. 391); BATHYCORBIS (p. 392), type *Chione despecta* Hedley. Thyasiridae: GENAXINUS (p. 392), type *Thyasira albigena* Hedley; PARATHYASIRA (p. 392), type *P.* resupina* (p. 392), 63-75 fm.; *P. r.* neozelanica (p. 393), 110 fm., New Zealand; PROTHYASIRA (p. 393), type *P.* peroniana* (p. 393), 63-75 fm.; *P. peroniana* peregrina (p. 393), New Zealand; *P.* adelaideana* (p. 393), 100 fm., S. Australia; *P.* benthicola (p. 394), 470 fm.; VIRMYSELLA (p. 394), resembling *Mysella*, type *V.* spernax* (p. 394). MERIDOSINIA (p. 394) [Dosinidae?], type *M.* nedigna* (p. 394); *Sunettina* Jousseaume is preoccupied by *Sunettina* Kobelt (=*Solanderina* Dall); SUNEMEROE (p. 395), type *Sunetta adelinae* Angas; *Antigona lamellaris* moderata (p. 395); TIGAMMONA (p. 396), resembling *Antigona*, type *T.* persimilis* (p. 396), New South Wales (type) and Queensland; VEREMOLPA (p. 397), resembling *Antigona*, type *V.* ethica* (p. 397), New South Wales (type) and Queensland; PUNIPAGIA (p. 397), type *Tellina subelliptica* Sowerby; DELTACHION (p. 398), resembling *Donax*, type *Deltachion* virilis* (p. 398), New South Wales (type) and Queensland; PLEBIDONAX (p. 398), type *Donax deltoides* Lamarck; TENTIDONAX (p. 398), type *Donax veruinus* Hedley; *Deltachion* electilis* (p. 399), South Australia; AUSTROMACTRA (p. 400), related to *Mactra*, type *A.* caloundra* (p. 401), Queensland (type) and New South Wales; NANNOMACTRA (p. 400), type *Mactra jacksonensis* Smith; ELECTOMACTRA (p. 400), type *Mactra parkesiana* Hedley; *E.* antecedens* (p. 401), New South Wales (type) and Queensland; DIAPHOROMACTRA (p. 400), type *Hemimactra versicolor* Tate; NOTOSPISULA (p. 400), type *Gnathodon parvum* Petit; *Zenatia victoriae* Pritchard & Gatliff is referred to the genus *Zenatiopsis*; SPONDERVILIA (p. 402), type *Ervilia australis* Angas, AMESODESMA (p. 402) (Amphidesmatidae), type *A.* perfuga* (p. 402); *A.* cuneata (*Amphidesma c.* Lamarck) (p. 402); *A. c.* vanidica (p. 402); VENATOMYA (p. 403), type *Sphaenia elliptica* A. Adams; BENTHOQUETIA (p. 403), type *Turquetia integra* Hedley; *Corbula rosea* [author ?] is designated as the type of *Corbula* Bolten, which is reduced to the synonymy of *Asaphis* Modeer; NOTOCORBULA (p. 404) (Corbulidae), related to *Corbula*, type *N.* vicaria* (p. 404); *N.* hydropica* (p. 405), Queensland; *N.* stolata* (p. 405), Victoria (type) and New South Wales; ANISOCORBULA (p. 404), type *Corbula macgillivrayi* Smith; *Hiatella* Bosc. (=*Saxicava* Bellevue); HIATELLIDAE (=Saxicavidae).

2450. KEVAN, D. K. Report on the molluscan fauna of Duddingston Sanctuary (with supplement). *Scottish Nat.* 1931(187): 15-22; (188): 55-58. 1931.—Forty-four spp. are listed, with notes on local distribution and habitat.

2451. KOBAYASHI, TEIICHI. Ordovician fossils from Korea and South Manchuria. Part II. On the Bantatsu bed of the Ordovician age. *Jap. Jour. Geol. & Geogr. Trans.* 7(3/4): 75-100. Map, 4 pl., 6 fig. 1930.—The author gives an areal map, cross-section, and lithologic description, separating the formation into 4 members, 2 of which are fossiliferous; 30 spp. and 1 variety are listed, 15 of which are also known from the Toufangkou or Machiakou formations. Cephalopoda: *Cycloceras* mantalense* (p. 82); *C.* kawasakii* (p. 84); *Actinoceras* exogastrale* (p. 85). Gastropoda: *Bucania* katoi* (p. 87); *Lophospira morrisi**; *L.* bantatsuense* (p. 88); *L.* konnoi* (p. 88); *L. trochiformis**; *L.* kodairai* (p. 89); *L. acuta** Grabau (=*L. pulchelliformis* Grabau); *L.* subpulchella* (p. 90); *L. gerardi**; *Pagodispira derwiduii**; *P.* sakamotoi* (p. 91), Manchuria; *P.* tetracarina* (p. 92), Korea and Manchuria; *Liospira* kawasakii* (p. 92), *L. barbouri**; *Eotomaria* concava* (p. 93); *Ophiletina* sp.*; *O.* (?) shokoriense* (p. 94); *Ecyliopterus kushanensis**; *Helicotoma* yabei* (p. 95); *H.* tamurai* (p. 95); *Maclurea* tofangoense* (p. 96), Manchuria and Korea; *M.* niuhsintaiense* (p. 97), Manchuria; *M.* kotoi* (p. 97), Manchuria; *Trochonema* ozawai* (p. 98); *T. o.* var. depressa* (p. 99); *Tentaculites* tofangoense* (p. 99), is the only Tentaculite known from the Ordovician on N. China and Korea. Types of *Lophospira konnoi*, *L. bantatsuense*, and *Maclurea tofangoense* in Imperial Univ. Tokyo; not given for others. New forms from Korea unless otherwise stated.

2452. [KRYMHOLZ, G. ЙА.] КРЫМГОЛЬЦ, Г. Я. Верхнеюрские Cylindroteuthinae Тимана, басс. р. Сысолы и Оренбургской губ. [Upper Jurassic Cylindroteuthinae from the Timan, the basin of the Syssola River, and the Province of Orenburg.] [German summary.] Известия Геологического Комитета (*Bull. Com. Géol. [Leningrad]*) 48(7): 103-142. 2 pl. 1929.—The author presents a list of 27 belemnites, with synonyms, descriptions and taxonomic remarks. He follows the classification of A. Naef, except that he assigns the *Belemnites absolutus* group to the genus *Cylindroteuthis*. *Pachyteuthis breviaxis* (Pavlow), which had been proposed to replace *P. abbreviata* (Miller), is retained by the present author for certain of the forms figured by Pavlow. *Cylindroteuthis* tschernyschewi* (p. 110), Callovian; *C.* sarygulensis* (p. 114), and *Pachyteuthis* ingens* (p. 126), Up. Kimmeridgian. There is a bibliography of 64 titles.

2453. KULLING, O. Studier över den kaledoniska fjällkedjans stratigrafi och tektonik inom norra delen av svenska Lappland. [Stratigraphy and tectonics of the Caledonian Mountains in northern Swedish Lapland.] [German summary.] *Geol. Foren. Stockholm, Förhandl.* 52(4): 647-672. 2 maps, 1 pl., 11 fig. 1930 (1931).—*Fordilla troyensis* Barrande, previously known only from N. Amer. and Greenland, is reported from Lr. Cambrian.

2454. LAWS, C. R. New Tertiary Mollusca from New Zealand. No. 1. *Trans. & Proc. New Zealand Inst.* 61(3/4): 547-553. 3 pl. 1930.—*Glycymeris* marshalli* (p. 547) and *Dosinia* (*Raina*) benereparata* (p. 547), Ototaran; *D.* (*R.*) bartrumi* (p. 548), Waitotaran; *Cardium* strangi* (p. 549), Ototaran, type in Univ. of Otago; *Elachorbis* albolapis* (p. 549), Awamoan; *Modelia* nukumaruensis* (p. 550), Pliocene (Castlecliffian and Nukumaruan (type)); *Sinum* marwicki* (p. 551), Awamoan; *Verconella* finlayi* (p. 552), Hutchinsonian. Types in author's coll. unless otherwise stated.

2455. LOVÉN, PER-MAGNUS. Untersuchungen aus dem Öresund. XVI. Beiträge zur Kenntnis der Cyprina islandica L. im. Öresund. *Lunds Univ. Årsskr. Sect. 2. Med. Mat. Naturvetensk.* 26(paper 1): 1-37. Map. 1 pl.,

4 fig. 1929(1930).—A map and description of the area investigated are given. The depth of the water and condition of the bottom at each station where the investigations were carried on, the number (including both dead and living specimens) of *C. islandica* taken, are recorded. Shell dimensions were compared and studied; variations in length and height, and the length-height ratio are given in detail. For several stations graphs are given illustrating these facts. For the southern and northern parts of the Öre Sund statistics relative to medium, dispersion, correlation, and regression were compiled. From data obtained the author endeavored to ascertain the duration of life and growth rate of *C. islandica* with the conclusion that the species is apparently dying out in the southern parts of the area investigated. A detailed, illustrated description of the shape and structure of the shells is included.—*P. M. Lovén.*

2456. McLEARN, F. H. Notes on some Canadian Mesozoic faunas. *Trans. Roy. Soc. Canada, Sect. 4, Geol. Sci.* 24(1): 1-7. 2 pl. 1930.—Of Lr. Middle Jurassic age are *Telocceras* **dowlingi** (p. 2); *T.* **warreni*** (p. 3), and *Stemmatoceras* **palliseri** (p. 3), types in Univ. of Alberta. Of Lr. Jurassic age (Up. Lias): *Dactylioceras* **kanense*** (p. 4); *Harpoceras* **maurelli*** (p. 4); *H.* **alliformense*** (p. 4); as the lectotype of *H. propinquum* (Whiteaves) the author designates figs. 2, 2a only [sic]. Geol. Surv. Canada, Mes. Foss., vol. 1, p. 247, pl. 33 (1884); **FANNINOCERAS** (p. 4), a degenerate harpoceratid, type *F.* **fannini*** (p. 4); *F.* **carlottense** (p. 4); *F.* **kunae*** and v. **latum*** (p. 5); *F.* **lowrii*** (p. 5); *Stephanoceras* **caamoni*** (p. 5); *S.* **yakounense** (p. 5); all from Brit. Columbia. Of late Lr. Cretaceous age: **GASTROPLITES** (p. 6), type *G.* **canadensis** (*Hoplites c.* Whiteaves) (p. 6), Alberta. Types in Nat. Mus. Canada unless otherwise stated.

2457. McLEARN, F. H. A preliminary study of the faunas of the Upper Triassic Schooler Creek formation, Western Peace River, Brit. Columbia. *Trans. Roy. Soc. Canada, Sect. 4, Geol. Sci.* 24(1): 13-17. 1 pl. 1930.—Arctic affinities of the faunas are suggested. **MEGINOCERAS** (p. 16), n. subg. of *Steinmannites*, erected for *S.* **meginae*** (p. 16); **SILENTICERAS** (p. 16), n. subg. of *Daphnites*, erected for *D.* **hatae*** (p. 16); *Protrachyceras* **sikanianus*** (p. 16) and v. **zauwae*** (p. 17); *Isculites* **schooleri*** (p. 17); *Arcestes* ? **selwyni*** (p. 17); **STIKINOCERAS** (p. 17), erected for *S.* **kerri*** (p. 17). Types in Nat. Mus. Canada.

2458. MATSUMOTO, HIKOSHICHIRÔ. On the marine faunae of three fossil zones of the Upper Miocene of Natori District, Province of Rikuzen. *Sci. Rept. Tôhoku Imp. Univ. Geol.* 13(3): 95-109. 2 pl. 1930.—These zones, in descending order, are *Arca amicula* zone, *Balanus bisulcatus* zone, and *Pecten natoriensis* zone. Lists are given of the mollusks, both extinct and living, found in each, with their geographical and stratigraphical distribution. About 50 spp. are included. *Mya* **paternalis*** (p. 98); *Entodesma* **lagoveneris*** (p. 102); *Mactra* **charischema*** (p. 103); *Lutraria* **takadatensis*** (p. 103); *Pecten* **natoriensis*** (p. 104); *P. n.* var. **subovalis*** (p. 105); *P. n.* var. **inequilateralis*** (p. 105); *P.* **plicicostulatus*** (p. 105); *P.* (*Pseudamusium*) **akihoënsis*** Saga (MS.) (p. 106); *Velopecten* **survivans*** (p. 106); *Crepidula* **yokoyamai*** (p. 108). Crustacea: *Balanus flosculus* v. **orientalis*** (p. 108). All new forms from Up. Miocene.

2459. MOORE, E. W. J. Species of the genus Dimorphoceras in the Bowland shales. *Geol. Mag.* [*London*] 67(790): 162-168. 9 fig. 1930.—Determination of spp. of *Dimorphoceras* can be made only from the suture lines of uncrushed specimens. Critical notes and range determination are given for *D. gilbertsoni** and an unnamed variety*, *D. discrepans**, *D. looneyi**, and 2 undetermined species. *Neodimorphoceras* **hawkinsi*** (p. 168). Specimens in Brit. Mus. Nat. Hist.—*C. L. Fenton.*

2460. PEYER, B., und E. KUHN. Die Kopulation von Limax cinereoniger Wolf. *Vierteljahrschr. Naturforsch. Ges. Zürich* 73(3/4): 485-521. 5 pl. 10 fig. 1928.—In the copulation of *L. cinereoniger*, as it occurs in Canton Tessin (Monte San Giorgio) and the western part of this district, the penis is extended to a maximum length of 82 cm. and is firmly wound around the body of the other copulant as has been observed of the snails' bodies. The animal raises itself from the substratum by a triangular plate of slime. Copulation lasts 12-19 hours not counting the introductory courtship of 2 hrs. After the complete eversion of the penis, the sperm mass passes from the vas deferens and with the shortening of the penis to 10 cm. is spread over the partner. The anatomical finding did not differ materially from those of earlier published accounts.—*H. Hoffman* (*transl. by W. Scott*).

2461. PING, CHI. Two new Cretaceous fresh-water gastropods from Mongolia. *Amer. Mus. Novitates* 437. 1-4. 12 fig. 1930.—*Vivipara* **grangeri*** (p. 1), with 3 mutations, and *V.* **fusistoma*** (p. 4), from the Dohoin Usu formation (Cretaceous); types in Mus. Geol. Surv. China.

2462. REED, F. R. COWPER. Faunas triassicas do Brazil. (Triassic faunas from Brasil.) [In Portuguese and English.] *Minist. Agric., Industr. e Comm., Serv. Geol. e Min. Brasil, Monographia* 9. 1-97. 5 pl. 1929.—Fossils collected from the Estrada Nova and Rio do Rasto beds (Middle or Up. Triassic) include over 50 forms, chiefly Lamellibranchiata, most of which are figured and compared with European forms, rather than identified. The following new forms from the State of Paraná are described: *Myophoria* (*Heminajas*) **holdhausi*** (p. 27); *Myophoriopis* **martialis*** (p. 31); *Pseudocorbula* **emerita*** (p. 37); *Isocyprina* **curvata*** (p. 39); *I.* **reducta*** (p. 41); *Pleurophorus* ? **bipleura*** (p. 47); *Thracia* **printina*** (p. 51); *T.* **perversa*** (p. 53); *Cypridina* **roxoensis*** (p. 67); *Pachycardia rugosa* v. **occidentalis*** (p. 71); *Myophoriopis* **braziliensis*** (p. 73).

2463. POWELL, A. W. B. New species of New Zealand Mollusca from shallow-water dredgings. Part 2. *Trans. & Proc. New Zealand Inst.* 61(3/4): 536-546. 2 pl., 10 fig. 1930.—The taxonomy of *Condylocardia* Bernard and *Benthocardiella* Powell is discussed. *Benthocardiella* **obliquata*** (p. 538), 6-10 fms.; *B.* **orbicula*** (p. 538), Recent (6-38 fms.) and Up. Pliocene; *B.* **hamatadens*** (p. 539), 6-10 fms. *Lodderene* **formosa*** (p. 541), 0-10 fms.; *L.* **nana*** (p. 541), 6-10 fms. *Orbitestella* **toreuma*** (p. 542), 6-12 fms., type depository not given. *Scrobs* (*Nannoscrobs*) **rugulosa*** (p. 542), 5-6 fms.; the genus *Nannoscrobs* Finlay is here used subgenerically; *Notosetia* **unicarata*** (p. 543), 5-6 fms.; *Lironoba simplex* Powell is transferred to *Notosetia*; *Rissopsis* **expansa*** (p. 544), 6-10 fms.; type in author's coll. *Eulimella* **larochei*** (p. 544), 6-12 fms.; *Turbonilla* (*Chemnitzia*) **aoteana*** (p. 545), 6-10 fms. Types of new spp. are in Auckland Mus. unless otherwise stated.

2464. PRASHAD, B. Further notes on Indian Ampullariidae (= Pilidae). *Proc. Malac. Soc. London* 19(4): 167-168. 1931.

2465. PRASHAD, B. On some undescribed fresh-water molluscs from various parts of India and Burma. *Rec. Geol. Surv. India* 63(4): 428-433. 1 pl. 1930.—*Vivipara* **hasani** (p. 429), India, "geologically not very old." *Lamellidens* **proctori*** (p. 430), Burma, horizon not determined. Types in Geol. Surv. India. Three other unnamed spp. of *Lamellidens* (1 from Burma, 2 from the Siwalik strata of India) are described and figured.

2466. REESIDE, JOHN B., Jr. Exogyra olisiponensis Sharpe and Exogyra costata Say in the Cretaceous of the western interior. Shorter contributions to general geology, 1928. *U. S. Geol. Surv. Prof. Paper* 154-I. 267-278. 5 pl. 1929.—*Exogyra olisiponensis** Sharpe, reported for the first time from the U. S. A. (southern Utah), as well as the varieties *E. o. duplex**, *E. o.* **oxyntas*** (*E. oxyntas* Coquand) (p. 271), and *E. o.* **forresteri*** (p. 271), are described, with synonymies and taxonomic discussion, from a horizon correlated with the lower Turonian. *E. costata** Say is reported for the first time outside the Atlantic and Gulf Coastal region (in Colorado) from a sandstone horizon in the Pierre shale correlated with the upper Campanian.

2467. REESIDE, JOHN B., Jr., and A. ALLEN WEYMOUTH. Mollusks from the Aspen shale (Cretaceous) of southwestern Wyoming. *Proc. U. S. Nation. Mus.* 78(17): 1-24. 4 pl. 1931.—The tuffaceous Aspen shale has hitherto yielded abundant fish scales, but only *Metoicoceras* sp. and *Lingula* sp. in addition. This paper records 11 pelecypods and 5 ammonites. The fauna indicates an early Turonian age. Types are in the U. S. Nat. Mus. Pelecypods: *Periplomya?* **aspenana*** (p. 7), *Thracia?* **wyomingensis*** (p. 8), *Tancredia?* **lincolniana*** (p. 8), *Aphrodina?* **aspenana*** (p. 9), *Mactra?* **aspenana*** (p. 11). Ammonites: **KANABICERAS** (p. 11), type *Acanthoceras? kanabense* Stanton, *K.* **wyomingense*** (p. 12), *Epengonoceras* **aspenanum*** (p.16), *Acompsoceras* **americanum*** (p. 18). The family Engonoceratidae Hyatt and its constituent genera *Protengonoceras, Engonoceras, Hypengonoceras, Parengonoceras, Metengonoceras, Epengonoceras* are characterized briefly. The genus *Acompsoceras* is also characterized, and the genus *Metoicoceras* and its 14 known species are briefly described.—*J. B. Reeside, Jr.*

2468. RENZ, CARL. Über eine untertriadische Ammonitenfauna von der Kleinasiatischen Insel Chios. *Eclogae Geol. Helvetiae* 21: 154-156. 1928.—Records unnamed species of 22 genera of cephalopods in the cephalopod limestone of Chios believed to indicate an age in the upper part of the Lr. Triassic (Upper Werfenian). The faunal association indicates equivalence to the Lr. Triassic fauna of Kčira in Albania, and shows interesting connections with the Lr. Triassic of central Asia and western America. The genera *Columbites* and *Paranannites* are particularly significant.—*C. Renz (transl. by C. O. Dunbar).*

2469. SARDESON, FREDERICK W. Actinoceras in Minnesota. *Pan. Amer. Geol.* 53(2): 91-104. 1 pl. 1930.—Discusses in detail the external and internal characteristics of the Ordovician cephalopods, *Actinoceras bigsbyi**, *A. tenuifilum, Cameroceras subannulatum, Endoceras proteiforme, Kochoceras tyrrelli* and *Selkirkoceras tyndallense*. The author accounts for the absence of entire shells by assuming that they broke off at the smaller and first-built end while growing longer at the other larger end, which would also explain the very characteristic structures that have grown within the shells; he states that *Endoceras subannulatum*, being a *Suecoceras*, should be called *Cameroceras subannulatum.—D. J. MacNeil.*

2470. SARDESON, FREDERICK W. Cameroceras and its allies. *Pan. Amer. Geol.* 53(3): 175-182. 1 pl. 1930.—The confusion arising from the uncertainty in making *Cameroceras** and *Endoceras* 2 valid genera is discussed; the author maintains that *Endoceras subannulatum* Whitfield, being a *Suecoceras*, belongs to *Cameroceras*, and that *Endoceras annulatum* Hall is possibly the mature shell of *Cameroceras trentonense* Conrad. He points out that in the *Endoceras* species the first separation into a chamber and siphuncle is abrupt, producing a constricted siphuncle, which grows with uniform diameter until it reaches ⅓ the conch's diam., maintaining that proportion in its subsequent expansion. In *Cameroceras subannulatum* (Whitfield) the separation from siphuncle is early and gradual, with a larger siphuncle, that finally reaches ½ the conch's diam.—*D. J. MacNeil.*

2471. SCHENCK, HUBERT G. Cephalopods of the genus Aturia from western North America. *Univ. California Publ. Dept. Geol. Sci. Bull.* 19(19): 435-465. Map, 13 pl., 4 fig. 1931.—The genus has a world-wide distribution and ranges from Up. Cretaceous to Lr. Pliocene; but on the Pacific Coast it is not known above the Temblor (middle Miocene). There are additions to the descriptive terminology, and sexual dimorphism and the importance of ontogenetic stages are emphasized, especially in view of parallelism among adults. It is thought that *Aturia* is a tachygenic genus, and that the organism emerged from the egg-capsule with adult characteristics; it then lived a vagile benthonic life in the sublittoral zone of the sea. *Nautilus aturi* Basterot is established as the type of *Aturia;* the subg. *Sphenaturia* of von Ihering is not considered valid. The account of each of the following West Coast spp. includes synonymy, description, citation of type and type locality, associated fauna, and comparisons: *Aturia* **dickersoni*** (p. 451), Chico (Up. Cretaceous), California; *A. mathewsonii** Gabb; *A. myrlae** (emended from *myrli*) M. A. Hanna; *A. kerniana** Anderson & Hanna; *A. angustata** (Conrad); *A. a.* **grandior*** (p. 462), Oligocene, Washington; *A. a.* **alaskensis*** (p. 463), Up. Oligocene?, Alaska. Types of new forms in Univ. California.

2472. SCHILDER, F. A. Die Cypraeacea des Daniums von Dänemark und Schonen. *Danmarks Geol. Undersøgelse Ser. 4.* 2(3): 1-27. 2 pl. 1928.—The Danian of Faxe (Denmark) and Limhamn (near Malmö, Sweden) yielded *Cypraedia* **separabilis*** (p. 9) with subspecies **minuta** and **maxima** (p. 11); *C.* **ravni*** (p. 11); *Eocypraea* **danica*** Schild, first description of complete shells; *E. bullaria** Schloth; *Vicetia* **faxensis*** (p. 17); **PALAEOCYPRAEA** (p. 17) type *P.* **spirata** (*Cypraeacites spiratus* Schloth.) (p. 19), first description of complete shells; *P.* **suecica*** (p. 22); *Protocypraea globuliformis** Ravn. Keys of casts and shells, and emended descriptions are given; also tables to show variability of size at different localities. This fauna with Cypraeacea is more Cretaceous than Tertiary. The chalk of Limhamn corresponds to the uppermost horizon of Faxe.—*F. A. Schilder.*

2473. SCHILDER, F. A. Beiträge zur Kenntnis der Cypraeacea (Moll. Gastr.). III. *Zool. Anz.* 92(3/4): 67-78. 1 fig. 1930.—A significant correlation between length of shell and number of teeth is found in *Triviella aperta, Lyncina lynx,* and *Monetaria moneta* s. lat., et al. A specimen twice as long has about 1¼ as many teeth as another. The relationship between length and tooth number is: Z[tooth number, zahnzahl] = aL + b, where a and b are constants. The teeth number for the outer and the inner lips bear slightly different relationships to length. Data are given, in tables or graphically, for 25 spp. The author briefly reviews the genus *Triviella*, in which he recognizes 8 spp. *T. ovulata* Lam. (= *T. amaryllis* Schild.); *T.* **phalacra** (p. 72), Cape Colony, type in author's coll.; *T.* **neglecta** (p. 72), locality unknown, type in author's coll. There are notes on distribution and a table for separating the spp. The author also discusses ecological or geographical races of Cypraeidae, including: *Zoila friendii* **vercoi** (p. 74), W. Australia; *Mauritia arabica* **grayana** (p. 75), French Somaliland, Eritrea, and Sumatra, type in author's coll.; *Luria lurida* **oceanica** (p. 76), Ascension and St. Helena, type in Brit. Mus.; *Erosaria albuginosa* **nariaeformis** (p. 76), Costa Rica to Galapagos, type in author's coll.; *E. spurca* **sanctaehelenae** (p. 77), St. Helena and Ascension, type in Brit. Mus.; *Schilderia achitidae* **inopinata** (p. 77), Atlantic Ocean; *Umbilia hesitata* **beddomei** (p. 77), N. So. Wales, type in author's coll.; *Adusta asellus* **latefasciata** (p. 78), Sunda Isls., type in author's coll.

2474. SEURAT, L. G. La petite pintadine du golfe de Gabès. *Bull. Trav. Publiés Stat. Aquicult. et Pêche de Castiglione* 1929(1): 11-28. 4 pl. 3 fig. 1929.—This Red Sea form entered the eastern Mediterranean following the cutting of the Suez Canal; unknown in 1882 in the Gulf of Gabès (Dautzenberg), it is now one of the dominant species. This species, the synonymy of which is rather intricate, bears the name *Meleagrina albina* Lamarck (= *M. occa* Reeve, *M. savignyi* Monts., *M. radiata* Desh. etc.). The shell of the ♀ is proportionally longer than that of the ♂. The *Meleagrina* of the little Syrte sometimes bears pearls; the author has determined that pearls are particularly frequent among mollusks which live in places where the strongest tidal currents, flood and ebb, prevail. The formation of pearls is due principally to the intrusion of extraneous particles such as grains of sand. The author states that he has rarely found pearls of parasitic origin.—*L. G. Seurat (transl. by J. S. Gutsell).*

2475. SHIMIZU, SABURÔ. Notes on two Tithonian species of Perisphinctes from the Torinosu limestone of Koike, Province of Iwaki. *Jap. Jour. Geol. & Geogr. Trans.* 7(2): 45-48. 1 pl. 1930.—*P.* (*Aulacosphinctes*) cf. *steigeri** and *P.* (*Virgatosphinctes*) sp.*, Jurassic.

2476. SHIMIZU, SABURÔ. On some triassic Ammonites from the Sakawa Basin, Province of Tosa in Shikoku. *Jap. Jour. Geol. & Geogr. Trans.* 8(1/2): 13-18. 1 pl. 1930.—Specimens of *Protrachyceras* aff. *archelaus** (Laube); *Paratrachyceras* cf. *hofmanni** (Boeckh); *P.* sp. nov.*?; and *Thisbites* orientalis* (p. 17) are described. All are allied to certain forms from the Mediterranean region, the Himalayas, and Timor.

2477. SPATH, L. F. The fossil fauna of the Samana Range and some neighbouring areas: Part V. The Lower Cretaceous Ammonoidea; with notes on Albian Cephalopoda from Hazara. *Mem. Geol. Surv. India, Palaeont. Indica* 15: 51-66. 2 pl. 1930.—The author discusses 12 forms of Ammonoidea from the Albian of the Samana Range, including *Cleoniceras* daviesi* (p. 53) and *Brancoceras* indicum* (p. 55); also 1 form from the Neocomian of Thal. Several of the forms are listed as new but not specifically named. Hamitidae, emended diagnosis; **METAHAMITES** (p. 57), erected for *Hamites sablieri* d'Orb., is included in the Anisoceratidae; *Lyelliceras* cotteri* (p. 61); **PROLYELLICERAS** (p. 65), erected for *P.* peruvianum (*Acanthoceras prorsocurvatum* Douvillé, not Gerhardt) (p. 65). Types in Geol. Surv. India. Numerous additional Albian Ammonoidea are listed from various localities in India.

2478. THOMAS, H. DIGHTON. An Upper Carboniferous fauna from the Amotape Mountains, northwestern Peru. (Continuation and to be cont.) *Geol. Mag.* 67(795): 394-408. 1 pl. 1930.—The following are described.—Gasteropoda: *Bellerophon* sp.* cf. *crassus* Meek & Worthen; *B.* sp., *Bucanopsis* multiscalpta* (p. 395); *Euphemus carbonarius** (Cox); *Euomphalus* browni* (p. 396); *Pleurotomaria* amotapenis* (p. 398); *P.* sp. Conularida: *Conularia* sp.* aff. *crustula* White. Brachiopoda: *Lingulodiscina?* sera* (p. 400); *Orbiculoidea meekana** (Whitfield); *Chonetes amazonicus** Derby; *C. variolatus** (d'Orb.).—*M. A. Fenton.*

2479. TOMLIN, J. R. le. The land shells of Kaw Tao. *Jour. Siam Soc., Nat. Hist. Suppl.* 8(1): 15-17. 1929.—A list of 12 spp. from this Siamese Isl., with notes on habitat and general distribution. *Sarika* kawtaoensis (p. 15).

2480. TROEDSSON, GUSTAF T. On the Middle and Upper Ordovician faunas of northern Greenland. I. Cephalopods. *Meddelel. om Grønland* 71(Paper 1): 1-157. 65 pl. (in separate issue), 17 fig. 1926.—Report of the Danish Jubilee Exped. to Greenland 1920-23. Résumé of previous geological expeditions to Arctic regions with lists of fossils collected. Cephalopoda, Nautiloidea, are treated with discussion of terminology and classification. Holochoanites: Ten spp. including *Narthecoceras* inflatum* (p. 33); and 5 forms only generically identified. Orthochoanites: Seventeen spp. including *Ephippiorthoceras* modestum* (p. 34); *Dawsonoceras ?* aquilonare* (p. 35); *D. ?* cf. *aquilonare** n. sp. unnamed (p. 36); *Apsidoceras* elegans* (p. 38); *Charactoceras* rotundum* (p. 40); *Plectoceras ?* foerstei* (p. 42); *Lambeoceras* princeps* (p. 46); *L.* nudum* (p. 47); *L.* magnum* (p. 48); *L.* boreum* (p. 40); *L. ?* leve-annulatum* (p. 50); and 3 forms only generically identified. Cyrtochoanites: Thirty-seven spp. and vars. including *Actinoceras tenuifilum* v. clarkei* (p. 54); *A. centrale* v. calhounense* (p. 57); *Leurorthoceras (?)* ruedemanni* (p. 58); *Armenoceras* arcticum* (p. 61); *A. arcticum* v. angusum* (p. 62); *A.* concinnum* (p. 63); *Huronia* arctica (p. 63); **KOCHOCERAS** (p. 65) (Actinoceratidae), type *K.* cuneiforme* (p. 68); *K. c.* var. robustum* (p. 71); *K.* ellipticum* (p. 73); *K. ellipticum* v. minutum* (p. 74); *K.* undulatum* (p. 75); *K.* productum* (p. 75); *K. (?)* vetustum* (p. 76); **CALHOUNOCERAS** (p. 77) (Actinoceratidae), type *C.* candelabrum* (p. 77); *Sactoceras* striatum* (p. 79); *S. (?)* lineatum* (p. 80); **ESKIMOCERAS** (p. 81) (Sactoceratidae), type *E.* boreale* (p. 81); *Gonioceras* holtedahli* (p. 83); *G.* wulffi* (p. 85); *G.* groenlandicum* (p. 86); *G.* cf. *groenlandicum** n. sp., unnamed (p. 89); *G.* angulatum* (p. 89); *Westenoceras* latum* (p. 90); *Maelonoceras (?)* reclinatum* (p. 91); **THULEOCERAS** (p. 93) (Oncoceratidae), type *T.* ornatum* (p. 94); *Cryptogomphoceras* curvatum* (p. 96); *C.* turgidum* (p. 97); *C.* sacculus* (p. 98); *Diestoceras* pyriforme* (p. 100); and 6 forms only generically identified. Nautiloidea incertae sedis: **DANOCERAS** (p. 101) (Aff. *Oncoceras* and *Beloitoceras*), type *D.* ravni* (p. 102); one unnamed species* also placed here. All forms described from Middle and Upper Ordovician strata (undifferentiated) Cape Calhoun series, Cape Calhoun, Greenland. All specimens in the Mineralogical Mus., Univ. of Copenhagen. Seven spp. of Ordovician cephalopods are described from the Baltic region, including *Ormoceras* holmi* (p. 105), Vaginatum limestone, Esthonia and elsewhere; *O.* oelandicum* (p. 105) Upper Red Orthoceras limestone, Island of Oeland, and elsewhere; **NYBYOCERAS** (p. 106) (subg. of *Actinoceras*), type *A.* (*Nybyoceras*) bekkeri* (p. 106), Lyckholm (F-1) Nyby, Esthonia; *Megadiscosorus* balticus* (p. 107); *Cryptogomphoceras* stensioei* (p. 108); Lyckholm (F-1) Esthonia, and elsewhere; and one form not specifically identified. Specimens in the Riksmuseum (Royal Mus. Nat. Hist.), Stockholm. Remainder of paper is a preliminary discussion of the stratigraphy of the Cape Calhoun region, the local succession of the faunal zones, tables showing distribution of species described. The Cape Calhoun series is correlated in the Upper Black River, Trenton and Richmond horizons of N. Amer. Older strata are known and one form, *Protocycloceras lamarcki** (Billings)?, has been identified from them If correct this indicates the Beekmantown age of these lower beds. The bulk of this fauna is of Richmond age. The relationships with the American and Swedish faunas and their paleogeographical significance are discussed. Bibliography of 87 titles. An explanation of the 65 plates concludes the report.—*J. Bridge.*

2481. TRUEMAN, A. E. The Lower Lias (Bucklandi Zone) of Nash Point, Glamorgan. *Proc. Geologists' Assoc.* [*London*] 41(2): 148-159. 2 pl. 2 fig. 1930.—A detailed account of the faunal succession of part of the Lr. Lias (Sinemurian). The following ammonites are described: *Charmasseiceras* simplicicosta* (p. 156), *Arnioceratoides* aptus* (p. 157), *A.* crassus* (p. 157), *Arnioceras* concinnum* (p. 158); holotypes in Brit. Mus. Nat. Hist., London.—*A. E. Trueman.*

2482. WARREN, P. S. Three new ammonites from the Cretaceous of Alberta. *Trans. Roy. Soc. Canada, Sect. 4, Geol. Sci.* 24(1): 21-26. 4 pl. 1930.—*Acanthoceras* albertense* (p. 21), Smoky River and Colorado shales, correlates the basal beds of these formations. *Acanthoscaphites* albertensis* (p. 23), Bearpaw shale; *Prionotropis* borealis* (p. 25), base of Smoky River shales. Types in Univ. of Alberta.

2483. WEIR, JOHN. The geological collection from the south central Sahara made by Mr. Francis R. Rodd. II. Upper Cretaceous fossils. *Quart. Jour. Geol. Soc.* 86 (343): 404-408. 3 pl. 1930.—New localities for the following fossils.—Lamellibranchs: *Exogyra olisiponensis** Sharpe; *E. tamalleni** Pervinquière; *Plicatula ferryi** Coquand. Specimens in the Hunterian Mus., Glasgow Univ.—*M. A. Fenton.*

2484. WEISBORD, NORMAN EDWARD. Miocene Mollusca of northern Colombia. *Bull. Amer. Paleontol.* 14(54): 235-306. 9 pl. 1929.—Describes and figures 75 forms from several Miocene horizons. There are 18 new spp.—*Spondylus* colombiensis* (p. 246), ? *Dermatomya* harrisi* (p. 247), *Chama* corticosaformis* (p. 250), *Cardium* (*Cerastoderma*) brantlyi* (p. 251), *Chione* (*Chione*) bolivarensis* (p. 254), *C.* (*Lirophora*) usiacurina* (p. 255), *Asaphis* delicatus* (p. 257), *Potamides* maracaibensis* (Williston) (p. 270), *P.* (*Pyrazisinus*) bolivarensis* (p. 271), *Strombina* colombiana* (p. 275), *Melongena* colombiana* (p. 275), *Solenosteira* falconensis* (Williston) (p. 277), *Xancus* magdalenensis* (p. 278), *Mitra* colombiana* (p. 279), *Conomitra* carribbeana* (p. 280), *Surcula* nuevagranada* (p. 286), *Drillia* puer-

tocolombiana* (p. 287), *Conus* colombiensis* (289); 7 new subspecies,—*Scapharca grandis* colombiensis* (p. 237), *Glycymeris lloydsmithi* multicostata* (p. 242), *Ostrea messor* colombiensis* (244), *Chione* (*Lirophora*) *latilirata* colombiana* (p. 254), *Metis trinitaria* colombiensis* (p. 256), *Turritella vistana* colombiana* (p. 264), *Bursa crassa* colombiana* (p. 273); 7 new varieties,—*Scapharca grandis* v. cedralensis* (p. 240), *S. chiriquiensis* v. bolivari* (p. 240), *Glycymeris canalis* v. colombiensis* (p. 243), *Crassatellites reevei* v. pleurarostra* (p. 248), *Turritella altilira* v. atlanticensis* (p. 264), *Solenosteira cochlearis* v. magdalenensis* (p. 278), *Cancellaria epistomifera* v. acuticarinata*. *Venericardia* dominica* (*V. scabricostata* Maury not Guppy) (p. 249). Of the fossils recorded, 29 belong to the class Pelecypoda, 1 to Scaphopoda, and 45 to Gastropoda. Types in Paleontological Lab., Cornell Univ.—*N. E. Weisbord.*

2485. YÜ, C. C. The Ordovician Cephalopoda of central China. *Geol. Surv. China, Palaeont. Sinica B* 1(2): 1-101. 9 pl., 7 fig. 1930.—The faunas of Ordovician beds from localities in eastern, western, southeastern, and northern Hupeh are compared. Discovery of *Didymograptus murchisoni* Beck for the first time in Hupeh or neighboring provinces correlates the Neichiashan formation bearing it with the zone characterized by that graptolite in the Brit. Ordovician. Cephalopods are listed from corresponding horizons in northern and southern China, affinities of the Hupeh forms with those of southern China and Europe being noted, as well as lack of affinity with those of N. China and N. Amer. The Hupeh forms are described chiefly from internal structures, as preservation rarely allowed study of surface ornamentation. They include *Cameroceras tenuiseptum* v. ellipticum* (p. 24); *C.* hsiehi* (p. 25); *C.* subtile* (p. 26); *Endoceras* leei* (p. 28); *E.* grabaui* (p. 29); *Vaginoceras* wahlenbergi* (*Endoceras w.* Foord) (p. 30); *V. w.* var. cylindrica* (p. 32); *V.* endocylindricum* (p. 33); *V.* peiyangense* (p. 35); *V.* shui* (p. 37); *V.* chientzekouense* (p. 38); *V.* neichianense* (p. 39); *V.* reedi* (p. 40); *V.* uniforme* (p. 42); *V.* multiplectoseptatum* (p. 44); *V.* giganteum* (p. 45); *Orthoceras* chinense*; *O. c.* v. kuangchiaoense* (p. 48); *O. c.* var. eccentrica* (p. 49); *O. c.* var. equiseptatum* (p. 50); *O.* regulare*; *O. squamatulum**; *O. thyrsus* ?*; *O.* remotum* (p. 55); *O.* rudum* (p. 55); *O.* suni* (p. 56); *O.* elongatum* (p. 57); *O.* densum* (p. 58); *O.* yangtzeense* (p. 59); *O.* ? wongi* (p. 60); *Protocycloceras* deprati*; *Discoceras eurasiaticum**; *Lituites* lii* (p. 65); [*Oncoceras*] (*Meloceras*) *asiaticum**. Types in Geol. Surv. China.

2486. ZÁZVORKA, VLASTISLAV. (Transl. by T. OAKES HIRST.) Revision of the Hyolithi from dγ. *Palaeontographica Bohemiae* 13: 1-22. 3 pl. 1930.—Three genera, 14 spp. and 1 variety are discussed: *Hyolithes* (11 spp., 1 variety), *Bactrotheca* (2 spp.), and *Orthotheca* (1 species). All are from Ordovician dγ1-dγ2. *Hyolithes* hanuši* (p. 13), dγ1, dγ2; *H.* klouček* (p. 14), dγ2; *H.* kolihai* (p. 15), dγ1, dγ2; *H. pauxillus* v. latus* (p. 17), dγ2; *Bactrotheca* nováki (p. 19), dγ2. *Hyolithes* sp.* Novák is a juvenile stage of *Hyolithes pauxillus* Novák. All originals are in the Nat. Mus. Prague. The author does not recognize the subg. *Camerotheca* Matthew as a division of *Hyolithes*.—*V. Zázvorka.*

2487. BARNARD, K. H. Diagnosis of new genera and species of Amphipod Crustacea collected during the "Discovery" Investigations, 1925-1927. *Ann. & Mag. Nat. Hist.* 7(40): 425-430. 1931.—This paper is based on a large material of amphipods, collected up to the end of 1927. Lysianassidae: **SHACKLETONIA,** near *Acidostoma* and *Phoxostoma,* type *S.* robusta (p. 425), S. Georgia Isl. and S. Shetlands [Antarctica]; **AUSTRONISIMUS,** near *Onisimus* and *Lysianella,* type *A.* rhinoceros (p. 425), S. Georgia Isl.; **AMBASIOPSIS,** resembles *Metambasia,* type *A.* georgiensis (p. 425), So. Georgia Isl.; **LEPIDEPECREOIDES,** type *L.* xenopus (p. 426), S. Georgia Isl. and S. Shetlands. Ampeliscidae: **BYBLISOIDES,** resembling *Byblis* and *Ampelisca,* type *B.* juxtacornis (p. 426), So. Shetlands Isls.; *Haploops* securiger (p. 426), So. Georgia Isl. Haustoriidae: **HAUSTORIELLA,** type *H.* psammophila (p. 426), So. America. Acanthonotozomatidae: **LABRIPHIMEDIA,** type *L.* vespuccii (p. 427), Falkland Isls. **PAGETINIDAE** n. fam., with **PAGETINA,** type *P.* genarum (p. 427), So. Georgia Isl. Oedicerotidae: **PARAPERIOCULODES,** type *P.* brevimanus (p. 427), So. Georgia Isl. Tironidae: **CACAO,** (p. 427), near *Alexandrella,* type *C.* lacteus (p. 428), off Portuguese W. Africa. Calliopiidae: **CLARENCIA,** type *C.* chelata (p. 428), So. Shetlands. Pleustidae: **AUSTROPLEUSTES,** type *A.* cuspidatus (p. 428), So. Shetlands. Paramphithoidae: **EPIMERIOPSIS,** type *E.* australis (Chilton) n. comb. (p. 428). Photidae: **KUPHOCHEIRA,** near *Haplocheira,* type *K.* setimanus (p. 429), So. Orkneys. **DIDYMOCHELIA** (incertae sedis), type *D.* spongicola (p. 429), So. Georgia Isl. Hyperiidae: **PEGOHYPERIA** (p. 429), type *P.* princeps (p. 430), So.-E. Atlantic. Caprellidae: **DODECASELLA,** type *D.* elegans (p. 430), So. Georgia Isl.; *Cyamus* balaenopterae (p. 430), So. Africa, from *Balaenoptera musculus* and *B. physalus.* This is the first cyamid described from true *Balaenoptera.*

2488. BARNARD, K. H. Crustacea. Part XI. Amphipoda. *Nat. Hist. Rept. Brit. Mus. (Nat. Hist.) Brit. Antarctic ("Terra Nova") Exp. 1910. Zool.* 8(4): 307-454. 63 fig. 1930.—The location of all collecting stations is given and species obtained at each station are listed. Lysianassidae: *Kerguelenia* antarctica* (p. 318), McMurdo Sound, Antarctica; *Hirondellea* Chevr. (=*Tetronychia* [Stephensen ?]); **PARACYCLOCARIS** (p. 321), near *Cyclocaris,* based on *P.* bidens* ♀ (p. 321), New Zealand [=N. Z.]; *Hippomedon* incisus* ♂ (p. 325), N. Z. Stegocephalidae: *Andaniotes* simplex* ♀ (p. 328), N. Z. Ampeliscidae: *Ampelisca* hemicryptops* ♀ (p. 329), Oates Land and McMurdo Sound, Antarctica. Phoxocephalidae: *Phoxocephalus* regium* ♂ (p. 331), N. Z.; *Paraphoxus* pyripes* (p. 332), McMurdo Sound (type) and N. Z.; *Heterophoxus* videns* (p. 334), off Cape Adare (type) and McMurdo Sound, Antarctica; **PROTOPHOXUS** (p. 335), near *Phoxocephalus,* based on *P.* australis* (p. 355), N. Z.; **TRICHOPHOXUS** (p. 336), near *Phoxocephalus,* based on *T.* capillatus* ♂ (p. 336), N. Z. Amphilochidae: **PELTOPES** (p. 337), near *Peltocoxa,* based on *P.* productus* (p. 338), N. Z. Metopidae: *Proboloides* perlatus* (p. 339), off Cape Adare. Stenothoidae: *Stenothoe* ornata* ♂ (p. 341), N. Z. Lafystiidae: Laphystiopsidae is united with this family because of the following intermediate genus: **PROLAPHYSTIUS** (p. 342), based on *P.* isopodops* ♀ (p. 342), McMurdo Sound. Acanthonotozomatidae: *Acanthonotozomella* oatesi* ♀ (p. 346), off Cape Adare; *Iphimediella margueritei* Chevr. (=*Iphimedia microdentata*); *I.* cyclogena* (p. 349), McMurdo Sound (type) and Oates Land; *I.* brevispinosa* (p. 351), and *I.* rigida* ♂ (p. 351), McMurdo Sound; **GNATHIPHIMEDIA** (p. 352), near *Iphimediella,* type *G.* mandibularis* (p. 352), McMurdo Sound (type) and Oates Land; *G.* pacifica* (Stebb.), n. comb. (p. 353); **MAXILLIPHIMEDIA** (p. 355), near *Iphimedia,* based on *M.* longipes* (*Iphimedia l.* Wlkr.) (p. 355),

emended description; **ANCHIPHIMEDIA** (p. 357), based on *A.* **dorsalis*** ♂ (p. 357), McMurdo Sound; **ECHINIPHIMEDIA** (p. 358), erected for *E.* **hodgsoni*** (*Iphimedia h.* Wlkr.) (p. 359); *E.* **scotti*** ♀ (p. 360), McMurdo Sound, and *E.* **nodosa*** (Dana), n. comb. (=*Iphimedia echinata* Walker) (p. 361). Oedicerotidae: *Bathymedon* **neozelanicus** (p. 365), and *Oediceroides* **microcarpus*** ♀ (p. 366), New Zealand. Tironidae: *Syrrhoites* **anaticauda*** ♀ (p. 367), McMurdo Sound. Calliopiidae: *Chosroes incisus** Stebb., first description of ♂; **REGALIA** (p. 370), based on *R.* **fascicularis*** (p. 371), N. Z. Paramphithoidae: *Epimeria macrodonta* **f. similis** (*E. s.* Chevr.) (p. 373); *E.* **inermis*** Wlkr., range extended to west of Falkland Isls.; *E.* **robusta*** (p. 375), and *E.* **puncticulata*** ♀ (p. 376), McMurdo Sound; *Epimeriella* **scabrosa*** ♀ (p. 378), Oates Isl.; *E.* **walkeri*** ♀ (p. 380), McMurdo Sound. Atylidae: *Nototropis* **reductus*** ♀ (p. 382), N. Z. Melphidippidae: *Melphidippa antarctica* Schell., ♂ redescribed. Eusiridae: *Eusirus* **antarcticus*** Thoms., redescr.; *E. perdentatus** Chevr. (=*E. splendidus* Chilton), redescr.; *Eusiropsis riisei** Stebb., additional description. Pontogeneiidae: *Atyloides* **quadridens** ♂ (p. 387), McMurdo Sound. Dexaminidae: *Paradexamine pacifica** (Thoms.) is removed from the synonymy of *P. fissicauda* Chevr. Photidae: *Eurystheus* **distichon*** ♂ (p. 391), off Cape Adare. Jassidae: *Ischyrocerus anguipes* **v. longimanus** (*Wyvillea l.* Hasw.) (p. 393). Hyperiidea: **ARCHAEOSCINIDAE** (=Pygmacidae Wolt., which is nomenclaturally inadmissible), erected for *Archaeoscina* Stebb., *Micromimonectes* Wolt., *Mimonecteola* Wolt., and *Microphasma* Wolt. Mimonectidae (=Eumimonectidae): *Parascina* Stebb. is maintained as a valid genus; *P.* **setosa*** ♂ (p. 395), Antarctic, 67° 23′ S., 177° 59′ W.; *P.* **diomedeae** (*Sphaeromimonectes d.* Wolt.) (p. 397). Lanceolidae, emended diagnosis: *Lanceola clausi* Bov., descr. of variations; **PARALANCEOLA** (p. 398), near *Lanceola*, based on *P.* **anomala*** (p. 398), Antarctic, 71° 41′ S., 166° 47′ W. Vibiliidae (=Cyllopodidae): *Vibilia chuni* Behn. & Wolt., first descr. of ♂*; *Cyllopus magellanicus* Dana (=*Vibilia macropis* Bov., *V. serrata* Stewart); *C. lucasii* Bate (=*C. antarcticus* Spandl). Hyperiidae: *Hyperia fabrei* (M. Edw.), and *H. promontorii* Stebb., new to New Zealand; *H. galba* (Mont.) (=*H. gaudichaudii* Wlkr., *H. antarctica* Spandl); *H. macronyx* Wlkr., emended descr.; *Hyperiella dilatata* Stebb. and *H. antarctica* Bov., additional descr.; *Hyperioides longipes* Chevr., new to New Zealand region; *Hyperoche*, key to spp.; *H.* **capucinus*** ♂ (p. 416), off Cape Adare; *Iulopis* Bov. (=*Euiulopis* Bov.): *I. loveni* Bov., new to New Zealand; *Parathemisto* Boeck, key to species with *Euthemisto* Stebbing treated as subgenus; *P.* (*E.*) *australis** (Stebb.), new to New Zealand. Lycaeidae: *Tryphana malmi* new to New Zealand and the Pacific Ocean; *Lycaea* key to spp.; **THYROPIDAE** (=Parascelidae) (p. 436), the new name being required because *Thyropus* is the oldest genus in the family. Platyscelidae: *Tetrathyrus* **pulchellus*** ♂ (p. 439), N. Z. Caprellidae: *Caprellinoides* **spinosa*** (p. 441), off Cape Adare, and McMurdo Sound; *Aeginoides gaussi** Schell., redescribed. Taxonomic and distibutional notes are given for many previously described spp. Bibliography of 62 references. Appendix I includes unpublished records of 4 spp. collected by the "Discovery" expedition (1901-1904), Appendix II, adds records on 14 spp. collected on the "Nimrod" expedition of 1907-1909.

2489. BEURLEN, K. Vergleichende Stammesgeschichte. Grundlagen, Methoden, Probleme unter besonderer Berücksichtigung der höheren Krebse. *Fortschr. Geol. u. Paläont.* **8(26)**: I-VIII+317-586. 82 fig. 1930.—Part 1 deals with the systematics and evolution of the decapod crustacea. Instead of the usual division of the decapods into 2 suborders, Natantia and Reptantia or Macrura and Brachyura, a division is made involving 4 suborders: Trichelida, Anomocarida, Palinura, and Heterura. The Trichelida includes the divisions Nectochelida (tribes Penaeidea, Stenopidea, Uncinoidea), Proherpochelida (tribe Paranephropsidea (=Erymaidea) containing the n. fam. **STENOCHIRIDAE** (p. 326) erected for *Stenochirus* Oppel.), and Herpochelida (tribe Nephropsidea Alcock=Astacura Borradaile). The suborder Anomocarida includes the divisions: Neotocarida with the single tribe Eucyphidea Ortmann (=Caridea Dana); and Herpocarida with 2 tribes, Thalassinidea containing 6 families including Callianassidae with the n. subfam. **PROTOCALLIANASSINAE** (p. 332) with the genus **PROTOCALLIANASSA** (p. 332) (Up. Cretaceous), and the tribe Paguridea. The 3 divisions (1) **GLYPHEIDEA** (p. 335) (to include tribes **PEMPHICOIDA** (p. 335) and Glypheoida), (2) Eryonidea with the families **TETRACHELIDAE** (p. 339) for *Tetrachela* Reuss, from the "Raibler Schichten," Eryonidae with emended description, and **POLYCHELIDAE** (p. 340) for the living genera *Polycheles* (=*Pentacheles*) and *Willemoesia* and the fossil genera *Palaeopentacheles* v. Knebel and *Palaeopolycheles* v. Knebel from the Up. Malm and *Willemoesioearis* van Straelen from the Up. Dogger, and the division (3) Scyllaridea containing families, **CANCRINIDAE** (p. 342) erected for *Cancrinus* Münster (Up. Jurassic), and Scyllaridae, are placed in the suborder **PALINURA** (p. 334). Finally in the suborder **HETERURA** (p. 343) the following divisions are made: Anomura s. str. (with tribes Galatheidae and Hippidea), and Brachyura which is subdivided into the tribes (a) **DROMIOMORPHA** (p. 346) with the subtribes Dromiacea, Oxyrrhyncha, with **MICROMAIINAE** (p. 349) subfam. of Maiidae, **OCYPODOIDA** (p. 350), and Cancriformia with 4 families including **LOBOCARCINIDAE** (p. 353), (b) **XANTHIMORPHA** (p. 354) (=Brachygnatha Borrad. partim, Brachyrhyncha Borrad. partim) with subtribes **PORTUNOIDEA** (p. 354) containing 2 families **CARCINERETIDAE** (p. 354) for the genus *Carcineretes* Withers (Up. Cretaceous), and Portunidae with 4 subfamilies including **PSAMMOCARCININAE** (p. 355), and subtribe **XANTHOIDEA** (p. 356) (c) Oxystomata with subtribes Gymnopleura containing 2 families including **RANINELLIDAE** (p. 363), and **CALAPPOIDA** (p. 363). A short synopsis of the fossil and recent forms is given. In support of this system it is stated that within the Trichelida, the Penaeidea are the most primitive, and of the Reptantia the Paranephropsidea and Nephropsidea are iterative offshoots. In the Anomocarida the Reptantia Thalassinidea are the most primitive, giving rise to the Paguridea on the one hand, and to the Natantia Eucyphidea on the other. The resemblance between the Natantia Penaeidea and the Eucyphidea is due to convergence. In Palinura, from the primitive Glypheidea, the Eryonidea branch off above Pemphix and Scyllaridea above Glypheidea. Finally in the Brachyura, the Dromiomorpha, which are the most primitive, give rise to a direct descendant, from which the Xanthimorpha and Oxystoma have become differentiated. In the following manner the relationships of the 4 suborders are indicated: The Anomocarida have evolved above the Mecochidae (Glypheidea) and the Heterura above the Pemphicoida of the Palinura, while both the Trichelida and the Palinura have evolved almost from the basic line of development of the decapods. Within these groups the reptantian forms are the most primitive, while the natantian forms are of secondary derivation, with the exception of the Trichelida where the conditions are reversed. As regards this system, Beurlen and Glaessner, have, in a recent publication, combined these 3 suborders into the suborder Heterochelida, which stands in contrast to the Trichelida. Within the Heterochelida a modification is made so that the divisions Anomocarida, Glypheocarida (Glypheidea) and Gastralida (Palinura and Heterura) are distinct. Following this is a short discussion of the origin of the decapods and the evolutionary relationships of the Thorastraca, with the conclusion that the Phyllocarida were the original relatives of the palaeozoic Archaostraca which at the present time have been slightly transformed into the Leptostraca. In the lower Paleozoic the Archaeostraca have given rise to the Pygocephalomorpha (group of *Pygocephalus, Anthrapalaemon*, etc.), and that from

the Pygocephalomorpha the Schizopoda, Dichelopoda, Decapoda, Stomatopoda, and Cumacea have evolved directly. Part 2. An explanation of the evolutionary analysis gives a synopsis of the development of all the crustacea and of all the vertebrates. A comparison of the developmental periods of both groups shows that their development is not a uniformly continuous process, but cyclic and it is in such a manner that the first developmental stage brings out the various characters of directional adaptation. A second period follows in which no new adaptations appear but which are enriched by orthogenetic developments and finally lose potency and die out. The first period is actually short only in comparison with the second. The generalizations concerning this theory are explained by a short discussion of the development of arthropods, and of mollusks (lamellibranchs and cephalopods). All of these show the same characteristic cyclic development. In the development of the genus, family, order, and class, the uniformity of the line of descent corresponds to a certain degree with the developmental periods in the ontogeny of the individuals (youth, maturity, old age, death). Part 3 gives the theoretical discussion of these conclusions. The consideration of the first developmental stage, the explosive period, shows that the basic form and the adaptable line are built up together. Throughout this period the adaptive forms are carried on, while those not adaptive (inadaptive, Kowalewsky) promptly die out with the appearance of the basic type. This explosive developmental state is not the same as the following fixed adaptive period. Much more has been given concerning this primordial stage than of the adaptive period. This view is substantiated in a consideration of the second developmental period in which the existing adaptive structures are augmented by orthogenesis. The legitimacy of mentioning these orthogenetic developmental stages (iterative structures, parallel development, continuous diminution of the evolutionary field, etc.), shows, namely, that the evolutionary potentiality is continuous within the bounds of the type forms and within those of adaptive lineage, and that through a gradual concentration of forms a progressive stabilization of the type is instigated. A last section seeks this information through a more elaborate discussion of problems of ontogeny and phylogeny. It is shown that the 1st developmental period formulates the metakinetic form of ontogeny and that this form of ontogeny does not run in a determinable manner, so that universal physiological reverses of the larvae and immature stages can still produce incomplete organisms, which in an older condition can produce new type forms. This instability and indeterminability of ontogeny during this phase, makes the frequency of structural specialization during these developmental periods understandable. As opposed to this is the 2nd developmental stage which allows a palingenetic outlet of ontogeny. This calls for a progressive determinable form of ontogeny which is inserted gradually as a rigid type. Cenogenesis is only an exceptional case of palingenesis and does not stand in contrast to it.—*K. Beurlen* (*transl. by E. P. Creaser*).

2490. BOROS, LAJOS. Pristicephalus carnuntanus emésztö készülékének anatomiai szövettani vizsgálata. [Anatomy and physiology of P. carnuntanus.] *Acta. Litt. Ac. Sci. R. Univ. Hungaricae Francisco-Josephinae, Sect. A Biol. Sci. Nat. Acta Biol.* 1(2): 127-191. 3 pl. 1929.—This phyllopod swims with its back downward, but when killed with a light charge of electricity and allowed to sink the back assumes the upright position. The habit of swimming back downward is regarded as an adaptation to feeding. The appendages form a canal on the ventral side in which the food is collected and passed forward to the mouth. The structure of the various appendages is discussed as well as the microscopic structure and function of the various parts of the digestive tract.—*C. Juday.*

2491. CAMPAN, F. Contribution à la connaissance des Phyllopodes Notostracés. *Bull. Soc. Zool. France* 54(2): 95-118. 8 pl. 1929.—Observations were made on *Lepidurus apus* from the Toulouse district of France, mainly on growth stages and sexual differences. The species was found from Jan. to May, in temporary ditches filled with flood water and inhabited by *Scirpus palustris* and *Ranunculus fluitans*, among which lived ostracods, copepods and isopods. It feeds on organic débris and, in spite of its large mandibles, seldom eats hard substances. Growth is rapid, with a large number of moults. The interval between moults varies with age, being short in the early stages, and from 8-10 days in animals which are nearly adult. Males are in excess of ♀♀ and reproduction is always, apparently, sexual. The author found no evidence of reproduction by parthenogenesis such as has been reported in the German form of the species. The metanauplius of the Toulouse form is more advanced than that of the German variety, in that it moults into a 2nd stage which has the form and structure of a typical *Apus*. The mandibles of the metanauplius are represented by their palps only. The author describes the changes which take place in the antennae, mandibles, and caudal plate during the first 15 stages of growth. The antennae are well developed biramous appendages for the first 5 stages. Afterwards progressive degeneration sets in, resulting in the reduction of setae and loss of articulation, first in the exopodite and then in the endopodite. The exopodite and endopodite both disappear in the ♀, but a trace of the endopodite persists in the ♂. The mandible shows a progressive loss of the palp, resulting in its final disappearance, and the increasing development of the masticatory plate of the adult mandible, which is formed from the precosca of the metanauplian mandibles. The growth of the telson is proportionately more rapid than the rest of the body. The author has studied the differences between the sexes in detail, and, in addition to the well known difference in the form of the 11th pair of trunk legs, finds smaller sexual differences in size, color, carapace, caudal plate, 2nd antennae, subcoxal endite of the maxillae, and 2nd pair of trunk legs.—*W. M. Tattersall.*

2492. CANDEIAS, ALBERTO. Nota sôbre uma espécie nova de género "Iphinoë" Bate proveniente da costa de Portugal. *Mem. e Estud. Mus. Zool. Univ. Coimbra, Ser. 1* No. 38. 1-8. 1 pl. 1929.—*Iphinoë* **algarbiensis*** ♂ (p. 2), in Plankton.

2493. FLIPSE, H. J. Die Decapoda Brachyura der Siboga-Expedition. VI. Oxyrrhyncha: Parthenopidae. In: **Max Weber. Siboga-Expeditie** 112 (Monogr. 39c²). 96p. 45 fig. E. J. Brill: Leiden, 1930.—In 3 sections, of which the first comprises a short sketch of the external morphology of the Parthenopidae: *Parthenope* **erosa** (*Thyrolambrus erosus* Rathbun) (p. 12). The 2nd section is the systematic discussion: (a) Parthenopinae: *Lambrus* (*Lambrus*) **ornatus*** (p. 22), Makassar, Salawati Java Sea; *L.* (*Platylambrus*) *echinatus* v. **granulosus*** (p 25), Java Sea; *L.* (*Rhinolambrus*) **naso*** (p. 29), east o Dangar Besar; *L.* (*R.*) **armatus*** (p. 30), Salawati Java Sea; *L.* (*R.*) **coronifer*** (p. 33), Salomakiëe (Damar Isl., Timor, Samau-Isl.; *L.* (*R.*) **inconspicuus*** (p. 34) 1° 42′ 5″ S., 130° 47′ 5″ E.; *L.* (*R.*) **latifrons*** (p 35), Bima-Beach; *L.* (*R.*) **sternospinosus*** (p. 36), Ke Id.; *L.* (*Aulacolambrus*) **sibogae*** (p. 40), 4° 25′ 7″ S 130° 3′ 7″ E., and 10° 52′ 4″ W., 123° 1′ 1″ E.; *L.* (*A.* **sulcatus*** (p. 46), Roma Id., Java Sea; *L.* (*Pseudo lambrus*) **hepatoconus*** (p. 49), Sulu Arch., *L.* (*P.*) *hepa toconus* v. **longispinosus*** (p. 51), Sanguisiapo; *L.* (*P. confragosus* v. **bidentatus*** (p. 51), 1° 42′ 5″ S., 130 47′ 5″ E.; *L.* (*P.*) **lobatus*** (p. 53), Paternoster Isl.; *L* (*P.*) **bicornis*** (p. 54), Java Sea; *L.* (*P.*) **tuberculatus** (p. 55), Sulu Arch., *Parthenope* **semicircularis*** (p. 60), B nongka; *Cryptopodia fornicata* v. **queenslandi** (*C. queen landi* Rathbun) (p. 65); *C.* **collifer*** (p. 66), between th Wowoni and Buton Ids.; *C.* **pentagona*** (p. 67), Sal wati; *Heterocrypta* **bivallata*** (p. 69), Sapeh Strai (b) Eumedoninae: *Zebrida* **paucidentata*** (p. 73), Maka sar. The 3rd and concluding section is largely a tabul review of the geographic distribution of the famil An exhaustive list of the known Parthenopidae, wi

complete synonymy and the more important references in literature, concludes the paper.—*H. J. Flipse* (*transl. by W. L. Schmitt*).

2494. **IHLE, J. E. W., und M. E. IHLE-LANDENBERG.** Über einige Tiefsee-Brachyuren der Siboga-Expedition aus der Gruppe der Oxyrhyncha. *Zool. Anz.* 93(5/6): 147-163. 1931.—The authors report on their investigations of the genera *Platymaia, Cyrtomaia,* and *Pleistacantha,* and discuss certain morphological characters of the Oxyrhyncha. *Platymaia wyville-thomsoni* alcocki (*P. a.* Rathbun) (p. 149); *P. turbynei* Stebbing, *P. bartschi* Rathbun, and *P. remifera* Rathbun are regarded as perhaps subspp. of *P. wyville-thomsoni* Miers; *P. wyville-thomsoni* and *P. fimbriata* Rathbun, emended descriptions; *Cyrtomaia smithii* spp. **tenuipedunculata** (p. 152), East Indies; *C. horrida* ssp. **pilosa** ♀ (p. 154), Kei Isls., 204 m.; *C.* **bicornis** ♀ (p. 156), between Timor and Rotti, 390 m.; *C.* **balssi** ♀ (p. 157), East Indies, 798 m.; *Pleistacantha sancti-johannis* ssp. **erecta** ♂ (p. 160), between Timor and Rotti; *P.* **cervicornis** (p. 161), Kei Isls. Distributional and taxonomic notes are given on some previously known spp.

2495. **LÖRENTHEY, E., und K. BEURLEN.** Die fossilen Dekapoden der Länder der Ungarischen Krone. *Geologica Hungarica, Ser. Palaentol.* 1(3): 1-427. 16 pl., 49 fig. 1929.—A short synopsis of the more important members of the Hungarian decapod fauna follows in a systematic sequence the descriptions of the fossil Hungarian decapods. *Hoploparia* **eocenica*** (p. 45) (Nephropsidae). Carcinoplacidae: *Titanocarcinus* **elegans*** (p. 235), **LAEVICARCINUS**, type *L.* **egerensis*** (p. 238); **PARACOELOMA** (p. 243), Oligocene, (subg. of *Coeloma*) type *C.* (*P.*) *rupeliense* Stain., *C.* (*P.*) **egerense*** (p. 244), Oligocene, Ocypodidae: **LÖRENTHEYA** (p. 388) (monotypic), *L.* **carinata*** (p. 388). Except where otherwise given, species are from the Eocene. A synopsis is given of the stratigraphical and geographical distribution of Hungarian fossil decapods and their zoogeographical relationships to faunas of the same epochs outside of Hungary are discussed. Special comment is made on the zoogeographical relationships of the Galatheidae and Prosoponidae of the Malm formation (Up. Jurassic), and of the decapods of the Eocene, Oligocene, and Miocene. Evolutionary relationships of the Thalassinidea, Raninoidea, Oxystomata, Oxyrhyncha, Cyclometopa, and the Catometopa (p. 333), are briefly discussed in order that the interrelationships between the various groups of Brachyura may be considered. This results in the differentiation of 4 diverse groups as follows: (1) Dromiacea, Oxypodidea, Parthenopidae, Cancridae, Portunidae; (2) Raninoidea; (3) Xanthidae, Carcinoplacidae, Pinnotheridae, Gecarcinidae, Grapsidae; and (4) Oxystomata. The relationships between the Brachyura and Macrura in respect to the Anomura are considered with the conclusion that these 4 groups of Brachyura are of independent origin. The general environment and appearance of the Hungarian Tertiary and the adaptations of the decapod fauna within this environmental setting are also discussed. Brief mention is made concerning the problem of colonization of the deep sea by the decapods.—*K. Beurlen* (*transl. by E. P. Creaser*).

2496. **MÉHELY, L. v.** Der wahrhaftige Artcharakter. *Zool. Anz.* 81(7/10): 219-223. 6 fig. 1929.—That the genitalia are the principal specific characteristic is proved by the genus *Hyloniscus* (Isopoda), the species of which can be separated only on basis of the 2nd pair of pleopods of the ♂.—*A. de Buck.*

2497. **MONTEROSSO, B.** Contributo alla conoscenza dei Copepodi parassiti. L'intestino di Peroderma cylindricum Heller. [The intestine of the copepod P. cylindricum.] [With French, English and German summaries.] *Arch. Zool. Ital.* 14(2/4): 169-225. 2 pl. 1930.—In *P. cylindricum* the intestine functions as a kinetic organ for the body fluids and its activity is also connected with the respiratory processes: It incites, in the median segment, rhythmic dilatations which pass along the intestine in a posterior-anterior direction, the coelomic fluid being similarly displaced, while the enteric fluid passes in the opposite direction; after each wave the coelomic fluid takes on a redder color, containing probably a respiratory pigment. The intestinal wall is formed by a layer of epithelial cells and a layer of very fine muscle fibrils placed between 2 structureless membranes. The epithelial cells are sharply differentiated into 2 kinds which show distinct morpho-physiological changes and are derived from a common "initial cell" which is alone capable of division. The cells of the 1st type, originally club-shaped, then spherical with their bases drawn out into a delicate stalk, appear to be the seat of an intracellular digestion; those of the 2nd type are never club-shaped, but have a striated border, which is not present in the first type, and are, apparently, absorbing cells. The epithelial cells are continually destroyed and replaced.—*From author's summary.*

2498. **MONOD, TH.** Zoologische Ergebnisse der Reisen von Dr. Kohl-Larsen nach den subantarktischen Inseln bei Neuseeland und nach Südgeorgien. 6. Tanaidacés et Isopodes sub-antarctiques de la collection Kohl-Larsen du Senckenberg Museum. [In French.] *Senckenbergiana* 13(1): 10-30. 24 fig. 1931.—This account of 2 spp. of Tanaidacea and about 25 spp. of Isopoda includes synonymies, locality data, taxonomic remarks, and host records. Some of these marine forms are recorded from coastal waters, and some are pelagic (from over 100 fms.). *Munna* **neglecta*** (p. 14), South Georgia, Falkland Isls., South Orkneys, and Palmer Arch.

2499. **MOUCHET, S.** Note sur le cycle évolutif des Gnathiidae. *Bull. Soc. Zool. France* 53(6): 392-400. 1928.—By rearing the larvae of *Gnathia* (Pranizae) and causing them to become fixed as external parasites on appropriate fishes, successive stages in the larval life-history can be obtained. There are 3 stages, separated by as many moults, before the sexual adult is developed.

After each moult the *Praniza* is distinctly segmented. The thorax becomes swollen as soon as it parasitizes a fish. The large larvae, known as *Zuphea* by various authors, are the segmented larvae of the 3rd stage in the normal life-history.—*S. Mouchet (transl. by W. M. Tattersall).*

2500. MOUCHET, S. Contribution à l'étude de la digestion chez les Gnathiidae. *Bull. Soc. Zool. France* 53(6): 442-452. 1928.—Pranizae are colored variously according to the host whose blood they absorb. This diversity of color is related to the nature of the pigments contained in the digestive tract. The blood of some fishes, when subjected to the action of the digestive juices of Pranizae, is not altered and the haemoglobin of the blood remains intact and therefore red. Other haemoglobins, on the contrary, are transformed into biliverdine. In other cases the corpuscles are not absorbed by the parasite and the uncolored plasma alone appears in the intestine. In all cases the digestion results in the formation of black pigment.—*S. Mouchet (transl. by W. M. Tattersall).*

2501. NIERSTRASZ, H. F., und J. H. SCHUURMANS STEKHOVEN, Jr. Isopoda genuina. In: **GRIMPE, G., und E. WAGLER.** Die Tierwelt der Nord- u. Ostsee. Lief. 18. Pt. Xe_2. 77p. 85 fig. Akad. Verlagsges.: Leipzig. 1930.—In the introductory pages, the authors discuss morphology, anatomy, reproduction, habits, and distribution, and include a table showing the geographical and vertical distribution of the 81 spp. occurring in the North and Baltic Seas. Keys are given to all groups from suborders to spp. Each sp. is described and figured. Hosts of parasitic species are listed. Bibliography of 46 titles is given. Two additional spp. and table of contents are treated in a supplement. (Ib, Pt. Xe_4. p. 169. 171-172, 1 fig.).

(=*S. lateritia* Thoms.,=*S. f.* var. *major* Waterh. ♀.=*S. f.* var. *queenslandica* Ob.); *S. parvicollis* Saund. (=*S. picea* Kerr. ♀) —*H. M. Gilkey.*

2517. BRYANT, G. E. New species of African Megalopidae (Col., Phytophaga). *Ann. and Mag. Nat. Hist.* 6(36): 623-638. 10 fig. 1930.—A key to the spp. of *Colobaspis* is given, including *C.* nyassae* (p. 625), Nyasaland; *C.* carinata* (p. 627), Northern Rhodesia; *C.* hargreavesi* (p. 628) and *C.* neavei* (p. 629), Uganda; *C.* dollmani* (p. 630), Northwestern Rhodesia; a key

to the spp. of *Antonaria* is given, including *A.* **coriacea** (p. 633), Uganda; *A.* **nigropunctata*** (p. 634), Uganda and S. Nigeria; *A.* **villosa*** (p. 635), N. W. Rhodesia and Nyasaland; *A.* **ugandensis*** (p. 637), Uganda [type dep. not stated]. Unless otherwise mentioned, types are in British Mus. *A. fulvicornis* is removed from the synonymy of *Leucastea senegalensis*.

2518. BURGEON, L. Description de Graphipterus nouveaux. *Bull. & Ann. Soc. Ent. Belgique* 68(3/5): 114-120. 1928.—*G.* **congoensis** (p. 114), with v. **ghesquierei** (p. 115), *G.* **griseolineatus** (p. 115), and *G.* **ellipticus** (p. 115), all 4 Belgian Congo; *G. sennaariensis* ssp. **bayeri** (p. 116) and *G. obsoletus* ssp. **elgonensis**, Kenya Colony; *G.* **heterus** (p. 117), Mozambique, type in Berlin Mus.; *G.* **horni** (p. 117), Tanganyika; *G.* **bennigseni** (p. 118), S. W. Africa, type in Berlin Mus.; *G.* **duvivieri** (p. 119), Tanganyika, type in Brussels Mus.; *G.* **dymorphus** (p. 119), Belgian Congo. Unless otherwise specified, types are in Belgian Congo Mus.

2519. CAMERON, MALCOLM. Coleoptera. Staphylinidae. Vol. I. In: The Fauna of British India, including Ceylon and Burma. xvii+471. 1 map. 3 pl. 134 fig. Taylor & Francis, London, 1930.—A systematic enumeration, including generic and specific descriptions, distribution, and keys to tribes, subfamilies, genera, and spp. The present volume treats the subfamilies Micropeplinae, Oxytelinae, Oxyporinae, Megapolinae, Steninae, and Euaesthetinae. The following are proposed as new: *Apatetica* **indica*** (p. 29), Bhutan, type in British Mus.; *A.* **intermedia** (p. 30), Burma; *A.* **caeruleipennis*** (p. 32), Assam, type in Brit. Mus.; *A.* **birmana** (p. 33), Upper Burma, type in Brit. Mus.; *Lispinus* **andrewesi** (Fauvel, in litt.) (p. 56), Nilgiri Hills [S. India]; *Eleusis* **nilgiriensis** (p. 77), *E.* **andrewesi*** (p. 79), and *E.* **denticollis*** (Fauvel, in litt.) (p. 80), all 3 Nilgiri Hills; *E.* **beesoni** (p. 81), United Provinces, Brit. India; *E.* **secreta** (p. 87), U. Prov.; *Priochirus* (*Cephalomerus*) **rubiginosus*** (p. 105), Sikkim and Assam; *P.* (*C.*) **andrewesi*** (Fauvel, in litt.) (p. 107), Nilgiri Hills; *P.* (*Plastus*) **crassisornis*** (p. 113), India, type in Brit. Mus.; *P.* (*P.*) **eucerus*** (p. 114), Sikkim; *P.* (*P.*) **taprobanus*** (p. 116), Ceylon; *P.* **birmanus*** (p. 117), Burma, type in Brit. Mus.; *Thoracochirus* **assamensis** (p. 120), Assam; *Phyllodrepa* (*Dropephylla*) **monticola** (p. 137), Chakrata; *P.* (*D.*) **flavipennis** (p. 138), Dehra Dun; *Phloeonomus* **nigritulus** (p. 143), Assam; *P.* **assamensis** (p. 145), Assam; *P.* (*Phloeostiba*) **temporalis** (p. 148); **PARALEASTER** (p. 169) (Oxytelini), related to *Deleaster*, with *P.* **longipennis*** (p. 170), Assam; *Trogophloeus* (*Thinodromus*) **assamensis*** (p. 181), Assam; *T.* (*Th.*) **pubicollis** (p. 182), Assam; *T. siamensis* v. **siwalikensis** (p. 187), Siwaliks; *T.* (*Boopinus*) **chatterjeei** (p. 188), Central Provinces; *T.* (*B.*) **congruus** (p. 188), Central Provs.; *T.* **granulatus** (p. 189), *T.* **laticeps** (p. 190), *T.* **coriaceus** (p. 190), *T.* **flavipennis** (p. 191), and *T.* **palitans** (p. 192), all 5 U. Provs.; *T.* **pusae** (p. 192), Pusa; *T.* **gratus** (p. 193), U. Provs.; *T.* **piceicollis** (p. 193), Central Provs.; *T.* **abnormalis** (p. 194), Almora [Brit. India]; *T.* **ruficornis** (p. 195), Ceylon; *T.* **torrentum** (p. 196), U. Provs.; *T.* **trivialis** (p. 197), Central Provs.; *T.* **vagans** (p. 198), U. Provs.; *T.* **bengalensis** (p. 199), Pusa; *Apocellagria* **tenuicornis** (p. 203), Assam; *Oxytelopsis* **andrewesi*** (p. 207), Nilgiri Hills; *Oxytelus* **aeneotinctus** (p. 215) and *O.* **sordidus** (p. 216), U. Provs.; *O.* (*Tanycraerus*) **almorensis*** ♂ (p. 221), Almora; *O.* (*T.*) **discalis*** (p. 222), U. Provs.; *O.* (*T.*) **dohertyi** (p. 223), Manipur; *O.* (*T.*) **pallidipennis*** (p. 224), U. Provs.; *O.* (*T.*) **nilgiriensis*** ♂ (p. 227), Nilgiri Hills; *O.* (*T.*) **foetidus** (p. 230), U. Provs.; *O.* (*Anotylus*) **birmanus** (p. 240), Burma and Assam; *O.* (*A.*) **opacellus** (p. 243), Pusa; *O.* (*A.*) **andrewesi** (p. 244), Nilgiri Hills; *O.* (*A.*) **masuriensis** (p. 244), Mussoorie and Simla Distrs.; *O.* (*A.*) **occultus*** (p. 245), U. Provs.; *O.* (*A.*) **simlaensis** ♂ (p. 247), Simla; *O.* (*A.*) **pauper** (p. 249), Mussoorie and Ceylon; *O.* (*A.*) **intermedius** (p. 249), Mussoorie; *O.* (*A.*) **pumiloides** (p. 250), Chakrata Distr.; *O.* (*A.*) **kraatzi** (*O. pulcher* Kr. not Grav.) (p. 251); *O.* (*A.*) **laetus*** (p. 252), U. Provs.; *O.* (*A.*) **alternans*** (p. 253), Mussoorie, in fungus; *O.* (*A.*) **rubicundus*** (p. 255), U. Provs., in rotting fruit; *O.* (*A.*) **ruber** (p. 256), Burma; *O.* (*A.*) **rubidus*** (p. 259), U. Provs., in fungus; *O.* (*A.*) **frater** (p. 262), Mussoorie; *Platystethus* **indicus** (p. 267), U. Provs.; *Bledius* **bison** ♂ (p. 273), East India, type in Brit. Mus.; *B. verres* v. **monachus** (Bernh. in litt.) (p. 275), Siwaliks; *B.* (*Pucerus*) **rhinoceros** (p. 277), Assam; *B.* (*P.*) **transversus** ♂ (p. 277), U. Provs.; *B.* **fuscicornis*** (p. 280), Almora; *B.* **indicus** (p. 282), Kumaon; *B.* **birmanus** (p. 283), Burma; *B.* **beesoni** (p. 285), U. Provs.; *Thinobius* **simlaensis** (p. 289), Simla Hills; *Osorius* **birmanus** (p. 301), Burma; *Mimogonus* **andrewesi** (p. 305), Nilgiri Hills; *Holotrochus* **chatterjeei** (p. 308), U. Provs., bred from *Odina wodier*; *Oxyporus* **birmanus** (p. 311) and *O.* **stigmaticus** (p. 311), Burma; *O.* **apicata*** (*O. apicalis* Cam. preocc.) (p. 311); *O.* **cephalotes** (p. 313), *O.* **variegatus** (p. 313), *O.* **dohertyi** (p. 314), and *O.* **nigricornis** (p. 314), all 4 Burma; *Stenus* **tortuosus** ♀ (p. 324), Chakrata Distr.; *S.* **assamensis** ♂ (p. 335), Naga Hills; *S.* **cyaneovirens** ♂ (p. 335), Assam; *S.* **chatterjeei** ♂ (p. 337), Assam; *S.* **aeratus*** ♂ (p. 337) and *S.* **plumbeus** ♀ (p. 339), Chakrata Distr.; *S.* **musicola** (p. 339) and *S.* **morosus** (p. 340), Simla Hills; *S.* **viridescens*** (p. 340) and var. **almorensis** (p. 341), Chakrata Distr.; *S.* **nigripes** ♀ (p. 342), Central Provs.; *S.* **hirsutus** ♂ (p. 342), Siwaliks; *S.* **inconspicuus** ♂ (p. 342), *S.* **peratus*** ♂ (p. 344), and *S.* **simlaensis** (p. 345), all 3 Simla Hills; *S.* **beesoni** ♂ (p. 346), Chakrata Distr.; *S.* **lugubris** ♀ (p. 347), India; *S.* (*Hypostenus*) **rajpurianus*** (p. 353), U. Provs.; *S.* (*H.*) **flavostigma*** (p. 356), Assam; *S.* (*H.*) **sinuatus*** (p. 360), Burma; *S.* (*H.*) **tuberculicollis*** (p. 361), Assam; *S.* (*H.*) **persimilis*** (p. 367), Burma; *S.* (*H.*) **frater** ♂ (p. 370), Chakrata Distr.; *S.* (*Mesostenus*) **masurianus** ♂ (p. 388), U. Provs.; *S.* (*M.*) **obliquenotatus*** (p. 390) and *S.* (*M.*) **chakratianus*** (p. 392), Chakrata Distr.; *S.* (*M.*) **maculifer*** (p. 395), Assam; *S.* (*M.*) **submetallicus*** (p. 400), Chakrata Distr.; *Dianous* **ocellatus*** (p. 430) and *D.* **aeneus*** (p. 442), Assam; *Stenaesthetus* **quadrisulcatus*** (p. 446), Almora; footnote (p. 445) refers all spp. of *Dimerus* Fivri described by Broun from New Zealand to this genus; addenda, with amended keys pp. 451-461; *Eupiestus spinifer* v. **unicolor** (p. 451), Rangirum; *Lispinus* **dipterocarpi** (p. 452), Middle Andamans; *L.* **assamensis** (p. 452), Assam; *Eleusis* **simulans** (p. 452) and *E.* **birmana** (p. 453), Burma; *Priochirus* (*Plastus*) **sikkimensis** (p. 454) and *P.* (*P.*) **gardneri** (p. 454), Bengal; *Geodromicus* **kashmirensis** (p. 455), Kashmir; *G.* **similis** (p. 455), Kashmir; *Oxytelus* (*Anotylus*) **gardneri** (p. 456), Darjeeling, ex *Evodia fraxinifolia*; *Osorius* **gardneri** (p. 456), *O.* **lopchuensis** (p. 457), and *Mimogonus* **niger** (p. 457), all 3 Darjeeling; *Stenus* **almoranus** ♀ (p. 458), Almora; *S.* (*Hypostenus*) **obliteratus** ♀ (p. 458), *S.* (*Mesostenus*) **tenuimargo** (p. 459), *S.* (*M.*) **lopchuensis** ♀ (p. 460), and *S.* (*M.*) **gardneri** (p. 460), all 4 Darjeeling. An index of generic and specific names, arranged alphabetically, with synonyms, concludes the paper.

2520. CARTER, H. J. Revision of Athemistus and Microtragus (fam. Cerambycidae) with notes and descriptions of other Australian Coleoptera. *Proc. Linn. Soc. N. S. W.* 51(4): 492-516. 7 fig. 1926.—There is a preliminary discussion of synonymy in the families Buprestidae and Dryopidae. In the Cerambycidae, a revision is made of the genus *Athemistus*, of which there are 23 spp., 13 new: *A.* **macleayi** (p. 495), Queensland, in Australian Mus.; *A.* **maculatus** (p. 496), *A.* **aborigine** (p. 496), *A.* **harrisoni** (p. 497), *A.* **luciae** (p. 497), and *A.* **punctipennis** (p. 497), all 5 New South Wales, and in Macleay Mus.; *A.* **laevicollis** (p. 498), N. S. W., in Nation. Mus., Melbourne; *A.* **approximatus** (p. 498), Victoria, in Nat. Mus.; *A.* **puncticeps** (p. 499), N. S. W., in Nat. Mus.; *A.* **tricolor** (p. 499), Victoria, in Lea coll.; *A.* **barretti*** (p. 500), N. S. W., in Carter coll.; *A.* **mastersi** (p. 500), Queensland, in Macleay Mus.; table of spp. of *Athemistus; Microtragus*, revision of spp.; *M.* **echinatus** (p. 504) and *M.* **bimaculatus** (p. 505), Queensland, in S. Australian Mus. These **longicorns**

strikingly resemble the phalidurine weevils in habitat, habit, wide distribution, and great variability. *Somatidia* australiae (p. 506), N. S. W., in Nation. Mus.; *Helmis* barretti (p. 506), *H.* cuprea (p. 507), *H.* maculata (p. 507), and *H.* purpurea (p. 508), all 4 N. S. W., and in Carter coll.; *Platydema* nigrosuffusum (p. 509), N. S. W., Carter coll.; *Docalis* elongatus (p. 509), Western Australia; in Macleay Mus.; *Mesomorphus* meridianus (p. 509), S. Australia, in British Mus.; *Ulodes* tuberculatus (p. 510), Queensland, in Queensland Mus.; *Nyctozoilus* macleayi* (p. 511), N. S. W., Macleay Mus.; *N.* nicholsoni (p. 511), N. S. W., Macleay Mus. [since thrown into synonymy]; *Cardiothorax* consimilis* (p. 512), N. S. W., in Carter coll. [since thrown into synonymy]; *Adelium* bassi (p. 512), Bass Straits, in Austr. Mus.; *A.* brevi (p. 513), *Licinoma* planata (p. 513), and *Amarygmus* puteolatus (p. 514), all 3 N. S. W., in Carter coll.; *A. porosus* Blkb. (=*A. regius* Carter); *Chromomoea* varicornis (p. 514), Queensland, in Queensland Mus.; *Tanychilus* aeratus (p. 515), Queensland, in Austr. Mus.; *Hybrenia* substriata (p. 515) and *Ommatophorus* illidgei (p. 516), both Queensland, and in Carter coll.; *O. atripes* v. bicolor (p. 516), N. S. W., in Carter coll.—*H. J. Carter.*

2521. **CHITTENDEN, F. H.** New species of North American weevils of the genus Lixus. *Proc. U. S. Nation. Mus.* 77(18): 1-26. 1 pl. 1930.—*L.* albisetiger (p. 2), Texas, type in Illinois State Nat. Hist. Survey; *L.* aspericollis (p. 3), Kansas; *L.* coloradensis ♀ (p. 4) and *L.* perstriatus (p. 5), Colorado; *L.* acirostris ♀ (p. 6), North Carolina; *L.* ordinatipennis ♀ (p. 7), Louisiana; *L.* quadratipunctatus (p. 8), Colorado; *L. sylvius* v. profundus (p. 9), District of Columbia and Georgia to Missouri and Texas, type in Canadian Nat. Coll.; *L.* crassipunctatus ♂ (p. 9), Arizona, type in Univ. Kansas Mus.; *L.* ivae (p. 10), reared from stems of *Iva ciliata* and *Ambrosia* sp., Louisiana; *L.* dissimilis ♂ (p. 11), Georgia; *L.* tricristatus* (p. 12), ovipositing on *Bidens* sp., Iowa and New York to Arkansas and Alabama; *L.* planicollis ♂ (p. 13), Iowa and Louisiana; *L.* pervestitus* (p. 14), Arizona and New Mexico; *L.* flexipennis ♀ (p. 15) and *L.* buchanani ♀ (p. 16), Iowa; *L.* plucheae (p. 17), Texas, breeding in *Pluchea camphorata; L. fossus* v. ocellatus (p. 18), New York and New Jersey; *L.* capitatus ♂ (p. 19), from *Ambrosia trifida* Maryland; *L.* lodingi* (p. 20), Florida, Alabama, and Louisiana; *L.* regularipennis (p. 21), Illinois and District of Columbia to Louisiana and Alabama; *L.* cleonoides (p. 22), Texas, on *Helenium microcephala; L.* mephitis ♀ (p. 23), South Carolina; *L.* elephantulus ♀ (p. 24), Illinois, type in Illinois State Nat. Hist. Survey. Types, unless otherwise specified, in U. S. Nat. Mus.

2522. **CROS, AUGUSTE.** Notes sur les larves primaires des Meloidae. (3e série.) *Ann. Soc. Ent. France* 98: 193-222. 1929.—The chief distinctive characters of Meloidae larvae are given for the following: *Zonitis bilineata,* the larva of American spp. resembling the palearctic spp. of *Z. praeusta* F. and *Z. immaculata* Ol.; *Hornia minutipennis,* resembling *H. nymphoides* larvae of Morocco and Algeria; *Meloe proscarabaeus,* the larvae observed clinging to the hymenoptera *Cerceris, Halictus,* and *Andrena; Meloe* sp., resembling *proscarabaeus; M.* ? *violaceus,* from Austria; *M. brevicollis,* from S. Germany; *M. variegatus; Pomphopoea sayi,* resembling closely larvae of *Lytta vesicatoria* and of the genera *Lydus* and *Oenas; Zonabris variabilis; Z. 12-punctata* misidentified larva, which belongs to *Z. geminata; Z. geminata;* supplementary note on *M.* sp., near *proscarabaeus,* causing damage to beehives in California.—*A. Cros* (*transl. by C. Zeimet*).

2523. **DEVILLE, J. SAINTE CLAIRE.** Note relative à l'aire de dispersion de la Nebria complanata. *Bull. et Ann. Soc. Ent. Belgique* 70(3/4): 144-145. 1930.—Distributional notes.

2524. **EGGERS, H.** Neue Xyleborus-Arten (Col. Scolytidae) aus Indien. [In German.] *Indian Forest Rec.* (*Entomology Ser. pp. 1-32*) 14(9): 177-208. 1930.—Descriptions are given of 41 new spp. and 3 varieties of Indian *Xyleborus,* viz. lineatus ♀ (p. 177); subnepotulus ♀ (p. 178); mussooriensis (p. 179); sulcatus ♀ (p. 180); lantanae ♀ (p. 180); longidens ♀ (p. 181); terminatus ♀ (p. 182); mesuae ♀ (p. 182); eugeniae (p. 183); resecans ♀ (p. 184); sampsoni ♀ (p. 184); glaber ♀ (p. 185); subsimilis ♀ (p. 186); *mancus* v. formosanus ♀, Formosa (p. 186); pseudocomans ♀ (p. 187); metacomans ♀ (p. 188); rufobrunneus n. n. (*X. similis* Eggers) (p. 189); *r.* var. dihingensis (p. 189); moestus ♀ (p. 189); *riehli* Eichh., ♂ described; brevidentatus ♀, Andamans (p. 190); quadridens ♀, Borneo (p. 191); malloti (p. 192); rudis ♀ (p. 192); ovalicollis ♀ (p. 193); tristis ♀ (p. 194); granulipennis ♀ (p. 194); assamensis ♀ (p. 195); sibsagaricus ♀ (p. 196); dalbergiae ♀ (p. 196); incurvus ♀ (p. 197); *sordicaudulus* v. peguensis ♀ (p. 198); corpulentus (p. 198); mucronatulus ♀ ? (p. 199); birmanus ♀ (p. 200); suturalis ♀ (p. 200); protensus ♀, Java (p. 201); subgranulatus ♀ (p. 202); spinipennis ♀ (p. 202); subspinosus ♀ (p. 203); mus ♀ (p. 203); minutissimus ♀ (p. 204); chrysophylli ♀ (p. 205); distinguendus ♀ (p. 205); pinicola ♀ (p. 206); PSEUDOXYLEBORUS (p. 206), type *P.* beesoni ♀, Burma (p. 207). Types are in British Mus.—*C. F. C. Beeson.*

2525. **FISHER, W. S.** Notes on the rhinotragine beetles of the family Cerambycidae, with descriptions of new species. *Proc. U. S. Nation. Mus.* 77(19): 1-20. 1930.—These beetles are remarkable for their generally abbreviated elytra and for the mimetic resemblance of many of them to other Coleoptera and to Hymenoptera. There are notes on the distribution, taxonomy, and life histories of several previously known forms. *Odontocera* triplaris (p. 3), Colombia, from dead wood of *Triplaris; O.* buscki (p. 4), Panama and Canal Zone; *O.* zeteki (p. 6), Canal Zone; *O.* nevermanni ♂ (p. 8), Costa Rica; *O.* darlingtoni ♀ (p. 9), Colombia, from dead wood of *Triplaris; Acyphoderes* rufofemorata ♀ (p. 12), Bahia, Brazil; *Bromiades* meridionalis ♀ (p. 14), *Phygopoda* manni (p. 15), *Tomopterus* vittipennis ♂ (p. 17), and *T.* similis ♂ (p. 19), all 4 Bolivia. Types in U. S. Nat. Mus.

2526. **FLEUTIAUX, E.** Melasidae nouveaux d'Indochine. *Bull. Soc. Zool. France* 53: 370-373. 1928.—*Dromaeolus* semisericeus (p. 370); *D.* tonkinensis (p. 371); *D.* granosus (p. 371); EPIPLEURUS (p. 372), near *Temnillus* and *Temnus,* erected for *E.* coomani (p. 372); *Entomophthalmus* coomani (p. 372); *Raapia galboides,* also recorded. All from Tonkin.

2527. **FLEUTIAUX, E.** Two new species of Coleoptera from India. [In French.] *Indian Forest Rec.* (*Entomology Ser. pp. 21-22*) 14(6): 153-154. 1930.—Describes *Fornax* carissae ex *Carissa,* and *Cardiophorus* gardneri from larvae found in sand. Types in British Mus.—*C. F. C. Beeson.*

2528. **GARDNER, J. C. M.** Immature Stages of Indian Coleoptera (6). *Indian Forest Rec.* (*Entomology Ser. pp. 1-30*) 14(4): 103-132. 6 pl. 1929.—Differential characters of the larvae of *Calosoma indica, C. beesoni**, and *C. himalayanum** are mentioned. Descriptions are given of larvae of: *Nebria cameroni**; *Diceromerus orientalis**; *Idgia melanura**; *I. flavibuccis**; *Atractocerus reversus**; *Acmaeodera kerremansi* v. *fasciatipennis**; *Schoutedenia apicata**; *Chrysochroa eburnea* v. *albiventris**; *Chrysochroa gratiosa**; *Capnodis miliaris**; *Sphenoptera konbirensis**; *Melanophila coriacea**; *Anthaxia** (generic characters); *Chrysobothris andamana; Belionota prasina**; *Agrilus derrisi**; *A. gardneri**; *Coraebus cingulatus**; *Setenis* (generic characters); *S. cribrifrons**; *S. confusa; S. furva; Derosphaerus* (generic characters); *D. crenipennis**; *Lyprops indicus** (also pupa*); *Falsosessinia sculpticollis** (also pupa); *Oniticellus cinctus* (also egg); *Onitus falcatus.* A characterization, and a key to 11 genera, are given for larvae of the Buprestidae. There is a note on *Serphus gravidator* v. *Partipes**, a parasite of the larva of *Nebria cameroni.*—*J. C. M. Gardner.*

2529. **GARDNER, J. C. M.** Some new Indian Cerambycidae. *Indian Forest Rec.* (*Entomology Ser. pp. 23-33*) 14(7): 155-165. 1 pl. 1930.—Descriptions are given

of the ♀ of *Cyriopalpus wallacei* Pasc., ex *Pentacme suavis* (p. 155), and of the following new spp.: *Perissus* **dalbergiae** ex *Dalbergia sissoo* (p. 155); *Olenecamptus* **anogeissi** ex *Anogeissus latifolia* (p. 156); *Cylindrepomus* **andamanicus**, Andaman Is. (p. 158); *Atimura* **combreti** ex *Combretum decandrum* (p. 158); *Pothyne* **combreti** ex *Combretum decandrum* (p. 160); *P.* **acaciae** ex *Acacia gageana* (p. 160); *P.* **convexifrons** ex *Saccharum spontaneum* (p. 29); *Serixia* **andamanica**, North Andaman, ex *Myristica andamanica* (p. 162); *Glenea* **gahani***, Burma (p. 162); *G.* **plagiata*** (p. 163); *G.* **bifasciata*** (p. 164); *Scytasis* **sericea** Burma (p. 164). Types are in British Mus.—*J. C. M. Gardner.*

2530. **HEYMONS, R., und H. von LENGERKEN (unter Mitwirkung von M. BAYER). Studien über die Lebenserscheinungen der Silphini (Coleopt.) VI. Blitophaga undata Müll. (Buckelstreifiger Rübenaaskäfer).** *Zeitschr. Wiss. Biol. Abt. A, Zeitschr. f. Morph. u. Ökol. Tiere* 18(1/2): 170-188. 5 fig. 1930.—The imago is almost exclusively herbivorous, taking animal food only occasionally. On a pure animal diet the egg production is greatly diminished. The beetles were repeatedly found in nature on grasses and grain-plants, where they climb to a height of 0.75 m. The digestive tract is described. The eggs are laid in small holes in the ground and as in other Siphini there is an embryonic moult. The larvae devour the tips of young grain-plants, such as barley. The number of eggs, the egg-depositing apparatus, the death, hibernation, and development of the egg and embryo, the development of the larva, morphology of the 3 larval stages, pupation, and appearance of the young beetles are described. The larval instars, pupa, and imago are figured.—*R. Heymons (transl. by L. H. Hyman).*

2531. **HUSTACHE, A. Curculionides de la Guadeloupe. Première partie.** In: **Faune Colonies Françaises** 3(3): 165-267. 8 fig. 1929.—This report is based upon a study of 10,000 specimens, collected chiefly by G. Dufau. 124 genera are represented, including 8 new ones, and 314 spp., of which 190 are new. The island is still incompletely explored for Curculionidae. The keys cover tribes, genera, species, and varieties. Previously known spp., as well as new ones, are described. The following are new, with types in Fleutiaux coll., Mus. Paris, and author's coll. *Auletobius* (*Eumetopon*) **guadelupensis*** (p. 178); *Apion* **guadelupense** (p. 179); *A.* **dufaui** (p. 180); *Pandeleteius* **testaceipes** (p. 181); *Diaprepes abbreviatus* v. **guadelupensis** (p. 184), and var. **desideradensis** (p. 184); *Polydrosus* **latitarsis** (p. 185); *P.* **guadelupensis** (p. 186); *Litostylus* Faust (=*Germariella* Champ.); *Exophalmodes* Pierce (=*Exophthalmus* Champ.); *Prepodes* **dufaui** (p. 198); *P. marmoreus* v. **marmoratus** (p. 198); *Promecops* **sinuatocollis** (p. 202); *Hilipus* **carinifrons** (p. 205); *Ozoctenus* **dufaui** (p. 208); **DORYTOMORPHA** (p. 209), type *D.* **tonsa*** (*Euscepes tonsus* Chevr.) (p. 209); *Anchonomorpha* **guadelupense** (p. 211), **PARANCHONUS** (p. 212), somewhat similar to *Anchonus*, type *P.* **verrucosus** (p. 213); *P.* **ovatus*** (p. 214); *P.* **latirostris** (p. 214); **DUFAUIELLA** (p. 215), resembles *Paranchonus*, type *D.* **heterorostris*** (p. 215); *Anchonus* **scrabrosus** (p. 229); *A.* **tuberosus** (p. 230); *A.* **spinosus** (p. 231); *Rhyparonotus* **insularis*** (p. 236); *Ceratopus* **fulvus** (p. 239); *Catiline* **tuberculatus** (p. 240); *C.* **elongatus** (p. 241); *Neochetina* **gaudelupensis** (p. 243); *Phyllotrox* **nigriventris** (p. 245); *P. n.* var. **nigripennis** (p. 245); *P.* **callosipennis** (p. 245); *Udeus* **muticus** (p. 246); *Anthonomus* (*Leptarthrus*) **dufaui** (p. 250); *A.* (*L.*) **spinipennis** (p. 251); *A.* (*Anthonomus*) **flexuosus** (p. 253); *A.* (*A.*) **filicornis** (p. 257), type in author's coll.; *A.* (*A.*) **convexifrons** (p. 257); *A.* (*A.*) **guadelupensis** (p. 258); *A. homunculus* v. **différens** (p. 260); *A.* (*A.*) **bimaculatus** (p. 261); *A.* (*A.*) **squamulatus** (p. 262); *A.* (*A.*) **thyasocnemoidus** (p. 263); *Pseudanthonomus* **sylvaticus** (p. 264); *P.* **bellus** (p. 264); *P.* **seriatus** (p. 265); *P.* **pusillus** (p. 266).

2532. **JEANNEL, R. Bathysciinae nouveaux d' Espagne.** *Butl. Inst. Catalana Hist. Nat.* 10(6): 90-91. 1930.—*Anillochlamys moroderi* spp. **subtruncatus** ♀ (p. 90); *A.* **baguenai** ♂ (p. 91), type in coll. R. Zariquiey; *Speophilus* (s. str.) **españoli** ♀ (p. 91), types in coll. Jeannel and coll. R. Zariquiey. All from Spain.

2533. **KLEINE, R. Bibliographie der Brenthidenliteratur. (Col.).** *Stettiner Ent. Zeitung* 91(2): 195-213. 1930.—A list of works by 103 authors from many publications, dating from 1784 to 1929.

2534. **KROGERUS, ROLF. Studien über Choleva-Arten. 1.** *Notulae Ent.* [*Helsingfors*] 6(1): 1-9. 8 fig. 1926.—Revision of misidentified spp. with descriptions of new spp. and locality corrections. Key is given to ♀♀ and ♂♂. *Choleva* **aquilonia*** (p. 5); *C. a.* var. **brevicollis** (p. 6); *C. sibirica* Jeann. (=*C. pallida* Poppius) is not a *Choleva* but belongs to *Catops.*

2535. **LEVER, R. J. A. W. Notes on nomenclature of some neotropical Chrysomelidae (Coleoptera), with descriptions of two new species.** *Ann. and Mag. Nat. Hist.* 6(36): 668-671. 5 fig. 1930.—*Diabrotica tripunctata* Fabr. (=*D. melanocephala* Fabr. 1798 and *D. m.* 1775 (=*D. vittata*); *Oedionychis* **abercrombyi** (*O. illigeri* Jacoby) (p. 669); *Diabrotica* **rubrimarginata*** (p. 669), type in Brit. Mus., and *Dacirys* **trinidadensis*** (p. 671), type in National coll., both Trinidad, and on *Crotalaria juncea.*

2536. **MAMAJEV, K. Zur Elateriden-Fauna des Kamensky-Bezirkes des sibirischen Gebiets (südwestliches Sibirien, früheres Gouvernement Tomsk).** *Zeitschr. Österr. Ent.-Vereines* 13(6): 64; (7): 71-72. 1928.—A list of 24 spp., based on a collection made in this district, 1925-1927.

2537. **MARCU, O. Ein neuer Beitrag zur Kenntnis der Geschlechtsunterschiede der Stridulationsorgane einiger Curculioniden.** *Zool. Anzeiger* 91(1/4): 75-81. 5 fig. 1930.—Descriptions and figures of these organs in the genera *Lepyrus, Hylobius, Pissodes, Pachytychius,* and *Cryptorrhynchus.*

2538. **MARCU, O. Beitrag zur Kenntnis der Stridulationsorgane von Prionus coriarius L.** *Zool. Anzeiger* 92 (3/4): 65-66. 1 fig. 1930.—In this species the organ is not elytro-metatibial, as supposed, but of a new type, elytro-metafemoral.

2539. **[OBRAZTSOV, N. S.]** ОБРАЗЦОВ, Н. С. К распространению и биологии **Gibbium boieldieui Levr. [Propagation and biology of G. boieldieui.]** Русское Энтомологическое Обозрение (*Rev. Russe d'Ent.*) 22 (1/2): 134-136. 1 fig. 1928.—This sp., hitherto known in Russia only from the Crimea, occurs in Nikolaef (Ukraine). It is found in houses, March to May, in dark rooms, appearing only in darkness or in artificial light. The beetle, in captivity, did not touch wool, leather, cotton, or paper, but preferred as food dried insects, bread, and mould on organic substances, and, less willingly, cheese, skin of sausage, and cork. The copulation period began the middle of April and the copulae lasted from several to 20 minutes. The oviposition was observed at the end of June. The eggs are white, measuring 0.6-0.7 mm. The white larvae, 3-4 mm., are covered with dense stiff hairs. When at rest, or feeding, they lie in a curved position (like Scarabaeidae larvae) and feed on the same substances as the adults. After 3-5 weeks they form white, spheric, silken cocoons, 2-2.5 mm., without the addition of any foreign material. The beetles emerge after 1½-3 weeks and live during the summer without feeding.—*G. Maydell.*

2540. **OHAUS, F. Neue brasilianische Dynastinen. (Col. Lamell.)** *Stettiner Ent. Zeitung* 91(2): 261-265. 3 fig. 1930.—*Brachysiderus* **minicola** (p. 261); *B.* **goyanus** (p. 263) and *B.* **matogrossensis** (p. 264), types in author's coll. A key is supplied for these 3 spp.

2541. **OHAUS, F. Eine neue Plusiotis aus Guatemala. (Col. Lamell. Rutelin.).** *Stettiner Ent. Zeitung* 91(2): 265-266. 1 fig. 1930.—*P.* **pehlkei*** ♂ (p. 265), type in Naturkundemus., Stettin.

2542. **OHTA, YUAI. Byturiden Japans.** *Insecta Matsumurana* 4(3): 100-103. 1 fig. 1930.—A key is given to the Japanese spp., and an annotated list. **TEROBYTURUS** (p. 102) is proposed for *T.* **shibakawai*** (p.

102); *Byturus* oakanus (p. 101); *Terobyturus* japonicus (p. 102); *T.* fallax (p. 103).—*R. Takahashi.*

2543. **PAOLI, GUIDO.** Prime notizie sulla biologia dello Stasiodis parvulus F. (Col. Curcul.) *Boll. Soc. Ent. Ital.* 62(9): 172-174. 1 fig. 1930.—Includes figures of eggs and larva, and description of egg-laying, with list of plants damaged by the adults, in Italy.

2544. **PIC, M.** Pour aider à l'étude du genre Xylobanus Wat. [Col.] *Bull. Soc. Zool. France* 53: 46-50. 1928.—This paper consists chiefly of critical remarks on a previous work [author not named] on *Xylobanus*, published in Over. Tijdschr. Entom., LXX, 1927, pp. 43-72. *X.* borneensis (*X. parallelus* Kleine, not Pic) (p. 47); *X.* kleinei (*X. luzonicus* Kleine, not Pic) (p. 47); *X. ambrensis* v. destrictus (*X. d.* Kleine) (p. 49); *X.* inapicalis (p. 50) and *X.* vicinus (p. 50), Uganda. Types in author's coll. A key is given for 12 spp. of the genus.

2545. **PIC, M.** Observations, rectifications et nouveautés diverses [Col.] *Bull. Soc. Zool. France* 53: 132-134. 1928.—*Indalmus grandis* (Pic) is removed from the synonymy of *I. ephippiatus* Gerst., *Ancylopus lineatus* Pic from that of *Indalmus bivittatus* Puch., and *Ancylopus atricornis* Pic from that of [*A.* ?] *kirbyanus* Latr.; *Cyclotomima* lunulata (p. 133), *Hylophilus* notatipes (p. 133), and *H.* truncaticeps (p. 133), all from Tonkin; *Tokiophilus* reductefasciatus (*Hylophilus r.* Pic) (p. 134).

2546. **PIC, M.** Communications entomologiques. *Bull. Soc. Zool. France* 53: 265-268. 1928.—*Dictyopterus* miniatus (p. 267), Kashmir; *Stenactyla* strangulata (p. 267), *Nemostira* charleufi (p. 267), *Allecula* charleufi (p. 268), and *A.* donckieri (p. 268), all 4 French Congo. Types in author's coll.

2547. **PIC, M.** Nouveaux Coléoptères surtout Tonkinois. *Bull. Soc. Zool. France* 53: 377-379. 1928.—*Tenerus robustus* v. discoidalis (p. 377), Cochin China; *Tonkinius* nitidus (p. 377), Tonkin; *Setenis* sinuatipes ♂ (p. 377), Indo-China; *Aoria* pallidipennis (p. 377), Tonkin; *A.* rufa (p. 378), China; *A.* thibetana (p. 378), Tibet; *Trichochrysea* humeralis (p. 378), *Iphimoides* latus (p. 378), *I.* suturalis (p. 378), *I.* binhanus (p. 378), *Nodostoma* jeanvoinei (p. 379), and *N.* latipenne (p. 379), all 6 Tonkin; *N.* nigripenne (p. 379), China. Types in author's coll.

2548. **PIC, M.** Cryptocephalides du Congo. *Rev. Zool. Bot. Africaines* 18(2): 162-183. 1929.—This report is based upon the collection of the Musée du Congo, where the types of the new forms are deposited. The keys to genera, species, and varieties include, besides the new forms, certain species that are related or difficult to distinguish. Unless otherwise stated, the new forms are from the Belgian Congo. *Anteriscus* superbus (p. 166), Uganda; *A. s.* var. bayeri (p. 166), Uganda; *Melixanthus* signaticeps (p. 167); *M. conradti* var. malelanus (p. 167); *M.* brunneiceps (p. 167); *M.* cephalotes (p. 168); *M.* externevittatus (p. 168); *Anteriscus* lembanus (p. 168); *A. neglectus* v. binotatithorax (p. 169); *A.* punctatus (p. 169); *A.* kasaiensis (p. 170); *A.* atrithorax and var. disjunctus (p. 170); *A.* atrofasciatus (p. 170); *A. a.* var. alberti (p. 171); *A.* rubronotatus (p. 171); *A. schubotzi* v. burgeoni (p. 171); *A.* maynei (p. 172); *A.* basinotatus (p. 172); ? *A.* subcrucifer (p. 172); *Cryptocephalus* cyaneometallicus (p. 176); *C. bilunulatus* v. unilunulatus (p. 176); *C.* semimetallicus (p. 177); *C.* colmanti (p. 177); *C.* preapicalis (p. 178), Brit. E. Africa; *C.* vanderijsti (p. 178); *C. gladiatorius* v. callewaerti and *C. g.* var. concoloripennis (p. 174); *C.* tinantae (p. 178); *C.* trimaculatithorax (p. 179); *C. pantherinus* v. elisabethae (p. 179); *C.* quadri-undulatus and *C. q.-u.* var. inundulatus (p. 180); *C. oblongosignatus* v. subbiobliteratus (p. 180); *C. luteotrilineatus* v. subobliteratus (p. 181); *C.* biquadrimaculatus (p. 181); *C.* albidomaculatus (p. 181); *C.* maculaticeps (p. 181); *C.* maynei (p. 182); *C.* flavoapicalis (p. 182); *C. stanleyi* v. moucheti (p. 176); *C.* diversithorax (p. 182); *C.* charliersi (p. 183); *C. pengalensis* v. plasi (p. 183); *C. p.* var. diversifasciatus (p. 183).

2549. **RIVNAY, EZEKIEL.** Revision of the Rhipiphoridae of North and Central America (Coleoptera). *Mem. Amer. Ent. Soc.* no. 6. 1-68. 4 pl. 1929.—This study attempts to bring this rare and little studied group into better taxonomic order. Keys to the genera and spp. are given and the following are described as new: *Trigonodera* schaefferi* n. n. for *Pelecotomoides nubilus* Schaeffer (p. 18); *Macrosiagon* fernaldum* (p. 26); California, type in U. S. Nation. Mus.; *M. octomaculatum* v. maritimum (p. 33), Alabama, type in American Mus. Natural Hist.; *M. cruentum* v. horni (p. 36) (first described by Horn as *Rhipiphorus cruentum* var.); *M. limbatum* v. pulchrum (p. 38), North Carolina, type in Acad. Natural Sci., Philadelphia; *Rhipiphorus* calopterus* (p. 45), Maine, in Frost coll.; *R.* brevipes* (p. 46), Mexico, in Mus. Comp. Zool.; *R.* neomexicanus* (p. 50), New Mexico, in Acad. Nat. Sci.; *R.* nomiae* (p. 51), Alabama, in U. S. N. M.; *R.* aurantus* (p. 55), Texas, in U. S. N. M.; *R.* mutchleri* (p. 57), Nevada, Amer. Mus. Nat. Hist.; *R.* iridescens (p. 60), Texas, in Amer. Mus. Nat. Hist. Bibliography and index are given.

2550. **SAVIO, AUGUSTE.** Notes d'entomologie chinoise. Longicornes du bas Yang-tsé. Genre Exocentrus. *Bull. Univ. Aurore* 1929. 6p. 1 pl.—*E.* zikaweiensis, Shanghai; *E. curtipennis* v. *savioi* Pic, description and biological notes.—*A. P. Jacot.*

2551. **SAVIO, AUGUSTE.** Notes d'entomologie chinoise. Longicornes du bas Yang-tsé. Genre Linda. *Bull. Univ. Aurore* 18. 32-41. 7 fig. 1929.—Descriptions of *Linda atricornis, L. femorata,* and *L. fraterna.*

2552. **SCHWARZER, BERNHARD.** Spolia Mentawiensia. Longicornia. *Treubia* 12(2): 121-128. 1930.—This paper deals with beetles from the islands of Siberut, Sipora, and N. and S. Pagi of the Mentawi group off the west coast of Sumatra, the insect fauna of which is little known. Types of the new spp. are in the Brit. Mus. Prioninae (1), Cerambycinae (7), Lamiinae (54), including PARABYBE (p. 122), near *Bybe*, based on *P.* subfoveolata (p. 122), Siberut; *Orsidis* pleuralis (p. 123) and *Batocera rubus* v. siporensis (p. 123), Sipora; *Ancanthocacia* punctipennis (p. 124); *Cacia* integricornis (p. 124), Siberut; *C.* subfasciata (p. 124), Sipora; *Micromulciber* sumatrensis (p. 125); *Glenea* dorsalis ♂ (p. 126), *G.* cincticornis (p. 126), and *G.* longitarsis (p. 127), all 4 Siberut; *Nupserha* rufopicea ♂ (p. 127), Batu; *Ossonis* mentawensis ♂ (p. 127), Pageh.

2553. **STROHMEYER, GERHARD.** Systematisches und Zoogeographisches über die Cypholobini (Carab. Anthiinae). Ein Beitrag zur Kenntnis der Fauna des afrikanischen Trockenwaldes. *Mitteil. Zool. Mus. Berlin* 14(2): 287-462. 13 maps, 4 pl., 40 fig. 1928.—This tribe includes the genera *Atractonotus, Eccoptoptera, Netrodera,* and *Cypholoba* with the subg. *Microlestia.* The 121 known spp. are reduced to 18, and 226 geographic races are recognized. *Atractonotus, Netrodera,* and *Microlestia* are not included in the study, being too little known. The phylogenetic treatment is based on the degree of evolution of the elytra, prothorax, and head. There may be distinguished 70 areas of dry woods, each with typical geographic races. An analytical key is given, and a bibliography. The following are from N. Africa, Belgian Congo, equatorial Africa, Rhodesia, Cape of Good Hope, and S. Africa; and type depositories are indicated as follows: H=Hamburg, B=Berlin, M=Methner, S=Stettin. *Cypholoba gracilis* ssp. schirensis* (p. 304) (H); *C. g.* ssp. ngona* (p. 304) (B); *C. g.* ssp. heha* (p. 305) (M); *C. g.* ssp. pangwana* (p. 305) (B); *C. g.* ssp. kiwirana* (p. 306) (B); *C. g.* ssp. njikana* (p. 306) (B); *C. g.* ssp. fipana* (p. 306) (M); *C. g.* ssp. vicina* (p. 307) (H); *C. g.* ssp. kondoana* (p. 307) (H); *C. g.* ssp. bulungwana* (p. 308) (S); *C. g.* ssp. banghaasi* (p. 308) (B); *C. g.* ssp. errata* (p. 308) (B); *C. g.* ssp. bemba* (p. 309) (B); *C. g.* ssp. crampelina* (p. 310) (B); *C. g.* ssp. hemiraphis* (p. 310) (B); *C. g.* ssp. ochthodysma (p. 311) (B); *C. g.*

Paris; *A.* bicornis (p. 164), type in Brit. Mus.; *A.* cardoni (p. 166); *A.* lestagei ♂ (p. 167); *A.* malloti (p. 168); *Habroloma* gardneri (p. 170); *Trachys* ipomeaea (p. 171).

2559. THÉRY, A. Description d'un Buprestide de Sicile. *Boll. Soc. Ent. Ital.* 62(9): 175-176. 1930.—*Agrilus* verres (p. 175), Sicily, type in author's coll.

2560. THÉRY, ANDRÉ. Le genre Paratrachys Saunders. *Compt. Rend. Assoc. Franç. Avanc. Sci.* 49: 429-432. 1925(1926).—Critical notes on the genus. The author, having examined 144 specimens, concludes that *P. fisheri* is not specifically distinct from *P. kannegieteri,* both being races of the same sp., one from the Philippines, the other from Sumatra. The author restores to validity and claims priority for his *P. bicincta,* which was sunk by Obenberger under *P. bakeri* Obenb.

2561. ULRICH, WERNER. Die Strepsipteren-Männchen als Insekten mit Halteren an Stelle der Vorderflügel. *Zeitschr. Wiss. Biol. Abt. A., Zeitschr. Morph. u. Ökol. Tiere* 17(3): 552-624. 1 pl. 29 fig. 1930.—The anterior wings of the ♂ stylops are flat, striated, body appendages with a characteristic basal and terminal club. On the anterior aspect they resemble the halteres of the Diptera. Laterally they are much deeper than wings and serve as locomotor organs in the narrow sense of the word. They arise in the membranous, lateral impression of the mesothorax in such a manner that the principal movement of the wings is guaranteed an extraordinary flexibility. They cannot be laterally adjacent to the body, nor be inclined, but stand, in a position of rest, horizontal to the body. The movement of the anterior wings is, in contrast to the extensive flexibility of the hind wings, reduced to a simple upward and backward movement, which is executed with enormous difficulty. The front and hind wings can be moved independently. Both wings possess certain muscles independent of one another which are arranged segmentally. The completely different structure of the meso- and metathorax produces different mechanics of wing movement in both thoracic segments. The front wing is to be considered as a flat, sac-shaped outgrowth of the lateral body wall. The central cavity which fills with blood consists of a lumen of the end-knob, a lumen of the basal swelling and a canal extending along the anterior edge. With the exception of the end knob, the lumina are clothed with an epidermis. The dorsal and ventral layers are held together in the posterior, flatly developed wing parts by an epidermal thread-like bridge. A peculiar end club web ("Endkolbengewebe") occurs in the terminal club which forms a wall and apparently is not a true web but a web-like appearance. The anterior wings are consequently, in the physical sense of the word, true halteres which consist of a light axis and a heavy end knob on the free end of the axis. The front wing is richly supplied with sense organs. A multitude of sensory setae occur on the end knob. A great number of cuticular sense organs occur

in the basal enlargement, lying in a dorsal and a ventral sense-cup field. Chordotonal organs are probably present in the basal swelling. The sense organs of the front wings are innervated by a lateral nerve of the mesothoracic ganglion. The mesothoracic wing nerve is stronger than the metathoracic wing nerve arising in the metathoracic ganglion. The front wings are organs of sense and irritation, which for the conditions of flight are of definite significance. On the basis of the foregoing anatomical and physiological study it is deemed proved that the forewings of ♂ Strepsiptera are typical halteres. Halteres are commonly considered as modified insect wings, which in insects have reached a development where they can employ the 1st as well as the 2nd pair of wings.—*W. Ulrich (transl. by W. P. Hayes).*

Rostock* 2: 125-148. 1927/29(1930).—An annotated list containing: (Diptera, Agromyzidae) *Phytomyza hellebori* ssp. buhri Hering (p. 128), from *Anemone hortensis* L., and *P.* phillyreae Her. (p. 132), from *Phillyrea media* L.

2570. **CARDAMATIS, J. P.** Les espèces de moustiques en Grèce et tout particulièrement d'Athènes. *Bull. Soc. Path. Exotique* 24(2): 122-131. 4 fig. 1931.—Enumeration of spp. and comparative description of characters, particularly those of *Pyretophorus atheniensis* (Cardamatis, 1930).

2571. **CAVANAUGH, WILLIAM J., and JOSEPHINE E. TILDEN.** Algal food, feeding and case-building habits of the larvae of the midge fly, Tanytarsus dissimilis. *Ecology* [*Brooklyn*] 11(2): 281-287. 3 pl. 1930.—The larva of this midge feeds entirely upon minute forms of algae growing attached to the substratum. The older larvae make their cases of algae, connecting them with a secretion from the salivary glands. The same spp. of algae serve for both food and case making. Pupation takes place in the larval case.—*O. A. Johannsen.*

2572. **COLLIN, J. E.** Some species of the genus Meoneura (Diptera). *Ent. Month. Mag.* 66(791): 82-89. 1 pl. 1930.—A key is presented for identification of the 10 British and 1 French spp. known to the author. Of these the following are new, and all but the first are from England: *M.* exigua* (p. 84), France; *M.* flavifacies* (p. 85); *M.* lamellata* (p. 86); *M.* neottiophila* (p. 87), bred from birds' nests; *M.* bicuspidata* (p. 88); *M.* triangularis* (p. 88); *M.* neglecta* ♂ (p. 88).—*H. M. Gilkey.*

2573. **DAVIES, W. MALDWYN.** Parasitism in relation to pupation in Lucilia sericata Meig. *Nature* [*London*] 125(3160): 779-780. 1930.—Live sheep attacked by larvae of *Lucilia sericata* offer no attraction for ovipositing ♀♀ of its parasite, *Alysia manducator,* and thus the larvae in this environment escape the attacks of the parasite.

2574. **DOLLEY, WILLIAM L. Jr., and HENRY G. HAINES.** An entomological sheep in wolf's clothing. *Sci. Monthly* 31(6): 508-516. 3 fig. 1930.—The cosmopolitan drone fly *Eristalis tenax**, which closely resembles the honey bee, has a record dating back to the Bible. The author describes its life history, quoting details from many workers. It was first noticed in the United States in 1870.

2575. **DUDA, O.** Die Ausbeute der deutschen Chaco-Expedition 1925-26 (Diptera). VI. Sepsidae, VII. Piophilidae, VIII. Cypselidae, IX. Drosophilidae und X. Chloropidae. *Konowia* 8(1): 33-50. 7 fig. 1929.—Two spp. of Sepsidae are recorded, 1 from Bolivia and 1 from Argentina. *Piophila casei* L. is recorded from Bolivia and Argentina. 13 spp. of Cypselidae (=Borboridae) are recorded from Paraguay, Bolivia, and Argentina, including: *Scotophilella* caudata* (p. 35); *Coprophila* setulosa (p. 38); *Archileptocera,* n. subg. PALAEOCEROPTERA (p. 41), with *A.* (*P.*) boliviensis* (p. 39); *Scotophilella* analis* (*S. paramoesta* Duda) (p. 36). The following new spp. of Drosophilidae are described: *Rhinoleucophenga* punctulata (p. 43); *R.* subradiata (p. 45); *R. stigma* v. flaviceps (p. 46); *Leucophenga* conjuncta* (p. 47). There is a key to 4 spp. and 1 var. of *Rhinoleucophenga* and to 4 spp. of *Leucophenga. Scaptomyza graminum* Fall. (=*Parascaptomyza disticha* Duda); *Drosophila nebulosa* Strtvnt. (=*limbata* Will. nec *limbata* v. Ros.).—*C. E. Mickel.*

2576. **EDWARDS, F. W.** New neotropical Nematocerous Diptera. *Ann. and Mag. Nat. Hist.* 7(39): 255-261. 1931.—Types of the following spp. are in the Brit. Mus. *Macrocera* unidens ♂ (p. 255); *Platyura* (*Isoneuromyia*) xanthocera ♀ (p. 256) and *P.* (*Lapyruta* ?) batesi ♀ (p. 256), Para; *Eudicrana* vittata ♀ (p. 257), *E.* claripennis ♀ (p. 258), *Mycomyia* peruviana ♀ (p. 258), *Leiella* zonalis ♀ (p. 259), and *Rhymosia*

pilosa ♀ (p. 259), all 5 Peru; *Plecia* **pictipennis** (p. 260) and *P.* **nitidicollis** (p. 260), Parana; *Dixa* (*Paradixa*) **peruviana** ♂ (p. 266), Peru.

2577. **EDWARDS, F. W. British non-biting midges (Diptera, Chironomidae).** *Trans. Ent. Soc. London* 77 (2): 279-430. 3 pl., 15 fig. 1929.—A synopsis of the British spp., with keys to the genera and species. Most of the species of Walker, originally described under the genus *Chironomus,* have been properly referred to modern genera. In quoting synonymy the author omits the generic name under which the synonym was published. Several generic names are replaced by those of Philippi. The chief characters used in specific diagnosis are described. There are descriptions and discussions, synonymies, and new spp., as follows: *Pentaneura* Phil. (=*Ablabesmyia* Joh., *Isoplastus* Skuse, *Peritaphreuusa* Beck., *Nilotanypus* Kieff.); *P.* **guttipennis** (v.d.W.) n. comb. (p. 289), *P.* **lentiginosa** (Fries) n. comb. (p. 290); *P.* **eximia** ♀* (Verrall i. l.) (p. 290), Great Britain; *P.* **ornata** (Mg.) n. comb. (p. 290), *P.* **maculipennis** (Zett.) n. comb. (p. 290) (=*costalis* Kieff., *subincurvatus* Goet.); *P.* **fusciceps** ♂* (p. 290), Great Britain: *P.* **carnea** (Fab.) n. comb. (p. 291) (=*incurvatus* Goet.); *P.* **hirtimanus** (Kieff.) n. comb. (p. 291); *P.* **northumbrica*** (p. 291), Great Britain; *P.* **nubila** (Mg.) n. comb. (p. 291) (=*dubius* Staeg., nec Mg., *carneus* Goet. nec Fab.); *P.* **pallidula** (Mg.) n. comb. 2578. GRAHAM-SMITH, G. S. Further observations on the anatomy and function of the proboscis of the blow-fly, Calliphora erythrocephala L. *Parasitology* 22 (1): 47-115. 4 pl. (1 col.), 36 fig. 1930.—Detailed investigations of the anatomy and function of the proboscis, with notes on the modes of feeding and distribution of infection, are given. Flies are able to filter out the larger particles of their liquid food, ingest emulsions produced by scraping surfaces, moistened with saliva or vomit, with their prestomal teeth, or are able to suck up such thick liquids as sputum of faeces containing haemolymph ova without the use of their filtering apparatus or teeth. Pathogens taken into the crop retain their virility for several days, during which time the labella is frequently reinfected. Infection may occur by the vomit, by contact with the oral disc, or by the disposition of faeces. Intradermal infection is brought about by the prestomal teeth moistened with infected vomit.—*M. H. Doner*.

2579. HARDY, G. H. Notes on the identity of described Australian flies of the genus Cerdistus (Asilidae). *Proc. Linnean Soc. New South Wales* 54(2): 80-88. 2 fig. 1929.—Attention is drawn to the probable error made by Macquart in crediting 140 spp. of Diptera to Tasmania, and in applying the view expressed in a previous paper to the genus *Cerdistus;* and several taxonomic changes are suggested. *Cerdistus* **fuscipennis** (*Erax f.* Macq.,=*Erax asiloides* Macq., *Cerdistus constrictus* Hardy) (p. 81); *C.* **maculatus** (*Neoitamus m.* White,=*Machimus forrestii* Dakin & Fordham) (p. 82); *C. margitis* Walk. (=*Asilus nigrinus* Macq., *Cerdistus australis* Ric.); *C. maricus* Walk. (=? *Asilus australis* Macq.); *C. gibbonsi* Ric. (=*Neoitamus vulgatus* var. White); *Rhabdotoitamus* White (p. 83), a color group of *Cerdistus*, is revised with a key to include *Cerdistus* **vittipes** (*Asilus v.* Walker,=*Neoitamus vittipes* Hardy) (p. 84); *C.* **volaticus** (*Rhabdotoitamus v.* White,=? *Asilus varifemoratus* Macq.=*Neoitamus graminis* var. White) (p. 85); *C.* **mistipes** (*Asilus m.* Macq. not Ric., =*Rhabdotoitamus claripes* White) (p. 86); *C.* **cognatus** (*Asilus c.* Macq.,=*Neoitamus neoclaripes* Hardy) (p.

87). A synonymic list of Tasmanian spp. of *Cerdistus* is given and notes on the Gibbons collection of *Cerdistus* in the Australian Mus.—*G. H. Hardy.*

2580. HARDY, G. H. Revisional notes on the tribe Brachyrrhopalini (robber flies), with remarks on habits and mimicry. *Proc. Roy. Soc. Queensland* 41: 59-72. 1929(1930).—Key to genera. *Asilus conopsoides* Fab. is possibly *Codula limbipennis* Macq.; *Brachyrrhopala,* key to species; *Dasypogon nigrinus* Macq. is possibly *Brachyrrhopala quadricincta* Big.; *Brachyrrhopala* **semirufa** (p. 65), Queensland; *Chrysopogon,* key to species; *Opseostlengis insignis* White, type a ♂ not ♀, as recorded. In observations on habits and mimicry it is suggested that some forms may have adapted habits away from the normal of the family, tribe, or genus to which they belong, and if by so doing they have added to their chance of survival, views on mimicry among robber-flies could be more certainly established. The habits of various tribes in Australia are discussed, and the habits of *Erethropogon limbipennis* seem to indicate a good example of possible contrast in so far as it is one of the so-called mimic species, frequents flowering shrubs, and is not known to be predaceous. Moreover its habits and deportment on flowers are like the cerambycid beetle *Hesthesis ?cingulata* with which it occurs.—*G. H. Hardy.*

2581. HARNLY, MORRIS HENRY. A critical temperature for lengthening of the vestigial wings of Drosophila melanogaster with sexually dimorphic effects. *Jour. Exp. Zool.* 56(3): 363-368. 1 fig. 1930.—Six temperatures were used in these experiments extending through a range of 13°, one-degree intervals being used in the critical part of the range. The variation within any incubator was ±0.05°C. Measurements were made of the right wings of the emerging vestigial flies. Over a range of 11° there was no significant lengthening of the wings. An increase of 1° beyond that point caused a marked lengthening of the wings of the ♂ flies. This change in wing length occurred at a temperature of 1° higher for the ♀♀ than for the ♂♂. An increase of 2° beyond the critical point caused additional morphological changes in the ♂ flies.—*Author (courtesy Wistar Bibl. Serv.).*

2582. HENDEL, FRIEDRICH. Trypetidae. In: ERWIN LINDNER—Die Fliegen der palaearktischen Region. No. 16, 17, 18 & 19. pp. 1-221. 17 pl., 79 fig. Schweizerbart'sche Verlagsbuchhandl.: Stuttgart, 1927.—The larval stages of some of these flies are injurious to cultivated fruits, especially in tropical regions. The morphology, larval development, classification, and distribution of the family are discussed, and a list of food plants of the various species is given. There are keys to subfamilies, tribes, genera, subgenera, and species. *Dacus* (*Leptoxyda*) **persicus** (p. 29), Persian Baluchistan [type depository not given]; *Euribia* **manni** (p. 45), Austria, type in Mus. Wien; **GONIOXYNA** (p. 160), type *G.* **magniceps*** ♂ (p. 161), Mongolia, type in Hamburg Mus.; *Actinoptera* **meigeni*** ♂ (p. 163), France, type in Mus. Wien; *A.* **tatarica*** ♀ (p. 163), Mongolia, type in Hamburg Mus.; *Oxyna* **amurensis** (p. 166), Amur, type in Mus. Wien; *Euaresta* **sinensis** ♀ (p. 173), China; **EUARESTELLA** (p. 174), type *E.* **megacephala** (Loew), n. comb. (p. 174); *Tephritis* **cornupuncta*** (p. 185), Austria and Spain [depository not given]; *T.* **crepidis** (p. 186), central Europe and Triest [depository not given]; *T.* **frauenfeldi*** (p. 187), Austria, Roumania, and Albania [depository not given]; *T.* **heliophila*** ♀ (p. 188), Germany and Austria, type in Hamburg Mus.; *T.* **kukunoria*** ♀ (p. 189) and *T.* **mongolica*** ♂ (p. 191), Mongolia, types in Hamburg Mus.; *T.* **oedipus*** n. n. for *Urellia cribrata* Beck (p. 192); *T. valida* Loew (=*T. procera* Loew,=*T. subvalida* Portsch. ♀); *T.* **zernyi*** (p. 197), south and central Europe and N. Africa; **GONIURELLIA** n. subg. of *Trypanea* (p. 199), type *T. augur* Frfld.; *T.* (*G.*) **ensina*** (p. 200), Egypt; **TEPHRITOMYIA** n. subg. of *Acanthiophilus* (p. 202), type *A. lauta* Loew; **PARACANTHELLA** (p. 205), type *P.* **pavonina*** (Portsch.), n. comb. (p. 205); **PARACARPHOTRICHA** (p. 208), near *Ditricha,* type *P.* **alpestris** (Pokorny), n. comb. (p. 209). Unless otherwise stated, types are in U. S. Nation. Mus. An index to subfamilies, tribes, genera, and species with their synonyms, concludes the paper.

2583. HENDEL, FRIEDRICH. Neue oder weniger bekannte Bohrfliegen (Trypetidae) meist aus dem Deutschen Entomologischen Institut Berlin-Dahlem. *Ent. Mitteil.* 17(5): 341-370. 1928.—The following are described: **AETHIOTHEMARA** (p. 354) with *A.* **fallacivena** (Enderl.), n. comb. as type; **CERATITOIDES** (p. 365), type *C.* **nigromaculata** (p. 366), British Uganda; **PRISTACIURA** (p. 366), type *P.* **incisa** (p. 368), Ceylon; **DYSEUARESTA** (p. 368), type *Euaresta adelphica* Hend., including also the spp. *gephyrae, mexicana,* and *melanogastra; D.* **apicalis** (p. 368), Bolivia; **TETREUARESTA** (p. 368), type *Euaresta obscuriventris* Lw., including also the spp. *phthonera, ellipa, myrtis, spectabilis* and the genus *Acinia; Dacus* (*Chaetodacus*) **australis** (p. 341), N. Australia; *D. australis* v. **halterata** (p. 342), Queensland; *D.* (*Zeugodacus*) **quadrifidus** (p. 343), Ceylon; *D.* (*Dacus*) **clinophlebs** (p. 344), E. Africa; *D.* (*D.*) **triangulifer** (p. 344), *D.* (*D.*) **furcatus** (p. 345), *D.* (*D.*) **zimmermanni** (p. 346), and *D.* (*D.*) **rubiginosus** (p. 347), all 4 from Amani, E. Africa; *Coelopacidia* **apicalis** (p. 349), E. Africa, type in author's coll.; *C.* **carinata** (p. 349), E. Africa; *Rioxa* (*Dirioxa*) **testacea** (p. 352), Queensland; *Hexacinia* **stigmatoptera** (p. 353), Philippines, type in the U. S. Nation. Mus.; *Aethiothemara* **trigona** (p. 357), Cameroons, type in author's coll.; *A.* **striata** (p. 357), Uganda; *A.* **graueri** (p. 358), Urwald Moera; *A.* **transiens** (p. 358), Fernando Po,

type in author's coll.; *Acanthoneura* **australina** (p. 359), Queensland; *A. acidiomorpha* (p. 360), New South Wales, type in U. S. Nat. Mus.; *Callistomyia* **horni** (p. 361), W. Australia; *Euphranta* **minor** (p. 362), N. Australia; *E.* **conjuncta** (p. 361), Ceylon; *Strobelia* **ferruginea** (p. 369), Argentina. There are notes on other genera and spp. A key is given to 5 spp. of *Coelopacidia* End., to the 4 genera associated with *Aethiothermara*, and to the 6 spp. of the latter genus. Unless otherwise mentioned, types are in Deutsches Ent. Inst.—*C. E. Mickel.*

2584. JOBLING, B. A revision of the genus Raymondia Frauenfeld (Diptera, Pupipara, Streblidae). *Parasitology* 22(3): 283-301. 10 fig. 1930.—The author discusses the technique of preparing specimens and the general morphology of the genus. A key is given to the 6 spp. and subspp., of which 3 are described as new. The previously known spp. are redescribed and figured, and records of localities and hosts are given. *R.* **planiceps*** ♀ (p. 290), Brit. E. Africa, *R.* **quadriceps*** (p. 295), Brit. Somaliland, and *R. huberi* **setosa*** ♂ (p. 301), Aden, hosts of all 3 spp. being bats. Types in Brit. Mus.

2585. KARL, O. Zweiflügler oder Diptera. III. Muscidae. In: **Friedrich Dahl's Die Tierwelt Deutschlands.** 13: 232pp. 114 fig. Gustav Fischer: Jena, 1928.—The family Muscidae is divided into 6 subfamilies with a key for the German forms. The subfamilies comprise the Muscinae, including the tribes Muscini and Stomoxydini; Phaoniinae including the tribes Phaoniini, Hydrotaeini, and Fanniini; Eginiinae; Mydaeinae including the tribes Azeliini, Mydaeini, and Limophorini; Anthomyinae with the tribes Anthomyini and Fucellini; and Coenosiinae with the tribes Chelisiini and Coenosiini. The author changes the arrangement of genera and species from that of former authors by placing the species of *Pegomyia* with long setaceous antennae under the genus *Pegomyza* Schnb.; the genus *Hylemyia* R.D. contains only the spp. with feathered bristles on the antennae. *Pycnoglossa* Coqu. (=*Pogonomyza* Schnb.); spp. of the genus *Hylemyia* with pubescent antennae are incorporated into the genus *Chortophila* Mcq.; *Opsolasia* Coqu. (=*Lasiomma* Stein.); **CRINURINA** (p. 185), type *C.* **pictiventris** (*Chortophila p.* Zett.) (p. 185). *Adia* R.D. is removed from the *sepia*-group of Meigen in which the only species, *A. oralis* R.D., does not belong. The name *Phorbia* R.D. is used as the genus name for this group. The remaining species of *Chortophila* are distributed among 7 subgenera. Some members of the genus *Mydaea* R.D. have been placed in the genus *Helina* R.D. A systematic and an alphabetical list of genera and spp. concludes the monograph. Other new forms are: **CHORTOPHILINA** n. gen. (p. 203), based on *C.* **fallax*** (Löw.) n. comb.; n. subgenera of *Chortophila* Mcq. are **FLAVENA** (p. 147); **TRICHARIA** (p. 160); **THRIXINA** (p. 165), with *C.* (*T.*) **laricicola*** (p. 169); and **NUDARIA** (p. 171), type *C.* (*N.*) **nigrifrons** (p. 171); *C.* (*N.*) **lineatula** (p. 173); also *C.* (*N.*) **brevicauda** (p. 173); *Hydrotaea* **nidicola** (p. 42); *Fannia* **spinosa** (p. 61); *Pegomyia* **trigonalis*** (p. 140); *Chortophila* (*Egeria*) **trilineata** (p. 152).—*C. Zeimet.*

2586. KRÖBER, O. Die Tabanidengattung Sackenimyia Big. *Zool. Anz.* 90(1/2): 1-12. 6 fig. 1930.—A key to the spp. and references to the literature are given. The treatment of about 10 spp. includes citation of the type, description, and distributional records. *Sackenimyia* **ornata*** ♀ (p. 6), Minas Geraes, Brazil, type in Halle.

2587. LANDROCK, KARL. Revision der Siebert'schen Pilzmückensammlung im Deutschen entomolog. Institut, Berlin-Dahlem (Dipt.). *Stettiner Ent. Zeit.* 91(2): 252-260. 1 pl. 1930.—In addition to brief notes on a number of spp., there are more extended notes on: *Macrocera fascipennis**; *Zelmira ochracea* v. *humeralis**; *Mycomyia circumdata**; *M.* **sieberti*** ♂ (p. 255), E. Baltic; *Neoempheria winnertzi**, ♀ described; *Gnoriste bilineata**; *Leia borealis**; *Exechia nitidicollis*, ♀ described; *Brachypeza obscura*, ♀ described; *Dynatosoma thoracicum* (p. 258), ♀ described.—*K. Landrock (transl. by F. J. Wenninger).*

2588. LINDNER, ERWIN. Über einige ägyptische Strationmyiden (Dipt.). *Bull. Soc. Roy. Ent. d'Egypte* 14(1): 25-29. 3 fig. 1930.—Descriptions of 4 spp., including: *Stratiomyia segnis** f. **deserticolor** (p. 25); *Eulalia xanthopus**, ♀ described for the 1st time; *Nemotelus punctiventris* Beck. (=*Brachystomus aegyptiacus* Lind.); *Aspidacantha atra*, new to the Palaearctic region.

2589. MALLOCH, J. R. Notes on Australian Diptera. XX and XXI. *Proc. Linnean Soc. New S. Wales* 54(4): 283-343. 34 fig.; 408-410. 7 fig. 1929.—Part XX contains notes on Calyptrate Diptera and makes a final contribution on *Rutilia*. *Helina howei*, descriptive notes on ♀; *Hyalomyia* **costalis** ♂ (p. 284), N. S. Wales, reared from *Dysdercus sidae* [type depository not given]; *Amenia* **nigromaculata** ♂ (p. 286), W. Australia, type in coll. of I. M. Mackerras; *Microtropeza*, key to spp., including *M.* **latimana*** ♀ (p. 287), Queensland; *M.* **ochriventris*** ♀ (p. 287), on *Leptospermum*, N. S. Wales, type apparently in Mackerras' coll.; *M.* **flavitarsis** ♂ (p. 288), Tasmania; tribe Cylindromyiini, extent and contents indicated; *Cylindromyia* Meigen (=*Ocypteropsis* Towns.); *Cylindromyia*, emended description; *C. flavifrons*, described; *Prodiaphania* **georgei*** ♂ (p. 292) and *P. testacea* v. **claripennis*** (p. 292), W. Australia; *Rutilia leucosticta* Schiner (=*R. albopicta* Thompson). Macquart's *assimilis* belongs, not to *Rutilia*, but to *Paramphibolia* B. & B., of which it is the genotype. *Rutilia formosa* v. **subvittata** (p. 295), W. Australia. *R. vivipara*, brief description; *R.* **micropalpis** ♀ (p. 298) and *R.* **micans** ♀ (p. 299), New S. Wales. Key for the 13 species of Group II; *R. inornata*, note on ♂; *R. ethoda*, ♀ described; *R.* **dubitata** (p. 303), N. S. Wales; *R. potina*, described; *Rutilia* subgen. *Senostoma*, key to spp.; *R.* (*S.*) **hirticeps** ♂ (p. 305), and *R.* (*S.*) **nigriceps** ♂ (p. 306), N. S. Wales; *R.* (*S.*) **albovirida** ♀ (p. 307), Queensland; *Chrysopasta* **zabrina** (*Rutilia z.* Walker,=*C. versicolor* B. & B.) (p. 307); *Formosia*, key to spp.; *F.* **confusa** (p. 309), S. Australia [type dep. not clear]; *F.* **frontosa** ♂ (p. 310), N. S. W.; *F.* **smaragdina** (p. 312), N. Queensland; *Paramphibolia assimilis**, ♂ described; **CHAETOGASTRINA** (p. 313), similar to *Paramphibolia*, type *C.* **stolida*** ♂ (p. 313), N. S. W.; key distinguishing *Paramphibolia*, *Amphibolia*, and *Chaetogastrina*. The following are illustrated: *R. splendida* ♂, *R. pellucens*, *R. erichsoni* ♂, *R. micans* ♂, *R. regalis* ♂, *R. inornata* ♂, *R. ruficornis*, and *Formosia atribasis*. The author attributes to Dexiini a tribal rank rather than that of a family or subfamily. Tribe Linnaemyiini, key distinguishing *Linnaemyia*, *Chaetophthalmus*, and *Apalpus*; *Linnaemyia bicolor** ♂, described; **APALPUS** (p. 318), near *Peleteria*, type *A.* **dorsalis*** ♀ (p. 318), W. Australia, type in Mackerras' coll.; *Chaetophthalmus brevigaster**, described; **QUADRA** (p. 320), in Tachinini, near *Gonia*, type *Q.* **ornata*** ♀ (p. 320), W. Australia; **ZEBROMYIA** (p. 321), near *Gonia*, type *Z.* **obesa*** ♂ (p. 321), Tasmania; **ARRHENOMYZA** (p. 322), near *Gonia*, type *A.* **conspicua*** ♂ (p. 322), W. Australia; *Froggattimyia*, *Protomeigenia*, and *Gonia*, brief notes; *Chlorotachina* (=*Chlorodexia* Towns.), key to 3 spp., including *C.* **nigrocaerulea*** (p. 324), W. Australia; **MACROCHLORIA** (p. 326), resembling *Calliphora*, type *M.* **calliphorosoma*** (p. 326), N. S. W.; **PHOROCEROSOMA** (p. 327), related to *Madremyia* and *Murdockiana*, type *P.* **setiventris*** ♂ (p. 327), Queensland; **HILLIA** (p. 328), near *Phorocera*, type *H.* **polita*** ♀ (p. 328), N. Australia; discussion of *Phorocera*; *Sturmia elzneri*, described; *Sturmia* R.D. (=*Ugimeigenia* Towns.); *Thrycolyga* Rondani (=*Podotachina* B. & B.,=*Neoscotia* Towns.); *Thrycolyga sorbillans**, brief note; *Actia* **darwini** ♂ (p. 334), N. Australia. Synoptic treatment of the genera of Australian and New Zealand Tachinidae, including *Gymnosoma*, *Calcageria*, *Calcager*, *Dexia*, *Peremptor*, *Nemoraea*, *Demoticus*, *Protohystricia*, and *Gonia*. Notes on New Zealand genera include: **PROTOHYSTRICIA** (p. 341), resembling *Winthemia*, type *P.* **pachyprocta** (*Hystricia p.* Nowicki) (p. 342); *Calcageria* Curran (=*Opso-*

phagus Aldrich). Unless otherwise mentioned, types are in the Australian Mus. Part XXI. Asilidae. The author has examined all the Australian material available in U. S. Nation. Mus. and briefly discusses: *Ommatius chinensis*, O. distinctus**, and *O. queenslandi*; O.* flavicaudus* (p. 409), N. Queensland, type in U. S. Nation. Mus.

2590. **PARENT, O. Les espèces paléarctiques du genre Hercostomus LW.** *Ann. Soc. Ent. France* 96(3/4): 209-231. 1 fig. 1927.—Contains extensive key to ♂♂ and ♀♀ and description of: *H.* **phoebus*** (p. 230), Angora.

2591. **PARENT, O. Description d'un Diptère nouveau.** *Ann. Soc. Ent. France* 96(3/4): 232. 1927.—*Oligochaetus* arrogans from Italy, type in coll. V. Roder.

2592. **ROOK, H. de, and R. SOESILO. Anopheles (Bironella) papuae.** *Mededeel. Dienst Volksgezondheid Nederlandsch-Indië* 19(2): 213-218. 6 fig. 1930.—The larva, ♂ and ♀, is described, the authors stating that it has characters in common with *A. bironelli* and *A. travestitus* Brug and that these 3 *Anopheles* should be considered one group, the *Bironella* group. In 1920 Swellengrebel described the larva of *Stethomyia aitkeni* v. *papuae* from the south-coast of west New Guinea. This larva, it is found, differs from that of *S. aitkeni*, but does possess all the characteristics of the larva found by the authors; accordingly, it is very probable that Swellengrebel dealt with the above-mentioned form. Upon rearing, the larva proved to be an *Anopheles*. The authors propose for it the name *Anopheles* (*Bironella*) papuae (p. 217).

2593. **SCHMIDT, M. Vorkommen von Tipula czizeki de Jong in den Provinzen Brandenburg und Sachsen.** *Zeitschr. Wiss. Insektenbiol.* 25(8/9): 168. 1930.—First record for Germany.

2594. **SÉGUY, E. Description d'un nouveau calliphorine.** *Ann. Soc. Ent. France* 97(1/2): 152. 1928.—*Rhynchomyia* **ursina** ♂ from the Atlantic coast, Sahara.

2595. **STUDY, E. Über einige mimetische Fliegen.** *Zool. Jahrb. Abt. Allgen. Zool. u. Physiol. Tiere* 42(4): 421-427. 2 col. pl. 1926.—Three mimetic robberflies, of the family Asilidae, are figured, each with its dead prey, its model. Two other examples of wasp-mimicry are cited. One n. sp. is described, *Systropus* **studyi*** Enderlein (p. 426), So. China.—*E. Study.*

2596. **TOKUNAGA, MASAAKI. The morphological and biological studies on a new marine cranefly, Limonia (Dicranomyia) monostromia, from Japan.** *Mem. Coll. Agric. Kyoto Imp. Univ.* 10: 93p. 17 pl. 1930.—*L.* **monostromia*** (p. 58) (types in author's coll.) was collected in a biological survey at Seto beach, Wakayama Prefecture, central Japan. The morphology, especially external (mouth parts and head of larva and adult, wing venation, legs, thorax, abdomen, etc.), of this sp. in all stages of development is fully described and figured. Musculature of the larva is also described. Variation of wing venation of both sexes is found in the veins surrounding the median cell. Variation curves of number of teeth in claw, show a sexual difference. Secondary sexual character is distinct in the structure of the last tarsal segment. This cranefly emerges in spring and is evidently single brooded. The relation between the stages of life history and the condition of the food alga, *Monostroma* sp., is shown in a diagram. Diurnal haunts are rock caves on the seashore. Breeding place is rocky shore, where eggs are laid and larvae feed exclusively on *Monostroma* alga in situ. Laboratory experiments on respiratory behavior were carried out. Observations of other habits—feeding, resting, oviposition, emergence, photic behavior, swarming and mating—are reported in detail. The biological relations between the food algae and various natural enemies—*Miniopterus* bat, birds, fish, predaceous insects and mites, parasitic mites, etc.—are shown diagrammatically. The biological complex of seashore insects associated with this cranefly, the tidal rhythm, and daily and spatial change in habitats, are also discussed and diagrammed. An extensive bibliography is appended.—*M. Tokunaga.*

2597. **VIMMER, ANT. Appareil trachéen des larves des Schizophores (Diptères).** *Acad. Tchèque Sci. Bull. Internat. Cl. Sci. Mat. Nat. et Méd.* 27: 545-549. 1 fig. 1926.—This account gives in detail the tracheal "innervation" of various organs (pharynx, esophagus, proventriculus, ventriculus, intestine, rectum, heart, salivary glands, and many others) of many spp. The topography of the tracheary systems in these larvae is described in detail.

2598. **VOGEL, R. Beobachtungen über blutsaugende Zweiflügler im Kanton Tessin [Switzerland].** *Zool. Anz.* 93(1/2): 1-3. 1931.—*Atrichopogon infuscus,* previously known only from Belgium and Austria, was found on the wing of *Stauropus fagi* [Lepidoptera], where it was probably feeding on blood or some secretion. Ecological notes are given on *Anopheles bifurcatus, Culex hortensis, Finlaya geniculata,* and *Phlebotomus papatasi.*

HEMIPTERA AND HOMOPTERA

HEMIPTERA

2599. **KNIGHT, HARRY H. Rectifications for Blatchley's "Heteroptera" with the description of a new species (Hemiptera).** *Bull. Brooklyn Ent. Soc.* 24(3): 143-154. 1929.—Comparison of types is made and discussion of synonymy of: *Eustictus filicornis* (Walk.); *Labops hirtus* Kngt.; *Barberiella apicalis* Kngt.; *Pilophorus strobicola* Kngt.; *Dicyphus vestitus* Uhl.; *D. gracilentus* Parsh.; and *Sixeonotus insignis* Reut. Complete specimen data are given for 81 spp. of Miridae which are said to be recorded incorrectly by Blatchley. *Sixeonotus* **recurvatus** (p. 153), District of Columbia, type in author's coll.—*H. H. Knight.*

HOMOPTERA

2600. **DeLONG, D. M., and J. P. SLEESMAN. New genera and subgenera from the genus Deltocephalus. A study of the internal male genitalia of the American species and their bearing upon taxonomy.** *Ann. Ent. Soc. Amer.* 22(1): 81-114. 9 pl. 1929.—Genera of Cicadellidae like *Thamnotettix, Euscelis,* and *Lonatura* are more closely related to the different subgenera of *Deltocephalus* than some of the subgenera are to each other; and those subgenera are therefore now treated as genera. **SECOPENNIS** n. subgen. (p. 85) of *Flexamius,* type *Flexamius* (*S.*) *slossoni;* **PALUS** n. subgen. (p. 95) of *Flexamius,* type *Flexamius* (*P.*) *delector,* all spp. occurring in northern habitats on sedges or coarse grasses of freshwater marshes; **ALAPUS** n. gen. (p. 86) near *Flexamius,* type *A.* **fraternus** (p. 86), n. comb.; **LATALUS** n. gen. (p. 87) near *Flexamius,* type *L.* **sayi** (p. 87), n. comb.; *Flexamius* **surculus*** (p. 99), Texas, type in Osborn coll.; *Latalus ocellaris* v. **sobrinus** (p. 100), Alberta; *Polyamius* **aestuarium** (p. 101), North Carolina, in DeLong coll.; *P.* **montanus*** (p. 101), Montana, type in DeLong coll.; *Laevicephalus* **cicatrix*** (p. 102), Alberta; *L.* **orbiculus*** (p. 103), Wyoming, type in Osborn coll.; *L.* **subrutilus*** (p. 103), North Dakota, type in Osborn coll.; *Deltocephalus* **comesus*** (p. 104), Texas, type in DeLong coll. Interrelationships of the various spp. are discussed under their respective genera. —*M. W. Boesel.*

2601. **JANCKE, O. Über eine neue Eriosoma-Art an Birnenwurzeln. (Vorläufige Mitteilung.)** *Zeitschr. Angewandte Ent.* 17(1): 146-155. 10 fig. 1930.—Biological and

morphological observations on this small bright-yellow plant louse found on pear roots, presumably a n. s., *E.* flavum (p. 155).

2602. **LALLEMAND, V.** Nouveaux Cercopides de la Presqu'île Malaise. *Jour. Fed. Malay States Mus.* 16 (1/2): 98-107. 1 fig. 1930.—This paper is based on material in the Federated Malay States Mus. *Eoscarta* [thus in Corrigenda; *Roscarta* on p. 98] punctata (p. 98); *Notoscarta* malayana (p. 99); *Phymatostetha* pahangana (p. 99); *P. semele* v. limbata (p. 100); *Trichoscarta* pendleburyi (p. 100); *T. p.* var. interrupta (p. 100); *Cosmoscarta* diminuta (p. 101); *Leptataspis* selangorensis (p. 101); *L.* hendersoni (p. 102); *L.* ophirina (p. 102); *Homalostethus* humilis (p. 103); *Opistharsostethus* sexpunctatus (p. 103); *O.* tripunctatus (p. 104); *O.* malayanus (p. 105); *Ectemnonotum* apicale (p. 105); *E.* kedahanum (p. 106); *E.* coruscans (p. 106); GYNOPYGOCARTA* [drawing of the protuberances and posterior side of the mesosternum] (p. 106), resembling *Ectemnonotum* and *Gynopygoplax*, type *G.* butleri (*Cosmoscarta b.* Distant) (p. 107).

2603. **LALLEMAND, V.** Quelques espèces et variétés nouvelles de Cercopides exotiques des collections du Musée Zoologique de Hamburg. [In German.] *Folia Zool. et Hydrobiol.* [*Riga*] 2(2): 164-169. 1931.—List of 14 spp., including: *Homalostethus* luzonensis (p. 165), Philippines, *Cosmoscarta fumosa* v. obscura (p. 165), India, and *Aufidus* wagneri (p. 165), Borneo, types of all 3 in Hamburg Mus.; *Triecphora* fortunata (p. 166), Goyaz, type in author's coll.; *T. xanthospila* v. obliterata (p. 166), Cameroons, type in Hamburg Mus.; *T.* nigripes (p. 167), Cabana, Brazil, and *Sphenorhina hebes* v. rubens (p. 167), Peru, both types in author's coll.; *S. rubra* v. obliterata (p. 167), Colombia, type in Hamburg Mus.; *S. pubescens* v. aequatoriana (p. 167), Ecuador, Sta. Inez, type in author's coll.; *S.* cyanescens (p. 167), Colombia, type in Hamburg Mus., *S.* sericea (p. 168), Rio de Janeiro, type in author's coll.

2604. **MONZEN, KOTA.** Studies on some gall producing aphides and their galls. *Saito Ho-On Kai* (*The Saito Gratitude Foundation*) *Monographs No. 1* 80p. 17 pl. 1929.—A survey of the Japanese gall-producing aphids with synonymy, descriptions or re-descriptions, and illustrations of most of the 42 spp. *Schlechtendalia mimifushi** on *Rhus semi-arata; Nurudeopsis rosea** on *Rhus semi-arata; Mansakia miyabei** on *Hamamelis japonica; M.* kagamii* (p. 12), on *H. japonica; M.* gallifoliae* (p. 14), on *H. japonica; Astegopteryx nekoashi** on *Styrax japonica; A. styraci** on *Styrax obassia; Nipponaphis distychii* on *Distylium racemosum; Hamamelistes shirakabae** on *Betula japonica; Astegopteryx* ? sp.* on *Elsholtzia patrini; Eriosoma lanigerum* on *Malus pumila* v. *domestica; E. japonicum** on *Ulmus japonica; Gobaishia japonica** on *Ulmus* sp.; *Tetraneura yezoensis** on *Ulmus japonica; T. akinire** on *Ulmus japonica; Watabura moriokensis** on *Zerkowa serrata; Pemphigus matsumurai** on *Populus maximowiczii; Pemphigus dorocola** on *Populus maximowiczii; Pemphigus niishimae** on *Populus maximowiczii; Prociphilus pourthiacae** on *Pourthiaca villosa; Prociphilus kuwanai** on *Pirus serotina* v. *culta; Prociphilus sasakii** on *Malus pumila* v. *domestica; Prociphilus nidificus** on *Fraxinus shioji; Phyllaphis fagi** on *Fagus silvestri* and *F. japonica; Brevicoryne brassicae** on *Brassica oleracea* v. *capitata; Hyalopterus* albus* (p. 47), on *Ligusticum acutilobum; Cryptosiphum gallarum** on *Artemisia vulgaris* v. *indica* and *A. japonica; Toxoptera piricola** on *Pirus serotina* v. *culta; Pergandeidia siphonella** on *P. s.* var. *culta; Aphis gossypii** on *Cucumis sativus*, etc.; *Myzus japonica** on *Malus pumila* v. *domestica; Aphis* utsugicola* (p. 54), on *Deutzia scabra; Aphis* uwamizusakurae* (p. 56), on *Prunus grayana; Myzus sasakii** on *Prunus serrulata* v. *spontanea; M. higansakurae** on *Prunus subhirtella; M. higansakurae* v. *rarus** on *Prunus serrulata* v. *spontanea; M. sakurae** on *P. s.* var. *spontanea; Aphis fukis** on *Petasites japonicus; M. impatiensae** on *Impatiens textori* and *I. noli-tangere; M. persicae** on *Prunus persicae; Macrosiphum* sumomocola* (p. 70), on *Prunus salicina; Chermes* japonicus* (p. 71), on *Picea jezoensis* v. *hondoensis; Phylloxera vastatrix* on *Vitis vinifera*.—*E. P. Felt.*

2605. **PENDLEBURY, H. M.** Malaysian Cercopidae in the Raffles and Federated Malay States Mus. *Jour. Fed. Malay States Mus.* 16(1/2): 108-118. 1930.—A list of about 90 spp., with records of localities and dates.

2606. **PRUTHI, HEM SINGH.** Studies on Indian Jassidae (Homoptera). Part I.—Introductory and description of some new genera and species. *Mem. Indian Mus.* 11(1): 1-68. 5 pl., 92 fig. 1930.—An historical survey of the family and of the terminology used in the paper are given. 5 new genera, 40 new spp. and 1 new var. are described: *Ulopa* brunneus* (p. 5); MAGNENTIUS (p. 6), type *M.* clavatus* (p. 7); TROCNADELLA (p. 8), type *T.* shillongensis* (p. 9), *T.* punctatus* (p. 10); *Agallia* robustus* (p. 10); *Durgades* mirabilis* (p. 12), *D.* idiocerus* (p. 13); *Symphypyga* maculatus* (p. 15); *Idiocerus* nagpurensis* (p. 17); *Parabolocratus* mandlensis (p. 18); *Bumizana* ruberosa* (p. 20); *Kana* fasciata (p. 22); *Chiasmus* alata* (p. 23); *Leofa* parwala* (p. 26); *Gurawa* minorcephala* (p. 29); BAILEYUS (p. 31), type *B.* brunneus* (p. 31); *Platymetopius* rahmani* (p. 33); *Rhombopsis* viridis* (p. 34); *Drabescus* kempi* (p. 36); *Selenocephalus* brunneus* (p. 37); *Aconura* dindorensis* (p. 38), *A.* tolla* (p. 39); *Arya* rotundus* (p. 40); *Paternus* viridula* (p. 42), *P.* vertica (p. 44); BELLA (p. 44), type *B.* apicalis* (p. 45); BALCLUTHINA (p. 46), type *B.* viridis* (p. 46); *Eugnathodus* indica* (p. 48), *E.* micropterous (p. 50), *E.* ocellatus* (p. 51); *Cicadula* indica* (p. 54), *C. montanus* v. macropterous* (p. 58), *C.* maculata* (p. 58), *C.* bipunctatus* (p. 59), *C.* fletcheri* (p. 60), *C.* indrina* (p. 61); *Thamnotettix* prabha* (p. 62), *T.* veinatus* (p. 63), *T.* chhota* (p. 64), *T.* bicolor* (p. 65); *Orosius* maculatus* (p. 67); *Chiasmus* mustelina* (*Kartwa m.* Dist.) (p. 25); *Eugnathodus* sanguinescens (*Nesosteles s.* Kirk.) (p. 52); *Cicadula* montanus (*Deltocephalus m.* Dist.) (p. 56). Types of all new genera and spp. in the Indian Mus.—*S. Ribeiro.*

2607. **ARNOLD, GEORGE.** The Sphegidae of South Africa. Part 9. Ampulex group. Part 10. Chlorion group. Parts 11-14. *Ann. Transvaal Mus.* 12(3): 191-232. 1 pl. 18 fig.; 233-279. 3 pl. (1 col.) 9 fig.; (4): 338-375. 20 fig. 1928. 13(4): 217-319. 62 fig.; 320-380. 1 pl. 42 fig.; 381-418. 1 pl. 49 fig. 1929.—The scope of the work is greater than is indicated in the title, as it is a monograph, dealing with the Sphegidae of the entire Ethiopian region and not only of S. Africa. Part 9.—*Dolichurus* rubripyx ♀ Brauns (in litt.) (p. 194), Cape Province, type in coll. Brauns; *D.* venator* (p. 194). S. Rhodesia, type in Rhodesia Mus.; *D.* kohli ♀ Brauns (in litt.) (p. 196), Cape Province, type in coll. Brauns; *D.* bimaculatus ♂* (p. 196), S. Rhodesia, type in Rhodesia Mus.; *Ampulex cyanura* with races rhodesiana* (p. 207), and monticola ♀* (p. 208), S. Rhodesia, types in Rhodesia Mus.; *A.* arnoldi* Brauns (in litt.) (p. 212), Cape of Good Hope, type in coll. Brauns. Part 10.—*Sceliphron* (*Pelopoeus*) fulvohirtum* (p. 246), S. Rhodesia, type in coll. R. H. R. Stevenson; *Sphex* (*Parapsammophila*) herero* (p. 253), S. W. Africa and S. Rhodesia, type (from Kaross) in S. African Mus.; *S.* (*P.*) consobrinus ♀* (p. 255), Cape Province, type in coll. Brauns; *S.* laticeps ♀* (p. 268), S. W. Africa, type in S. African Mus.; *S.* perin-

gueyi ♀* (p. 269), Cape of Good Hope, type in S. African Mus. Keys are given to spp. of *Dolichurus, Ampulex* and *Sphex* (olim *Ammophila*), of the Ethiopian region. *Ampulex nebulosa* Smith, 1956 (=*A. cribrata* Kohl, 1893); *A. mutilloides* Kohl, 1893 (=*A. sanguinicollis* Brauns, 1899); *A. cyanura* Kohl, 1893 (=*A. capensis* Cameron, 1905 and *A. africana* Cameron, 1905); *Sphex (Parapsammophila) gigantea* Kohl, 1901, is reduced to a variety of *S. ludovici* Smith, 1856. Part 11 deals only with the genus *Chlorion* which is divided by key into 8 subgenera. Key to ♂♂ and ♀♀, and discussion of 49 spp. and varieties, including *C. (Proterosphex) haemorrhoidalis* v. **kobrowi** (p. 367), Transvaal, type in Brauns coll.; *C. (P.)* **neavei*** (p. 370), Nyasaland, type in Brit. Mus.; *C. (P.) stadelmanni* v. **integrum*** (p. 372), Natal, S. Rhodesia, Portuguese E. Africa, type in Stevenson coll.; *C. (P.)* **abyssinicum*** ♂ (p. 372), Abyssinia, type in Brit. Mus. Part 12.—Keys are given to species of all genera. *Nysson* **decipiens*** (p. 225), Zululand and S. Rhodesia; *N.* **minutus** ♂* (p. 227) and *N.* **rhodesiae*** (p. 228), S. Rhodesia; *Arpactus* **umtalicus** ♀* (p. 240), S. Rhodesia and Natal. Types of the 4 preceding spp. in Rhodesia Mus. *Arpactus (Ammatomus)* **gemellus*** (p. 250), S. W. Africa, type in S. African Mus.; *A. (A.)* **pictipes** ♂* (p. 251) and *A. (A.)* **fuscipes** ♀* (p. 253), S. Rhodesia, types in Rhodesia Mus.; *A. (A.)* **stevensoni*** (p. 251), S. Rhodesia, type in coll. Stevenson; *Sphecius* **citrinus** ♀* (p. 257), Cape Province, type in S. African Mus.; *Stizus braunsii* v. **corpulentus*** (p. 270), *S.* **fraterculus*** (p. 272), and *S.* **sipapomae*** (p. 272), S. Rhodesia, type in Rhodesia Mus.; *S. boer* v. **rufipes** (p. 275), *S.* **mitulus*** (p. 275), *S.* **witzenbergensis*** (p. 275), and *S.* **laticaudatus** ♂* (p. 276), Cape Province, type in Brit. Mus.; *S.* **buyssoni** (Brauns in litt.) (p. 277), S. Rhodesia, type in Transvaal Mus.; *S. hoplites* v. **minor*** (p. 286), Cape Province, type in Brit. Mus.; *S.* **proteus*** (p. 287), S. Rhodesia, type in Rhodesia Mus.; *S.* **laticinctus** ♂* (p. 289), Cape Province, type in Brit. Mus.; *S.* **hyperocrus** ♀ (Brauns in litt.) (p. 295), Cape Province, type in Transvaal Mus.; *S.* **mutabilis*** (p. 295), Cape Province, type in Brit. Mus.; *S.* **quadristrigatus** ♀* (p. 297), S. W. Africa, type in Brit. Mus.; *S. dewitzii* v. **hamatus** ♂* (p. 309), S. Rhodesia, type in Rhodesia Mus.; *S.* **ellenbergeri** ♂* (p. 309), Basutoland, type in Mus. Nat. Hist. Nat. Paris; *S.* **scoliaeformis*** (p. 317), and *S.* **pubescens** ♂* (p. 318), S. W. Africa, type in S. African Mus. The following new synonymy is reported: *Arpactus effugiens** Brauns, 1911 (=*A. fugax* Turner 1915); *A. aglaia** Handl., 1895 (=*A. euphrosyne* Handl., 1895); *A. thalia* Handl., 1895 (=*A. transvaalensis* Cameron, 1910); *A. monstrosus** Handl., 1894 (=*A. silverlocki* Turner, 1912); *Stizus braunsii* Handl., 1894 (=*S. pruinosus* Cameron, 1910,=*S. pulchritinctus* Cameron, 1912); *S. cinguliger* Smith, 1856 (=*S. clavicornis* Handl., 1892). Part 13.—Keys are given to species of all genera. *Bembex* **ulula*** (p. 330) and *B.* **stevensoni*** (p. 331), S. Rhodesia, types in Rhodesia Mus.; *B.* **anomalipes** ♂* (p. 334), S. Rhodesia and Belgian Congo, type in coll. Stevenson; *B.* **speciosa*** (p. 337), *B.* **cultrifera*** (p. 339), and *B.* **scaura*** (p. 340), S. Rhodesia, types in Rhodesia Mus.; *B.* **venusta*** (p. 347), S. W. Africa, type in S. African Mus.; *B.* **bequaerti*** (p. 250), with var. **dira** (p. 350), Belgian Congo, types in Congo Mus., Tervueren; *B.* **arnoldi*** Brauns (p. 353), Cape Province, type in Transvaal Mus.; *B. melanopa* r. **litoralis** (p. 356), Cape Province, type in coll. Stevenson; *B. kriechbaumeri* r. **scitula** ♀ (p. 363), S. Rhodesia and S. W. Africa, type in Rhodesia Mus.; *B.* **fraudulenta*** (p. 367), Durban, type in Durban Mus.; *B. liturata* r. **flavopicta** ♂ (p. 370), S. W. Africa, type in Transvaal Mus.; *B.* **harenarum*** Brauns (p. 371), Cape Province, type in Transvaal Mus.; *B.* **albopilosa** ♂* (p. 378), S. W. Africa, type in S. African Mus.; *B.* **junodi** ♂* (p. 379), Portuguese E. Africa, type in Transvaal Mus. The following synonymy is recorded: *Bembex albofasciata* Smith, 1973 (=*B. karschii* Handl., 1893); *B. intermedia* Dahlb., 1845 (=*B. olivata* Dahlb., 1845); *B. ochracea* Handl., 1893 (=*B. opima* Turner, 1917). Part 14.—This part includes the third appendix. *Gastrosericus braunsi* **v. unicolor** ♀ (p. 383), and *G.* **pratensis** ♀* (p. 383), S. Rhodesia, types in Rhodesia Mus.; *G.* **pulchellus** ♀* (p. 383), S. Rhodesia, type in coll. Stevenson; *Tachysphex braunsi* v. **rufopictus** ♂ (p. 385), Cape Province, type in Rhodesia Mus.; *T.* **suavis** ♀ (p. 385), S. Rhodesia, type in Rhodesia Mus.; *T.* **ebeninus*** (p. 385), and *T.* **scabrosus** ♂* (p. 386), S. Rhodesia, types in coll. Stevenson; *T. oberon* v. **mashona** ♀ (p. 387), S. Rhodesia, type in coll. Stevenson; *Tachytes* **midas*** (p. 389), *T.* **lepida*** (p. 389), and *Paranysson* **brevispinosus** ♀, ☿* (p. 391), S. Rhodesia, types in Rhodesia Mus.; *P. oscari* r. **servus** ♂* (p. 392), Liberia, type in Congo Mus.; Tervueren; *P.* **congoensis*** (p. 392), *Notogonidea* **bequaerti** ♀ (p. 394), *N.* **nitens** ♂* (p. 394), and *N.* **egregia** ♂ (p. 395), Belgian Congo, types in Congo Mus., Tervueren; *Palarus handlirschii* r. **occidentalis** (p. 398), S. W. Africa, type in S. African Mus.; *Nitela* **parallela** ☿* (p. 398), S. Rhodesia, type in coll. Stevenson; *N.* **lubutuana** ☿* (p. 399), Belgian Congo, type in Congo Mus., Tervueren; *Miscophus* **modestus** ☿* (p. 401), *M.* **ichneumonoides** ♂* (p. 402), *M.* **infernalis*** (p. 403), *M.* **lugubris** ☿* (p. 404), and *Saliostethus* **rhodesianus*** (p. 404), S. Rhodesia, types in coll. Stevenson; *Psenulus* **luctuosus** ☿* (p. 405), S. Rhodesia, type in Rhodesia Mus.; *Passaloecus braunsi* v. **ferrugineipes** ♀ (p. 406), and *P.* **bequaerti** ☿* (p. 406), Belgian Congo, types in Congo Mus., Tervueren; *Philanthus* **gwaaiensis** ♂* (p. 407), S. Rhodesia, type Rhodesia Mus.; *Thyreopus* **libertinus** ♂* (p. 408), Liberia, type in Congo Mus.; **KAROSSIA** (p. 409), type *K.* **hessei** ☿* (p. 410), S. W. Africa, type in S. African Mus.; *Belomicrus* **funestus** ☿* (p. 411), Cape Province, type in Rhodesia Mus.; *Oxybelus* **bicornutus** ☿* (p. 412), *O.* **hessei*** (p. 413), and *O.* **decipiens** ☿* (p. 415), S. W. Africa, types in S. African Mus.; *Stizus* **ctenopus** ☿* (p. 416), S. Rhodesia, type in coll. Stevenson; *Tachysphex braunsi* v. **boer** (*T. b.* var. **debilis** Arnold) (p. 387).—*G. Arnold.*

2608. ARNOLD, GEORGE. The Sphegidae of South Africa. Part XV (conclusion). *Ann. Transvaal Mus.* 14(2): 135-220. 51 fig. 1931.—*Cerceris*, key to spp. of the Ethiopian region, *C. vigilans* r. *pervigilans* Turner (=*C. fongosi* Brauns, *C. trilineata* Bisch.); *C. natalensis* Sauss. (=*C. morosula* Brauns); *C. kalaharica* Bisch. (=*C. africana* r. *karooensis* Brauns); *C. schultzei* Bisch. (=*C. transvaalicola* Brauns); *C. lichtenburgensis* Brauns is considered a variety of *C. ruficauda* Cam.; *C. varilineata* Cam. is assigned as a variety of *C. emeryana* Grib.; *C. eulalia* Brauns is considered a race of *C. rufiscutis* Cam.; *C. cratocephala* Cam., *C. deceptrix* Brauns, and *C. libitina* Brauns are varieties of *C. iniqua* Kohl; *C. fingo* Brauns ♀ (p. 149) and *C. holconotula* Brauns (p. 150), both Cape Province, first descriptions of previously figured species, types in Brauns coll.; *C. macalanga* ♂, *C. arnoldi* ♂, *C. discrepans* ♂, and *C. pictifacies* ♂, first descriptions of sex; *C. hypocrita*, emend. descr.; *C. ruficauda* **r. barbara** ♀ (p. 152), Brit. E. Africa; *C. macololo* **r. capensis*** (p. 152), and *C. nobilitata* **r. sordidula** ♀ (p. 153), Cape Province; *C. discrepans* **r. perplexa** ♂ (p. 153), S. W. Africa; *C. varicincta* **r. manicana** (p. 154), Southern Rhodesia, type in Rhodesia Mus.; *C.* **bicuspidata*** ♂ (p. 154), S. W. Africa; *C.* **ludibunda** ♂ (p. 155), Orange Free State; *C.* **uncifera*** ♂ (p. 156), Nigeria; *C.* **mutabilis*** ♂ (p. 157), Natal; *C.* **illustris*** (p. 158), So. Rhodesia, types in R. H. R. Stevenson coll.; *C.* **erynnis*** ♀ (p. 159) and *C.* **monticola*** ♀ (p. 160), Nyasaland; *C.* **sumptuosa*** ♀ (p. 160), Pondoland, Cape Province, and Orange Free State; *C.* **dejecta*** ♀ (p. 162), Brit. E. Africa; *C.* **arida*** ♀ (p. 163), N. Nigeria; *C.* **placita*** ♀ (p. 163), Victoria Nyanza; *C.* **arrogans*** ♀ (p. 164), and *C.* **nephthys*** ♀ (p. 165), S. W. Africa; *C.* **inconspicua*** ♀ (p. 166), Nyasaland; *C.* **hamiltoni*** ♀ (p. 167), Brit. E. Africa; *C.* **egena*** ♀ (p. 167), Nyasaland; *C.* **turneri*** (p. 168), *C.* **quadridentata*** ♀ (p. 170), and *C.* **grata*** ♀ (p. 170), S. W. Africa; *C.* **placida*** (p. 171), Nigeria; *C.* **osiris*** (p. 172), *C.* **amatoria*** (p. 173), So. Rhodesia, type in Stevenson coll.; *C.* **ponderosa*** ♀ (p. 174), Brit. E. Africa; *C.* **hausa*** ♀ (p. 174), Nigeria; *C.*

uncta* ♀ (p. 175), Gambia; *C.* **nugax*** ♂ (p. 176), Nigeria; *C.* **horus*** (p. 177), S. W. Africa; *C.* **isis*** (p. 178), So. Rhodesia, type in Rhodesia Mus.; *C.* **ugandensis*** ♀ (p. 179), Uganda; *C.* **vumbui*** (p. 180), So. Rhodesia, type in Rhodesia Mus.; *C. rufiscutis**, emended description; *C. r.* race **decolorata*** (p. 182), Brit. E. Africa; *C. repraesentans**; *C. bicolor** Sm. (=*C. fossor* Sm.) and *C. albifrons* redescribed; *C. kilimandjaroensis**; *C. raptor** redescribed; *C. barbifera** Bisch. (= *C. bagandarum* Turner); *C. andersoni**; *C. yalensis**; *C. yungvei** Cam. (=*C. massaica* Cam.); *C. albigena**; *C. erythroura** redescribed; *C. rigida*, *C. flavifrons*, and *C. tyrannica*, emended descriptions; *C. albolineata**; descriptions of various other species are copied in full. *Mesopalarus* **turneri** ♀ (p. 205), *Ampulex denticollis* r. **rufithorax** ♂ (p. 205), and *Arpactus* **mimicus*** ♂ (p. 206), S. W. Africa; *Bembex regnata* Parker (=*B. speciosa* Arnold); *B. albata* Parker (=*B. albopilosa* Arnold); *B. stadelmanni* Handl. (=*B. opinabilis* Parker); *B. diversipennis* Smith (=*B. refuscata* Parker); *B. d.* var. *johnstoni* Turner (=*B. tenebrosa* Parker), a valid variety; *B. fuscipennis* Lep. (=*B. stevensoni* Parker); *B. intermedia* Dahlb. (=*B. olivata* Dahlb., *B. lacta* Parker). Unless otherwise stated, types are in Brit. Mus.

2609. BAGNALL, RICHARD S. The gall-wasps and their allies in Northumberland and Durham. *Vasculum, Newcastle-on-Tyne* 14: 62-65. 1928.—Refers to previous work on gall-wasps proper and gives lists of parasitic and inquiline cynipids, the total of 120, or about 70% of known Brit. spp., being represented as follows: Parasitic forms, 43; gall causers, 59; inquiline, 18. The inquiline *Synergus evanescens* Mayr., is added to the Brit. fauna.—*R. S. Bagnall.*

2610. BLEDOWSKI, R., und K. KRAINSKA. Über die Entwickelung von Banchus femoralis Thoms. *Jordan & Horn's Verhandl. 3. Internat. Ent.-Kongress., Zürich, 1925* 2: 642-643. 1926.—Abstract of paper presented on the embryology of this species which develops in the larva of *Panolis flammea*. The larvae of the parasite are immune to the bacterial disease of the host.

2611. BLOOD, B. N., and J. P. KRYGER. New genera and species of Trichogrammidae with remarks upon the genus Asynacta (Hym. Trichogr.). *Ent. Meddel.* [*Copenhagen*] 16(4): 203-222. 5 pl. 1928.—**NEOCENTROBIA** (p. 203), type *N.* **hirticornis*** (p. 204); **MONORTHOCHAETA** (p. 205), type *M.* **nigra*** (p. 206); **TRACHOCERA** (p. 208), type *T.* **longicauda*** ♀ (p. 209); **ORTHONEURA** (p. 211), type *O.* **bimaculata*** (p. 211); **DIACLAVA** (p. 214), type *D.* **waterhousei*** ♂ (p. 214); new spp. all from England, types in British Mus. Nat. Hist. Notes are given on *Asynacta exigua*, descr. emended.

2612. BLOOD, B. N., and J. P. KRYGER. A correction. *Ent. Meddel.* [*Copenhagen*] 16(6): 322. 1929.—The following nomenclatorial change is made: **OTHONEURELLA** (for *Orthoneura* Blood & Kryger preocc.). [See preceding entry.]

2613. BRADLEY, J. CHESTER. A revision of the new world species of Trielis a subgenus of Campsomeris (Hymenoptera: Scoliidae). *Trans. Amer. Ent. Soc.* 54(3): 195-214. 1 pl. 4 maps. 1928.—Key is given to the Amer. genera of Scoliidae and to the subg. *Trielis;* a comparative table is given of the ♂ genitalia, also a list of 6 spp., including *C.* (*Trielis*) **flammicoma*** (p. 209), California; type in Cornell Univ.

2614. BRÈTHES, JEAN. Hyménoptères Sud-Américains du Deutsches Entomologisches Institut: Terebrantia. *Ent. Mitteil.* 17(6): 426-428. 1928.—This is a supplement to a previous paper. The description of *Distantella fischeri* from Brazil is concluded. [See B. A. 3(1/3): entry 3853.] *Neomesostenus* **sumariensis** (p. 427) and *Polycyrtus* **guaruja** (p. 428), Brazil. *P. semirufus* Szépl. is recorded from Brazil.—*C. E. Mickel.*

2615. BUGNION, E. Les pièces buccales, le sac infrabuccal et le pharynx des fourmis. *Folia Myrmecologica et Termitologica* 1(2/3): 33-44. 1926; (4/5): 59-71; (6): 73-88; (8/9): 105-134. 45 fig. 1927.—The morphology of the buccal apparatus and pharynx of species of *Oecophylla, Camponotus, Cataglyphis, Dolichoderus, Messor,* and *Paltothyreus* is discussed in detail.

2616. CHEESMAN, L. EVELYN. A contribution towards the insect fauna of French Oceania. Part II. *Ann. & Mag. Nat. Hist.* 1(2): 169-194. 8 fig. 1928.—The present paper is based on part of the St. George collection on Tuamotu, Marquesas, and the Society Isls.: annotated lists of Dermaptera (7), Hymenoptera (19), and Hym. (Parasitica) (20) are given including: Hymenoptera, *Tachysphex* **fanuiensis*** (p. 172), Tuamotu Arch. and Society Isl.; *Oxybelus* **uturoae*** (p. 177), Society Isl.; *Polistes macaensis* ssp. **tahitensis** (p. 180), Tuamotu Arch. and Society Isls.; *Monolexis* **brugirouxi*** ♀ (p. 185) and *Microdus* **tautirae** ♀ (p. 186), Society Isls.; *Barichneumon* **veo** (p. 187), and *Echthromorpha atrata* ssp. **marquisensis** ♀ (p. 189), Marquesas Isl.; **VAKAU** (p. 189), (*Ichneumonidae*), type *V.* **taitensis** (p. 189), Society Isl.; *Limnerium* **christianae** ♀ (p. 191), Society Isl.; *Eremotylus* **moea*** ♀ (p. 193), Marquesas Isl.

2617. CONDE, OTTO. Ostbaltische Tenthredinoidea. *Korrespondenzblatt Naturforscher-Ver., Riga* 59: 67-91. 2 pl. 1927.—An annotated list of 229 spp.

2618. DAVIS, WM. T. Wasps and bees as water-straddlers. *Bull. Brooklyn Ent. Soc.* 21(3): 127. 1926.—*Emphor bombiformis* is reported as alighting directly on the surface of the water of a roadside puddle, to drink; the wasp, *Polistes rubiginosus,* was also seen standing on the water of a ditch; both cases are reported from Virginia.

2619. DUSMET y ALONSO, J. M. Sobre la dificultad que hay en escoger los caracteres preferibles para la clasificación de los himenópteros. [Difficulty encountered in selecting satisfactory characters in classification of Hymenoptera.] *Mem. R. Soc. Españ. Hist. Nat.* 15(1): 173-182. 1929.—Classification of Hymenoptera based upon external morphology alone is frequently misleading since external structures are not infrequently subject to quite a range of variation in direct relation to the topography, climatic conditions, etc., of the country in which the specimens are taken. Spain, owing to its topography and the varied climatic conditions, is an excellent region for noting complicated changes occurring among representatives of the same species of Hymenoptera. Variation in colors among individuals of the same species are described from specimens under the author's observation. Cases of variations are also cited with regard to the position of bristles and hairs, formation of spots, wing venation, size of body, and to the spiniform processes of the tibiae, all of which are apt to mislead in the identification of the respective species. Special cases of variations in morphological details are cited. The author concludes that in the selection of distinctive characters those which occur more constantly in a great number of specimens should be sought rather than characters of a transitory nature.—*C. Zeimet.*

2620. FRIESE, H. Die Bienen, Wespen, Grab- und Goldwespen. In: C. SCHRÖDER. Die Insekten Mitteleuropas insbesondere Deutschlands. Bd. 1: Hymenoptera. I. Teil. Stuttgart. pp. i-vi+1-192. 8 pl. 107 fig. 1926. Pr. 10 M.—This monograph discusses European bees (Apidae) as to distribution, morphological variations, habits, nest building, parasites, place in nature, collection and preservation of specimens, and relationships among living genera; a key to genera is given; 41 genera and 336 spp. are briefly described; a key is given to varieties of *Apis mellifica* L. The true wasps (Vespidae) include Eumeninae, Masarinae, and Vespinae. The morphology, habits, and relationships of the group are followed by a key to the genera, and by brief characterization of 7 genera and 26 spp.; a key is given to subgenera of *Odynerus.* For the fossores the group morphology, bibliographical references, and general habits are followed by key to 5 families; a key is given to genera of Sphegidae; descriptions of 30 genera and 98 spp.; key is given to subgenera of *Crabro;* habits, relationships, and key to genera of Pompilidae; descriptions of 7 genera and 23 spp.; the morphology, habits, parasitism, and relationships of the Sapygidae with 1 genus and 4 spp. described; the

morphology, habits, hosts, and development of the Scoliidae, and key to genera, with descriptions of 3 genera and 5 spp.; the structure, habits, hosts, and key to the genera of Mutillidae, with 3 genera and 6 spp. are described. The group characteristics of the Chrysididae, review of literature, the habits and relationships, are followed by key to genera and descriptions of 8 genera and 19 spp. Many structural peculiarities or habits are figured.—*H. Spencer.*

2621. **GEORGE, LUCIENNE. Sur la biologie de l'Apanteles glomeratus L.** *Bull. Soc. Hist. Nat. Afrique Nord* 19(2): 104-112. 1928.—Two experiments were conducted which showed that in *Apanteles* the ♂♂ use principally the antennae in their search for the ♀♀, and that the ♀♀ use the antennae for finding their hosts. A brief review given of articles by H. Fabre and L. G. Seurat showed that, contrary to Fabre's observation, young *Apanteles* larvae, because of physiological reasons, are unable to thrive in blood outside of the host body. This conclusion was substantiated by the author's personal observation. He also observed an exceptional case of the survival of a parasitized caterpillar which produced an imago. Series of rearings of *Apanteles* were made which showed the occurrence of prolonged life cycles in the proportion of 7% in March, 14.45% in April, 8.2% in June, and 16.8% in Nov. Another series of rearings gave delayed eclosions in the proportion of 9.46% in Aug. and 16.16% in Nov. Individuals which emerged in Aug. because of delayed life cycles were forced to seek other hosts due to the sparsity of the primary host at that time. *Apanteles* were reared from 2 caterpillars of *Macroglossa stellatarum* and 1 of *Abraxas grossulariata.* Parasitic invasion proved more intense in summer than at other times of the year, and temp. accelerated the length of larval and nymphal life. The sex ratio of *Apanteles* in Oct. shows 67% ♂♂, in July 40% ♂♂. Experiments were conducted which showed that copulation did not take place as freely in the shade as under sunlight.—*C. C. Hill.*

2622. **GRANDI, GUIDO. Imenotteri sicofili raccolti dal Prof. F. Silvestri denn' Indocina, nella Cina, nella penisola Malacca e a Formosa. [Hymenoptera collected by F. Silvestri in Indo-China, China, Malacca Peninsula (Straits Settlements) and Formosa.]** *Boll. Lab. Zool. Gen. e Agraria [Portici]* 20: 169-188. 8 fig. 1927.—*Ceratosolen* **effractarius*** (p. 169), Indo-China; *C.* ? *marchali* Mayr., ♀* and ♂* described; *C. jucundus* Grnd., notes on ♂ and ♀; *Blastophaga* **silvestrii*** (p. 179), China; *Eupristina verticillata* Wat., ♂* described; *E. jacobsoni* Grnd., ♀* and ♂* described.

2623. **GRANDI, GUIDO. Un nuovo genere e quattro nuove specie di Imenotteri sicofili di Sumatra. [A new genus and 4 new species of fig-inhabiting Hymenoptera from Sumatra.]** *Bol. Lab. Ent. Ist. Sup. Agrario Bologna* 1: 71-89. 8 fig. 1928.—*Blastophaga* **cristata** ♀* (p. 71); *B.* **coronata** ♀* (p. 75); **DIAZIELLA** (p. 80) (Sycophagini), based on *D.* **bicolor** ♀* (p. 82); *D.* **macroptera** ♀* (p. 86); key is given to the species of Sycophagini.

2624. **HEINRICH, G. Zur Systematik der Ichneumonidae.** *Konowia* 7(3): 199-202. 1928.—The author examined types in the Berlin Zool. Mus. and the Deutsches Ent. Inst. and offers the following synonymy: *Cratichneumon pachymerus* Ratzeb. ♀ (=*Ichneumon septimus* Berth. ♀); *I. caloscelis* Wesm. ♀ (=*Amblyteles decens* Berth. ♀); *Amblyteles glaucatorius* F. ♂ (=*A. praetextus* Berth. ♂); *Platylabus pactor* Wesm. ♂ (=*Dicaelotus septemtrionalis* Berth. ♂); *Pycnocryptus director* Thunb. ♀ (=*Spilocryptus leucopygoides* Strand ♀); *Hoplocryptus fugitivus* Grav. ♀ (=*H. ignalinoensis* Strand ♀); *Triptognathus unidentatus* Berth. ♂ (=*Amblyteles jugorum* Strobl. ♂); *Ichneumon molitorius* Grav. (=*I. melanotis* Holmgr. ♀); *Ichneumon molitorius* v. *melanotis* Holmgr. (=*I. m.* var. *discolor* Berth. ♀); *I. m.* var. **holsaticus** (*I. holsaticus* Tischb. ♀). In most cases there is a discussion of the data on which the above synonymy is based.—*C. E. Mickel.*

2625. **HEINRICH, G. Die Kennzeichen der Ichneumoninen auf ihren arttrennenden Wert. (Hym.).** *Konowia* 7(3): 203-213. 1928.—Certain markings and characters of the Ichneumonidae and their value for the diagnosis of species are discussed. Three groups of characters are considered: (1) Color; (2) sculpture and pubescence; (3) morphological characters. The white markings of the tibia, scutellum, the front, the last abdominal tergites, the "rings" of the antennae, and the lines in front and under the wings, and the yellow, yellowish red, and brown colors are considered, with the conclusion that in many cases these color characters are variable, hence their value as species diagnostic characters is not high. Examples illustrating the variations are given. In the 2nd group such characters as sculpture of the postpetiole, the enclosed area of the propodeum, the felt-like pubescence of the tarsi, and the coxal brushes are considered and shown to be variable in a number of cases. Characters belonging to the 3rd category are listed but dismissed with a brief discussion. It is suggested that an investigation of the genitalia may disclose useful and possibly more constant characters for species diagnosis than the ones now more commonly used. Wing venation is said to have very little value in this connection.—*C. E. Mickel.*

2626. **HELLÉN, WOLTER. Zur Kenntnis der Braconiden (Hym.) Finnlands I. Subfam. Braconinae (part.), Rhogadinae und Spathiinae.** *Acta Soc. Fauna et Flora Fennica* 56(paper 12): 1-59. 1 map. 1924-1927.—A general account of the Finnish representation of the groups cited. There are keys to subfamilies, to the genera of the 3 subfamilies, and to the species of numerous genera, usually these with more than 3 or 4 spp. Braconinae: *Iphiaulax* **borealis** (p. 13), *Coeloides* **stigmaticus** (p. 15), Rhogadinae: *Rhogas medianus* ♂ Thomas, described; *R.* **freyi** ♂ (p. 25), *Aleiodes* **esseni** (p. 29), *A.* **caudalis** ♀ (p. 32), *A.* **ochraceus** (p. 32), *A.* **linearis** ♂ (p. 34), *Clinocentrus* **arcticus** ♀ (p. 42), *Exothecus* **longicornis** ♀ (p. 47). Spathiinae: *Phaenodus* **rugulosus** (p. 53), **PACHYSTIGMUS** (p. 54), based on *P.* **nitidulus** ♂ (p. 55). For each species there are usually given hosts, variability, and Finnish localities.

2627. **HINGSTON, R. W. G. The potter wasp (Rhynchium nitidulum) Part I.** *Jour. Bombay Nat. Hist. Soc.* 32(1): 98-110. 2 pl. 3 fig. 1927.—The formation of cells by *R. nitidulum* is discussed. Cells built of mud are usually 4-5 in number. The wasp lays her egg when the masonry is finished. After storing supplies the mouth of cell is permanently closed by a lid, but the eggs hatch even before the cell is closed. Two days after the lid is sealed the larva has grown into a huge maggot; it pupates 2 weeks after the egg is laid. Emergence takes place on the 26th day. Geometrical principles underlying the masonry are discussed.—*M. Sharif.*

2628. **HUBER, L. L. A taxonomic and ecological review of the North American chalcid-flies of the genus Callimome.** *Proc. U. S. Nation. Mus.* 70(Art. 14): 1-114. 4 pl. 1927.—This paper deals with 112 spp. of Chalcidoidea of which 104 belong to the genus *Callimome* Spinola. Of the 104 spp. treated under *Callimome,* 11 are unrecognized and of the 112 spp. listed as Chalcidoidea 8 were wrongly classified. To accommodate these 8 spp. it has been necessary to transfer 6 to previously described genera and to erect 2 new genera. The following new species of *Callimome,* types of which are in the U. S. Nat. Mus., are described: *Callimome* **aeneoscapum*** (p. 35), Idaho; **aereum** (p. 71), Texas; **alamedensis*** (p. 28), California; **alaskensis*** (p. 31), Alaska; **albitarse*** (p. 80), Kansas; **asteridis*** (p. 43), New Hampshire; **atriplicis*** (p. 44), and **baccharidis*** (p. 46), California; **bicoloratum*** (p. 73) and **capillaceum*** (p. 74), Arizona; **capite*** (p. 32), Washington, D. C.; **castanopsidis*** (p. 64), California; **cinerosum** (p. 84), Texas; **citripes*** (p. 48), Colorado; **coccineum*** (p. 68), Virginia; **coloradensis*** (p. 49), Colorado; **cruentatum*** (p. 50), Connecticut; **dasyneurae*** (p. 56), Ohio; **dubiosum*** (p. 24), Washington, D. C. (?); **duplicatum*** (p. 27), Ohio; **ferrugineipes*** (p. 33), California; **fulvum*** (p. 26), Nebraska; **gahani*** (p. 69), Oregon; **giganticum*** (p. 65), Mexico; **hirsutum*** (p. 74), Arizona; **kinseyi***

(p. 44), **koebeli*** (p. 52), and **longistigmum*** (p. 47), California; **mellipes*** (p. 23), Massachusetts; **minutissimum*** (p. 78), California; **missouriensis*** (p. 42), Missouri; **multicolor*** (p. 51) and **occidentale*** (p. 79), California; **osborni*** (p. 93), Wyoming; **perplexum*** (p. 49), Oregon; **pilularidis*** (p. 45), California; **prunicola*** (p. 91), New Mexico; **rhoditidis*** (p. 34), Massachusetts; **robustum** (p. 72), Florida; **rohweri*** (p. 58), California; **rosae*** (p. 35) and **rubenidis*** (p. 78), Colorado; **scalaris*** (p. 21), Arizona; **solidaginis*** (p. 92), New York; **strobiloides*** (p. 40), Ohio; **sulcatum*** (p. 22), California; **tarsale*** (p. 76) and **tricolor*** (p. 96), Texas; **tubularis** (p. 39), Colorado. *Callimome californicum* v. **subdolum** (p. 85), California; **ALLOTORYMUS** (p. 104) (Callimominae), type *A.* **splendens** (*Syntomaspis s.* Provancher) (p. 105), type in Mus. Depart. Agric. Ottawa, Canada; **PLATYKULA** (p. 106) (Monodontomerinae), type *P.* **albihirta** (*Syntomaspis a.* Ashmead) (p. 106), ♂ described, type in U. S. Nat. Mus. The following are given as new names: *Callimome* **bruesi** (*Torymus sackeni* Brues not *C. sackeni* Ashmead) (p. 19), a fossil species from the Florissant, Colorado, type in Mus. Comp. Zool.; *C.* **fullawayi** (*Syntomaspis coerulea* Fullaway preocc.) (p. 19); *C.* **sativae*** (*Syntomaspis medicaginis* Gahan preocc.) (p. 77). *Callimome lissus, theon, aea, splendidulus, cecidomyiae, ochreatum, pavidum, advenum, thompsoni, longicaudum. pallidipes,* and *abortum* are unrecognized species. Species wrongly classified as *Callimome* (*Syntomaspis* or *Torymus*) are *splendens* and *albihirta* (types of the 2 new genera), and the following: *Dimeromicrus* **howardi** (*Torymus h.* Dalla Torre) (107); *D.* **eucalypti** (*Torymus e.* Ashmead) (p. 107); *D.* **gifuensis** (*Torymus g.* Ashm.) (p. 108); *Diamorus* **axillaris** (*Torymus a.* Ashm. (p. 108); *Microdonsomerus* **anthidii** (*Torymus a.* Ashm.) (p. 108); *Cryptopristrus* **lazuella** (*Syntomaspis l.* Ashm.) (p. 108). With the exception of a few cases previously recognized species are not redescribed. A key is given to all the recognized species of the genus. The genus *Callimome* was erected in 1811 by Spinola. *Misocampus* Latreille, *Torymus* Dalman, and *Syntomaspis* Förster are treated here as synonyms. Species of *Callimome* have a wide range of distribution. This paper includes spp. from all portions of N. Amer., from South Amer., and Japan. On the basis of ecological data and morphological characters the genus is divided into 2 species groups viz., A and B. Species of group A greatly prefer Cynipidae (Hymenoptera) as hosts while those belonging to group B show a preference to Itonidae (Diptera). Five species are reported as wholly or partly phytophagous. It seems safe to assume that species of this genus will be found wherever the host plants of gall making insects abound.—*L. L. Huber.*

2629. ISHII, TEI. Enargopelte ovivora, a new chalcid fly from Japan. *Kontyu* 2(4): 205-208. 1 pl. 1928.—This species, the larva of which feeds on the eggs of a *Lecanium* on *Celtis* at Nagasaki, has a generation a year, hibernating in the pupal stage. The adults appear about the middle of April and lay some 10 eggs under each host. They hatch in about a week, the larvae maturing 20 days later. Descriptions are given of the adult (p. 205), matured larva, and egg. Types in author's coll.—*R. Takahashi.*

2630. KINSEY, ALFRED C. The gall wasp genus Cynips. A study in the origin of species. *Indiana Univ. Studies* 16(84/86): 1-577. 429 fig. 1929.—Ninety-three species, represented by more than 17,000 insects and 54,000 galls, are the basis of this study of the re-defined genus *Cynips.* The nature and origin of species within the genus are discussed, with the suggestion that similar taxonomic studies of other animal and plant groups, interpreted in the light of modern genetics, will provide a sounder basis for an understanding of evolution than has been obtained through the several theories philosophically advanced during the last century. Species are defined as populations with common heredity. Emphasis is placed upon the world populations in this definition. It is maintained that species are more than mental concepts—that species are realities which preserve a morphologic and physiologic identity under varying conditions, over vast areas, and through periods of time that may extend beyond the present geologic epoch. Detailed evidence is presented that most of the present day species of *Cynips* are at least Pliocene in origin. Within these species individuals vary, mutations occur, and Mendelian races develop as they are observed to develop in the laboratory. Forty-two subapterous species, hitherto considered members of exclusively subapterous genera, are recognized as belonging to the same genus as the typically long-winged species of *Cynips.* These provide data on the origin of well-established species through mutation strikingly similar to that observed for subapterous races of *Drosophila* in the laboratory. Several physiologic qualities are shown to be as characteristic of *Cynips* species as their morphologic structures, and of equal stability, particular gall-producing capacities dating back to the differentiation of the subgeneric stocks not later than the Miocene. The importance of the isolation of newly arisen mutant stocks before they may develop into species populations is evidenced by the fact that since the origin of each present-day species of this genus, no new species has ever succeeded in developing from the same stock, in the same geographic area, on the same host. The multiplication of species has been accomplished only when the mutant stocks were isolated in new areas or on new hosts. Five of the 93 spp. appear to be of hybrid origin, developing in the Pleistocene when northern and southern relatives were brought into contact, spreading through the northeastern U. S. A., and into parts of the southern Appalachians where unoccupied territory was available for the isolation of the hybrid populations upon the retreat of the ice sheets. *Cynips* is believed to have originated in southwestern U. S. A., and the geologic and geographic factors controlling the migration over the rest of N. Amer. and into Asia and Europe are discussed at length. The systematic study which provides the data for these conclusions on *Cynips* embodies synonymical bibliographies of each species, comparative descriptions of insects and galls (alternating generations being recognized for 11 spp.), detailed distribution data, data on type material (80 of the 85 existent holotypes having been available for study), records of inquilines and parasites, and biologic and phylogenetic discussions for each species. Appendices include a bibliography, key to described species, check list, and index. The figures include distributional and phylogenetic maps, whole insects, details of insect structures, diagrams of gall structures, and half-tones of the galls. As re-defined the genus includes *Cynips* L. (=*Dryophanta* Förster), *Philonix* Fitch, *Acraspis* Mayr (=*Sphaeroteras* Ashmead), and 3 newly named groups as subgenera. New subgenera: **ANTRON** (p. 180), with *C. echinus* v. *schulthessae* as type; **BESBICUS** (p. 222), with *C. multipunctata conspicua* as type; **ATRUSCA** (p. 276), with *C. dugèsi simulatrix* as type. New species, varieties, and alternating forms: *C. folii* v. **atrifolii*** (p. 134), Denmark, range northern Europe; *C. longiventris* v. **forsiusi*** (p. 147), Finland, northern Europe, type in Univ. Helsingfors; *C. divisa* v. **atridivisa*** (p. 162), Denmark, northern Europe; *C. echinus* v. **vicina*** (p. 196), forms **vicina*** (p. 196) and **incepta*** (p. 198), *C. e.* var. **dumosae*** (p. 199), *C. e.* var. **mista*** (p. 200), *C. e.* var. **schulthessae** (p. 202), forms **schulthessae*** (p. 202) and **atrata*** (p. 204), *C. teres* v. **hildebrandae*** (p. 217), *C. multipunctata* v. **indicta*** (p. 228), *C. m.* var. **conspicua*** (p. 229), *C. maculosa* v. **tritior*** (p. 235), and *C. mirabilis* v. **leachii*** (p. 238), all 11 from California; *C. fulvicollis* v. **rubricosa*** (p. 254), Tennessee, Texas to Tenn.; *C. f.* var. **vorisi*** (p. 255), Kansas, Indiana to Oklahoma; *C. f.* var. **major*** (p. 257), Illinois, Indiana to Kansas; *C. f.* var. **canadensis*** (p. 273), Michigan, northeastern U. S. A. and Appalachian area; *C. dugèsi* v. **simulatrix*** (p. 280), New Mexico and Arizona; *C. d.* var. **pupoides*** (p. 284) and *C. bella* v. **con-**

2631. KISS von ZILAH, ENDRE. Ichneumonidák a Magyar Nemzeti Múzeum Gyüjteményéből. [Ichneumonidae in the coll. of the Hungarian Nation. Mus.] [With German translation.] *Ann. Hist. Nat. Mus. Nation. Hungarici* **24**: 237-286. 1926.—An annotated list of 291 spp., of which 44 are new to Hungary, and 23 new to science: *Ichneumon elephas* v. **thalhammeri** ♀ (p. 238); *Orotylus* **hungaricus** ♀ (p. 239); *Odinophora occidentalis* v. **rubroatra** (p. 243); Spain; *Lissonota* **hortobágyensis** (p. 245); *L.* **sziládyi** (p. 248); *Agrypon tenuitarsum* v. **rufipes** ♂ (p. 251); *Trophocampa mesozosta* v. **nigrata** ♀ (p. 251); *Pyracmon* **hungaricus** (p. 252); *Polyblastus* **horváthi** ♀ (p. 260); *P. pyramidalis* v. **rufus** ♀ (p. 262); *Erromenus junior* v. **cingulipes** ♂ (p. 264); *E.* **rufescens** ♀ (p. 264); *Perilissus subcinctus* v. **horváthi** ♀ (p. 266); *P.* **chyzeri** ♀ (p. 266); *Trematopygus* **hungaricus** ♀ (p. 267); *Prionopoda stictica* v. **melana** ♀ (p. 271); *Brischkea* **aigneri** ♂ (p. 271), Rumania; *B.* **croatica** ♀ (p. 273), Yugo-Slavia; *Alexeter inconspicuus* v. **rufus** ♂ (p. 278), Rumania; *A. sectator* v. **sibricus** ♂ (p. 280), east Siberia; *Lamachus lophyrorum* v. **nigrescens** (p. 280); *Barytarbes* **csikii** (p. 280); *Mesoleius multicolor* v. **transsylvanicus** ♀ (p. 284), Rumania. Except where otherwise given, types are from Hungary.

2632. KISS von ZILAH, ANDREAS. Zweiter Beitrag zur Kenntnis der ungarischen und siebenbürgischen Ichneumoniden-(Schlupfwespen-) Fauna. *Verhandl. u. Mitteil. Siebenburg. Ver. Naturwiss. Hermannstadt. Wissenschaftl. Teil.* **75/76**: 74-120. 1925-1926[1926].—Additional spp. and vars. are added to the fauna of the regions (total 2393), including *Probolus slaviceki* v. **nigrosternus** ♀ (p. 82); *Caenocryptus dentifer* Thoms., emended description; *Rhyssa* **silbernageli** ♀ (p. 94); *Polysphincta* **silbernageli** ♀ (p. 96); *Glypta rufipes* Bris., ♀ described; *Cryptopimpla* **szilagysagiensis** ♀ (p. 99); *Lissonota insignita* vars. **rufifemur** ♂ (p. 101) and **szeplígeti** ♂ (p. 102); *Xylonomus fasciipennis* v. **habermehli** (p. 102); *X. praecatorius* v. **rufopicta** ♂ (p. 103); *Campoplex nitidulator* v. **obscurus** ♂ (p. 106); *Eriborus perfidus* v. **obscuriventris** ♂ (p. 107); *Eulimneria rufifemur* v. **nigrotibialis** ♂ (p. 107); *Anilastus* **parvulus** ♀ (p. 109); *Mesochorus orbitalis* v. **nigrithorax** ♂ (p. 112); *Exochus* **dioszeghyi** ♂ (p. 117); *E. notatus* v. **nigroscutellatus** ♀ (p. 118).

2633. [KOKUEVA, N. R.] КОКУЕВА, Н. Р. Hymenoptera, собранные В. В. Совинским на берегах озера Байкала в 1902 году. [Hymenoptera collected by V. Sovinskii on the shores of Lake Baikal in 1902.] Труды Комиссии по изучению озера Байкала (*Trav. Comm. Étude lac Bajkal*) **2**: 63-76. 1927.—Annotated list of Tenthredinidae (20 forms including *Athalia* **novittola** (p. 64)), Braconidae (2), Ichneumonidae (15 forms, including *Mesochorus* (s. str.) **postfurcalis** (p. 66), *Sichelia* **korotnevi** (p. 67), *Conoblasta* **nigricoxa** (p. 67), *Cryptus* (*Meringopus*) **sovinskii** (p. 68), *Amblyteles* **affinis** (p. 69), *A.* **carinatus** (p. 69), *A.* **uniguttatus** v. **baicalicus** (p. 70)), Chrysididae (1), Formicidae (1), Scoliidae (1), Pompilidae (3), Crabronidae (7), Vespidae (8, including *Eumenes arbustorum,* v. **baicalensis** (p. 72)), *Apidae* (25, including *Anthrena* **baicalica** (p. 73), *Megachile* **baicalica** (p. 75).

2634. MAIDL, F. Zwei neue indomalayische Notogonidea-Arten. *Treubia* 9(4): 409-410. 4 fig. 1927.—*Notogonidea* **karnyi** ♀* (p. 409) and *N.* **sumatrensis** ♂* (p. 410), Sumatra. Type in Naturhist. Mus. Wien.

2635. MEYER, R. A new species of Sphecodes from the Belgian Congo (Hymenoptera). *Bull. Brooklyn Ent. Soc.* 21(5): 191-192. 1926.—*S.* **bequaerti** ♀ (p. 191), type in Congo Mus., Tervueren.

2636. NOVICKIJ, S. Popis Nového Rodu Eucyrtidů, Vylíhlého Z Pobřežního Náplavu Labského. Generis novi Eucyrtidarum ex Detrito Litorali prope Albim Flumen, in Bohemia Centr. Exclusi Descriptio. *Sborník. Ent. Oddělení Národního Mus. v Praze* [*Bull. Sect. Ent. Mus. Nation., Prague*] 4(28/39): 105-109. 1 pl. 1926.—**PEZAPHYCUS** (p. 105), near *Aphyco* Dalm., type *P.* **obenbergeri*** (p. 105), Bohemia.

2637. NOWICKI, ING. S. Bemerkungen zur Gattung Asecodes Först. (Hym. Chalc. Euloph. Ented. Omphal.). *Konowia* 7(3): 223-230. 4 fig. 1928.—A discussion of the taxonomic status of *Asecodes* with a history of the position assigned it by various authors since its erection in 1856. It was first proposed without referred species, but in 1861 Förster assigned 2 species to it; one of these, *fuscipes* Först., was designated as genotype by Ashmead in 1904. The author has located the types of these 2 species in the Staatsmus. at Vienna and gives new descriptions and figures of both *Asecodes nitens* Först. and *A. fuscipes* Först.—*C. E. Mickel.*

2638. OGLOBLIN, A. A. Nový Druh Rodu Allotropa (Scelionidae, Hymenoptera). A new species of Allotropa (Scelionidae Hymenoptera). *Sborník. Ent. Oddělení Národního Mus. V Praze* [*Bull. Sect. Ent. Mus. Nation., Prague.*] 4(28/39): 145-149. 1 pl. 1926.—*Allotropa* **jacobsoni*** ♂ (p. 114), Bohemia.

2639. PARKER, JOHN BERNARD. A generic revision of the fossorial wasps of the tribes Stizini and Bembicini, with notes and descriptions of new species. *Proc. U. S. Nation. Mus.* 75(5): 1-203. 15 pl. 1929.—*Stizus* **occidentalis*** (p. 9), California, type in U. S. Nat. Mus.; **THERAPON*** (p. 12) (Bembicini), type *T.* **chilensis** (*Stictia c.* Esch.) (p. 12); **TRICHOSTICTIA*** (p. 14) (Bembicini), type *T.* **vulpina** (*Monedula v.* Hdl.) (p. 14); *T.* **brunneri** (p. 15), Peru, type in U. S. Nat. Mus.; **EDITHA*** (p. 17) (Bembicini), type *E.* **magnifica** (*Monedula m.* Perty) (p. 17); *E.* **adonis** (*Monedula a.* Hdl.=*M. stridulans* Strand) (p. 18); *E.* **pulcherrima** (p. 19), Uruguay, type in Carnegie Mus.; **SELMAN*** (p. 20), type *S.* **angustus*** (p. 20), Brazil, type in Carnegie Mus.; *Stictia* **trifasciata*** (p. 24), Paraguay, type in U. S. Nat. Mus.; *S.* **sombrana** (p. 30), Peru, type in Cornell Univ.; *S.* **infracta** (p. 33), Peru, type in U. S. Nat. Mus.; *Stictiella* **spinifera** (*Monedula s.* Mickel=*Stictiella melampous* Parker) (p. 43); *S.* **scitula** (Fox) (=*Stictiella villosa* Parker=*Monedula villosa* Fox); *Steniolia* **elegans** (p. 50), Mexico, type in Massachusetts Agric. Coll.; *S.* **guatemalensis** (*Stictia g.* Rohwer) (p. 53); **RUBRICA*** (p. 53) (Bembicini), type *Rubrica*

gravida (*Moncdula g.* Hdl.) (p. 53); *Bembix* regia* (p. 68), west central Africa; *B.* fucosa* (p. 72), Burma; *B.* loupata* (p. 73), German E. Africa; *B.* residua* (p. 75), China; *B.* recurva* (p. 76), and *B.* levis* (p. 78), west central Africa; *B.* opinabilis* (p. 79), German E. Africa; *B.* tenuifasciata (p. 82), West Africa; *B.* torosa* (p. 84), New Guinea; *B.* quinquespinosa* (p. 86), Philippines, type in U. S. Nat. Mus.; *B.* tenebrosa (p. 90), German E. Africa; *B.* stevensoni* (p. 92), German E. Africa, type in U. S. Nat. Mus.; *B.* refuscata* (p. 94), German E. Africa; *B.* alacris* (p. 99), Africa (?); *B.* aldabra* (p. 99), Aldabra Isl., type in U. S. Nat. Mus.; *B.* seculata* (p. 101), India, type in U. S. Nat. Mus.; *B.* fumida* (p. 105), Japan; *B.* nigrocornuta* (p. 106), India, type in U. S. Nat. Mus.; *B.* miserabilis* (p. 108), Japan, type in Cornell Univ.; *B.* merceti* (*Bembex handlirschi* Mercet) (p. 110); *B.* regnata* (p. 111), German E. Africa; *B.* spatulata* (p. 112), India, type in U. S. Nat. Mus.; *B.* frioensis (p. 116), Colombia, type in U. S. Nat. Mus.; *B.* festiva* (p. 118), Arizona, type in Univ. of Kansas; *B.* gradilis (p. 122), Argentina, type in Cornell Univ.; *B.* liberiensis* (p. 126), Liberia, type in U. S. Nat. Mus.; *B.* albata* (p. 127), German E. Africa; *B.* comantis* (p. 131), Brazil, type in Carnegie Mus.; *B.* flavolatera* (p. 134), Australia; *B.* agrestis* (p. 135), Abyssinia; *B.* bahiae* (p. 138), Argentina, type in U. S. Nat. Mus.; *B.* nubilosa (p. 140), Mexico, type in Massachusetts Agric. Coll.; *B.* luzonensis (p. 141), Luzon Isl.; *B.* nupera (p. 142), Kenya, Africa; *B.* gracilens* (p. 143), German S. W. Africa; *B.* liventis (p. 144), German E. Africa; *B.* hexaspila (p. 145), India (?); *B.* spiritalis (p. 147), Brazil; *B.* longipennis (p. 149), Nyasa, Africa; *B.* laeta* (p. 151), German E. Africa; *B.* bellatrix* (p. 151), Brazil; *B.* generosa* (p. 153), E. Africa; *B.* piraporae (p. 153), Brazil, type in Cornell Univ.; *B.* incognita (p. 154), Asia (?); *Microbembex* bidens* (p. 157), Argentina, type in U. S. Nat. Mus.; *M.* tricosa* (p. 159), Jamaica, type in U. S. Nat. Mus.; *M.* natalis* (p. 162), Brazil, type in U. S. Nat. Mus.; *M.* nasuta* (p. 163), Argentina, type in Cornell Univ.; *M.* equalis* (p. 164), Peru, type in U. S. Nat. Mus.; *Bicyrtes* tricolorata* (p. 171), "America Merid"; *B.* quinquemaculata* (p. 175), Bolivia, type in U. S. Nat. Mus.; *B.* pullata (p. 176), Brazil, type in Carnegie Mus.; *B.* bradleyi* (p. 178), Argentina, type in Cornell Univ.; *B.* pexa (p. 179), Cayenne, Fr. Guiana, type in Carnegie Mus.; *B.* sola (p. 180), Brazil, type in Carnegie Mus. Except where otherwise given, types of new spp. are in Zool. Mus. Berlin. A generic revision of the subfam. Bembicinae with keys for determining the various genera and keys for the several genera of the tribe Bembicini, including only those species mounted specimens of which have been examined by the author. New species described are from various parts of the world, chiefly Africa. The notes include comments on specific characters of recognized species together with emended descriptions of some of these and also data on distribution of the species listed.—*J. B. Parker.*

2640. RABAUD, E., et J. MILLOT. Étude sur Polistes gallicus (Fr.) infesté par Xenos vesparum (Rossi). *Arch. Anat. Microsc.* 25: 280-293. 1 pl., 1 fig. 1929.—Of 22 parasitized wasps collected only 4 were ♂♂. Externally the wasps parasitized by the Stylopidae had larger abdomens than normal. Microscopic study showed a decrease of adipose tissue; a reduction of cells (2-3) in the subepidermal fat layer; the malpighian tubules, genital organs, and digestive tract seemed to float free in the abdominal cavity. The ovarian tubules and ovaries were smaller than normal. The genitalia of the ♂ were scarcely affected by the parasite. There was muscular atrophy in both sexes. In extreme cases of *Xenos vesparum* infestation the wasps were castrated by the parasite.

2641. RAU, PHIL. Field studies in the behavior of the non-social wasps. *Trans. Acad. Sci., St. Louis* 25(9): 319-489. 11 pl. 1928.—A report on observations made on the behavior of 23 spp. of solitary wasps in the vicinity of St. Louis, Missouri, between the years 1917-1923. The following are treated: The life and habits of 2 beetle-hunting wasps, *Cerceris raui, C. bicornuta;* an amputator of spiders' legs, *Pseudagenia mellipes;* the grass-carrier wasp, *Chlorion auripes;* an assortment of twig dwellers, *Diphlebus biparitor, D. tenax, Silaon niger, Solenius interruptus, Stigmus fraternus raui, Hypocrabro stirpicolus;* wasps of the genus *Odynerus* and their nesting habits, *O. conformis, O. pennsylvanicus, O. leucomelas, O. foraminatus, Stenodynerus zendaloides, S. vagus, Odynerus capra;* the patriarchate wasps of the genus *Trypoxylon, T. clavatum, T. albopilosum, T. politum, T. plesium, T. texense;* the nesting habits and prey of the yellow-legged mud-dauber, *Sceliphron caementarium.*—*J. S. Wade.*

2642. RICHARDS, O. W. The species of Notogonia (Hymenoptera, Larridae), occurring in the Mediterranean Basin. *Proc. Zool. Soc. London* 1928(2): 357-363. 1928.—Keys are given to females and to males. *N. pompiliformis* Pz. with synonymy; *N. opalipennis* ♀ Kohl, Algeria; *N. subtessellata* Smith, Mesopotamia; *N. nigrita* Lep., N. Africa; *N. memnonia* Sm., with synonymy, Egypt and Mesopotamia; *N. trivittata* Kby., (type ♀ in Brit. Mus.), Sokotra; *N.* praetermissa (p. 361), France, type in Brit. Mus.; *N. nigricans* Walker, with synonymy, type ♂ from Egypt. Bibliography of 23 references.—*G. E. King.*

2643. SANTSCHI, F. Fourmis de Sumatra, récoltées par Mr. J. B. Corporaal. *Tijdschr. Ent.* 71(1/2): 119-140. 2 fig. 1928.—*Aenictus* spathifer* ♂ (p. 119); *Platythyrea* pulchella ☿ (p. 121); *Pseudoponera amblyops,* descr. of ♂; *Leptogenys* (*Lobopelta*) karawaiewi (= *Euponera* (*Brachyponera*) *luteipes* Mayr var. *arcuata* [Karawaiew?]) (p. 124); *Crematogaster* (*Acrococlia*) corporaali ☿ and ♀ (p. 126); *C.* (*Physocrema*) *inflata* Sm., first descr. of ♀; *C.* (*Orthocrema*) *biroi* v. andelis ☿ (p. 129); *Myrmicaria* (*Heptacondylus*) *arachnoidea* v. adpressipilosa ♀ (p. 130); *Iridomyrmex myrmecordiae* v. mandibularis ♂ (p. 131); *Polyrhachis* (*P.*) *bihamata* v. tonsilis (p. 133); *P.* (*Cyrtomyrma*) *rastellata* vars. corporaali*, pagana* (p. 134), and congener* ☿ (p. 135), *P.* (*Myrmhopla*) *tibialis* vars. completa ☿ (p. 135), nigricornis ☿, pectita ☿, and addax ☿ (p. 136), with key to the varieties; *Leptogenys* (*Lobopelta*) *diminuta fruhstorferi* v. nitidula (*L.* (*L.*) *d. f.* var. *nitida* Karawaiew preocc.); *Polyrhachis* (*Myrmatopa*) *fruhstorferi* v. torta (*P.* (*M.*) *f.* var. *arcuata* Karaw. preocc.); *P.* (*M.*) *schang* v. amboinae (*P.* (*M.*) *s.* var. *gracilior* Karaw. preocc.); *P.* (*Chariomyrma*) karawaiewi (*P.* (*C.*) *convexa* Karaw. preocc.); *P.* (*C.*) verticalis (*P.* (*C.*) *abrupta* Karaw. preocc.); *P.* (*Hedomyrma*) indocilis (*P.* (*H.*) *bicolor* Karaw. preocc.); *P.* (*Myrmhopla*) *acantha* st. romanovi (*P.* (*M.*) *a.* st. *dichroa* Karaw. preocc.); *P.* (*Myrma*) *conops* st. simpla (*P.* (*M.*) *c.* st. *simplex* Karaw. preocc.); *P.* (*M.*) *c.* var. stitzi (*P.* (*M.*) *c.* var. *bismarkensis* Karaw. preocc.); *P.* (*M.*) *sericata* st. pruinosula (*P.* (*M.*) *s.* st. *pruinosa* Karaw. preocc.) Africa, type in Congo Mus.; *C.* (*M.*) *v.* var. lujai (p. 75), Belgian Congo; *C.* (*M.*) *rhamses* v. completus (p. 76), and *C.* (*Paramyrmamblys*) moderatus (p. 76), Abyssinia.

2645. SATO, KAKU. The Chalastogastra of Korea. (No. 1). [To be contd.] *Insecta Matsumurana* [*Sapporo*] 2(4): 178-190. 7 fig. 1928.—Phymatocerinae: TOMOSTETHOPSIS (p. 178), related to *Tomostethus*, type *T.* metallicus (p. 179); *Atomostethus* flavicollaris (p. 179); ZAPHYMATOCERA (p. 180), allied to *Phymatocera* Dahl., type *Z.* typica* (p. 181); APHYMATOCERA (p. 182), allied to *Zaphymatocera*, type *A.* coreana* (p. 182); PHYMATOCERIOLA (p. 183), related to *Phymatocera*, type *P.* suigenensis* (p. 184); APAREOPHORA (p. 185), related to *Pareophora* Konow, type *A.* forsythiae* (p. 185); *A.* coreana (p. 187), Cimbicinae: OKAMOTONIUS (p. 188), related to *Cimbex*, *Cimbicisoma*, and *Trichisoma*, type *O.* kurisuei (p. 189). Types in author's coll.—*R. Takahashi.*

2646. SCHULTHESS, A. von. Contribution to the knowledge of African Masaridae (Vespoidea). *Ann. & Mag. Nat. Hist.* 3(17): 498-511. 5 fig. 1929.—The present article is based on the study of a small collection of vespoids (40 specimens, mainly Masaridae) from Cape Province. Keys are given to the species of *Masariella*, with which *Ceramiellus* Schulth. is seemingly synonymous, and to the species of *Quartinia* and *Quartiniella*. All types are in Brit. Mus. unless otherwise given. *Masariella* (?) turneri ♀* (p. 500); *M.* (?) algerica ♀* (p. 501), type in author's coll.; *M.* (?) testaceopicta ♀* (p. 502). Nigeria; *Quartinia* atra ♀ (p. 505); *Q.* metallescens ♀ (p. 505); *Q.* media ♀ (506); *Q.* vagepunctata ♀ (p. 507); *Q. signata* Brauns in litt. is perhaps identical with what Bradley mentions as *variegata* Brauns, not published; *Q.* scutellimacula (p. 508); QUARTINIELLA (p. 510), conforming with *Quartina*, type *Q.* waterstoni* (p. 510).

2647. SHESTAKOV, A. Species novae Ichneumonidarum subfamiliae Pimplinarum. Русское Энтомологическое Обозрение (*Rev. Russe Ent.*) 21(3/4): 220-224. 1927.—*Ephialtes* zhedenevensis ♀ (p. 220), *Polysphincta* eltshaninovi ♀ (p. 220), *Clistopyga sauberi* v. terebralis (p. 221), *Glypta* jaroslavensis ♀ (p. 221), *G.* animalcula ♀ (p. 222), *G.* pygmaea ♀ (p. 223), *Cryptopimpla* memoranda ♀ (p. 223), and *Calliclisis* patria ♀ (p. 224), all from Jaroslavl, Russia.

2648. SILVESTRI, F. Studi sugli Aphelininae (Hymenoptera: Chalcididae). *Boll. Lab. Zool. Gen. e Agraria* [*Portici*] 20: 35-41. 4 fig. 1927.—DIASPINIPHAGUS (p. 35), near *Prospaltella*, type *D.* similis* (*Prospalta s.* Masi) (p. 36); *D.* kuwanae* (p. 39), Japan.

2649. STÄGER, ROB. Unterirdische "Grabkammern" in einem Nest von Formica pratensis. *Folia Myrmecologica et Termitologica* 1(2/3): 17-21. 2 fig. 1926.—In the high Alps *F. pratensis* carries its dead and other debris to chambers made below the nest, while in other sections the dead were removed outside of the nest. The author concludes that the soil and climate are the factors which determine the disposal of the dead of this species.

2650. STÄGER, ROB. Beiträge zur Biologie von Messor barbarus L., Messor instabilis var. bouvieri Bondroit und Pheidole pallidula Nyl. *Zeitschr. Wiss. Insektenbiol.* 23(3/4): 65-94. 2 fig. 1928.—Formicidae. A treatise on the nesting habits, the collecting of seeds and other foods, warfare, trails and galleries, and their association with other ants and organisms.

2651. STÄGER, ROB. Anergates atratulus Schenck am Mittelmeer. (Hym., Formic.) *Zeitschr. Wiss. Insektenbiol.* 23(5/7): 159-162. 1928.—A preliminary note on this species, heretofore recorded only from central and northern Europe. The specimen was taken in the Italian Riviera di Ponente in the nest of *Messor barbarus;* the nest contained a mixed colony of *Tetramorium caespitum, Anergates atratulus,* and *Platyarthrus hoffmanseggi.*

2652. SZABO-PATAY, J. Trois Orectognathus nouveaux de la collection du Musée National Hongrois. *Ann. Hist. Nat. Mus. Nation. Hungarici* 24: 348-351. 6 fig. 1926.—*O.* horváthi* (p. 348); *O.* birói* (p. 350); *O.* csikii* (p. 350), all New Guinea. All 3 are hermaphrodites.

2653. THOMSEN, MATHIAS. Some observations on the biology and anatomy of a cocoon-making chalcid larva, Euplectrus bicolor Swed. *Videnskab. Meddel. Dansk Naturhist. Foren København* 84: 73-90. 13 fig. 1927.—The 3rd and 4th larval stages of *E. bicolor* are described. Unlike other chalcids before pupating this larva forms a cocoon of loose web, the thread coming out of the anus; the last 4 segments of the body which are much narrowed and form a slender, very movable "tail," are used like an arm in the construction of the cocoon. The pupa is of the usual type in chalcids (pupa obtecta). To determine the origin of the material for the cocoon the anatomy of the larva was investigated. The secretion fills the whole hind-intestine (rectum, colon, and ileum) which, as in other hymenopterous larvae, is not in connection with the mid-intestine; but the secretion is produced in the malpighian tubes of which there are 3, 2 long anterior bands of large cells and a short median, backward projecting unsymmetrical tube. No other hymenopterous larva is known where the cocoon is formed by a secretion from the malpighian tubes. The other organs are briefly described. The author disagrees with Tiegs in his interpretation of some of the organs of another chalcid larva, *Nasonia brevicornis.*—*M. Thomsen.*

2656. ULBRICHT, ALB. Niederrheinische Ichneumoniden. *4th Supplement. Mitteil. Naturwiss. Mus. der Stadt Crefeld, March* 1926: 1-30. 1926.—An extensive list of spp. including: *Ichneumon fabricator* v. varicolor (p. 3); *Gelis* leucurus ♀ (p. 10); *Pimpla* inornata (p. 11); *Glypta genalis* v. rufina (p. 12); *Ophion* ocellaris (p. 14); *Exochilum circumflexum* v. rubropictum (p. 15); *Absyrtus luteus* v. exareolatus (p. 19); *Tryphon signator* v. nigrifacies (p. 22); *Polyblastus varitarsus* v. xanthostomus (p. 22); *P. carbonarius* v. rhenanus (p. 22); *P. pastoralis* v. rufiventris ♀ (p. 23); *P. p.* var. tegularis (p. 23); *P.* hachfeldi ♀ (p. 23); *Grypocentrus* erythrusus (p. 24); *Mesoleptus prosoleucus* v. rufiventris (p. 26); *Ipoctonus atomator* v. melanurus (p. 26); *Barytarbes* ruficornis (p. 27).

2657. VERLAINE, L. La détermination du sexe femelle chez les Hyménoptères sociaux. [Determination of female sex among wasps and bees.] *Naturalistes Belges.* 7(6): 86-95. 1926.

2658. VERLAINE, L. L'instinct et l'intelligence chez les Hyménoptères. IX. La notion du temps. *Bull. et Ann. Soc. Ent. Belgique* 69(4): 115-125. 1929. [See also B. A. 2(3/5): entry 8107; 3(4/6): entries 4799 and 4800.]—A contrivance similar to that used by Tolman and Sams (1925) to demonstrate time discrimination in white rats, was em-

ployed to test the conception of time by wasps. Wasps used in the experiment learned to discriminate between a passage-way in which they had been imprisoned for 30 minutes from one which permitted the leaving of the nest in 4-6 min. Of these 2 passages of equal length it was soon apparent that the first was always avoided by a certain number of individuals. Experiments with labyrinths with apertures of unequal lengths, such as used by White and Tolman, gave less satisfactory results.—*L. Verlaine (transl. by H. Spencer).*

2659. **VERLAINE, L. L'instinct et l'intelligence chez les Hyménoptères. X. La reine des abeilles dispose-t-elle à volonté du sexe de ses oeufs?** *Bull. & Ann. Soc. Ent. Belgique* 69(8/9): 224-238. 1929.—In a previous article the author advanced the hypothesis that fertile queens, with abundant spermatozoa, lay only fertilized eggs which produce workers and queens; that the ♂♂ (drones) all develop from eggs of laying worker-bees. Recent experiments indicate that queens lay eggs of 2 kinds: fertilized and not fertilized; but at the same time in a normal hive, workers also deposit some eggs. The queens of several hives of Italian bees were exchanged with queens from hives of pure black bees. Drones of 2 colors have continued to appear in each hive.—*L. Verlaine (transl. by H. Spencer).*

2660. **VERLAINE, L. L'instinct et l'intelligence chez les Hyménoptères, XI. La construction des cellules hexagonales par les Guêpes et les Abeilles.** *Bull. et Ann. Soc. Entom. Belgique* 69(10/11): 387-417. 3 pl. 3 fig. 1930.—After building a certain number of cylindrical cells, the fundatrix wasp queen constructs hexagonal cells; workers do likewise. *Vespa media* is possibly an exception. *Chartergus chartarinus* Sauss., from the Amazon, places the bases of hexagonal cells upon the flat surface of the last built comb. The same phenomenon obtains in bees to a certain extent but the type of material used by them is not well adapted to this unusual construction. Swarms composed of bees, reared in artificial breeders, which have had no contact with other individuals, live only on condition that they remain on the combs for a maximum period of 24 hrs. These bees succeed in building in a normal way but at first are ignorant of the ultimate destination of the wax secreted by their abdomens. This wax is shed or else permitted to accumulate in large quantities under the abdomen. The placing of cupules containing pollen in the hives has made possible the gathering of wax in 15 day old bees. Some groping is evident in first construction. The hexagonal cell and regularity of construction is the result of work in common, as demonstrated by V. Willem in 1929.—*L. Verlaine (transl. by H. Spencer).*

2661. **VERLAINE, L. Le détermination du sexe mâle chez les Hyménoptères sociaux. [Determination of male sex in social hymenoptera.]** *Naturalistes Belges* 7(7): 103-107. 1926.

2662. **WALL, R. E. A comparative study of a chalcid egg parasite in three species of Plataspidinae.** *Lingnan Sci. Jour.* 6: (3): 231-239. 1928.—An unidentified chalcid egg parasite of *Coptosoma cribrarium* Fabr., was discovered in the field and by insectary rearing was found to parasitize equally well the eggs of *Brachyplatus subaëneus* Westw. and those of another species of *Coptosoma*, all being pentatomids of the subfamily Plataspidinae. The eggs of the 3 host spp., which commonly feed upon the vines of cultivated beans at Canton, vary greatly in size and the individual parasites emerging from them vary in direct proportion. The ratio of size of parasites as expressed by averages of linear measurements is 55:66:81 from *Coptosoma* sp., *Coptosoma cribrarium*, and *Brachyplatus subaëneus* respectively and there is no overlapping in size between the 3 groups. Thus if the parasite develops in *Brachyplatus* eggs instead of *Coptosoma* sp. eggs, for example, it will have about 4 times as great a bulk in the former case as in the latter. Seventy-six % of all egg groups of *Coptosoma cribrarium* collected in the field during July and Aug., and approximately 51% of the total number of eggs were parasitized. Within 24 hrs. after emergence the parasites will oviposit in host eggs if supplied. The life cycle is, therefore, 13-14 days at summer temp. The adult parasites live only about 2 days and deposit a small number of eggs (10-20) in as many host eggs. The host egg may be successfully parasitized at any time during approximately the first ⅔ of its development. It is thought that parthenogenesis occurs in the parasite but this has not been definitely proved. The developmental period of the parasite from egg to adult within the host egg requires 12-13 days in the different hosts at summer temp. Escape from the darkened egg is then effected by the lifting of the operculum just as occurs in hatching. The chalcid parasite has a life cycle of 2 weeks as compared with 7-9 weeks for the hosts. There are probably about 4 host generations annually with overlapping, and 16 parasite generations. It is thought that sufficient host eggs can be found by the parasites during the winter to enable them to continue their development which is very much retarded at this season.—*From author's summary.*

2663. **WATERSTON, JAMES. On the hedycryptine genus. Oneilella, Cam. (Hym., Ichneumonidae).** *Bull. Ent. Res.* [*London*] 18(2): 189-204. 8 fig. 1927.—A synopsis of the spp. of this African genus, which heretofore has remained monotypic, with *Cryptus formosus* Brullé as genotype. The range of the genus is coextensive with the Ethiopian region and possibly the neotropical region and the altitude range from 2000 to 10,000 ft. Hosts include various spp. of the lepidopterous genus *Anaphe*. The author finds that because of the prior use of the generic name *Cryptus* in the Tenthredinidae it is invalid in the Ichneumonidae and, following Bradley, uses Hedycryptinae as the name for the subfamily formerly known as the Cryptinae. The genus is apparently not an entirely natural category, but is formed of species of very similar general facies, and a description of the genus on this basis is given. A paragraph is devoted to genera of similar appearance. *Oneilella* Cameron (=*Ateleonotus* Cameron), type *A. ruficeps* Cameron; *Oneilella* **ruficeps** (*Ateleonotus r.* Cam.); *O.* **alacer** (*Cryptus a.* Tosq.); *O.* **corpulenta** (*C. corpulentus* Tosq.); *O.* **eugenea** (*C. eugeneus* Tosq.); *O.* **fervida** (*C. fervidus* Tosq.); *O.* **vittata** (*C. vittatus* Tosq.); all on p. 191. The following species and race are described as new, the holotype being ♀♀ where that sex is represented (types, with exception noted below, in the Brit. Mus.); *O.* **inclinata*** (p. 194), Natal; *O.* **caudata** (p. 195), Natal, Transvaal; *O.* **angusta** ♀ (p. 195), Natal; *O.* **latifascia*** (p. 196) and *O.* **approximata** (p. 196), Uganda; *O.* **analis** (p. 197), Nigeria; *O.* **dimidiata** ♂ (p. 198), Uganda; *O.* **nigeriensis** ♀ (p. 198), Nigeria, with race **rugulosa** ♀ (p. 198), Congo, type in Mus. Congo Belge; *O.* **contracta** (p. 198), Uganda; *O.* **robusta** ♀ (p. 199), Belgian Congo; *O.* **linearis** ♂ (p. 199), Brit. Sudan; *O.* **brevispicula*** (p. 200), *O.* **subquadrata*** (p. 201), and *O.* **areolata*** (p. 202), Uganda; *O.* **rufopetiolata*** (p. 202), Nyasaland. Keys for the separation of the spp. and a bibliography of 8 titles conclude the paper.—*R. A. Cushman.*

2664. **WHEELER, WILLIAM MORTON. Ants of the Balearic Islands.** *Folia Myrmecol. et Termitol.* [*Berlin*] 1(1): 1-6. 1926.—An annotated list of the ants collected on Majorca, Minorca, and Iviza in 1925. *Solenopsis latro* **fairchildi** ☿ ♀ ♂ (p. 3), Majorca; *Camponotus lateralis* **armouri** ☿ ♀ ♂ (p. 5), Minorca. Additions from the lists of Lomnicki and Menozzi make a total of 26 forms known from these islands. The fauna is Iberian and depauperate, with no endemic species but with 4 endemic subsp. and varieties: *Aphaenogaster testaceopilosa gemella, Crematogaster auberti laestrygon* v. *submaura* and the 2 new forms cited. Two other insects not previously recorded from the islands are: the myrmecophilous cricket, *Myrmecophila ochracea*, Majorca, with a new host, *Lasius niger;* and the leptid dipteron *Vermileo vermileo*, Majorca and Minorca, the larvae of which make funnel-shaped pits in dust or fine sand, and capture ants and other small insects.—*G. C. Wheeler.*

2665. WHEELER, WILLIAM MORTON. Ants collected by Professor F. Silvestri in Indochina. *Boll. Lab. Zool. Gen. e Agraria [Portici]* 20: 83-106. 9 fig. 1927.—Report on 67 spp. (a few from Siam), including: *Centromyrmex feae* Emery, larva described; *Anochetus risi* Forel, ♂ described; *Odontomachus* silvestrii* (p. 85) and v. substriatus (p. 86); *Monomorium* silvestri* (p. 87); *M.* lippulum* (p. 89); *Aneleus* cribriceps* (p. 90); *Oligomyrmex* capreolus* (p. 93); HENDECATELLA (p. 93), subg. of *Oligomyrmex; Aneleus pygmaeus* v. albipes Emery, ♂ described; *Anillomyrma decamera* ssp. continentis (p. 96); *Tetramorium* indosinense* (p. 97); *Dolichoderus feae* v. caligatus (p. 99), Siam; *Acropyga (Rhizomyrma)* silvestrii* (p. 100); *Pseudolasius* silvestrii* (p. 102); *P.* lasioides* (p. 104); *Paratrechina (Nylanderia)* picta* (p. 104).

2666. WHEELER, WILLIAM MORTON. The physiognomy of insects. *Quart. Rev. Biol.* 2(1): 1-36. 42 fig. 1927.—In the ants, the size and shape of the mandibular flexor muscles largely determine the form of the head and face, and functional peculiarities of the mandibles are closely correlated with the character of the flexor muscles. This holds for species and for castes within species. Types of mandibles may be placed in 9 groups: cutting, biting, gnawing, crushing, grappling, clipping, piercing, vestigial, and aberrant. The 1st 4 types are large and powerful, with heads correspondingly developed. The last 5 types are relatively weak, with less powerful muscles and small heads. As extremes in the same species, soldiers and large-headed workers contrast with small-headed ♂♂ with mandibles feebly developed. A similar condition exists among species of beetles, except that here the ♂♂ have the more powerful mandibles. In certain species, conspicuous, frontal convexities are due to the great development of flexor and extensor antennal muscles. Some adaptive structures in the head configuration, such as scrobes, are due to antennae. In ♂ ants having large eyes, the shape of the head is correspondingly modified. This is more conspicuous in certain haustellate insects (Diptera, Lepidoptera, Mecoptera, Heteroptera, etc.). In some of the latter the eyes may form most of the ♂ head. Development of hairs on the gula, mandibles, and clypeus of certain species of ants indigenous to dry regions gives them a "bearded" appearance. Adaptations to non-living environment are found in the elongated head and body of ants living in narrow cavities, and in peculiar modifications ("phragmosis") for closing the burrows. Shape of thorax is largely dependent on development of wing musculature, although development of leg muscles is also important. The abdomen physiognomy is determined more by volume of viscera than by development of segmental musculature.—*R. B. Friend.*

2667. WIEL, P. van der. Een nest van Ponera punctatissima Rog. [A nest of P. punctatissima.] *Ent. Berichten [Amsterdam]* 7(153): 175-176. 1927.—Imagines of this species were taken at Mijdrecht for several successive years, and in Oct. 1925 a nest was found, containing immature stages and workers.

Ent.-Vereines* 13(9): 91-92; (10): 96-100; (11): 107-108; (12): 117-120. 1928; 14(1): 11-12; (2): 22-24; (3): 34-36; (4): 44-48; (6): 66-68; (7): 76; (8): 83-84; (9): 89-91; (12): 125-126. 1929.—An extensive list of 596 spp., based on material collected by Dr. M. Kitt in 1917-18 and by the author 1913-1919.

2673. HORMUZAKI, CONSTANTIN. Grundlinien für die Biogeographie und Biogenese der europäischen Makrolepidopteren. Die Entwicklung der europäischen Lepidopterenfauna seit der Tertiärzeit im Lichte der Paläogeographie, Pflanzengeographie und Paläontologie. *Bul. Fac. Stiinte Cernăuți* 3(1/2): 111-159. 1929; 4(1): 3 maps. 50-135. 1930.—In both papers the author states that the European Lepidoptera probably did not migrate after the ice age from Siberia or from western Asia. Taking into consideration the geographical distribution of Lepidoptera, the geological evolution, palaeontology and phytogeography, it is shown that at the end of the Pliocene period Europe and northern Asia were inhabited by a rather homogeneous Lepidoptera fauna of different origins (autochthonous, American, northern, etc.), and that recent spp. were almost entirely developed at that time. The Lepidoptera adapted to temperate zones were destroyed in Siberia by the cold dry climate of the Quaternary, but persisted in some sheltered parts of central and southern Europe and in portions of eastern Asia, as in the Amur-territories, Korea, and Japan. After the ice age Siberia was again populated by hardier Lepidoptera of the temperate zone, from both Europe and eastern Asia. But many delicate spp., called by the author "Sibylla-type," were prevented from penetrating again into Siberia even with its recent continental climate, and are now confined to Europe and to eastern Asia. This discontinuous distribution is evidence of the described evolution. The appearance of new families, genera and species during the geological periods are discussed. The expression "eurytopy" is introduced for a sudden appearing of new spp. in an extended territory. The autochthonous origin of the Mediterranean and alpine fauna and the difference between the latter and the arctic one, and the common origins of the European

and Caucasian fauna, are also explained by the distribution and geological history of Lepidoptera. It is shown, further, that the quaternary fauna of northwestern Africa was tropical (like the recent one south of the Sahara), and that the actual Mediterranean fauna of this region immigrated from Europe. Northern Europe received its fauna after the retrogression of the last glaciation by immigration from the southern parts of central Europe, where, during the ice age, the central-European Lepidoptera remained. The author concludes that there have been no extensive immigrations of Lepidoptera into Europe later than the Tertiary and that the recent European fauna is indigenous.—*C. Hormuzaki.*

Map. 1929.—Notes on the distribution of certain mammals, birds, and reptiles in this sharply-defined faunal area are given, and previous work on the Lepidoptera is mentioned. Of 515 recorded forms of Lepidoptera, 180 belong to the Noctuidae. The author lists 62 forms of Macrolepidoptera not previously recorded from this area.

2684. **PROUT, LOUIS B.** New Fijian Geometridae. *Ann. and Mag. Nat. Hist.* 6(36): 690-697. 1930.—*Erythrolophus bipunctatus* **idmon** (p. 690); *Gymnoscelis* **tylocera** ♂ (p. 691), bred from larvae feeding on leaves of *Glochidion; Sauris* **acanthina** ♂ (p. 692); *S.* **priva** ♂ (p. 693); *Scardamia* **eucampta** ♀ (p. 694); *Bulonga* **phillipsi** ♂ (p. 695); *Luxiaria* **sesquilinea** ♂ (p. 695), type in Zool. Mus. Hamburg; *Petelia* **aesyla** ♂ (p. 696). Types in British Mus., unless otherwise stated.

2685. **RAEBEL, H.** Neue Boarmia-Formen. *Internat. Ent. Zeitschr.* 24(8): 103-106. 1 pl. 1930.—*B. crepuscularia* ab. *defessaria** f. **extrema*** (p. 104); *B. luridata** fs. **intermediata*** (p. 104), **variegata*** and **fasciata*** (p. 105). All from upper Silesia.

2686. **REISSER, HANS.** Beschreibung der unbekannten ersten Stände einiger corsischer Geometriden. *Zeitschr. Österr. Ent.-Vereines* 14(1): 3-6; (3): 31-33; (4): 42-44; (8): 79-81. 1929.—First to 4th moltings and pupa of *Ptychopoda obliquaria, Ellopia pinicolaria,* and eggs and larva of *Ptychopoda infirmaria* are described, with notes on rearing.

2687. **REUSS, T.** Die Argyreidae T. Rss., fam. nov. *Internat. Ent. Zeitschr.* 22(14): 145-146. 1928.—**ARGYREIDAE** (p. 146), with Argyreinae as typical subfamily, and to include also Yrameinae; **PROTODRYAS** (*Prodryas* T. Rss. preocc.) (p. 146).

2688. **SCHAWERDA, KARL.** Neue und interessante Formen aus meiner Sammlung. *Zeitschr. Österr. Ent.-Vereines* 14(11): 105-107; (12): 117-120. 1929.—[Macrolepidoptera] *Melitaea parthenie nevadensis* ab. **corythalina** (p. 105); *Eriogaster catax* ab. **auriflua** ♂ (p. 105); *Aporophila lutulenta* ab. (var.) **brunnea** (p. 106); *Episema* (*Derthisa*) *trimacula* ab. **lilascens** (p. 106); *Hadena satura* (*porphyrea* Esp.) ab. **variegata** (p. 107); *Plusia pulchrina* ab. **incipiens** (p. 107); *Acantholipes regularis* v. (ab.?) **hilaris** (p. 117); *Rhynchodontodes ravalis* (gen. *aestivalis?*) ab. **pallida** (p. 118); *Cidaria montanata* ab. **pseudolapponica** (p. 118); *Ematurga atomaria* ab. **kindervateri** (p. 119); [Microlepidoptera] *Zygaena rhadamanthus* ab. **minicolor** (p. 120).

2689. **SCHMIDT, ANTON.** Eine neue europäische Psodos-Art im Vergleich zur coracina-Gruppe und Ps. alpinata Scop. *Internat. Ent. Zeitschr.* 24(3): 25-32. 3 pl., 3 fig. 1930.—*P.* **dioszeghyi*** (p. 25), Transylvania, type in Hungarian Nat. Mus. Extensive comparative notes are given.

2690. **SCHWANWITSCH, B. N.** Studies upon the wing-pattern of Catagramma and related genera of South American nymphalid butterflies. *Trans. Zool. Soc. London* 21(2): 105-286. 5 pl. 18 fig. 1930.—The continuation of a series of studies on this subject, covering the *Catagramma* group, which are arranged in the following order of increasing specialization of pattern: *Lucinia, Perisama, Orophila, Cyclogramma, Callicore, Catagramma.* The pattern is found to be a development of the typical nymphalid pattern (Schwanwitsch, 1924), especially by a basal movement of elements, following the disappearance of the discocellular veins, and simplification by both fusion of elements and the dropping out of elements, with an increase in some, usually 3-5, of the series of ocelli. All the pattern elements are recognizable as belonging to the hypothetical pattern, though finally only 7 of the original 20 components may be present ("oligonome" type). However, 18 out of the 20 components may be found in the group, 15 in Catagramma alone. The principal feature of the wing patterns of *Catagramma* and *Callicore* is that the majority of the pattern components become strongly dislocated toward the wing-base, the stripes called "mediae" (which cross the middle of the wing in the prototype) becoming approximate to the wing-base, and the eyespots coming to lie near the center of the wing. The dislocations eventually lead up to the "meandric" type of pattern, composed of sinuous equidistant components, which are independent, in a sense, of the wing-venation (e.g., *Callicore anna*); and to the formation of 3 concentric rings on the periphery of the wing, by the joining up, via the anal part of the wing, especially, of "medial" and submarginal components. The principal characters of

the wing-pattern of *Catagramma* are (a) the tendency to nigrism, i.e., the broadening of the pattern components, which may culminate in a strong suppression of the ground color, (b) the presence of the "ocello-circuli," elements formed by the fusion of the ocelli with their surrounding circuli and (c) the coalescence of the 2 mediae. *Catagramma* may be divided into 3 sections: *astarte**-type with coalesced mediae, *cyllene** with separate mediae, and *maimuna** with a well-pronounced discal stripe. The principal pattern character of *Callicore* is the "medial hook,"—a separated portion of the first media which does not follow the rest basally, but combines with one of the "circuli" to form one of the two "8's." The other is formed of 2 circuli. The development of the "88" pattern is traced through *Perisama, Orophila,* and *Cyclogramma.* The medial hook occurs also in the *maimuna* pattern in *Catagramma.* The culminations of other principal modifications, which are traced, are *Perisama eminens** and *vaninka**, *Callicore liduina**, and *Catagramma kolyma, sorana, cynosura**, *costa**; *pyracmon**, *hesperis**, *felderi**, *atacama**, *eunomia**, *pitheas**, *lyrophila** and *odilia**. The lines of development, as in other groups discussed previously, may be treated under elimination of components, dislocation, coalescence, alteration in size, etc. Certain pattern components, or their parts, may acquire a red or ochre-yellow coloration, which indicates their approaching disappearance. These areas of change of color are exactly localized. The typical colors of the ground of the Catagrammas are yellow, metallic blue, and white, the blue and the white being localized in a few definite interspaces between or within the prototypical components. Four more general phenomena are dealt with: elasticity of pattern components, interaction between them, their independence of the veins, and their incongruity with the enclosing outline of the wing, whereby certain elements may migrate beyond the wing-edge and be lost. The components may influence each other (a), by a sort of repulsion, or by symmetrical alterations in their various features, or (b), by the fusion or even mutual annihilation of 2 components in contact with each other, or (c) one component may override another and so annihilate it. The discussion is confined in large part to the under sides of the hind wings, most of which are figured.—*W. T. M. Forbes.*

2691. SEITZ, ADALBERT. Die Gross-Schmetterlinge der Erde. *Fauna Palaearctica. Suppl.* 1: pp. 57-91. pl. No. 5 & 6. Alfred Kernen: Stuttgart, 1929-1930.—Continuation and conclusion of the treatment of the palearctic Papilionidae by CHR. BOLLOW. An alphabetic index with place of original publication, of all the spp. listed, concludes the paper.

2692. SEITZ, ADALBERT. Die Gross-Schmetterlinge der Erde. *Fauna Palaearctica. Suppl.* 1: pp. 93-120. pl. No. 7 & 8. Alfred Kernen: Stuttgart, 1930.—The present installment contains the genera and spp. of the family Pieridae by CHR. BOLLOW. The alphabetic index is begun of all the palearctic spp. listed, with data of original descriptions.

T. M. Forbes.*

2696. SÜFFERT, FRITZ. Zur vergleichenden Analyse der Schmetterlingszeichnung. (Vorläufige Mitteilung.) *Biol. Zentralbl.* 47(7): 385-413. 9 fig. 1927.—The author establishes certain principles of pattern in Lepidoptera. He indicates the transverse banding of the wings and outlines the system of primary symmetry according to which the basal part of the wing is a repetition in mirror-fashion of the arrangement of pattern of the outer side of the wing, with the dividing line running through the middle of the wing. Furthermore, he describes the compound pattern with the special case of spiral formation as a central ocellus. The *nymphalid* pattern forms 2 bands followed by another pair of bands on both sides divided by the disco-cellular vein as the component parts of the primary symmetry indicated above. In the region of the exterior part of the wing extends a row of interneural ocelli enclosed between 2 bands, constituting a phenomenon of local symmetry. The sequence of the pattern is concluded by an antemarginal band. An example of the formation of secondary compound bands is found in *Papilio podalirius.** The author characterizes the principle of a generalized pattern independent from anatomical properties and structural border lines of the wing. A lifelike mimetic underside of the genus *Kallima** is an example of extreme generalized pattern. The exposed part of the wing frequently has a pattern different from the concealed part in the natural position of the insect. Finally, the author discusses the significance of the pattern from the phylogenetic, physiological and morphological angles.—*A. Avinoff.*

2697. VERITY, ROGER. The Asiatic origins of the western palaearctic Rhopalocera exemplified by Melitaea didyma Esp. *Ent. Rec. and Jour. Variation* 41(2): 31-34; (3): 39-43; (4): 63-67; (5): 72-76; (6): 89-91; (7/8): 111-118; (9): 127-132. 1929.—The genus *Melitaea* is considered to have developed from the American *Phyciodes* during the Cretaceous in the then united arctic continent. *M. didyma* is representative of a group centering in eastern Asia, and has no American relatives. It undoubtedly arose in Asia in the period when the arctic continent had become uninhabitable and the genus was driven further south. It is considered that in the warm Eocene, Asia was divided into a group of large and small islands, of which the principal were a Pamir-

Thibetan, a Thian-Shan island, and a more northern Siberian continent, all cut off in western Asia by a sea. Each of these is the origin of an "exerge" or group of races of common origin. Where two exerges come into contact secondarily and merge, races are produced belonging to what Verity calls "synexerges" to distinguish them from the similarly variable races that indicate the approaching differentiation of two races. Synexerges are now most characteristic of the zone from central Spain to the western Alps, where exerges from north and south of the Mediterranean have come into contact secondarily. In the early Miocene, the central Asian region became much cooler and the straits separating the islands tended to disappear, allowing the various exerges to spread and merge. The first release was from the Pamir-Thibetan area, the fauna of which migrated west through north Africa and even reached the Canary Is. Later a series of cooler forms escaped via Asia Minor, Greece, and Tunisia. Finally as the climate became much cooler, the mountain-types came west in association with the moufflon. Detailed parallels are drawn from other spp. and genera, especially from the Parnassiinae. The Thian-Shan and Pamir islands also fused and exchanged exerges, resulting in overlapping doublet-spp.,—sometimes closely related, though with different genitalia, sometimes mere exerges. There are 3 chief exerges in Asia, typified by *didymoides* Ev. in S. E. Siberia, *agar* Obth., in west China and Tibet, and *ala*, in central Asia. There are 3 exerges in Europe; *didyma* (north), *dalmatina-caucasica* (central) and *casta-occidentalis* (south, reaching north to Aragon). The numerous races and forms are discussed in detail, and the following are described as new: *M. ala chitralensis* summer form **chitralipluvia** (p. 43), India; *M. didyma* **rectealpina** (p. 66), Bormio, Rhaetic Alps, the original figure of *alpina* being based on a gray aberration from Constantinople; **superalpina** (p. 66), above Bormio, 2000 M.; **garumna** (p. 72), France; *garumna*, summer f. **postgarumna** (p. 72), Gironde; **pyrenealpina** (p. 73), Gèdre, Hautes-Pyrénées, 1100 M.; **subseilemis** (p. 73), France; **subtarlonia** (p. 74), Italy, 900 M., with a late spring form **praemarsilia** (p. 74); *M. d. georgi* spring form **ignea** (p. 74), and ab. **atrarubra**, Italy; *M. d. marsilia* autumn form **microleopardata** (p. 76), France; *M. d. subpatycosana* summer form **magnaestiva** (p. 76), France; *M. d. tarlonia* f. **atralpina** (p. 89), Valais, high levels; *M. d. t.* f. **ravalpina** (p. 90), Schnalsertal; *M. d. oreithyia* 2nd brood **postoreithyia** (p. 91), Istria; **araratica** (p. 113) race (or 2nd brood) of *meridionalis*, Mt. Ararat; **proteaoccidentis** (p. 117), Morocco; early spring form **cataprotea** (p. 117), Spain, with late spring form **cataoccasus** (p. 118) and summer form **cataminuta** (p. 118); **magnacasta** (p. 128), Persia; ab. **hiberava** (p. 130), Spain; *M. phoebe guevara* Früh (=*aabaca* Vty.); *M. cinxia* **carpetana** (*castiliana* Turati nec Melcón) (p. 132). —*W. T. M. Forbes.*

2698. WAGNER, FRITZ. Selenia bilunaria nov. var. harrisoni und nov. var. garretti. *Zeitschr. Österr. Ent.-Vereines* 13(6): 62-63. 1928.—Both from England.

2699. WARNECKE, G. Weitere neue Macrolepidopteren aus Süd-Arabien. *Internat. Ent. Zeitschr.* 23(33): 389-392. 1 fig. 1929.—[Microlepidoptera] *Cossus* **frater*** (p. 389), and [Macrolepidoptera] *Leucania* (*Hyphilare*) **affinis** ♀ (p. 391).

2700. WARNECKE, G. Einige Bemerkungen zu asiatisch-paläarkt. Schmetterlingsarten der Subfamilie der Hemitheinae (Lep. Geom.). *Internat. Ent. Zeitschr.* 24(10): 132-134. 2 pl. 1930.—This paper is based on study of material in the Zool. Mus., Hamburg. *Aracima muscosa* f. **privata*** (p. 132), Amur; *Thalera fimbrialis* ssp. **major*** (p. 133), Turkestan.

2701. WEHRLI, EUGEN. Ueber einige nordafrikanische Geometriden (Lepid. Heterocera). *Internat. Ent. Zeitschr.* 23(37/38): 429-438. 1930.—A list of little known spp., including: *Pseudoterpna coronillaria* ssp. **algirica** (p. 429), presumably Algeria; *Glossotrophia asellaria* ssp. **taurica** (p. 430), Turkey; *Ptychopoda* **culoti** (p. 434) and *P. oranaria* ssp. **maroccana** (p. 435), Morocco; *P. calunetaria* ssp. **episticta** (p. 436), Algeria and Morocco; *Lomographa trimaculata* vars. **oranaria** and **postrecta** (p. 438), Algeria.

2702. WOJTUSIAK, R. J. Entwicklungsgeschichtliche und psychographische Studien an Mamestra-Raupen. *Bull. Internat. Acad. Polonaise Sci. et Let. Cl. Sci. Math. et Nat. Sér. B: Sci. Nat. II* [*Zool.*] 1929(1/2): 1-54. 1 pl., 5 fig. 1929.—There is a detailed description of the eggs and all larval instars of the noctuid moths *M. brassicae* L., *splendens* Hb., and *trifolii* Rott. The eggs differ in size and number of ribs, the larvae in color of head, number of longitudinal stripes and other color markings. The markings change in definite directions during growth. All 3 spp. have both green and brown larval forms. Curves of the growth rate of each sp. are given. In *Mamestra*, the prolegs of the 3rd and 4th abdominal segments are poorly developed at hatching so that locomotion is of the geometrid type. With each successive instar the prolegs are better developed and the gait is correspondingly altered. The absolute speed of progression is faster but is less compared to body length in the later instars. Larval reactions are considered at length, including cleaning reflex, reactions to touch and shaking in various instars, response to light, behavior immediately after hatching and during ecdysis, and relation of light to finding of food.—*L. H. Hyman.*

2707. FIORI, ATTILIO. Valore sistematico di alcune forme del genere Hyponomeuta Latr. *Boll. Lab. Ent. Ist. Sup. Agrario Bologna* 3: 246-253. 1930.—A study of the characteristics of several hundred specimens of *Hyponomeuta* from broods cultivated on *Evonymus*, hawthorn, apple, and plum, demonstrated the extreme variability in the chromatic characters which had served to distinguish *H. cognatellus, H. padellus,* and *H. malinellus*. The form which lives on *Evonymus* is more homogeneous and fairly well characterized and may be assigned to *H. cognatellus*. The forms on the other 3 plants probably belong to one sp., *H. padellus* L. (=*H. malinellus* Zell.).—*From author's summary.*

2708. JONES, FRANK MORTON. The mating of the

Psychidae (Lepidoptera). *Trans. Amer. Ent. Soc.* 53(4): 293-312. 6 pl., 2 fig. 1927.—The ♂♂ are attracted by scent to the silken bag of a receptive ♀, which hangs head downward within her recently-split pupa-shell. By severe muscular exertion, the ♂ inserts the tip of his abdomen in the narrow opening of the silken bag. The abdomen then becomes enormously lengthened by pneumatic pressure, passing up between the body of the ♀ and the inner wall of her pupa-shell for her entire length. Mating is thus made possible by the extension of the body of the ♂, and not by the protrusion of a thread-like ductus ejaculatorius, as heretofore described, this organ being extrusible only by eversion and to a limited extent. In *Thyridopteryx ephemeraeformis* the numerical proportions of the sexes, the plural matings of the ♂♂, and the behavior of fertilized and unfertilized ♀♀, all indicate that if parthenogenesis occurs in this species, it is exceptional.—*F. M. Jones.*

2709. **McDUNNOUGH, J. The Lepidoptera of the north shore of the Gulf of St. Lawrence.** *Canadian Ent.* 62(5): 107-117. 2 fig. 1930.—A list containing large elements of the Labrador fauna, also typical members of the Canadian and Hudsonian zones. 21 families are represented, including: (Geometridae) *Eupithecia* **bradorata** ♀* (p. 110), Bradore Bay, Quebec; (Eucosmidae) *Dichrorampha dana* v. **bradorensis** (p. 115), Bradore Bay. Types in Canadian Nat. Coll. Genitalia of ♀ *Hemimene bowmanana* are figured for the first time.

2711. **PETERSEN, WILHELM. Die Blattminierer-Gattungen Lithocolletis und Nepticula (Lep.) Teil II. Nepticula Z.** *Stettiner Ent. Zeit.* 91(1): 1-82. 3 pl., 16 fig. 1930.—Mainly a review and reclassification of the palearctic spp. of *Nepticula,* based primarily on genitalic characters. Nearly 100 are described. Material is mostly from Estonia, Germany, Sweden, and England. There is a discussion of the chief variable characters in the genus. The simple uncus, presence of subscaphium, more complete venation, coarse scaling, and cocoon in the mine, are considered primitive. The black head is viewed as a modern specialization, frequently postglacial, and often confined to the ♂. The larva feeds upon woody members of the Rosaceae, Betulaceae, Fagaceae (Cupuliferae), and Salicaceae. Comparisons are made with the similar habits of the genus *Lithocolletis.* The spp. are divided into 11 genitalic types, 3 of which are subdivided; and ♂ genitalia are figured. There are descriptions and discussion of known spp., and of one new variety: *Nepticula betulicola* v. **nanivora** (p. 61), on *Betula pubescens* and *B. nana,* Saxony and Estonia.—*W. T. M. Forbes.*

2712. **PICKENS, A. L. The "coffee-pot" cocoon and the insect that makes it.** *Pan-Pac. Entomol.* 6(2): 63-66. 7 fig. 1929.—Describes the larva*, cocoon*, and spinning method of *Megalopyge crispata,* with notes on imago and oviposition.—*W. T. M. Forbes.*

2713. **PIERCE, F. N. Peronea fissurana Pierce and Metcalfe.** *Entomologist* [*London*] 63(810): 259. 1930.—*P. fissurana* fs. **costimaculana** and **trimaculana.**

2714. **PUPPINI, GIUSEPPE. Contributo alla conoscenza dell'Anarsia lineatella Zeller e appunti sulla Recurvaria nanella Hübn.** *Boll. Lab. Ent. Ist. Sup. Agrario Bologna* 3: 183-220. 2 pl., 18 fig. 1930.—The morphology and life history of *A. lineatella* are studied, with descriptions and figures of adult, egg, and larval stages. It has 2 annual generations in Emilia, Italy, and infests fruit trees (chiefly spp. of *Prunus*). The braconid *Apanteles xanthostigmus* and the chalcid *Paralitomastix variicornis* parasitize this sp. Methods of control are reviewed. *R. nanella** has but one generation. It attacks the flowers of almost all cultivated Rosaceae of the subfamilies Pruneae and Pomeae. Parasites obtained from it were 2 braconids, *Ascogaster annularis* and *A. quadridentatus,* and 1 dipteran, *Phytomiptera nigrina.*

2715. **SERVADEI, ANTONIO. Contributo alla conoscenza delle Hyponomeuta padellus L., cognatellus Hbn. e vigintipunctatus Retz.** *Boll. Lab. Ent. Ist. Sup. Agrario Bologna* 3: 254-301. 8 pl., 19 fig. 1930.—A detailed study of these 3 forms, including descriptions and figures of successive stages in the life history of each, and discussion of habits and habitat. The author confirms Fiori's conclusions that differences in host plant are responsible for the differences noted between the 3 forms, which constitute a single morphological species, *H. padellus.* The following parasites and predators were noted. On the *H. padellus* which lives on the apple: [Hymenoptera] *Herpestomus brunneicornis, Hemiteles areator, Pimpla examinator, P. alternans, Angitia armillata, Mesochorus vitticollis, Chorinaeus tricarinatus, Tetrastichus evonymellae,* and *Habrocytus hyponomeutae;* [Diptera] *Discochaeta hyponomeutae* and *Phorinia aurifrons;* and a dipterous predator, apparently *Sarcophaga affinis.* On the *H. padellus* of hawthorn: [Hymenoptera] *Herpestomus brunneicornis, Angitia armillata,* and *Tetrastichus evonymellae;* [Diptera] *Phorinia aurifrons;* and a dipterous predator (*?Sarcophaga affinis*). On the forms from the plum: *Tetrastichus evonymellae* and *Phorinia aurifrons.* On *H. cognatellus:* [Hymenoptera] *Angitia armillata, Mesochorus semirufus,* and *Ageniaspis fuscicollis;* [Diptera] *Ptychomyia selecta.* On *H. vigintipunctatus:* [Hymenoptera] *Angitia armillata* and [Diptera] *Nemorilla maculosa.* The life histories of the parasites are discussed in connection with their effect on *Hyponomeuta.*

2716. **van EECKE, R. Beschrijving der ontwikkelingsstadia van Thosea asigna. [Description of the immature stages of T. asigna.]** *Zool. Mededeel.* [*Leiden*] 13(3/4): 224-225. 1 fig. 1930.—Description of egg, larva*, pupa, cocoon*, and adult*. It is found on the oil-palm.

NEUROPTEROIDS

F. M. CARPENTER, *Editor*

(See also in this issue Entry 2759)

2717. **BANKS, NATHAN. Some new neotropical neuropteroid insects.** *Psyche* 37(2): 183-191. 1 pl. 1930.—Psocidae: **COMPSOCUS** (p. 183), type *C.* **elegans*** (p. 183), Panama; *Hemipsocus* **pretiosus*** (p. 184), Cuba and Florida; *Thyrsopsocus* **pretiosus*** (p. 185), Panama; *T.* **bellulus*** (p. 185), Honduras. Ephemeridae: *Callibaetis* **completa*** (p. 187), Cuba. Hemerobiidae: *Hemerobius* **cubanus** (p. 187) and *Megalomus* **cubanus*** (p. 188), Cuba. Coniopterygidae: *Coniopteryx* **marginalis** (p. 189), Cuba. Myrmeleonidae: *Myrmeleon* **wrighti*** (p. 189), Cuba; *Austroleon* **garciana** (p. 190), Isle of Pines. Type presumably in Mus. Comp. Zool., Harvard.

2718. **[BARTENEV, A. N.]** БАРТЕНЕВ, А. Н. О палеарктических видах подрода **Cordulegaster Leach.** (Odonata). [Palearctic spp. of the subgenus Cordulegaster.] [German summary.] Работы Северо-Кавказской Гидробиологической Станции (*Trav. Sta. Biol. Caucase du Nord*) 3(1/3): 1-33. 4 fig. 1930.—A table shows the distribution of the spp. and vars. of the genus *Cordulegaster,* and a key is given to the spp. and vars. of the subgenus. There is a detailed systematic account of the 14 known spp. *C.* **magnificus*** ♀ (p. 8), locality unknown; *C.* **mzymtae*** ♀ (p. 12), Caucasus; *C. insignis* v. **lagodechicus** (p. 14), "Kakketiia." Dimorphism, distribution, and evolutionary tendencies are discussed.

2719. **[BARTENEV, A. N.]** БАРТЕНЕВ, А. Н. Заметка о сборах стрекоз Северо-Кавказской Гидробиологической Станции в 1928 году в Кабарде и

Балкарии. [Odonata collections of the North Caucasus Hydrobiological Station in 1928 in Kabarda and Balkaria.] Работы Северо-Кавказской Гидробиологической Станции (*Trav. Sta. Biol. Caucase du Nord*) 3 (1/3): 85-86. 1930.—A list of 15 spp., with locality records.

2720. **BLAIR, K. G.** A list of the British Ephemeroptera. *Entomologist* 63(803): 82. 1930.—A check list of 42 spp.

2721. **BYERS, C. FRANCIS.** A contribution to the knowledge of Florida Odonata. *Univ. Florida Publ., Biol. Sci. Ser.* 1(1): 1-327. 7 maps. 11 pl., 12 fig. 1930.—The author lists 119 spp. taken in, or reported from, Florida. Of these he collected 92 species, consisting of 1592 specimens. At least 20 of the 92 spp. have never been recorded from Florida before, and 3 (*Negomphoides ambigua* (Selys), *Dythemis rufinervis* (Burm), and *Lestes tenuatus* Rambur) are new to the U. S. A. Many records, hitherto uncertain, have been authenticated. Complete descriptions and keys are given for 47 genera and 114 spp., ♂♂, ♀♀, and nymphs; 17 spp. were reared from nymphal instars to adult, 7 of these represent new life histories, the nymph never having been known previously. The author divides Florida into 9 major, natural biotic areas, which he characterizes, and attempts to determine the species, both nymph and adult, associated with each area. Detailed ecological observations on habits, habitat and life histories are recorded, with brief geological, physiographical, and climatological data included in order to furnish a background for discussions on zoogeography. The discussions of zoogeography deal with the place of origin, migration routes, present day distribution, and factors influencing distribution of the Odonata as appertaining to Florida, with the conclusion that temp. is the most potent single factor affecting distribution and acts as a barrier to their migration.—*C. F. Byers.*

2722. **IDE, F. P.** Contribution to the biology of Ontario mayflies with descriptions of new species. *Canadian Ent.* 62(9): 204-213. 1 pl.; (10): 218-231. 2 pl. 1930.—Collecting records made at 4 localities which are described for their ecological conditions. Ephemerinae 5 spp., Baetinae 25; *Leptophlebia*, key to and descriptions of nymphs of 5 spp., *L. volitans*, mollis*, guttata*, adoptiva*, and debilis**; *Ephemerella* depressa (p. 212), ♀* and nymph; *Eurycaenis* pallida ♂* (p. 218), type in Roy. Ontario Mus.; descriptions and figures are given of nymphs of *Baetis parvus, B. pygmaeus, Pseucloeon carolina, Centroptilum bellum,* and *Cloeon mendax; Centroptilum* convexum* (p. 222); *Callibaetis americanus,* description of mating habits. Heptageniinae, 15 spp.; *Iron pleuralis,* description of nymph*.

2723. **IWATA, MASATOSHI.** Five new species of trichopterous larvae from Formosa. *Annot. Zool. Japonenses* 11(4): 341-351. 5 fig. 1928.—*Rhyacophila* formosae* (p. 341); *Hydroptila* formosae (p. 343); *Hydropsyche* formosae* (p. 345); *Tinodes* formosae* (p. (347); *Ganonema* formosae* (p. 349).

2724. **KIMMINS, D. E.** Some records of British Trichoptera for 1929. *Entomologist* 63(807): 172-174. 1930.

2725. **LESTAGE, J. A.** Notes sur Tirleya belgica Lest. (Éphéméroptère). Stations nouvelles. *Ann. Biol. Lacustre* 1926(15): 163-167. 1927.

W. Africa; *S.* **abessinica** ♂ (p. 30), Abyssinia; **PICTOMANTIS** (p. 30), near *Hierodula*, type *P.* **werneri** ♂* (p. 31), Natal; *Deiphobe* **brevipennis** ♂ (p. 31), India; *Creobroter* **inornatus** ♂* (p. 32), Celebes; *Vates* **biplagiata** ♀* (p. 33), Colombia (type) and Peru. Types in Mus. Stockholm.

2738. SPETT, G. Entwicklung der sekundären Geschlechtsmerkmale in der Ontogenese des Chorthippus parallelus Zett. (Orthoptera). *Zeitschr. Wiss. Biol. Abt. D, Wilhelm Roux' Arch. Entwicklungsmech. Organ.* 122(3): 593-628. 9 fig. 1930.—The nymph of *C. parallelus* molts 4 times, the 5th stage being the adult. For this study 50 specimens of each stage (25 ♂♂ and 25 ♀♀) were measured. All measurements were treated biometrically. A striking analogy obtains between the development of the secondary sexual characters of this insect and the development of those of a vertebrate. These structures appear gradually with advancing age. They are missing in the 1st instar and are entirely or partly lacking in the 2nd, in the 3rd they are rudimentary, in the 4th they are clearly visible, but reach their maximum development only when the insect becomes an adult. In comparison with previous instars, a disproportional increase in the development of the secondary sexual characteristics occurs. This phenomenon may be explained by assuming an arrest in the development of the one and a developmental stimulus in the other characters of the 2 sexes. Only the external genitalia to which belong the apical abdominal segments are clearly differentiated into ♂ and ♀ at the hatching of the egg. These differences increase with age. In this way the differentiation of the external genitalia is much in advance of the other sexual characters.—*From author's summary (transl. by A. C. Hodson).*

2739. [TARBINSKIĬ, S. P.] ТАРБИНСКИЙ, С. П. К познанию рода Calliptamus Serv. (Orthoptera, Acrididae). [On Calliptamus.] Известия Академии Наук СССР. Отделение Физико-Математических Наук (*Bull. 2741. **BANKS, NATHAN.** On some Psocidae from the Hawaiian Islands. *Proc. Hawaiian Ent. Soc. Years 1929-1930* 7(3): 437-444. 3 pl. 1931.—Lists 16 spp. from Hawaii. *Caecilius* **analis*** (p. 437), on sugar cane; **HAGENIOLA** (p. 438) (Caecilinae), based on *H.* **solitaria*** (p. 438), on cane; *Hemipsocus* is referred to the Caecilinae; *Psocus lanatus* Hagen is a *Hemicaecilius; Ectopsocus* **perkinsi*** (p. 438); *Psylloneura* **williamsi*** (p. 439), on cane; *Echmepteryx* **costalis*** (p. 439); *E.* **marmorata** (p. 439), on *Albizzia; E.* **unicolor** (p. 439); **CYPTOPHANIA** (p. 440), near *Psocinella,* based on *C.* **hirsuta*** (p. 440), on cane. New spp. are all from Oahu Isl. Four other species are illustrated showing wing characters especially and in a few cases eggs.—*O. H. Swezey.*

2742. **BONET, F.** Un nuevo hipogastrúrido cavernicola de España (Collembola). [A new cavernicolous hipogastrurid from Spain.] *Bol. R. Soc. Española Hist. Nat.* [*Madrid*] 30(9): 443-444. 1 fig. 1930.—*Hypogastrura* (*Mesogastrura*) **levantina*** (p. 443), with table of species of this subgenus.—*F. Bonet.*

2743. **BUITENDIJK, A. M.** Naamlijst van Nederlandsche Collembola. [Checklist of Netherland Collembola.] *Zool. Mededeel.* 13(1/2): 53-76. 1930.—A list, with collecting data, containing 1 Poduridae, 3 Hypogastruridae, 4 Achorutidae, 3 Onychiuridae, 13 Isotomidae, 29 Entomobryidae, 4 Tomoceridae, 1 Cyphoderidae, 13 Sminthuridae.

2744. **FERRIS, G. F.** The louse of elephants. Haematomyzus elephantis Piaget (Mallophaga: Haematomyzidae). *Parasitology* 23(1): 112-127. 2 pl. 5 fig. 1931.—A morphological study of this species is presented, together with information concerning its development, and it is concluded that this insect, which has always been regarded as a sucking louse, does not belong to the order Anoplura. It is a form with mandibulate mouth-parts and is transferred provisionally to the Mallophaga, within which order a new sub-order, **RHYNCOPHTHIRINA** (p. 127), is named to contain the single family Haematomyzidae Enderlein which has previously been established for it.—*G. F. Ferris.*

2745. **JORDAN, KARL.** Three new species of Neopsylla (Siphonaptera) from the oriental region. *Novitates Zool.* 36(2): 220-224. 5 fig. 1931.—*N.* **sondaica*** (p. 220), Java, host *Rattus concolor ephippium, N.* **avida*** (p. 221) and *N.* **tricata** ♂* (p. 223), French Indo-China, host *Rattus bowersi.*

2746. **JORDAN, KARL.** Siphonaptera collected by Mr. F. J. Cox in France. *Novitates Zool.* 36(2): 225-229. 4 fig. 1931.—This paper is based on a collection of 12 fleas from France, including *Ctenophthalmus* **arvernus*** (p. 225), host *Apodemus sylvaticus;* **SAPHIOPSYLLA** (p. 227), near *Typhloceras,* type *S.* **nupera*** (p. 227), host *Evotomys* sp., *E. glareolus,* and *Microtus agrestis bailloni.*

2747. **JORDAN, KARL.** Records of fleas from the Austrian Tirol and the Dolomites. *Novitates Zool.* 36 (2): 230-232. 1 fig. 1931.—A list of 15 spp., 10 from the southern Dolomites, including *Saphiopsylla nupera* ssp. **palina** ♀* (p. 231), in mouse nest.

2748. **JORDAN, KARL.** On some fleas collected by Monsieur Heim de Balzac in western Algeria. *Novitates Zool.* 36(2): 233-234. 4 fig. 1931.—*Xenopsylla ramesis* Roths. was collected on *Gerbillus* sp., *Mustela numidica,* and *Meriones pallidus; Ceratophyllus henleyi* ssp. **ornaus*** (p. 233), on *Meriones shawi; Stenoponia tripectinata* Tirab. (=*S. insperata* Weiss).

2749. **MILLS, HARLOW B.** A preliminary survey of the Collembola of Iowa. *Canadian Ent.* 62(9): 200-203. 1930.—Collecting records on 16 spp. of Poduridae, 30 of Entomobryidae, and 13 of Smynthuridae.

2750. **MOULTON, DUDLEY.** The Thysanoptera of Japan: New species, notes, and a list of all known Japanese species. *Annot. Zool. Japonenses* 11(4): 287-337. 10 fig. 1928.—Descriptions of 41 spp. and 2 vars., including: *Chirothrips* **takahashii** ♀* (p. 289), Formosa, on *Sorghum* sp.; *Frankliniella* **formosae*** (p. 291), Formosa (type), Sapporo, ♀ on flowers of *Lagerstroemia indica* and many other plants; *F. j.* form **tricolor** (p. 294), Kyoto, on *Clerodendron tricotomum; Taeniothrips* **canavaliae*** (p. 295), Formosa, on *Canavalia obtusifolia; T.* **eriobotryae** ♀* (p. 297), Nagasaki, on *Eriobotrya japonica; T.* **formosae*** (p. 298) and *T.* **kotoshoi** ♀ (p. 300), Formosa, on *Canavalia obtusifolia; Thrips flavidus* v. **kyotoi** (p. 302), Kyoto, Honshu; *T.* **setosus** ♀ (p. 304), Honshu, from *Aster indicus; Isochaetothrips* **querci** ♀ (p. 306), Formosa, on *Quercus* sp.; *Gynaikothrips* **kuwanai*** (p. 308) and *G.* **liliaceae*** (p. 310), Formosa, on *Smilax* sp.; *G.* **takahashii*** (p. 313), Formosa, on *Ficus retusa; G.* **yuasai** ♀* (p. 315), Formosa; *Haplothrips* (*Karnyothrips*) **fuscipennis** (p. 320), Formosa. A list of the Thysanoptera (94) known from Japan, with references, hosts, and localities, concludes the paper.

2751. **MOULTON, DUDLEY, and JOHN B. STEINWEDEN.** A new Taeniothrips on Gladiolus. *Canadian Ent.* 63(1): 20-21. 1 fig. 1931.—*T.* **gladioli*** (p. 20), Ontario (type in Canadian Nat. Coll.), and also in Ohio.

2752. **PETERS, HAROLD S.** A new louse from domestic chickens (Mallophaga: Philopteridae). *Ent. News* 42(7): 195-199. 2 fig. 1931.—*Lipeurus* **tropicalis*** (p. 195), Bahama Isls. (type, in U. S. Nat. Mus.), Caicos Isls., Venezuela, and Liberia.

2753. **STEWART, M. A.** Notes on North American Ceratophylli (Siphonaptera). *Canadian Ent.* 62(7): 152. 1930.—*Ceratophyllus wagneri* Baker ♂ (=*C. peromysci* Stewart ♀); *Oropsylla fotus* (Jordan) (=*C. citelli* Stewart); *C. labis* Jordan & Rothschild is referred to *Oropsylla; C. abantis* Rothsch. is referred to *Paradoxopsyllus.*

2754. **STEWART, M. A.** New Nearctic Siphonaptera. *Canadian Ent.* 62(8): 175-180. 1 pl. 1930.—*Rhopalopsyllus* **sigmodoni*** (p. 175), Texas, hosts *Sigmodon hispidus* (type), *Canis familiaris,* and *Rattus norvegicus;* **CONORHINOPSYLLA** (p. 178), type *C.* **stanfordi*** (p. 178), New York, host *Sciurus hudsonicus; Neopsylla* **texanus** ♀* (p. 179), Texas, from *Rattus norvegicus.* Types in author's coll.

2755. **SUGIMOTO, MASAATSU.** On some Mallophaga from the Chinese domestic fowls. [In English and Japanese.] *Jour. Jap. Soc. Vet. Sci.* 9(3): 249-255. 2 pl. 1930.—The following are listed: *Degeeriella* **sinensis*** (p. 250), from fowls imported from Wenchow, So. China, to Formosa; *Goniocotes hologaster* Nitsch; *Goniodes dissimilis* Nitsch; *Lipeurus variabilis* Nitsch; and *Neummania pallidum.*

2756. **[TIFLOV, V. E.]** ТИФЛОВ, В. Е. Материалы по изучению фауны блох (Aphaniptera) Саратовской губернии. [The fauna of fleas (Aphaniptera) of the Province of Saratov.] (French résumé on pp. 477-478.) Труды Первого Всесоюзного Противочумного Совещания (*Compt. Rend. Premier Congrès Antipest. URSS, Saratov*) *1927:* 268-275. 2 fig. 1927(1928).—A study of fleas of the Saratov government, which is adjacent to the southwestern plague region, was undertaken for the purpose of comparing them with fleas of the plague region. Fleas of rodents, domestic animals, and man were studied. A complete list of the animals studied and their fleas is given. *Ctenophthalmus* **wagneri*** (p. 272) from nests of *Microtus arvalis.*—*G. A. Lebedeff.*

FOSSIL INSECTA

F. M. CARPENTER, *Editor*

(See also in B. A. 5(11): 29088, 29108, 29269; and in this issue 2801)

2757. **COCKERELL, T. D. A., and NORMA LeVEQUE. The antiquity of insect structures.** *Amer. Naturalist* 65 (699): 351-359. 2 fig. 1931.—The following fossil insects are described from Eocene of the Green River age in western Colorado. Lepidoptera: **CHIONAEMOPSIS** (p. 354), perhaps belonging to Oecophoridae near *Chrysonoma*, based on *C.* **quadrifasciatus*** (p. 355), described from a portion of a wing. This is one of the oldest Lepidoptera known. Homoptera: Fulgoroidea: *Protoliarus* **amabilis*** (p. 355), described from a wing. Hymenoptera: Ichneumonidae: *Tryphon* (sens. lat.) **amasidis*** (p. 356). Diptera: Syrphidae: *Chilosia* **scudderi*** (p. 357). Coleoptera: Elateridae: *Adelocera* **perantiqua*** (p. 359). The writers emphasize the fact that most of these forms are no more primitive than many living forms.

2758. **COCKERELL, T. D. A. Fossil beetle elytra.** *Psyche* 37(2): 176. 1930.—Notes, giving reasons which justify the description and naming of species based on fossil elytra.

2759. **MARTYNOV, A. On some new remarkable Odonata from the Permian of Archangelsk District.** [Russian summary.] Известия Академии Наук СССР. Отделение Математических и Естественных Наук (*Bull. Acad. Sci. URSS, Cl. Sci. Math. et Nat.*) 1931(1): 141-147. 3 fig. 1931.—The author's previous belief, on the evidence of wing venation, that the Anisoptera could not be derived from the Zygoptera, is confirmed by the discovery of the remains of wings of primitive forms, belonging to the stem of Anisoptera, in the Permian of the Archangelsk district. **PERMAESCHNIDAE** (p. 141), new fam. resembling Aeschnidae, based on **PERMAESCHNA** (p. 141), type *P.* **dolloi*** (p. 143); *P.* **proxima*** (p. 145). A new suborder **PROTANISOPTERA** (p. 146) is erected in Anisoptera for these Permaeschnidae. **CALVERTIELLIDAE** (p. 146), new fam. in Protodonata, is erected for *Calvertiella*. The author considers that the Anisoptera arose from the more archaic Palaeodictyoptera, not from Anisozygoptera, Zygoptera, or Protozygoptera.

CYCLOSTOMATA, ELASMOBRANCHII, AND PISCES

BARTON WARREN EVERMANN, *Editor*

H. WALTON CLARK, *Associate Editor*

(See also in this issue Entries 8, 266, 367, 933, 996, 997, 998, 999, 1176, 1334, 1343, 1365, 1690, 1716, 1740, 1742, 2177, 2178, 2179, 2181, 2185, 2192, 2214, 2216, 2291, 2311, 2372, 2373, 2509)

2760. **BHATIA, D. The production of annual zones in the scales of the rainbow trout (Salmo irideus). I.** *Jour. Exp. Zool.* 59(1): 45-60. 1931.—Specimens of rainbow trout when fed uniformly for a year, grew, on the average, at a uniform rate, though there was considerable individual variation in size. The size of the scales and the number of circuli formed increase more rapidly relative to the growth of the fish in early stages, but are proportionate subsequently. The number of circuli on the scales obtained from a particular area depends on the size of the fish, irrespective of its age. Specimens fed uniformly throughout a year do not show "periodic rings" on the scales. All the rings formed correspond to the "summer" type, and the so-called "winter rings" are not formed during winter. A few scales were obtained from 2 specimens which had been fed excessively for 10 months after living on uniform diet for a year, showing a band of abnormally broad rings at the periphery. Two specimens starved for the same period show narrow ring formation at the scale periphery. Width of scale rings does not show any correspondence to seasonal variations in temp. The chief factor concerned in the formation of broad or narrow "summer" and "winter" zones is the abundance or scarcity of food, and not the rise or fall of temp. Under natural conditions, temp. variations may, however, have an indirect effect by causing variations in the production, consumption, or assimilation of food.—*Author (courtesy Wistar Bibl. Serv.).*

2761. **BORODIN, N. A. Some new cichlid fishes from lakes Victoria and Tanganyika, Central Africa.** *Proc. New England Zool. Club* 12: 49-54. 1931.—*Haplochromis* **fasciatus** (p. 49); *H.* **tenuis** (p. 50), Lake Victoria; *Julidochromis* **macrolepis** (p. 51); *Pelmatochromis* **loveridgei** (p. 51), *P.* **tanganyicae** (p. 52), *P.* **xenotilapiaformis** (p. 53); *Tilapia* **nadinae** (p. 54). All from Lake Tanganyika unless otherwise stated; types in Mus. Comp. Zool., Harvard.

2762. **BREDER, C. M. Jr. On the structural specialization of flying fishes from the standpoint of aerodynamics.** *Copeia* 1930(4): 114-121. 3 fig. 1930.—A discussion of the aerodynamics of the Exocoetidae, in which these fishes are compared with structural principles embodied in the modern airplane. Various striking similarities are indicated as well as the reasons for necessary differences.—*C. M. Breder, Jr.*

2763. **BUEN, FERNANDO de. Lebetus Whinter [Winther] 1877, Odondebuenia nov. gen. y Cabotia nov. gen. (Gobiidae de Europa).** *Trab. Inst. Español Oceanogr.* 5. 1-30. 11 fig. 1930.—A key is given to the 3 genera treated; **ODONDEBUENIA** (p. 9), type *O.* **balearica*** (*Eleotris balearicus* Pellegrin & Fage) (p. 10), probably including also *O.?* **pruvoti** (*E.* (*Valenciennea*) *p.* Fage) (p. 14), with key to separate them; **CABOTIA** (p. 17), type *C.* **schmidti*** (p. 17); *Lebetus* Winther is redescribed, with key to separate *L. scorpioides** and *L. orca**. The specimens examined are in the Inst. Español de Oceanografia, from the Balearic Isls. A résumé in French includes keys in French.

2764. **CARTER, G. S., and L. C. BEADLE. The fauna of the swamps of the Paraguayan Chaco in relation to its environment. II. Respiratory adaptations in the fishes.** *Jour. Linn. Soc. London, Zool.* 37(252): 327-368. 5 pl., 5 fig. 1931.—In a previous paper these swamps were shown to be very poor in oxygen. A description is here given of the adaptations by means of which the fishes live in this environment. Eight out of 20 spp. use oxygen of the atmosphere for respiration. Of these *Lepidosiren paradoxa* and *Symbranchus marmoratus* are not here discussed. The remainder belong to the genera *Erythrinus, Hypopomus, Hoplosternum, Callichthys,* and *Ancistrus;* the structure of their accessory respiratory organs is described. Some observations on the physiology of respiration in these fishes are recorded. A comparative account of air-breathing in the fishes is given, and the suggestion is made that the use of air for respiration arose in the fishes primarily as an adaptation to life in a deoxygenated medium and not as an adaptation immediately directed towards migration on to the land.—*G. S. Carter.*

2765. **CHABANAUD, PAUL. Revision du genre Aseraggodes Kaup.** *Zool. Mededeel.* [*Leiden*] 13(3/4): 180-192. 1930.—The author gives a diagnosis of the genus and a key to 15 spp. The systematic list of species includes synonymies and distributional records. *A.* **beau-**

forti (p. 184), Timor Sea; *A.* abnormis (*Achirus a.* Weber & de Beaufort) (p. 192).

2766. COCKERELL, T. D. A. Note on the scales of apogonid fishes. *Copeia* 1930(4): 157. 1930.

2767. CORWIN, GENEVIEVE. A bibliography of the tunas. *Div. Fish & Game California, Fish Bull.* 22: 5-103. 1930.—The publication seeks to include all works prior to the close of 1929 dealing in any way with *Thunnus thynnus, Neothunnus macropterus, Germo alalunga, Euthynnus pelamis,* and *Sarda chiliensis.* There is a bibliography by authors, an index of subjects, and a list of abbreviations used for periodicals cited.

2768. CRAWFORD, D. R. The ayu, Plecoglossus altivelis, of Japan. *Jour. Pan-Pacific Res. Inst.* [*Honolulu*] 5(3): 15-16. 1930.—A popular account of this anadromous sp. Fishing in Japan is by means of cormorants, nets, and hooks. Attempts to introduce it into the western United States have been unsuccessful.

2769. DUNCKER, GEORG, und ERNA MOHR. Die Fische der Südsee-Expedition der Hamburgischen Wissenschaftlichen Stiftung 1908-1909. 3 Teil. (Acanthopteri sens. ampl., Physoclisti malacopterygii, Physostomi, Plagiostomi.) *Mitteil. Zool. Staatsinst. u. Zool. Mus., Hamburg* 44: 57-84. 9 fig. 1931.—This part consists of a systematic list of about 178 spp. with records of localities, dates, and length of specimens. In some cases there are also descriptive and taxonomic notes. All records seem to be from New Guinea or the Bismarck Arch. *Apogon thermalis* C. V., emended description; *Pentapus* pleurostictus* (p. 64), Neu Pommern; *Amphiprion percula* recorded as living in symbiosis with an actiniarian; *Tetraroge* albifrons (p. 70), New Guinea; *Balistes senticosus* Richards. and *B. oculatus* Gray are removed from the synonymy of *B. rotundatus* Procé; *Monacanthus* (*Acanthaluteres*) laevicaudatus* (p. 77), New Guinea; *Tetrodon* macrophthalmus* (p. 79), Neu Pommern.

2770. FANG, PING WEN. New and inadequately known Homalopterin loaches of China. With a rearrangement and revision of the generic characters of Gastromyzon, Sinogastromyzon and their related genera. *Contrib. Biol. Lab. Sci. Soc. China Zool. Ser.* 6(4): 25-43. 7 fig. 1930.—*Sinohomaloptera,* formerly a subg. of *Homaloptera,* is raised to generic rank, type *S.* kwangsiensis* (*Homaloptera k.* Fang) (p. 26); critical notes on *Hemimyzon* Regan; *Hemimyzon* sinensis* (*Psilorhynchus s.* Sauvage & Dabry de Thiersant) (p. 30); *Sinogastromyzon* Fang (1930) characters defined and differentiated; *Pseudogastromyzon* raised from subg. of *Hemimyzon* to generic rank, with the type *P.* zebroidus* (*Hemimyzon z.* Nichols) (p. 34); *Gastromyzon* Guenther described; *G.* szechuanensis* (p. 36). A synopsis in key form of the genera is included, and a bibliography appended.

2771. FOWLER, HENRY W. The pound-net fishes of Chincoteague, Virginia. *Fish Culturist* [*Philadelphia*] 10(8): 147-150. 1931.—An annotated list of 47 spp., chiefly marine, with locality and date records, and with some local names.

2772. FOWLER, HENRY W. A collection of freshwater fishes obtained chiefly at Tsinan, China. *Peking Nat. Hist. Bull.* 5(2): 27-31. 1 pl. 1930.—A list of 22 spp. collected by A. P. Jacot, with measurements and locality and date records. *Acanthogobius* jacoti* (p. 29) and *Aboma* tsinanensis* (p. 30), both from Shantung; types in Acad. Nat. Sci. Philadelphia. *Blennius yatabei,* redescribed and new to China (Shantung).

2773. FOWLER, HENRY W. The fishes obtained by the De Schauensee South African Expedition.—1930. *Proc. Acad. Nat. Sci. Philadelphia* 83: 233-249. 5 fig. 1931.—A systematic account of 14 spp. from Bechuanaland Protectorate, 2 from Dar-es-Salaam, 3 from Mombasa, 12 from Port Sudan, and 3 from Suez, with descriptive notes on many of them. *Tilapia* alleni* (p. 238), *T.* deschauenseei* (p. 240), and *Paratilapia* deschauenseei* (p. 244), all from Bechuanaland Protectorate; types in Acad. Nat. Sci. Philadelphia. Blenniidae: ANTENNABLENNIUS (p. 245), n. subg. of *Blennius,* type *B. hypenetes* Klunzinger.

2774. GILTAY, LOUIS. Notes ichthyologiques. *Rev. Zool. et Bot. Africaines* 19(3/4): 393-396. 3 fig. 1930.—*Ansorgia vittata* bistriata* (p. 393) and *Ichthyoborus besse* congolensis* (p. 395), both Belgian Congo; types in Congo Mus., Tervueren.

2776. GUDGER, E. W. Another capture on the New Jersey coast of the basking shark, Cetorhinus maximus. *Science* 72(1866): 341-342. 1930.—It is a northern fish found more frequently off Long Island and the New England coast.—*E. W. Gudger.*

2777. HERRE, ALBERT W. Notes on Philippine sharks, III. The hammer-head sharks, Sphyrnidae. *Copeia* 1930(4): 141-144. 1930.—A systematic account of the 3 Philippine spp. of *Sphyrna,* with key, synonymies, descriptions, and distributional records.

2778. KOUMANS, F. P. Note on a collection of fishes from the Moluccas collected by Dr. F. Kopstein. *Zool. Mededeel.* [*Leiden*] 13(1/2): 1-6. 1930.—Collection records on 23 spp. *Gobius* (*Stenogobius*) *genivittatus* C. & V. (= *G. polyzona* Bleeker), measurements of six specimens.

2779. LEACH, GLEN C. Propagation and distribution of food fishes, fiscal year 1929. [*U. S.*] *Bur. Fisheries Document 1070.* pp. 759-823. 1930.—Transactions for the fiscal year 1929 were somewhat above average, 30,000,000 fish and fish eggs produced in excess of previous years. Aggregate output, 7,060,369,500. A total of 45 spp. disseminated to inland and coastal waters. Important varieties distributed to interior waters: *Salvelinus fontinalis, Salmo shasta, S. lewisi, S. levenensis, S. rooseveltí, Micropterus salmoides, M. dolomieu, Pomoxis annularis, Ambloplites rupestris, Eupomotis gibbosus,* and *Ameiurus nebulosus.* The state hatcheries and forest service were cooperative in a large degree. Spiny lobsters (*Panulirus*) from Key West, Florida, are being established at Galveston, Texas. The customary replenishment from rescue work along the Mississippi was negligible due to the gradual recession of the waters. Reports of individual stations are given.—*J. Piatt.*

2780. MALLOCH, WILLIAM. Some aspects of the herring family. Presidential address. *Trans. and Proc. Perthshire Soc. Nat. Sci.* 9(1): 22-28. 1929/30(1931).—A nontechnical account of the characters, habits, capture, and economic importance of *Clupea sprattus* and *C. harengus,* particularly in or near Perthshire.

2781. MORI, TAMEZO. On the fresh water fishes from the Tumen River, Korea, with descriptions of new species. *Jour. Chosen Nat. Hist. Soc.* 11. 39-49. Map. 1 pl., 1 fig. 1930.—A systematic account of 38 spp., with locality records and descriptive notes. *Brachymystax* tumensis* (p. 42); *Mallotus* elongatus (p. 43); *Leuciscus waleckii* tumensis (p. 44); *Moroco variegatus* septentrionalis (p. 44); *M.* oxyrhynchus* (p. 45); *Gobio gobio* macrocephalus (p. 46); *Cottus* hangiongensis* (p. 48). The fish fauna of the Tumen River resembles that of eastern Siberia, Sakhalin, and Hokkaido.

2782. MYERS, GEORGE SPRAGUE. Ptychidio jordani, an unusual new cyprinoid fish from Formosa. *Copeia* 1930(4): 110-113. 1 pl. 1930.—Cyprinidae: PTYCHIDIO (p. 110), approaching *Semilabeo,* type *P.* jordani* (p. 112), type in Stanford Univ.

2783. NORDGÅRD, O. Notes on fishes. XII & XIII. *Kgl. Norske Vidensk. Selsk. Forhandl.* 3(papers 32 & 38): 128-129; 149-151. 1 fig. 1930(1931).—Occurrence of the following species is reported from the Trondhjem district: *Pterycombus brama, Caranx trachurus, Centrolophus pompilus*,* of which only 3 specimens were hitherto known in Norwegian museums; *Myctophum elongatum,* caught 1930; this rare fish was noted for the first time from Norwegian waters in 1879 and 1880, and is, apparently, one of the rarest visitors on the Norwegian coast; *Alopias vulpes,* of which only 3 specimens were formerly known from Norwegian waters (2 from Bergeb and 1 from Oslo Fjord). During the very dry and warm summer of 1930 several fishes from southern waters wandered northwards, as *Acipenser sturio, Orthagoriscus mola, Lampris guttatus, Trachypterus arcticus, Bothus rhombus,* and *Lepidorhombus whiffjagonis.*

2784. PARR, A. E. A note on the classification of the stomiatoid fishes. *Copeia* 1930(4): 136. 1930.—The author advances further arguments for including the Astronesthidae and the Melanostomiatidae in the suborder Gymnophotodermi, and proposes 2 new suborders: **LEPIDOPHOTODERMI,** to include the Stomiatidae, and **HETEROPHOTODERMI,** to include the Gonostomatidae and the Sternoptychiidae.

2785. PIETSCHMANN, VICTOR. Über eine verkümmerte Fettflosse bei Macrones gulio (Ham. Buch.). [A stunted adipose fin in M. g.] *Zool. Anz.* 90(7/8): 223-224. 3 fig. 1930.

2786. [POPOV, A. M.] ПОПОВ, А. М. **Cyclopteridae (Pisces) Охотского моря по сборам гидрографической экспедиции Восточного океана. [Cyclopteridae of the Sea of Okhotsk collected by the hydrographic expedition to the Pacific Ocean.]** Известия Академии Наук СССР. Отделение Математических и Естественных Наук (*Bull. Acad. Sci. URSS. Cl. Sci. Math. et Nat.*) 1931(1): 85-99. 4 fig. 1931.—This report is based on a collection of 19 specimens in the Zool. Mus. Acad. Sci. USSR. **CYCLOPSIS** (p. 86), near *Cyclopteroides,* is erected for *Cyclopsis* **tentacularis*** (p. 87); *Cyclopteropsis* **bergi*** (p. 90); *Eumicrotremus,* descriptive notes are given for 3 old spp.; *E.* **soldatovi*** (p. 94); key is given to the genera of Cyclopteridae. A detailed table shows body measurements for each specimen examined. Brief diagnoses of the new spp. are given in English also.

2787. REGAN, C. TATE. A new ceratioid fish. *Proc. Linnean Soc. London* 142. 57-58. 1929/30(1931).—*Caulophryne* sp. described, but not specifically named.

2788. RICHMOND, HECTOR A. A coleopterous fish. *Canadian Ent.* 62(8): 184. 1930.—An 18 inch trout was caught in the North Fork of the Ghost River, Alberta, containing in its stomach 27 perfect specimens of 11 spp. of beetles, which are listed.

2789. ROEDEL, H. Fischotolithen aus Paläozängeschieben. *Zeitschr. Geschiebeforsch.* 6(2): 49-77. 1 pl. 1930.—These erratics were derived from the southern Baltic regions, and are now found in Brandenburg, Holstein, Anhalt, and Hannover. They contain the Lower Paleocene "Fauna of Copenhagen." The following new spp. are described on the basis of the otoliths: *Otolithus* (*Arius*) **rotundatus*** (p. 52); *O.* (*Merluccius*) **schmitti*** (p. 54); *O.* (*M.*) **globulosus*** (p. 54); *O.* (*M.*) **latisculptus*** (p. 56); *O.* (*M.*) **nanus*** (p. 57); *O.* (Gadidarum) **insuetus*** (p. 58), *O.* (*Solea*) **solitarius*** (p. 60); *O.* (Berycidarum) **marchicus*** (p. 61); *O.* (B.) **balticus*** (p. 62); *O.* (Percidarum) **holsaticus*** (p. 63); *O.* (P.) **erraticus*** (p. 64); *O.* (P.) **obliquestriatus*** (p. 64); *O.* (P.) **minimus*** (p. 65); *O.* (incertae sedis) **ehrhard-voigti*** (p. 67). Types in author's coll.—*H. Roedel* (*transl. by A. E. Wood*).

2790. SCHMIDT, P. A list of fishes collected in Japan and China by Dr. A. Bunge and N. Grebnitzky. Известия Академии Наук СССР. Отделение Математических и Естественных Наук (*Bull. Acad. Sci. URSS. Cl. Sci. Math. et Nat.*) 1931(1): 101-123. 5 fig. 1931.—A list of 110 spp., including *Ophichthus urolophus**, emended description; *Gymnothorax reticularis**; a young specimen of *Priacanthus hamrur**; and *Cholëa* **bungei*** (p. 119), Korea, type in Zool. Mus. Acad. Sci. USSR. Locality records and synonymies are included.

2791. SCHMIDT, P. A check-list of the fishes of the Riu-Kiu Islands. *Jour. Pan-Pacific Res. Inst.* [*Honolulu*] 5(4): 2-6. 1930.—A list of 457 spp., compiled from the literature and the author's own collections.

2792. SCHNAKENBECK, W. Ein Dorsch aus dem Süsswasser. *Zool. Anz.* 94(1/2): 17-32. 9 fig. 1931.—The capture of a cusk (*Gadus morrhua*) [sic] in the Elbe, above Hamburg, is reported. The behavior of fishes in fresh and salt-water, and of cases in which fresh-water fishes have appeared in salt-water and vice versa are discussed. External and internal morphological adaptations correlated with the change of habitat of the cusk are described. The morphological changes indicate that the specimen must have wandered into fresh water when very young.—*W. Schnakenbeck* (*transl. by F. LaMonte*).

2793. SCHNAKENBECK, W. Über einige Meeresfische aus Südwestafrika. *Mitteil. Zool. Staatsinst. u. Zool. Mus., Hamburg* 44: 23-46. 9 fig. 1931.—This is a report on some specimens taken by a fishing steamer operating out of Walvis Bay. The systematic account treats of 22 spp., with descriptive and taxonomic remarks and notes on depths at which the species were taken. Exact localities are not recorded. The following are new to S. Africa: *Dentex macrophthalmus, Trigla lyra**, *T. hirundo,* and *Harriotta* **pinnata*** (p. 40), type in Zool. Staatsinst., Hamburg.

2794. SCHULTZ, LEONARD P. Miscellaneous observations on fishes of Washington. *Copeia* 1930(4): 137-140. 1930.—Notes on distribution and habits of 13 spp. *Icosteus aenigmaticus,* new to Oregon and Washington; *Pomoxis sparoides,* new to Washington.

2795. SMITH, J. L. B. New and little known fish from the south and east coasts of Africa. *Rec. Albany Mus.* [*Grahamstown*] 4(1): 145-160. 1 pl., 3 fig. 1931.—**PRIONOLEPIS** (p. 145) (Grammicolepidae), near *Vesposus,* type *P.* **hewitti*** (p. 145); *Synaptura* **barnardi*** (p. 148); **NEOSCORPIS** (p. 150) (Scorpididae), related to *Scorpis,* erected for *N.* **lithophilus** (G. & T.), n. comb. (p. 151); *Blennius fascigula** Barnard, emended description; *Clinus* **agilis*** (p. 154); *Amblyapistus marleyi* Regan, emended description; *Caracanthus zeylonicus* Day, redescribed and recorded for the first time from S. Africa (Cape Province); *Tropidichthys* **oxylophius*** (p. 159). New spp. from Cape Province; types in Albany Mus.

2796. SOLJAN, TONKO. Brutpflege durch Nestbau bei Crenilabrus quinquemaculatus Risso, einem adriatischen Lippfisch. *Zeitschr. Wiss. Biol. Abt. A, Zeitschr. Morph. u. Ökol. Tiere* 20(1): 132-135. 2 fig. 1930.—On the coast of Jugoslavia this sp.* breeds in March, April, and May. On a sandy bottom in 1-1½ m. of water, the ♂ forms a semilunar mound* of terminal branches of *Cystosira,* covering it with grains of sand and fragments of mollusk shells. The ♂ faces the concave side of the mound, and on this side the mud and sand are washed away, leaving an excavation with a bottom of small stones. The ♀ casts the eggs against the upright, concave wall of *Cystosira;* the ♂ pushes them into the interior and covers them with new material. Other ♂♂ linger about and often take part in the fertilization.

2797. TREWAVAS, ETHELWYNN. A revision of the cichlid fishes of the genus Lethrinops, Regan. *Ann. and Mag. Nat. Hist.* 7(37): 133-152. 5 fig. 1931.—A complete revision of the genus, based on types in the Brit. Mus. Nat. Hist., and in the Zool. Mus., Berlin, and on a collection of fishes from Lake Nyassa made by C. Christy in 1925-26. The genus is redefined. Notes on coloration and secondary sexual characters are given and there is a key to the spp. *L.* **variabilis*** (p. 139); *L.* **lituris** (p. 139); *L.* **brevis** (*Haplochromis b.* Regan) (p. 140); *L.* **trilineata** (p. 141); *L.* **microstoma*** (p. 141); *L.* **parvidens** (p. 141); *L.* **macrophthalmus** (*Haplochromis m.* Regan) (p. 143); *L.* **aurita** (*Haplochromis auritus* Regan=*H. macrochir* Regan) (p. 144); *L.* **longimanus** (p. 145); *L.* **cyrtonotus** (p. 145); *L.* **macracanthus*** (p. 145); *L.* **alta*** (p. 146); *L.* **lunaris** (p. 148); *L.* **oculata** (p. 148); *L.* **furcifer** (p. 149); *L.* **furcicauda** (p. 149); *L.* **christyi** (p. 150); *L.* **laticeps** (p. 150); *L.* **praeorbitalis** (*Haplochromis p.* Regan,=*Lethrinops macrorhynchus* Regan,=*L. fasciatus* Ahl) (p. 151). Previously known spp. are redescribed. Types in Brit. Mus. Nat. Hist.—*E. Trewavas.*

2798. VASILIU, GEORGE D. Beschreibung der Ceylon-Fische aus der Sammlung Plate. (Fauna et Anatomia ceylanica, IV, nr. 11.) *Jenaische Zeitschr. Naturwiss.* 65(2): 319-360. 4 pl. 1931.—This report is based upon a collection of both marine and fresh-water fishes made by L. Plate in 1913-14. It includes about 95 spp. belonging to 43 families. The systematic account includes synonymies, locality data, and taxonomic remarks. *Thalassoma cupido* var. **bipunctatum*** (p. 349), Ceylon. Bibliography.

2799. **WU, HSIEN WEN.** Notes on some fishes collected by the Biological Laboratory, Science Society of China. *Contrib. Biol. Lab. Sci. Soc. China Zool. Ser.* 6(5): 45-57. 5 fig. 1930.—A list of 14 spp. from Szechuan, Hunan, and Hupei, with descriptive notes. *Paracanthobrama* pingi* (p. 48). Kiukiang; *Pseudobagrus* eupogoides* (p. 51) and *P.* chinensis* (p. 53), Szechuan; *Siniperca* roulei* (p. 54), Hunan.

2800. **WU, HSIEN WEN.** On Zoarces tangwangi, a new eelpout from Chinese coast. *Contrib. Biol. Lab. Sci. Soc. China Zool. Ser.* 6(6): 59-63. 1 fig. 1930.—*Z.* tangwangi*, from Foochow.

AMPHIBIA AND REPTILIA

G. K. NOBLE, *Editor,* Amphibia

KARL PATTERSON SCHMIDT, *Editor,* Reptilia

(See also in 5(11): Entries 27912, 28026, 29138, 29148, 29149, 29151, 29158, 29212, 29245, 29246, 29804, 29987, 29999; and in this issue 32, 34, 1137 1375, 1444, 2190, 2209, 2223, 2339, 2683, 2842)

GENERAL

2801. **MOODIE, ROY L.** Vertebrate footprints from the Red-Beds of Texas. II. *Jour. Geol.* 38(6): 548-565. 16 fig. 1930.—This Permian formation in Texas contains many trails of insects and myriapods, as well as borings and numerous ichnites indicating the presence of small branchiosaurian and microsaurian amphibians and reptiles of a varanoid type. The following are listed: Amphibia, Caudata *Erpetopus willistoni;* Microsauria, *Microsauropus acutipes,** *M. clarki, M.* orthodactylus* (p. 557), *M.* parvus* (p. 554); Reptilia, *Varanopus curvidactylus, V. impressus,** *V. palmatus, V.* (?) *elrodi, V.* didactylus* (p. 558); **SOLIDOPUS** (p. 563), type *S.* perissodactylus* (p. 563); *Laoporus* wyldei* (p. 561), *L.* sp. (?)* (p. 561). Reference is made to the Reptilia, *Hoplichnus aquus* Hitchcock and (?) *Hyloidichnus bifurcatus* Gilmore from the Grand Canyon.—*D. J. MacNeil.*

2802. **PIVETEAU, JEAN.** Paléontologie de Madagascar. XIII. Amphibiens et reptiles permiens. [Continuation.] *Ann. Paléont.* 15(4): 77-126. 4 pl. 14 fig. 1926.—[See also B. A. 1(2/3): entry 4097.] A series of growth stages of a reptile identified as *Tangasaurus menelli** is described in detail. *Tangasaurus* is to be associated with a series of forms sometimes grouped as Protorosauria, for which the term Arœoscelia is preferred; this group is a suborder of "saurians," the true lizards to be grouped as suborder Lepidosauria. The "saurians" are compared with cotylosaurs, anomodonts (s. lat.), ichthyosaurs, and rhynchocephalians. *Seymouria* is an amphibian. Saurians and rhynchocephalians differ greatly in the structure of the temporal region, but present close analogies in other respects. A classification of reptiles which takes as a fundamental criterion one character (structure of the temporal region) does not correspond to the actual state of our knowledge. The situation of the pectoral and pelvic girdles shows that the cotylosaurs and anomodonts are not reptiles but constitute an independent group. No satisfactory superordinal classification of the true reptiles can be made. The structure and history of the reptilian shoulder girdle and sternum are discussed. The expressions procoracoid and metacoracoid should be abandoned and the coracoid region treated as a unit structure, regions of which have had a variable history. The sternum is not homologous in the various reptilian groups. Fenestrae in the coracoid and sternum have developed in relation to muscle insertions. The amphibian and reptilian pelvic girdles are compared. Certain fragmentary specimens from the Permian of Madagascar are described. One type, with a short anterior limb and a coiled tail, perhaps prehensile, may pertain to *Datheosaurus.* A second consists of caudal vertebrae superficially resembling *Urocordylus,* etc., but with the chevrons placed intercentrally, hence a reptile of uncertain position. Finally fragmentary remains of a small form already discussed by Boule are described as **COELUROSAURAVUS** with *C.* elivensis* (p. 121); type in Paris Mus. The skull is poorly preserved (? cf. *Scleromochlus*). The vertebrae and limbs resemble those of certain pseudosuchians and dinosaurs. *Aphelosaurus* resembles *Coelurosauravus* as far as known; as do *Pedeticosaurus, Scleromochlus,* and other ornithosuchids. *Compsognathus* and other related dinosaurs present close analogies; *Coelurosauravus* is to be placed in the dinosaurs at the base of the line leading to *Compsognathus,* etc. These forms should be placed in a special group, coelurosaurians, equal in rank with the ornithischians and saurischians among the (heterogeneous) group of the dinosaurs.—*A. S. Romer.*

2803. **[SOBOLEVSKIĬ, N. I.]** СОБОЛЕВСКИЙ, Н. И. Герпетофауна Талыша и Ленкоранской низменности. (The Herpetofauna of the Talysh and of the Lenkoran lowland.) [English summary.] Мемуары Зоологического Отделения Общества Любителей Естествознания, Антропологии и Этнографии (*Mém. Sect. Zool. Soc. Amis des Sci. Nat., d'Anthropol. et d'Ethnographie*) 5: 1-141. 3 maps. 1929.—This report is based upon personal investigations, supplemented by a study of museum collections and of the literature. There are introductory remarks on the topography and climate of this district, which comprises the southeastern part of Transcaucasia. The following biotic areas are differentiated: littoral zone; forests of the lowland and of the mountain foreland; mountain forests (700-1800 m.); upper mountain zone without forests; desert region of Zuvand; and the Mugan steppe. The topography and vegetation of each area are described, and characteristic reptiles and amphibians are mentioned. Study of the centers of dispersal of the 44 local spp. and subspp. indicates that 15 were derived from western Asia, 9 from Europe, 9 from Iran, 2 from Central Asia, while 5 are autochthonous and 4 are of undetermined derivation. A study of the fauna leads the author to recognize a west Asiatic province, including Asia Minor and Cyprus, and extending to Crimea, Caucasus, central Persia, and northern Arabia. A number of subdivisions of this province are described. A historical review of herpetological investigations in the Lenkoran district and an annotated bibliography of 59 titles are given. There is a systematic account of 3 turtles, 21 lizards, 20 snakes, 3 anurans, and 3 salamanders, including synonymies, descriptions, distributional records, and notes on habits and systematics.

REPTILIA

2804. **ABEL, WOLFGANG.** Junge Chamäleons im Terrarium. *Ber. Senckenberg. Naturforsch. Ges.* [*Natur u. Mus.*] 61(1): 35-36. 2 fig. 1931.—Account of birth, early life, and food of *Chamaeleon pumilus**.

2805. **BROOM, R.** On the carnivorous mammal-like reptiles of the family Titanosuchidae. *Ann. Transvaal Mus.* 13(1): 9-36. 1 pl., 24 fig. 1929.—Additional notes on the genera of the family Titanosuchidae from the Karoo beds of S. Africa, with a complete description of the skeleton of *Jonkeria truculenta** v. Hoepen; *J.* vanderbyli* (p. 23); *Jonkeria* cloetei (*Titanosuchus c.* Broom) (p. 25); *J.* crassus* (p. 26); *Jonkeria* sp.* (p. 27) described but not named; **DINOSPHAGEUS** (p. 31), type *D.* haughtoni* (p. 31); **PHONEOSUCHUS** (p. 31), type *P.* angusticeps* (p. 31). Notes are given on *Scapanodon duplessisi* Broom, *Titanosuchus ferox** Owen and *Dinophoneus ingens** Broom. **DINOCYNODON** (p. 33), type *D.* dubius (*Titanosuchus*) *d.* Haughton; **SCULLYA** (p. 34), type *S.* gigas* (p. 34). Notes are

given on *Enobius strubeni* Broom and *Anteosaurus magnificus* Watson; *A.* **minor*** (p. 35). The type of *Jonkeria truculenta* is in the Pretoria Mus., *J. cloetei*, *J.* sp., and most of the other specimens are in the S. African Mus., Capetown, *Anteosaurus magnificus* is in the Brit. Mus.—*G. L. Jepsen.*

2806. **CYRÉN, OTTO. Spanische und portugiesische Maereidechsen.** *Göteborgs Kgl. Vetensk. och Vitterhetssamh. Handl., Ser. B* 1(paper 1): 1-36. 6 pl. 1928 (1930).—This paper is based upon 2 brief collecting trips in 1924 and 1925. Accounts are given of 5 spp. and subspp. of *Lacerta*, with distributional records, extensive notes on morphology, coloration, taxonomy, ecology, and habits. *L.* **estrellensis*** (p. 10), Portugal, type in Gothenburg Mus. The characters of 6 spp. of *Lacerta* are compared in a table, and geographical variation in *L. bocagii** is shown in another table. The author endorses Méhely's division of the wall lizards into "Archaeolacertae" and "Neolacertae." *L. monticola** and *L. estrellensis* are westernmost representatives of the former.

2807. **ESSEX, R. Studies in reptilian degeneration.** *Proc. Zool. Soc. London* 1927(4): 879-945. 7 pl., 86 fig. 1928.—The subject is discussed under 2 heads, 1st anatomy of degeneration and 2nd geographical distribution of the S. African forms considered. The author takes exception to the explanation offered by Duerden that degenerative changes are due to germinal changes and suggests that germinal changes are rather the result of degeneration. He also finds, confirming the observations of Camp, that there is great similarity between extremely degenerate forms and early embryonic stages in such elements as the sternum and scapulo-coracoid and concludes that the so-called degenerate girdle is simply an arrested embryonic stage. The limbs and limb girdles of 3 species of *Chamaesaura* are discussed in some detail and the progressive reduction of the limbs and modification of the pectoral and pelvic girdle is noted in the species *C. aenea, C. anguina,* and *C. macrolepis*. This consideration of the anatomy together with a study of the facts of the geographical distribution of the 3 species, leads to the conclusion that the species represent different evolutionary stages all tending in the same degenerative direction, the more degenerate having passed through the stages represented by the less degenerate. A further study of the limb girdles in the genus *Acontias* revealed considerable variation in the development of the remnants of the parasternum and leads the author to modify an earlier statement concerning the fixity of the degenerative stage of the pectoral girdle in *A. meleagris*. In *Scelotes caffer* the degenerate limbs are extremely small but functional and the pectoral girdle shows little degeneration. The related *S. anguina* is entirely limbless and the pectoral girdle shows marked degeneration. The pelvic girdle is remarkable in that undoubted remnants of the femur are present. The degenerate limb girdles of *Feylinia currorii* also show variation and asymmetry. In the genus *Glauconia* the pelvic girdles of over a 100 specimens were dissected and the conclusion reached that the degenerate organ cannot be regarded as functionless and that the supposed fixity of form of these structures was more apparent than real. Considerable variation was found in the size of the claw and its nearness to the skin, in one adult ♂, actually protruding. The conclusion is reached that the girdle represents a degenerate organ, probably functional, at present in an evolutionary stage tending to further reduction rather than a functionless organ in a fixed stage of degeneration. In the snakes of the genus *Typhlops*, the pelvic vestiges were examined with the view of determining the range of variation in species with a wide geographic range. A study of the girdle of *T. delalandii* revealed little variation within the species but species of different countries have girdle-vestiges varying in the extent of degeneration and the constituent parts of the girdle tend to disappear by small degrees. The section of the paper dealing with geographical distribution is introduced by a short account of the geography and geology of the region. The author believes it is impossible to divide S. Africa into sharply defined zoological areas because of the lack of insurmountable barriers and that where such barriers exist the areas they include have faunas which, "seem to be aggregations of heterogeneous units which have become isolated in these areas." Following the list of species taken on various expeditions covering the entire watershed of the region, the author discusses the distribution of various species of lizards. In the case of the Scincidae and Gerrhosauridae the degenerate members of the groups were found to be limited to the coastal areas. The 3 degenerate members of *Chamaesaura* were also found south of the watershed. In determining, in any given genus, which species is the most primitive and which the most recent, the author points out that the one which possesses the best developed girdle is obviously the most primitive and oldest while that which possesses the most reduced girdle is the newest. Arranging the species of any genus according to the degree of degeneration it was found that the most primitive were found on the mountain tops. Summarizing his data, the author finds the main routes of migration into S. Africa were along the east coast and across Rhodesia to the South-West Protectorate, that degeneration is a gradual process, and that discontinuity is the result of the dying out of intermediate forms.—*S. C. Bishop.*

2808. **GREVE, L. Eine Lederschildkröte an der Nordsee-Küste gestrandet.** *Ber. Senckenberg. Naturforsch. Ges.* [*Natur u. Mus.*] 61(1): 30-33. 1 fig. 1931.—*Dermochelys coriacea**, of rare occurrence in European waters, was stranded on the North Sea coast of Germany.

2809. **HEWITT, JOHN. Descriptions of some African tortoises.** *Ann. Natal. Mus.* 6(3): 461-506. 3 pl., 5 fig. 1931.—*Pelusios sinuatus** (Smith), emended description; *P. nigricans* **castanoides*** (p. 463), Natal, type in Transvaal Mus.; a key is given to the S. African forms of *Pelusios;* the specific status of *Kinixys nogueyi* and *K. spekii* is maintained; *K. belliana* **zombensis*** (p. 469), Nyasaland (type) and Port. E. Africa, type in Albany Mus.; *K. b.* **zuluensis*** (p. 471), Natal, type in Natal Mus.; *K.* **australis*** (p. 477), Transvaal (type) and S. Rhodesia, type in Albany Mus.; *K. darlingi* Blgr., emended description; *K.* **jordani*** (p. 482), N. Rhodesia, type in Albany Mus.; *K.* **youngi*** (p. 486), Nyasaland, type in Albany Mus., *K. lobatsiana** Power, emended description; a key is given to the southern forms of *Kinixys;* **PSEUDOMOPUS** (p. 496), type *P.* **signatus*** (*Homopus s.* Wahlb.) (p. 500), including also *P.* **boulengeri*** (*Homopus b.* Duerden) (p. 497); **NEOTESTUDO** (p. 504), erected for *Testudo angulata* Duméril; a key is given to the genera of S. African tortoises.

2810. **PARKER, H. W. Notes on reptiles and batrachians from Matto Grosso and E. Bolivia.** *Ann. & Mag. Nat. Hist.* 2(7): 96-99. 1 fig. 1928.—The following species are from a coll. in the Brit. Mus., with notes and descriptions: *Helminthophis* **collenettei*** (p. 97), Brazil; *Apostolepis borelli* Peracca is apparently the first record for Bolivia. Salientia: *Hyla spegazzini* Blgr. (=*H. goodfellowi* Procter).

2811. **SAKIA, J. Record of symptoms and treatment of a bite from a Formosan viper (Trimeresurus mucrosquamatus).** *Jour. Bombay Nat. Hist. Soc.* 33(4): 998-999. 1929.

2812. **SWINTON, W. E. Daunophis langi, gen. et sp. n. (Pliocene, Burma).** *Ann. & Mag. Nat. Hist.* 17(99): 342-348. 1 pl., 1 fig. 1926.—**DAUNOPHIS** (p. 343) (Boidae), similar to *Paleryx*, type *D.* **langi*** (p. 344), from oil-shale exposed in a quarry; type in Hunterian Mus., Glasgow Univ.

2813. **SWINTON, WILLIAM ELGIN. On fossil Reptilia from Sokoto Province.** *Geol. Surv. Nigeria, Bull.* 13. 1-56. Map, 15 pl. 1930.—A short review of the few fossil reptiles previously recorded from W. Africa precedes the description of recent finds. **WURNOSAURUS** (p. 15) (Teleosauridae), type *W.* **wilsoni*** (p. 16); **RHABDOGNATHIDAE** (p. 18), erected for **RHABDO-**

GNATHUS (p. 18), type *R.* rarus* (p. 19); **SOKOTOSAURUS** (p. 22) (? Dyrosauridae (sic)), type *S.* nopcsai* (p. 23); *Dyrosaurus* minor* (p. 26); all described from skull fragments of Landenian (Lr. Eocene) age. Additional crocodilian material is figured and compared with several genera, but is not determined. *Mosasaurus* nigeriensis* (p. 40), described from teeth, jaws, vertebrae, and femur, Lr. Danian (Up. Cretaceous). Chelonian bony plates are also described from the latter formation. Types in Brit. Mus. Vertebrae previously described as dinosaurian by Nopcsa are the caudals of crocodiles. No evidence for dinosaurs in Nigeria exists. The Crocodilia are all of Jura-Cretaceous affinities, and their occurrence in the Eocene of Nigeria is further support for Cope's theory of the shifting of the older faunas towards the equator.

2814. WEIGELT, JOHANNES. Über die vermutliche Nahrung von Protorosaurus und über einen körperlich erhaltenen Fruchtstand von Archaeopodocarpus germanicus aut. *Leopoldina* 6: 269-280. 5 pl. 1930.—Seeds (57) of *A. germanicus* were found between the ribs of a specimen of *Protorosaurus speneri* in such a position as to preclude the possibility of the association being postmortal. **GRACILISAURUS** with *G.* ottoi (p. 279), is described, based on part of the skull, several vertebrae, and one extremity, from the copper slates of Mansfeld. —*J. Weigelt (transl. by. A. E. Wood).*

2815. WITTE, GASTON-FR. de. Un serpent nouveau du Congo Belge (Rhinocalamus rodhaini* sp. n.). *Rev. Zool. & Bot. Africaines* 19(1): 1-3. 5 fig. 1930.—Type in Congo Mus.

GENERAL

2816. BLOEKER, JACK C. von, et al. From field and study. *Condor* 29(4): 200-207. 1927.—Von Bloeker.—"A strange meeting with a Flicker." (p. 200). A Red-shafted Flicker (*Colaptes cafer collaris*) flying at night, during a rain, alighted on the writer's arm. **L. B. POTTER.** "Correct portraiture of some birds." (p. 200). Comments on portrayal of birds in beginners' manuals. **H. S. SWARTH.**—"The Rufous-necked Sandpiper on St. Paul, Pribilof Islands." (p. 200-201). *Pisobia ruficollis* at Northeast Point, August 27, 1920, first definite record in N. America; "Eversmann Shrike not a North American Bird." (p. 205). A specimen previously reported as *Lanius mollis* taken at sea 260 miles west of Sitka, Alaska, proves to be a young example of *L. borealis.* **LOUIS B. BISHOP.**—"The plumages of certain gulls." (p. 201-202). The pale browns and grays in the 1st and 2nd year individuals of *Larus hyperboreus* (and *L. glaucescens*), due to wear and fading, practically disappear through the winter, leaving the plumage in spring almost white. The gull described as *L. hutchinsii* by Richardson in 1831 is believed to have been one of this regular, faded category. The dark-winged gulls, such as *L. argentatus* and *L. californicus,* show this fading in varying amount. "The status of the Point Barrow gull." (p. 204-205). *Larus barrovianus* is considered a race of *L. hyperboreus,* of smaller size. A table of measurements comparing these with *L. leucopterus* is included. **LAURENCE M. HUEY.**—"Northward migration of Pacific Loons." (p. 202). *Gavia pacifica* at San Roque Bay, Lower California, April 10, 1927; also in April, 1926, seen flying overland toward Pacific Ocean, from head of Gulf of California. "Northernmost breeding station of the Heermann gull on the Pacific Ocean, and other notes from San Roque Island, Lower California." (p. 205-206). *Larus heermanni* nesting in latitude 27° 09′ north. Notes are given on other species observed. **CLINTON G. ABBOTT.**—"Records of two rare migrants in California." (p. 202-203). *Pisobia bairdii;* Eureka, Aug. 20, 1926; *Pluvialis dominica dominica,* Eureka, Sept. 10, 1922. **Mrs. H. J. TAYLOR.**—"The Allen Hummingbirds in Golden Gate Park [San Francisco]." (p. 203). Fourteen nests of *Selasphorus alleni,* on March 26, in various stages. The nuptial flight of the ♂ is described. **JOHN McB. ROBERTSON.**—"Lark Bunting in Orange County, California." (p. 203). *Calamospiza melanocorys* near Stanton, April 10. **M. P. SKINNER.**—"New additions to the Yellowstone Park List of Birds." (p. 203-204). *Squatarola squatarola* Sept. 24-26, 1926; *Tyrannus verticalis* in Upper Geyser Basin, Aug. 30, 1926; *Ixoreus naevius,* Sept. 5, 1926; *Lagopus leucurus,* Quadrant Mountain. **T. T. McCABE.**—"Bird banding near Barkersville, British Columbia." (p. 206-207). Discusses difficulties of landing cone-feeding birds.—*T. I. Storer.*

2817. BONNOT, PAUL, et al. From field and study. *Condor* 30(5): 320-329. 1928.—Paul Bonnot. An outlaw Barn owl. (p. 320). A Barn Owl (*Aluco pratincola*) on Castle Rock off Crescent City, California, had fed extensively on Beal Petrels (*Oceanodroma leucorhoa beali*). **ALFRED M. BAILEY.**—"Early nesting of the Redpoll in Alaska." (p. 320). **MYRTLE S. EDWARDS.**—"Note on a Bush-tit's eye color." (p. 320). **LAURENCE B. POTTER.**—"A Mockingbird in Saskatchewan." (p. 320-321). **JOHN McB. ROBERTSON.**—"Some returns of banded mallards." (p. 321, 1 fig.). In Sept. to Nov., 1927, 4019 individuals of *Anas platyrhynchos* were banded at Moiese, Montana. Returns on 705 (of 738 killed) prior to May 8, 1928, are plotted on the accompanying map. A majority of the birds moved west and southwest, a few slightly north, and individual birds were shot in Nebraska, Missouri, and Louisiana. **DONALD R. DICKEY.**—"A race of Virginia Rail from the Pacific coast." (p. 322). *Rallus virginianus* pacificus, type locality near Corona, Riverside County, California; differs from *R. v. virginiana* in larger size in all measurements. **CAROLINE WELLS.**—"Notes on some birds of western Montana." (p. 322-323). Adds *Ixoreus naevius meruloides* to state list. **CHAS. W. MICHAEL, and ENID MICHAEL.**—"Behavior of Saw-whet Owls in Yosemite Park." (p. 323-324). *Cryptoglaux acadica* nesting in old nest hole of Red-shafted Flicker in old cottonwood shaft in Yosemite Valley; young observed in nest May 12-18, 1926. **ROBERT S. WOODS.**—"An early spring record for the Costa hummingbird." (p. 324). *Calypte costae* at Azusa, California, March 7, 1928. **JOHN W. SUGDEN.**—"A nest site of the western Horned Owl in Utah." (p. 324-325). *Bubo virginianus pallescens* in Moki Cliff dwelling at Augusta Natural Bridge in San Juan County. **LOYE MILLER.**—"Additions to the faunal list of Anacapa Island [California]." (p. 325). Six species. **STUART ROWLEY.**—"Sage thrasher nesting near Victorville, California." (p. 325, 1 fig.) *Oroscoptes montanus.* **Mrs. T. F. JOHNSON.**—"Western Tanager in winter at San Diego [California]." (p. 325-326). *Piranga ludoviciana.* **CLINTON G. ABBOTT.**—"Another Hooded Merganser in San Diego County [California]." (p. 326). **THOMAS T. McCABE, and ELINOR B. McCABE.**—"Migration (?) of the Black-headed Jay." (p. 326-327). Two *Cyanocitta stelleri annectens* banded at Indianpoint Lake were later trapped at Vavenby, about 130 miles south, both localities in Brit. Columbia. **RALPH HOFFMANN.**—"An Oven-bird in Santa Barbara County, California." (p. 327). **RAYMOND B. COWLES.**—"Observation on the food habits of a Desert Sparrow Hawk." (p. 327). *Falco sparverius phalaena* at South Pasadena, Cali-

fornia, took a young Black Phoebe from a nest. **J. A. MUNRO.**—"Cormorants nesting on Bare Island, British Columbia." (p. 327-328). *Phalacrocorax auritus.* **TRACY I. STORER.**—"Further notes on lowland nesting of the western robin in California." (p. 328-329).—*T. I. Storer.*

2818. BRETSCHER, K. Neue Mitteilungen über den Vogelzug in Mitteleuropa. *Vierteljahrsschr. Naturforsch. Ges. Zürich* 74(1/2): 1-49. 8 map. 1929.—In 2 former works the spring migration mainly in Switzerland, Alsace-Lorraine, south Germany and Hungary is discussed. An attempt was made to determine paths of migration, in the various districts. Austria (the old monarchy), was added, and the influx of arrivals at high altitudes could be shown: 72% of the cases were later, 11% were earlier and 7% were coincident at higher elevations. Eight migration maps indicate that the migration, in general, follows rivers, and both slopes of mountain chains, such as the Alps and the Carpathians. —*K. Bretscher (transl. by G. B. Pickwell).*

2819. GANDER, FRANK F., et al. From field and study. *Condor* 29(5): 245-250. 1927.—By Gander.—"The cardinal in San Diego [California]." (p. 245). **ALLAN BROOKS.**—"Breeding of immature hawks." (p. 245-246). Instances of adult hawks, when the mate has been shot, acquiring a new mate in immature plumage are cited for Cooper, Sharp-shinned, Peregrine and Pigeon hawks. The author states that all hawks (except eagles) pass into adult plumage at 1st molt, so the 2nd, immature-plumaged mates must have all been less than 1 year of age. "Can hawks prevent mouse plagues?" (p. 249-250). Comment on abundance of hawks, 120 Buteos in the air at once, near Snelling, California, in 1923. **G. L. FOSTER.**—"A note on the dietary habits of the Barn Owl." (p. 246). Pellets were collected beneath the roost and nest of a pair of *Tyto alba pratincola* at Berkeley, California, over a period of 1½ yrs. From 571 pellets remains of 1780 individual animals were identified, the forms represented in order of abundance being *Microtus* 64%; *Peromyscus* 14%; *Reithrodontomys* 8.6%; *Thomomys* 4.8%; *Sorex* 1.8%; 7 other mammals and the Jerusalem cricket constituted less than 1% each in the total. No striking seasonal difference was found. **LAIDLAW WILLIAMS.** —"California Brown Pelicans nesting at Point Lobos, Monterey County, California." (p. 246-249). **LAURENCE B. POTTER.**—"Freak nesting site of a magpie." (p. 249).—*T. I. Storer.*

2820. HALL, E. RAYMOND, et al. From field and study. *Condor* 29(6): 271-276. 1927.—By Hall. "A commensal relation of the California quail with the California ground squirrel." (p. 271). Seeds of tar weed (*Madia sativa*) shaken out by *Otospermophilus grammurus beecheyi* when feeding upon the seed heads were gathered by *Lophortyx c. californica* at Berkeley, California. "The Barn Owl in its relation to the rodent population at Berkeley, California." (p. 247-275). Food of *Tyto alba pratincola* as determined by examination of 484 regurgitated pellets consisted of 276 *Microtus,* 84 *Thomomys,* 52 *Peromyscus,* 37 *Mus,* 26 *Reithrodontomys,* and scattering other species. The Barn Owl may be a factor in reducing the rodent population along the margin of the hills adjacent to the city. **FRANK F. GANDER.**—"Western Wood Pewees and Dwarf Cowbirds nesting at San Diego, [California]." (p. 271). *Myiochanes richardsonii* nesting in Zool. Society's gardens 1923-1927, and twice have reared young of *Molothrus ater obscurus.* **JOSEPH DIXON.**—"Black bear tries to gnaw into a woodpecker's nest." (p. 271-272). Nest of *Picoides arcticus* in live lodgepole pine in Yosemite National Park. A bear had bitten off slabs of greenwood but did not succeed in getting at the young. **CLINTON G. ABBOTT.** —"Another Man-o-war-bird wanders into Californian waters." (p. 272). *Fregata aquila* off San Diego, June 27. **THOMAS T. McCABE, and ELINOR BOLLES McCABE.**—"Analysis of sexes in a Junco migration." (p. 272-273). At Indianpoint Lake, near Barkerville, Brit. Columbia, 478 ♂♂, 144 ♀♀, and 66 "doubtful" (sex) Shufeldt Juncos were trapped and banded, April 7 to June 15. **ROBERT S. WOODS.**—"Road-runner versus Mockingbird." (p. 273). *Geococcyx californianus* captured a full grown immature *Mimus polyglottos leucopterus* at Azusa, California. **ANNIE M. ALEXANDER.**—"A further chronicle of the passenger pigeon and of methods employed in hunting it." (p. 273). In Franklin Township, Bergen County, N. Jersey, in March, 1838, at least 20,000 *Ectopistes migratorius* were taken in a fortnight within an area 10 miles square by means of a net on the ground. The birds were baited with buckwheat and attracted by decoys. **A. WETMORE.**—"The amount of food consumed by cormorants." (p. 273-274). Captive Florida cormorants in the Nation. Zool. Park at Washington, District of Columbia, receive ¾ to 1 pound of fish 6 days in the week. **H. S. SWARTH.**—"The Rufous-necked Sandpiper in Alaska." (p. 274). Comment on records by A. M. Bailey for *Pisobia ruficollis.* **HAROLD MICHENER.** —"Notes from the three Barkerville [British Columbia] banding stations." (p. 275-276).—*T. I. Storer.*

2821. HARRIS, HARRY. John Ridgway's Drawings for the Bendire plates. *Condor* 29(4): 177-181. 1 fig. 1927.—Account of preparation of plates illustrating eggs of birds for Charles Bendire's "Life histories of North American birds" issued by the Smithsonian Inst. in 1893 and 1895.—*T. I. Storer.*

2822. HEYDER, RICH. Aus der Frühgeschichte der Vogelkunde in der Oberlausitz. Ein Erinnerungsblatt. *Mitteil. Ver. Sächs. Ornithologen* 1(8): 185-207. 1926.—A detailed sketch of ornithological authors, publications, and societies in Ober Lausitz in the early and middle parts of the 19th century. Among the authors mentioned are N. G. Leske, F. P. Brahts, Meyer zu Knonow, J. G. Krezschmar, J. M. Bechstein, and J. G. Neumann. An appendix presents data on the occurrence of rare birds in the region.

2823. HILDEBRANDT, HUGO. Vogelschutzfragen. *Mitteil. Ver. Sächs. Ornithologen* 2(1): 9-16. 1927.—The author gives data on the increase or decrease of certain German birds, in some cases corresponding to changing ecological conditions, but in other cases without visible cause. These circumstances require consideration especially in the conservation of vanishing species.

2824. HOFFMANN, BERNH. Für ein einheitliches deutsches Namenverzeichnis unserer einheimischen Vogelwelt. *Verhandl. Ornithol. Ges. Bayern* 18(3/4): 318-336. 1929.—A plea is made for placing the German ornithological nomenclature on a basis that follows as far as possible the existing scientific one. Each species or form should receive only one scientific name, always to be placed first, but with the German name hitherto used admissible. Those of common genus should in the German have the same generic name. For different genera, different names should be used as far as possible; and finally all members of a "Formenkreis" should bear the same specific German name; a subspecies should be indicated by a special adjective. The author points out many examples of failure to observe this rule, and suggests corrections.—*B. Hoffmann (transl. by E. W. Count).*

2825. HUEY, LAURENCE. The bird life of San Ignacio and pond lagoons on the western coast of lower California. *Condor* 29(5): 239-243. 1927.—The tidal estuaries of the west coast of Lower California constitute 6 groups, alike in lacking in permanent supplies of fresh water from the inland mountains and in being separated from the ocean by sand spits. The marsh floras of the 4 northern groups are almost identical, but that of San Ignacio exhibits semi-tropical character, lacking kelp and salicornia, the sloughs being lined with mangroves (*Rhizophora mangle*), which are also present at Pond Lagoon to the south. A running account of 57 spp. of birds, mostly water birds, observed at these lagoons, April 10-18, is presented.—*T. I. Storer.*

2826. KENISTON, ALLAN. Trapping and banding owls during their migration. *Bull. Northeastern Bird-Banding Assoc.* 3(2): 39-42. 2 pl. 1927.—*Asio flammeus, A. wilsonianus*, Otus a. asio,* and *Nyctea nyctea** on Martha's Vineyard, Massachusetts.

2827. LEACH, FRANK A. Strange features in bird habits. *Condor* 29(5): 233-238. 1927.—A group of 8-10 California woodpeckers (*Balanosphyra formicivora bairdi*) lived as a colony, with headquarters in a particular oak tree, where others of the same species were not permitted to trespass; a nest hole in a nearby pole was worked upon by several members of the group in rotation, incubation of the eggs appeared to be done by several individuals, and even 3 and 4 adults engaged in feeding the resulting brood of young. California Jays have been observed to "cache" food. A domestic hen with a brood was attended by a ♂ Valley Quail. California Towhees exhibited skill in locating and removing pea seeds planted in separate "hills" in a garden. Several species of birds learned quickly to come to a table where food was set out for them at regular times.—*T. I. Storer.*

2828. McCABE, THOMAS T., and ELINOR BOLLES McCABE, et al. From field and study. *Condor* 30(3): 190-193. 1928.—McCabe. "Notes on certain injured birds." A Black-headed Jay (*Cyanocitta stelleri annectens*) with shot injury in shoulder joint survived more than a year in latitude 53°N. in Brit. Columbia; a Great Horned Owl (*Bubo virginianus*) with wing injury survived 5 months. An American Rough-legged Hawk (*Archibuteo lagopus sancti-johannis*) with but a stump of the right leg was shot; the parts of the head and neck ordinarily reached by the lost member were nearly denuded of contour feathers and swarming with lice. **ALEXANDER WETMORE.**—"The Short-tailed Albatross in Oregon." (p. 191). Part of the left tibio-tarsus of *Diomedea albatrus* recovered in an Indian shell mound near Netarts Bay. **H. S. SWARTH.**—"Winter occurrence of Sierra Nevada Rosy Finch and Black Rosy Finch in California." (p. 191). Several *Leucosticte tephrocotis dawsoni* and one of *L. atrata*, Jan. 15, 1904, at Bodie, the latter being the first record of the species in California. **JOHN B. MAY.**—"Occurrence of the Golden-crowned Sparrow in Massachusetts." (p. 191-192). *Zonotrichia coronata* at Bedford, Jan. 26. **LOYE MILLER.**—"The Sahuaro Screech Owl in California." (p. 192). *Otus asio gilmani* at Laguna Dam, Shaver's Well and White Tank, Colorado Desert. The "song" differs from that of *O. a. quercinus* in having 2 tetrads of notes, the 2nd half a tone below the 1st. At the 1st station the birds were in willow thickets, at the 2nd in dense mistletoe on an ironwood tree. **CLINTON G. ABBOTT.**—"American Goshawk in San Diego County, California." (p. 192-193). *Astur atricapillus* at Mesa Grande, Jan. 5. **J. H. RILEY, and A. WETMORE.**—"An erroneous record for the Japanese Pipit in Alaska." (p. 193). Specimen recorded as *Anthus spinoletta japonicus* from St. Paul Isl. determined to be *A. s. rubescens*. **DONALD R. DICKEY, and A. J. van ROSSEM.**—"A new race of the White-throated Swift from Central America." (p. 193). *Aeronautes saxatilis* **nigrior**, type locality, Los Esesmiles, El Salvador. Range, high mountains of El Salvador northwest through Guatemala, at least to Hidalgo, Mexico.—*T. I. Storer.*

2829. MATTINGLEY, ARTHUR H. E. Cormorants in relation to fisheries. *Condor* 29(4): 182-187. 1927.—*Phalacrocorax carbo, P. ater, P. fuscescens, P. varius,* and *Microcarbo melanoleucus* in Australia are currently believed by many fishermen to be the cause of decrease in the supply of food and game fishes. Both fish and cormorants have decreased since settlement of the Commonwealth. Cormorants feed their young on yabbies (crayfish), frogs, shrimps, and young water tortoise, which animals otherwise prey upon the ova and young of fishes. At Lake Wendouree cormorants catch perch but not trout. The average weight of *P. ater* and *P. fuscescens* is between 2½-3 pounds and individuals of these species are believed not to eat more than 1½ pounds of fish daily. Eels and lampreys are eaten but not fry of fishes. Damage to trout fry in ponds by cormorants can be eliminated by screening the hatchery ponds.—*T. I. Storer.*

2830. ROWAN, WILLIAM, et al. From field and study. *Condor* 30(4): 246-256. 1928.—Rowan. "Bears and birds' eggs." (p. 246). Bears reported to hunt duck eggs along lake margins; in northern Alberta evidence of bears having climbed trees containing hawk nests was not common. **WINTON WEYDEMEYER.**—"Some winter records from Montana." (p. 246-247). Notes on 12 spp. supplemental to data in A. A. Saunder's "A distributional list of the birds of Montana." **JOSEPH EWAN.**—"California Black Rail in Los Angeles County." (p. 247). *Creciscus jamaicensis coturniculus* at Playa del Rey, impaled on a barbed wire as if captured by California Shrike. **H. A. ALLARD.**—"Unusual singing of the eastern Chewink." (p. 247-249). Additional notes in the song of *Pipilo erythrophthalmus* at Chapel Hill, N. Carolina; speculates on conscious element in "improvement" of bird song. **S. F. BLAKE.**—"Field notes on certain California birds." (p. 249-250). Miscellaneous notes on 5 spp. **H. C. BRYANT.**—"Summer record of the Cedar Waxwing in Yosemite Valley [California]." (p. 250). *Ampelis cedrorum* early in June, 1927. **MILTON S. RAY.**—"A record set of eggs of the Golden Eagle." (p. 250). Four eggs of *Aquila chrysaëtos;* also set of 6 for *Elanus leucurus* and 5 for *Buteo borealis calurus.* **DON C. MEADOWS.**—"Bird notes from Santa Catalina Island [California]." (p. 250-251). **LAURENCE M. HUEY.**—"A mid-winter Anthony Green Heron." (p. 251). *Butorides virescens anthonyi* at Lakeside, San Diego County, California, Jan. 1. **F. KERMODE.**—"The Lichtenstein Kingbird on Vancouver Island." (p. 251). *Tyrannus melancholicus satrapa* at French's Beach, Renfrew District, Feb. 1923. **THEED PEARSE.**—"The nuptial display of the Buffle-head." (p. 251-252). *Charitonetta albeola* ♂♂ displayed before ♀♀ in 2 different ways: flying weakly a few yards then "sliding" towards the ♀, turning about and jerking the tail; again, laying the body depressed on the water, shooting the head up vertically and bobbing it back and forth several times. **G. L. FOSTER, and GRACE E. FOSTER.**—"Sixth record of Harris Sparrow in California." (p. 252). *Zonotrichia querula* at Berkeley, 1924-25, with one *Z. albicollis* and at least 3 *Junco hyemalis.* **RALPH C. TATE.**—"Rufous Hummingbird in the Oklahoma Panhandle." (p. 252-253). The ♂ *Selasphorus rufus* observed at Kenton, in Aug. and to Sept. 1, 1927. **JACK C. von BLOEKER, and SAMUEL G. HARTER.**—"Reddish Egret on Los Coronados Islands, Mexico." (p. 253). *Dichromanassa rufescens dickeyi,* May 6. **CHAS. T. VORHIES.**—"Band-tailed pigeon nesting in Arizona in September." (p. 253). *Columba fasciata* at Soldier Camp, Santa Catalina Mts., Sept. 9, 1923, building a nest. **J. GRINNELL.**—"Do Willow Downy Woodpeckers ever drill in tree-bark?" (p. 253-254). Woodpecker borings in bark of apple trees in Yosemite Valley, California, were ascribed by Grinnell and Storer to *Dryobates pubescens turati* on the basis of observation. C. W. Michael believes the drilling to be the work of the Red-breasted Sapsucker, never having been able to detect the first-named actually boring. He believes the "Downies" were "looting the honey pots of the Sapsucker." **LOYE MILLER.**—"Generic re-assignment of Morphnus daggetti." (p. 255-256). **WETMOREGYPS** (p. 255), type *Morphnus daggetti* Miller.—*T. I. Storer.*

2831. SAUNDERS, FREDERICK A. Banding results in Maine. *Bull. Northeastern Bird-Banding Assoc.* 2(2): 22-24. 1926.—From a limited number of banding returns, the author tentatively concludes that ♂ warblers remain on the breeding ground throughout the summer, while ♀♀ and young wander off in July. The same adults return the following year. The young seem not to return.

2832. SCHNEIDER, WOLFGANG. Erfahrungen bei der Starenberingung. *Mitteil. Ver. Sächs. Ornithologen* 2(2): 72-80. 1927.—In 7 years the author banded 850 starlings, including 356 adults, in Saxony, with 7% return records. The fact that none were known to carry the bands for more than 3 years indicates a brief span of life. The species appears very susceptible to hunger and storm. Adults captured and banded at the nest invariably deserted eggs or young. There is apparently only one brood per year in this region. Old birds nest in

May and lay 5-8 eggs; birds of the previous year nest in June and lay mostly 3 eggs, sometimes 4 or 5. Two young birds were taken in Spain during their first winter. Fourteen adults and 24 young birds were recaptured in the home locality in the year following. Starlings captured by the author learned to recognize him, and later were more alarmed at the sight of him than of another person.

2833. **STRESEMANN, ERWIN. Die Entwickelung der Begriffe Art, Varietät, Unterart in der Ornithologie.** [The development of the concepts of species, variety and subspecies in ornithology.] *Mitteil. Ver. Sächs. Ornithologen* 2(1): 1-8. 1927.—A review of the concepts of various workers, including Cuvier, Brehm, Gloger, Schlegel, Cassin, Baird, Darwin, Allen, and Kleinschmidt.

2834. **TAVERNER, P. A., et al. From field and Study.** *Condor* 30(2): 157-165. 1928.—Taverner.—"Bears and hawks." In the Peace River district northwest of Belvedere, Alberta, poplar trees containing nests of the large hawks practically all show evidence of having been climbed by [black] bears, suggesting egg-hunting by the latter. **CHARLES W. MICHAEL.**—"The Pileated Woodpecker feeds on berries." (p. 157). *Phloeotomus pileatus picinus* in Yosemite Valley, California, was observed feeding on ripe berries of mountain dogwood, *Cornus nuttali*, by hanging head downward while picking at the berry clusters. **ERNEST D. CLABAUGH.**—"Bird casualties due to automobiles." (p. 157). Between Berkeley and Redding, California, on June 1, 1927, fourteen birds (1 Coot, 2 Red-winged Blackbirds, 1 California Woodpecker and 1 English Sparrow identified), 3 squirrels and 4 jackrabbits were seen along 239 miles of road where killed by automobiles. "Fourth known occurrence of the Harris Sparrow in California." (p. 163-164). *Zonotrichia querula* trapped at Berkeley, Nov. 21, 1927. **LAURENCE M. HUEY.**—"Some bird records from northern Lower California." (p. 158-159). Brief mention of about 19 spp. observed during June and July, 1927. **JACK C. von BLOEKER.**—"Western mockingbird nesting in a mail box." (p. 159). *Mimus polyglottos leucopterus* at San Diego, California. **A. V. WILSON.**—"Condor caught in San Joaquin Valley." (p. 159-160. 1 fig.). *Gymnogyps californianus* southeast of Bakersfield, Kern County, in Sept. 1926; on ground, gorged with food. **CLARENCE COTTAM.**—"White pelicans wintering in northern Utah." (p. 160). Two *Pelecanus erythrorhynchos* on Utah Lake, Dec. 10, 1927; also one *Ardea herodias treganzai*. **J. STUART ROWLEY.**—"Western winter wren found breeding in Tulare County, California." (p. 160-161). *Nannus hiemalis pacificus* at Doyle's Camp, altitude 5000 ft., east of Porterville, California; 3 pairs, breeding in July, 1926. **C. HANNA WILSON.**—"Notes on the dwarf cowbird in southern California." (p. 161-162). *Molothrus ater obscurus* is increasing in the San Bernardino Valley; 100 nests of 12 passerine species, parasitized by cowbirds were examined. Eggs of cowbirds in nests of *Icteria virens longicauda*, about the largest of the host species, were larger than the average. *Empidonax t. traillii, Vireo bellii pusillus*, and *Dendroica aestiva brewsteri* were the species most often parasitized. One nest of *Polioptila plumbea* from the Coachella Valley west of Mecca contained the first cowbird egg from that locality. **DONALD R. DICKEY.**—"A third California record of the Rusty Blackbird." (p. 162). *Euphagus carolinus* on Santa Rosa Isl.; specimen found dead Nov. 6, 1927. **CLINTON G. ABBOTT.**—"Bird notes from San Diego County [California]." (p. 162-163). *Dafila acuta tzitzihoa* breeding at Lake Henshaw (a reservoir); adult ♂ and immature *Accipiter cooperi* paired and breeding; *Xema sabini*, one collected at Point Loma, Sept. 18, 1927; *Lobipes lobatus* feeding in thousands on smooth slick spots on water; *Lophortyx gambelii gambelii* present in Borega Valley; *Asyndesmus lewisi* at Point Loma; *Spizella atrogularis cana* and *Wilsonia pusilla pileolata* at San Diego on Dec. 21, 1927. **HAROLD H. COZENS.**—"Fifth record of Harris Sparrow in California." (p. 164). *Zonotrichia querula* at Encinitas, Dec. 21, 1927. **STANLEY G. JEWETT.**—"The Flammulated Screech Owl in Oregon." (p. 164). *Asio flammeolus* taken at 7000 ft. altitude on Hart Mt., May 25, 1927, adult ♀, not breeding. Moths and ground (Carabid) beetles comprised 94% of the stomach contents. **ALFRED M. BAILEY.**—"Notes on Variations in the White-fronted Goose." (p. 164-165). *Anser albifrons* in California exhibits 2 well marked subspecies, *albifrons* and a larger form, *gambeli*, the Tule Goose, as shown by Swarth and Bryant. Louisiana birds all fall within the size range of *albifrons*. Breeding birds from northwestern Alaska at Wainwright are *albifrons*. The number of rectrices and color of eye ring are not dependable characters for separating the two.—*T. I. Storer.*

2835. **TOWNSEND, CHARLES HASKINS. Old times with the birds: Autobiographical.** *Condor* 29(5): 224-232. 2 fig. 1927.—An outline of the author's experiences in ornithological work, from about 1875 up to the present, in the eastern U. S. A., California, Honduras, on the cruises of the "Corwin" and "Albatross," etc.—*T. I. Storer.*

2836. **TYLER, JOHN G., et al. From field and study.** *Condor* 30(1): 124-129. 1928.—Tyler.—"Can hawks prevent mouse plagues?—A reply." (p. 124-125). Refers to an article [see Entry 2819 in this issue] by A. Brooks regarding abundance of raptorial birds near Snelling in the northern San Joaquin Valley of California in 1923, and a mouse plague in the southern part of the same valley in 1926-27. The concentration in hawk population about Snelling is not general throughout the Valley and a succession of dry seasons in the intervening years reduced the nesting population of raptorial species in the central San Joaquin Valley. The unusual increase in mouse population was favored by planting Sudan grass, Egyptian corn, and barley in the Buena Vista Lake basin, raptorial species were at a minimum, and carnivorous mammals had been reduced by poisoning. **JACK C. von BLOEKER.**—"Fly-catching habits of the Western Tanager." (p. 125-126). *Piranga ludoviciana* catching a cicada in Cuyamaca Mts., San Diego County, California. **ERNEST D. CLABAUGH.**—"Winter roosts of western robins." (p. 126). *Planesticus migratorius propinquus* at Davis, California; maximum estimated number 700, Feb. 11, 1927. **J. GRINNELL.**—"September nesting of the Band-tailed Pigeon." (p. 126-127). *Columba fasciata* in Yosemite Valley, California, Sept. 27, 1927; autumnal nesting of other members of the species was inferred from their behavior. Late nesting believed to be due to time of ripening of acorn crop used by this pigeon for food. **CHARLES W. MICHAEL.**—"Nesting time of Band-tailed Pigeons in Yosemite Valley." (p. 127). Comment on a record by Grinnell [see preceding note] on Sept. nesting. Michael believes that the majority of young birds in the Valley are fledged by the end of Aug. He does not agree with Grinnell's statement that breeding season of birds coincides with period when food is most easily obtained. *Columba fasciata* also feeds on berries of *Rhamnus* and *Arbutus* which ripen at other seasons than the acorns. **STANLEY G. JEWETT.**—"Assistant parentage among birds." (p. 127-128). Russet-backed Thrush (*Hylocichla u. ustulata*) assisted in feeding young of a pair of Western Robins (*Planesticus migratorius propinquus*) near Portland, Oregon; "The Little Green Heron in Oregon." (p. 129). Five circumstantial or sight records for *Butorides virescens anthonyi*, 1917 to 1927. **LEON L. GARDNER.**—"Food of young Horned Owls includes adult Marsh Hawk." (p. 128). Young of *Bubo v. virginianus* fed chiefly on cottontail rabbits, with gophers, field mice and some birds, including a *Circus hudsonius*. The latter species was migrating through the region of the nest (Fort Riley, Kansas) in numbers at the time. **H. H. KIMBALL.**—"An abode of *Otus flammeolus*." (p. 129). In a mountain garage in Saliz Cañon, San Francisco Mts., New Mexico. **JOHN S. MAIN.**—"Whistling of the Wilson Snipe." (p. 128-129). *Gallinago delicata* in southwestern Wisconsin, produced a "winnowing" sound when on a downward course at 45° when flying 400-500 ft. above ground in a wide circular path.—*T. I. Storer.*

2837. **VÄLIKANGAS, ILMARI. Die Vogelberingungen**

in Finnland im Jahre 1926. (In German.) *Ornis Fennica* 4(4): 99-104. 1927.—In this year 1894 birds of 79 spp. were banded. Return records for 27 birds are given.

2838. **WHITTLE, CHARLES L. Purple finch and catbird returning ratios.** *Bull. Northeastern Bird-Banding Assoc.* 3(3): 58-59. 1927.—Records of banded *Carpodacus p. purpureus* in New Hampshire and of *Dumetella carolinensis* in Massachusetts show increasing returning ratios each year with the increasing age of the birds.

2839. **WHITTLE, C. L. Some additional bird weights.** *Bull. Northeastern Bird-Banding Assoc.* 3(3): 70-71. 1927. —Records of 14 spp. of Passeres.

2840. **WHITTLE, CHARLES L. A plea for more bird-weighers.** *Bull. Northeastern Bird-Banding Assoc.* 3(3): 75. 1927.—Certain migrant song sparrows, taken in Massachusetts in early April, weighed between 25 and 27 grams, as compared with a weight of 20 to 22 grams for local breeding birds. The former may be representatives of some northern race of this sp.

SYSTEMATIC

2841. **BANGS, OUTRAM, and JAMES L. PETERS. A collection of birds from Oaxaca.** *Bull. Mus. Comp. Zool. Harvard Coll.* 68(8): 385-404. 1928.—This paper is based on a collection of 128 spp. and subspp. made by W. W. Brown between 15 Feb.–12 Nov., 1927. The localities are, Chivelá, Lagunas, Almoloya, and Tapanatepec, all in Oaxaca. *Colinus virginianus* **thayeri** (p. 386), type from Chivelá; *Sittasomus griseicapillus* **gracileus** (p. 392), type from Chichen Itza, Yucatan; *Xiphorhynchus flavigaster* **tardus** (p. 393) and *Tyrannus crassirostris* **pompalis** (p. 396), types from Hacienda San Rafael, Chihuahua; *Heleodytes zonatus* **impudens** (p. 398), type from Chivelá. Types of new forms are in coll. Mus. Comp. Zool. *Aratinga holochlora* (Scl.) and *Aratinga strenua* (Ridgw.) are regarded as distinct species. *Aratinga canicularis* is divisible into 2 subspp.: *A. c. eburnirostrum* (Less.) ranges in western Mexico from Sinaloa to Guerrero and *A. c. canicularis* (Linn.) on the Pacific coast from the Isthmus of Tehuantepec to western Costa Rica. *Sittace petzii* Wagl. is a synonym of *Psittacus canicularis* Linn. The genera *Aratinga* and *Eupsittula* are merged under the former and older name. *Momotus mexicanus saturatus* Nels. is regarded as identical with *mexicanus* Swains. The range of *Myiodynastes luteiventris swarthi* van Ross. is extended south into Chihuahua. Two forms of *Chiroprion linearis* are recognized, *C. l. linearis* (Bonap.) southern Mexico to Guatemala and *C. l. fastuosa* (Less.) Nicaragua and Costa Rica.—*J. L. Peters.*

2842. **BOAS, J. E. V. Biologisch-anatomische Studien über den Hals der Vögel.** *Kgl. Danske Vidensk. Selsk. Skrifter, Naturvidensk. og Mathem. Afd. 9.* 1(3): 106-222. 23 pl. 20 fig. Andr. Fred. Høst & Son; København, 1929. Pr. 20 Kroner.—The author was led by a monograph by Hans Virchow on the vertebral column of the penguin (1910) to undertake further study in a neglected field. The author is interested in the articulation and flexional powers in the bird neck, hence he considers first its use as a tool, and confines himself to long-necked species. He describes and illustrates the vertebrae in detail, and divides the neck into 3 sections; the supraspinal ligaments in several species are compared as to size, and the musculature is compared in more or less detail for *Larus marinus* (used as the basis for comparison), *Tetrao urogallus, Ardea cinerea, Ciconia alba, Picus viridis, Spheniscus demersus, Graculus carbo, Plotus anhinga, Cygnus musicus, Anser domesticus, Rhynchotus rufescens, Dromaeus, Rhea, Struthio, Haliaëtus albicilla, Syrnium aluco.* There is a short chapter on necks of paleornithes. The author believes, on the evidence afforded by the neck, that the dinosaur group, including *Ornitholestes, Ornithomimus, Struthiomimus,* is the nearest extant fossil relative of the ancestral bird type. The latter preserved also the postpubis, which is lacking in the above-mentioned group. At least the possibility is suggested that the essential neck structure was already present in the bird-like dinosaurs. The modern Crocodilia, though admittedly distantly related, at least have a neck flexion similar to that of section 2 of the bird neck. This similarity is lacking in more distantly related reptiles. A sketch of the history of anatomical study on the bird neck from the point of view adopted by the author is given. There are tables comparing number of vertebrae per neck section in a large number of classified species; tables giving type and degree of possible flexions for all 3 sections of the neck in a somewhat smaller number; and a bibliography.—*E. W. Count.*

2843. **BOETTICHER, HANS von. Kritische Betrachtungen über Anatiden.** *Anz. Ornithol. Ges. Bayern* 2(1): 10-15. 1929.—*Punanetta* **versicolor** (*Anas v.* Vieill.) (p. 10); *Anas punctata* Burch. is also transferred to *Punanetta; Micronetta* Roberts is reduced to a subg. of *Punanetta* Bp.; *Querquedula* should include only *Q. querquedula* (L.), *Q. discors* (L.), and *Q. cyanoptera* (Vieill.); *Nettion georgicum* **flavirostre** (*Anas flavirostris* Vieill.) (p. 11); *N. g.* **oxypterum** (*Anas oxyptera* Meyen) (p. 11); *N. g.* **andium** (*Querquedula a.* Scl. & Salv.) (p. 11); **SIBIRIONETTA** (p. 11), n. subg. of *Nettion,* type *Anas formosa* Georgi; *Anas capensis* Gmel. is transferred to *Virago* Newt.; *Notonetta* Roberts is reduced to a subg. of *Virago;* **AMAZONETTA** (p. 12), type *A.* **brasiliense** [in error for *brasiliensis*] (*Anas brasiliensis* Gmel.) (p. 15), including also *Nettion leucophrys* (Vieill.); *Afranas* Roberts, *Melanas* Roberts, *Polionetta* Oates, and *Horizonetta* Oberh. are regarded as subgenera of *Anas* L.; **SPECULANAS** (p. 14), type *S.* **specularis** (*Anas s.* King) (p. 14); the author is now convinced that *Nyroca* Flem. and *Fuligula* Steph. are distinct.—*H. von Boetticher.*

2844. **BOETTICHER, H. von. Zur Systematik der Kakadus.** *Anz. Ornithol. Ges. Bayern* 2(1): 15-16. 1929.—Discussion of genera of Psittaciformes. In general, the classification of G. M. Matthews (Systema avium australasinarum) is accepted as correct and practical. But the form given by him as *Kakatoe galerita ophthalmica* (Sclater) should not be placed under *Kakatoe galerita* (Leth.); it approximates rather *Kakatoe albo* (Müll.) and *Kakatoe moluccensis* (Gmel.). It is recommended that these 3 forms, because of the crest formation be lumped under a special genus *Plyctolophus* Vieillot, and thus separated from the other species.—*H. von Boetticher (transl. by E. W. Count).*

2845. **BOETTICHER, H. von. Ueber die Verwandtschaft der Eulen mit den Raubvögeln.** *Verhandl. Ornithol. Ges. Bayern.* 18(1/2): 172-176. 1929.—In the dispute as to whether the owl belongs with the Raptores or the Coracornithes, especially to Podargidae, etc., the author takes the middle position that the owl is a very old branch on the avian tree. This branch comes from that of the Coracornithes, but at a very early time, and is low down and close to the origin of the Coracornithes branch; i.e., relatively close to the branching-off of Pelargornithes, to which group belong the Raptores. Hence it is that the owls show chiefly characters of Coracornithes but also some like those of Raptores; i.e., they show more common primitive characters.—*H. von Boetticher (transl. by E. W. Count).*

2846. **BOND, JAMES. The distribution and habits of the birds of the Republic of Haiti.** *Proc. Acad. Nat. Sci. Philadelphia* 80: 483-521. 1928.—This report is based upon 6 months' collecting on the mainland of Haiti and on Gonave and Tortuga Isls. It includes all the resident birds known to occur in the republic, but only those migrants that the author personally encountered. There is a brief description of 12 physiographic areas. The systematic list of 152 forms consists chiefly of notes on distribution, status, and habits. Local names are supplied for most of the birds. Twelve species are listed whose status as residents is doubtful. *Siphonorhis* Sclater (=*Microsiphonorhis* Chapman); *S.* **brewsteri** (*M. b.* Chapman) (p. 501); *Erismatura j. jamaicensis,* first definite record for Hispaniola; *Nesoctites micromegas* **abbotti** (*N. a.* Wetmore) (p. 505); *Dulus dominicus* L. (=*D. nuchalis* Swainson); *Agelaius humeralis* (Vigors)

(=*A. quisqueyensis* [sic] Danforth & Emlen).—*From abst. by C. E. Underdown.*

2847. BOWEN, W. WEDGWOOD. On the genus Nyctiperdix, Roberts: fifth preliminary paper on the birds collected during the Gray African Expedition—1929. *Proc. Acad. Nat. Sci. Philadelphia* 82: 145-148. 2 pl. 1930.—The genus *Nyctiperdix,* containing the 5 spp. *quadricinctus, fasciatus, bicinctus, lichtensteinii,* and *decoratus,* should be recognised on structural characters as being distinct from *Pterocles.* The 2 groups are also distinct in habits and ecology. Photographs of typical habitats are used to illustrate this point. The *Pterocles* group is considered a divergent offshoot from the parent form, which is most nearly represented today by the *Nyctiperdix* group.—*W. W. Bowen.*

2848. BOWEN, W. WEDGWOOD. The relationships and distribution of the bare-throated francolins (Pternistis): sixth preliminary paper on the birds collected during the Gray African Expedition—1929. *Proc. Acad. Nat. Sci. Philadelphia* 82: 149-164. 2 map, 6 fig. 1930.—The 3 species, *afer, cranchii,* and *swainsoni,* are united because they possess a similar type of feather-pattern, their ranges do not overlap and several of the races show affinities to 2 or more of the 3 groups. *P. afer* is the oldest name and 15 subspp. are recognized. *P. rufopictus* is closely related, but is kept separate on account of an apparent overlap in range. *P. leucoscepus,* with several races, is quite distinct and is only dealt with briefly. Keys to spp. and subspp. are followed by brief descriptions (illustrated by text-figs. of feathers and heads of all the forms) and outlines of the ranges are given. Two maps illustrate the distribution and the influence of altitude on the ranges of the various races. *P. afer angolensis* Roberts is a synonym of *P. a. benguellensis* Bocage; *P. a. punctulata* (Gray), which has hitherto been regarded as synonymous with *P. a. cranchii,* is a distinct form inhabiting central Angola.—*W. W. Bowen.*

2849. BOWEN, W. WEDGWOOD. Geographical variation in Cinnyricinclus leucogaster: seventh preliminary paper on the birds collected during the Gray African Expedition—1929. *Proc. Acad. Nat. Sci. Philadelphia* 82: 165-167. 1 fig. 1930.—*C. leucogaster* **friedmanni** (p. 166), Abyssinia, type in U. S. Nat. Mus. *C. l.* **lauragrayae** (p. 166), Kenya Colony, type in Acad. Nat. Sci. Phila. Four subspecies are recognized.—*W. W. Bowen.*

2850. DESSELBERGER, HERMANN. Bewegungsmöglichkeiten und Bewegungshemmungen im Hals der Bucerotiden. *Jour. Ornith.* [*Berlin*] 78(1): 86-106. 5 fig. 1930.—Among birds, it is only in the Bucerotidae that the first 2 vertebrae of the neck, atlas and epistropheus, have completely fused, thus limiting in these joints the possibility of turning the head, which is generally due to the joints connecting condylus occipitalis, atlas and epistropheus. But an examination of the neck in this family (carried out particularly on *Rhytidoceros undulatus*) demonstrates that this limitation in the foremost joints is compensated by a peculiar construction of the joints themselves in relation to the next adjoining vertebrae. For this reason, the Bucerotidae are, on the whole, able to turn the head just as well and as far as other birds. In connection with this study, all possibilities of motion in the necks of birds, especially the restrictions limiting or stopping their motions are discussed. With respect to potential motion, necks of all birds (except Struthios) are constructed according to the same principle. A discussion of the biological value of this construction closes the paper.—*H. Desselberger.*

2851. GRINNELL, JOSEPH. Notes on the systematics of west American birds. II. *Condor* 30(2): 153-156. 1928.—*Phalaenoptilus nuttallii* **dickeyi** (p. 153), type locality, San Ignacio, lat. 27° N., Lower California; *Baelophus inornatus* **transpositus** (p. 154), type locality, Mount Wilson, Los Angeles County, California; *Thryomanes bewickii* **correctus** (p. 154), type locality, Pasadena, Los Angeles County, California. The rock wrens of the southwest are all to be grouped as *Salpinctes o. obsoletus,* save the Guadalupe Isl. form which should be designated as a subspecies *S. o. guadeloupensis. S. o. proximus* by Swarth from San Martin Isl., Lower California, is now considered a synonym of *S. o. obsoletus* which exhibits considerable variation, further complicated by wear after the molt.—*T. I. Storer.*

2852. GRISCOM, LUDLOW. Studies from the Dwight collection of Guatemala birds. 2. *Amer. Mus. Novitates* 414. pp. 1-8. 1930.—A preliminary paper including: *Cerchneis sparveria* **tropicalis** ♂ (p. 1); *C. sparveria* (L.) (=*C. s. guatemalensis* Swann); *Morococcyx erythropygus* **macrourus** (p. 2), *Synallaxis erythrothorax* **pacifica** (p. 3); *Megarhynchus pitangua* **deserticola** (p. 4); *Pitangus sulphuratus* **pallidus** (p. 4). The various "species" of the genus *Polioptila* are discussed, the author coming to the conclusion that all the supposed species boil down to one, *bilineata.* The bird was of S. Amer. origin and pushed northward into Central Amer. and may be defined as follows: *Polioptila bilineata bilineata* (Bonaparte), which includes *P. superciliaris* and *P. s. magna; P. bilineata albiloris* Sclater & Salvin, which includes *P. nigriceps, P. n. restricta* and *P. bairdi,* and *P. bilineata albiventris* Lawrence. *Heleodytes capistratus* **xerophilus** (p. 7). The author states that *H. megalopterus* and *H. nelsoni* are conspecific and that it is doubtful if they are specifically separable from the *zonatus* group.

2853. HARTERT, ERNST. A rush through Tunisia, Algeria, and Marocco, and collecting in the Maroccan Atlas, in 1927. *Novitates Zool.* [*London*] 34(3): 337-371. 2 pl. 13 fig. 1928.—A general account of bird observations, with critically annotated list of some 52 spp. or subspp. of birds, among which are *Apus melba* archeri ♂ (p. 363), Somaliland; *A. melba* **bakeri** (p. 363), Ceylon; *A. affinis* **bannermani** (p. 365), Island of San Thomé and Princes Isl.; types, of *A. m. archeri,* of *A. m. bakeri,* and of *A. affinis bannermani,* in Tring Mus. See also correction *Ibid.* p. 395.

2854. JOHNSEN, SIGURD. Draktskiftet hos lirypen (Lagopus lagopus Lin.) i Norge. [Plumage changes of the willow ptarmigan in Norway.] [English translation p. 66-79.] *Bergens Museums Årbok, Naturvidensk. rekke* 1(paper 1): 1-84. 14 pl. (7 col.) 5 fig. 1929.—Four plumages are distinguished in the ♂,♂ in the ♀, all acquired by moult. Spring plumage of ♂♂ may begin to appear as early as the middle of March, more generally in April, and is retained during the mating season. Summer plumage then appears, giving way to fall plumage in the latter part of July or early in Aug. in paired cocks, somewhat earlier in single birds or those which have lost the chicks. Spring plumage of ♀ is complete in the latter part of May and persists until early in Aug., or middle of July in those which have lost the young, when the autumn plumage appears. The white winter plumage of both sexes, often tinged with a rosy flush, is worn from about the first of Nov. to March (♂) or April (♀). The 14 tail feathers are shed once a year, beginning with outer ones. Two median feathers, by some classed with upper tail coverts, are shed in spring and autumn. In July or early Aug. horny covering of bill and claws are shed.—*O. J. Murie.*

2855. LAUBMANN, A. Die Eisvögel der Deutschen Gran Chaco-Expedition. Ein Beitrag zur Erforschung der Avifauna Südamerikas. *Verhandl. Ornithol. Ges. Bayern* 18(3/4): 193-231, 1 map. 2 fig. 1929.—*Chloroceryle americana* with 7 subspp. is discussed in detail, with key and sketch of relationships; also *C. amazona* and *Streptoceryle torquata* with 3 subspp. Nesting and plumages are described. A classification of the Alcedinidae suggested is: Collective genus *Ceryle* with subgenera: *Ceryle, Megaceryle, Macroceryle, Streptoceryle, Chloroceryle,* and *Amazonis.*—*O. A. Stevens.*

2856. MATHEWS, GREGORY M. Another new book, which necessitates changes in nomenclature. *Austral Avian Record* 5(4): 81-100. 1926.—Attention is called to an obscure work published in 1787, "Index Systematicus Musei Geversiani." The author of the names em-

ployed was F. C. Meuschen, who followed the 12th edition of Linné, 1766. Mathews lists the names applied by Meuschen to birds, pointing out various cases of priority, new combinations, etc.

2857. MATHEWS, GREGORY M. [Two new names.] *Bull. British Ornith. Club* 49(326): 19. 1928.—**NEOLALAGE** (*Pseudolalage* Mathews, not Blyth). *Pagodroma nivea* pealei, "new name for *Procellaria nivea* Peale, United States Expl. Exped. vol. viii, p. 295, 1848." [In *loc. cit.*, under the name of *Procellaria nivea* Gmelin, Peale describes specimens from lat. 64° S., long. 104° W.]

2858. MILLER, ALDEN H. The passerine remains from Rancho La Brea in the paleontological collections of the University of California. *Univ. California Publ. Bull. Dept. Geol. Sci.* 19(1): 1-22. 1 pl. 1929.—A report on the passerine birds preserved as fossils in the Rancho La Brea asphalt beds of California. Ten families are represented by 15 genera, 8 of which are identified as to species. The Horned Lark, Yellow-billed Magpie, Western Crow, Northwest Crow, Cedar Waxwing, Loggerhead Shrike, and a newly described extinct species, *Euphagus* **magnirostris*** (p. 14) or La Brea Blackbird, are known to occur. Remains of a kingbird, jay, chickadee, thrasher, bluebird, and oriole also have been found. Evidence afforded by these fossils indicates that the Rancho La Brea fauna was characteristic of the Lower Sonoran life-zone and that the climate was slightly more humid but no warmer than is the climate of the vicinity today. These birds further serve to indicate that the asphalt deposits are of middle or late Pleistocene age.—*A. H. Miller.*

2859. MURPHY, ROBERT CUSHMAN. Birds collected during the Whitney South Sea expedition. IV. *Amer. Mus. Novitates* 322. 1-5. 1 fig. 1928.—Six forms of Procellariidae are treated. Data are given showing distinctions between *Pterodroma rostrata* (Peale), and *P. parvirostris* (Peale). *Pterodroma* **becki** ♀ (p. 1), lat. 155° E., long. 3° S. Range of *Puffinus lherminieri polynesiae* Murphy (1927) extended into the Tonga Group; new material confirms the distinctness of *P. l. nugax* Mathews (1912). *Fregatta grallaria* **titian** ♀ (p. 4), Rapa Isl., Austral Group, South Pacific. Types in Amer. Mus. Nat. Hist.—*A. H. Norton.*

2860. MURPHY, ROBERT CUSHMAN, and GREGORY M. MATHEWS. Birds collected during the Whitney South Sea Expedition. VII. *Amer. Mus. Novitates* 356. 1-14. 1929.—This paper treats of 8 spp. and 8 subspp. of Zosteropidae; lacking material of *Zosterops flavifrons* (Gmelin), from Tanna Isl. (type locality), material from Efate, which "agrees perfectly" with published descriptions and figure of typical *Z. flavifrons* "are regarded as such" and used as a basis for comparison. *Z. f. macgillivrayi* Sharpe (1900) is regarded as valid; *Z. f.* **brevicaudata** ♂ (p. 3), Malo Isl. *Z. f.* **perplexa** ♂ (p. 3), Ambryn Isl.; *Z. f.* **gauensis** ♂ (p. 5), Gaua Isl., Banks Group; *Z. f.* **majuscula** (p. 5), Aneiteum Isl., *Z. lateralis* (Latham) (1801), *Z. l. flaviceps* Peale (1848), *Z. l. vatensis* Tristram (1879) valid and new material described; *Z. l.* **valuensis** ♀ (p. 10), Valua Isl., Banks Group. The preceding new subspp. are all from islands of the New Hebrides group. *Z.* **samoensis** ♀ (p. 11), Savii Isl., Samoa. **SANFORDIA** (p. 13), type *S.* **lacertosa** ♂ (p. 13), Santa Cruz Isl., Santa Cruz Group. Types in Amer. Mus. Nat. Hist. "Ultimately, the names now applied to the white-eyes of the *flavifrons* group will probably need further revision, for the forms of *Z. flavifrons* seem to be closely akin to *Z. intermedia* of the Celebes Isl."—*A. H. Norton.*

2861. PETERS, JAMES L. An ornithological survey in the Caribbean lowlands of Honduras. *Bull. Mus. Comp. Zool. Harvard* 69(12): 397-478. 1929.—The collection on which this account is based was made by the author, assisted by Edward Bangs of Boston. The region covered was in northern Honduras the chief collecting locality being the Lancetilla Valley near Tela; specimens were also secured at Progreso in the Ulua valley and in extensive fresh water swamps lying between the 2 places. *Odontophorus melanotis* **verecundus** (p. 404), type from Lancetilla, 1100 ft., *Rhynchortyx cinctus* **pudibundus** (p. 405), type from Lancetilla, 1000 ft.; *Automolus ochrolaemus* **amusos** (p. 441), type from Lancetilla, 500 ft.; *Glyphorynchus spirurus* **sublestus** (p. 443), type from Changuinola (Caribbean slope) northwestern Panama; *Tanagra gouldi* **praetermissa** (p. 470), type from Western River, Almirante, Panama. Types in Mus. Comp. Zool. The following are recorded for the first time from Honduras: *Crypturellus boucardi costaricensis, Odontophorus melanotis, Rhynchortyx cinctus, Oreopelia montana, Rostrhamus sociabilis plumbeus, Pulsatrix perspicillata saturata, Electron platyrhynchum minor, Streptoprocne zonaris albicincta, Selenidera spectabilis, Formicarius analis intermedius, Myrmotherula s. schisticolor, Platyrinchus coronatus superciliaris, Tyranniscus vilissimus parvus, Empidonax albigularis australis, Iridoprocne bicolor, Helmitheros vermivorus, Vermivora chrysoptera, Brasileuterus c. culicivorus. Vultur atratus* F. A. A. Meyer, 1794, antedates *V. urubu* Vieillot 1807; *Streptoprocne zonaris bouchellii* Huber is identical with *S. z. albicincta* (Cabanis); *Thamnophilus intermedius* Ridgw. antedates *T. mexicanus* Allen; *Tyrannus superciliosus* Bonap. antedates *Muscicapa texensis* Giraud and the bird becomes *Myiozetetes similis superciliosus.* The form of *Pitangus sulphuratus* of southern Mexico and Central Amer. to western Panama is recognized as a distinct species for which *Saurophagus guatimalensis* Lafr. is resurrected. *Lathria unirufa clara* Ridgw. 1906 is not different from *L. u. castaneotinctus* Hart. 1902. *Heleodytes capistratus castaneus* (Ridgw.) is resurrected as a valid subsp. *Amblycercus holosericeus centralis* Todd is considered synonymous with *A. h. holosericeus* (Licht.). *Trogon caligatus* Gould applies to the bird occurring in northern Colombia, and must replace *T. c. columbianus* (Chapm.); the race occurring from Mexico to Honduras formerly referred to *caligatus* must be called *aganus* (Cabanis & Heine); a brief review of the subspp. of *T. violaceus* is appended. The ranges of the Mexican and Central Amer. races of *Myiarchus tuberculifer* are outlined. *Saltator magnoides* Lafresnaye proves to be the same as the bird hitherto known as *S. m. intermedius* Ridgw. while the bird formerly known as *S. m. magnoides* Lafr. becomes *S. m. gigantodes* Cabanis. Characters and ranges of the Central Amer. races of *S. magnoides* are given.—*J. L. Peters.*

2862. PETRONIEVICS, B. La question du pubis de Archaeornis. [In Serbian, with French résumé.] *Bull. Acad. Royale Serbe Sci. Arts, Belgrade* 131(62): 35-40. 1 pl. 1928.—Examination of the pubis of *Archaeornis* and of *Archaeopteryx* shows that while the pubis of the latter was a distal osseous enlargement corresponding to the distal enlargement of the former, the pubis of *Archaeornis* does not have the median enlargement characteristic of that of *Archaeopteryx.* Consequently, a symphysis of the 2 pubes does not exist as in *Archaeopteryx.* The study was undertaken in reference to a controversy as to whether the 2 are generically distinct. No definite pronouncement is made as to their generic identity or difference.

2863. SCLATER, W. L. [Notes on an African guineafowl and on African and Arabian chats.] *Bull. British Ornith. Club* 49(326): 10-19. 1928.—*Numida mitrata intermedia* is recorded as new to Uganda. The following races of *Oenanthe monticola* are recognized: *O. m. monticola* Vieill., SW. Africa (Namaqualand) to Cape Province and Transvaal; *O. m. atmorii* (Tristram), SW. Africa (Damaraland); *O. m. albipileata* (Bocage), Angola. *Saxicola* **borbonensis** (p. 14), Isl. of Bourbon, Indian Ocean. The following forms of sickle-winged chats are recognized: *Emarginata sinuata* (Sund.), Cape Province to Transvaal; *Karrucincla s. schlegelii* (Wahl.), SW. Africa (Damaraland and Ovampoland); *K. s.* **benguellensis** (p. 15), Angola, type in Brit. Mus.; *K. s.* **namaquensis** (p. 15), SW. Africa (Great Namaqualand), type in Brit. Mus.; *K. s. pollux* (Hartl.), Cape Province. *Myrmecocichla tholloni* **chaboti** (*Oenanthe c.* Meneg. & Berl.,=*Myrmecocichla lynesi* Bann.) (p. 17); *Oenanthe*

b. bottae (Bp.) (=*O. yemenensis* O.-Grant); *O. b.* frenata (*Saxicola f.* Heuglin) (p. 19).

2864. SHULPIN, L. Die Wiederentdeckung von Emberiza jankowskii Tacz. *Jour. Ornithologie* 76(1): 215-222. 1928.—Rediscovery of this species in south Ussuri, with a detailed systematic account and description of the nestlings.—*L. Shulpin.*

2865. SWANN, H. KIRKE. A monograph of the birds of prey (Order Accipitres). Part V. pp. 277-364. 5 pl. (3 col.) Wheldon & Wesley, Ltd.: London, 1926.—This part treats of 24 spp. of *Accipiter,* 1 species each of *Erythrotriorchis, Megatriorchis, Heterospizias,* and *Geranoaëtus,* and 7 spp. of *Buteo,* besides numerous subspp. Common names in various languages, synonymies, distribution, descriptions of plumage, and notes on habits, food, nests, and eggs are given. *Accipiter ovampensis* Gurney (=*A. hilgerti* Erlanger); *A. c. cirrocephalus* (Vieill.) (=*A. c. quaesitandus* Math.); *A. rubricollis* **brachyurus** (*Astur brachyurus* Ramsay) (p. 311); *Accipiter bicolor* **pileatus** (*Falco p.* Temm.) (p. 334); *Buteo japonicus* is considered a distinct species, not a subspecies of *B. buteo,* as treated by Hartert. There are keys to the genera of Buteoninae and to the species of *Buteo,* and colored plates of *Buteo ferox cirtensis, B. v. vulpinus, B. buteo intermedius,* and *B. polyosoma.*

2866. SWANN, H. KIRKE. (Edited by ALEXANDER WETMORE.) A monograph of the birds of prey (Order Accipitres). Part VIII. pp. 429-487. 2 col. pl.; Part IX. pp. v-lxvii. 2 col. pl. Wheldon & Wesley, Ltd.: London, 1930.—Part VIII includes 1 species each of *Buteola, Busarellus, Buteogallus, Harpyhaliaetus, Urubitornis, Harpia, Harpyopsis,* and *Pithecophaga,* 2 spp. each of *Asturina* and *Morphnus,* 3 spp. of *Rupornis,* 4 spp. of *Urubitinga,* and 9 spp. of *Leucopternis,* besides numerous subspp. The treatment of the various forms follows that in previous parts. *Urubitinga urubitinga* **azarae** (p. 453), Argentina, type in Swann coll.; *Leucopternis schistacea* **plumbea** (*L. p.* Salvin) (p. 464); *L. ghiesbreghti* (Du Bus) (=*L. g. costaricensis* W. L. Sclater). There are colored plates of *Heterospizias m. meridionalis* and *Urubitinga u. urubitinga.* Part IX includes a table of contents of vol. 1, an index of generic, specific, subspecific, and common names, errata, and colored plates of *Harpia harpyja* and *Pithecophaga jefferyi.*

2867. WENIG, JAR. Über einige Raritäten der Vogelwelt. *Zool. Anz.* 90(9/12): 285-294. 6 fig. 1930.—The author describes a case of a bony, spurlike outgrowth* on the mandible of a pheasant. He mentions melanistic specimens of *Alauda arvensis** and *Pyrrhula pyrrhula europaea* that were smaller than normal, and specimens of *Tetrao urogallus** and *Phasianus colchicus* whose plumage showed a mixture of ♂ and ♀ characters. In the last mentioned specimen no gonads were found. A specimen of *Corvus frugilegus** with a malformed, prolonged mandible had the usual bare area between eyes and bill, this being evidence that the feathers are not worn off this area by probing in the ground, as some have supposed. A specimen of *Motacilla flava feldegg* is recorded from Bohemia. Most of the other specimens mentioned above are likewise from Bohemia.

LOCAL AND FAUNISTIC

2868. CARPELAN, JARL. Om Buteo l. lagopus förekomst och fortplantning m. m. i Petsamo. [Occurrence and breeding of B. lagopus l. at Petsamo, Finland.] *Ornis Fennica* 4(1): 19-20. 1927.—The Rough-legged Buzzard is distributed throughout the Petsamo district. At least ¾ of them nest in mountain regions and are not often found in larger pine forests, since they feed on small rodents, which are more plentiful and more easily caught in the mountains.

2869. De GROOT, DUDLEY SARGEANT. The California Clapper Rail, its nesting habits, enemies and habitat. *Condor* 29(6): 259-270. 1927.—*Rallus obsoletus* on marshes around San Francisco Bay, formerly very abundant, is now greatly reduced by reason of: (1) Encroachment of civilization and industrial developments on marsh area; (2) hunting, which is illegal; (3) presence of Norway rat (*Rattus norvegicus*) as a permanent resident enemy in all of marsh areas; (4) disabling and death of rails by being trapped in valves of "a small black mussel" introduced some 30 years ago; (5) overcollecting of eggs; (6) attacks by predatory birds. Eggs in 74 observed nests ranged from 5 to 21. Nests are sheltered by *Grindelia cuneifolia* and *Salicornia ambigua;* nesting dates range from March 22 (1906) to July 13 (1926) and a scarcity of nests with eggs from mid-May to mid-June is taken to indicate that 2 broods are reared by many pairs. The possibility of domestication is discussed.—*T. I. Storer.*

2870. DITTMANN, ERICH. Brut des Raubwürgers, Lanius e. excubitor L., auf dem Heller bei Dresden. [Breeding of the great grey shrike near Dresden.] *Mitteil. Ver. Sächs. Ornithologen* 1(8): 210. 1926.

2871. DIXON, JOSEPH. Contribution to the life history of the Alaska Willow Ptarmigan. *Condor* 29 (5): 213-223. 13 fig. 1927.—Observations on the habits of *Lagopus lagopus alascensis* in Mount McKinley National Park, Alaska. Males are in attendance on the ♀♀ when the latter are incubating, though ♂♂ may gather in groups of as many as 25 at times. Six to 12 eggs constitute a set. The ♂ has a "form" near the nest occupied by the ♀. The period of incubation observed in one instance was 24-25 days. Adult ♀♀ utter at least 3 kinds of notes when caring for young. The adults feed on buds and tender leaves of the dwarf willow, taking insects as occasion offers. The stomach of a 4-5 day old chick contained insects wholly, 74% being yellow caterpillars. During the incubation period Short-billed Gulls raid nests. Red foxes capture adult ptarmigan and Black-billed Magpies capture young. Gyrfalcons also prey upon ptarmigan.—*T. I. Storer.*

2872. FERDINAND, King of Bulgaria, with the collaboration of HANS von BOETTICHER. Eine Osterreise an den Victoria-Nyanza und zu den Bergriesen Aequatorial-Afrikas. *Jour. Ornith.* [*Berlin*] 78(Sonderheft): 3-67. 7 pl. 1930.—King Ferdinand presents a narrative of a journey in 1929 through the Mediterranean and Red Seas and the Indian Ocean to Kenya, Uganda, and Tanganyika Territory. It includes notes on many birds as well as some mammals and plants. This narrative is followed by Von Boetticher's report (pp. 24-67) on the birds observed and collected. About 300 forms are listed, with distributional records and some notes on habits and taxonomy.

2873. GROTE, HERMANN. Die ornithologische Fauna der Aralo-kaspischen Steppen. Referat nach der gleichnamigen Arbeit W. Bostanjoglo's. *Verhandl. Ornithol. Ges. Bayern* 18(1/2): 18-43. 1 map. 1928-1929.—Lists 394 spp., of which 279 are local breeders, 43 transients, 25 winter residents, 47 occasional (exceptional) visitants. An especially interesting fact is the occasional breeding here of species otherwise confined to the Arctic; e.g., *Crocethia alba, Calidris ferruginea, Phalaropus fulicarius;* Russian ornithologists consider them as left-overs of an earlier geological period. The various life-zones of the region are roughly described and the specifications of the various bird species are given for the life-zones.—*H. Grote* (*transl. by E. W. Count*).

2874. GÜNTHER, ADOLF. Der Ortolan, Emberiza hortulana L., in Sachsen. *Mitteil. Ver. Sächs. Ornithologen* 1(8): 207-208. 1926.—Notes on the gradual spread of this species in Saxony.

2875. HACHISUKA, M. Contributions to the birds of the Philippines. No. 1. *Ornithological Soc. of Japan, Suppl. Publ. No. 13.* 1-137. 3 pl. 1929.—Part I gives a general account of the physical formation and climatic conditions in general of the Philippine Arch. Part II contains the ornithological history of the islands, with a detailed account of the various expeditions of earlier ornithologists and a summary of their more important discoveries. Part III is a bibliography starting from 1845; 233 headings are compiled, with a short review of the contents of each. Part IV is a zoogeographical summary, giving the opinions of former writers. About

a dozen zoogeographical subareas are recognized, while it is concluded that Palawan Calamianes and the Cuyo group belong to Borneo proper. Part V is an index of local names with locations.—*M. Hachisuka.*

2876. HOFFMANN, B. Ornithologisches von einer Reise nach der Schweiz. *Verhandl. Ornithol. Ges. Bayern.* 18 (1/2): 75-107. 1929.—This survey supplies detailed material from observations made during the trip, which extended from July 13 to Aug. 10, 1927, for a more comprehensive study of Swiss avifauna. There are numerous observations on bird notes, especially of those species which are almost never found outside of the Alps. Numerous biological and ecological observations are scattered throughout the essay, including some concerning altitudinal distribution of species.—*B. Hoffmann. (transl. by E. W. Count).*

2877. HORTLING, IVAR. Inwieweit wird Finnland von (hoch) nordischen Wandervögeln durchquert? [To what extent is Finland crossed by (high) northern migrants?] (In German.) *Ornis Fennica* 4(4): 104-113. 1927.—The author shows that Palmén's "submarine-littoral" species cross Finland in large numbers; that his "fluviolittoral" species regularly follow the seacoast; that many species hitherto considered "erratic" regularly cross the interior; and that the whole country is crossed by "migration routes" extending in general from north or east to south or south-west. He considers that many of Palmén's views were based upon insufficient data and require revision in the light of new information. He cites additional records for 17 arctic species of Limicolae, Anatidae, Laridae, and Alcidae to show that on migration they are not restricted to the south coast of Finland, but also regularly cross the interior and follow the Gulf of Bothnia.

2878. HORTLING, IVAR. Ornithologische Studien am Oulujarvi-See [Uleåträsk] im Sommer 1927. *Sonderheft des Ornis Fennica* 198p. Map. 11 pl. 1927/1928.—The author systematically observed and studied the spring and fall migration in the interior of Finland. He describes the nature of the territory observed, tabulates daily observations and weather, gives curves for arrivals, departure, and non-stop passage flights, and summarizes each period of 2 weeks for the sake of perspective. He describes breeding habits and traces out the breeding territories and life-zones on the basis of original observations and upon that of older literature. Foot impressions of birds captured are reproduced. Chief results: Arctic birds go straight across Finland; spring migration is closely correlated with temp. and snow conditions; many species fly over Finland in phalanx; observations are less abundant for the interior than for the sea-coast.—*I. Hortling (transl. by E. Count).*

2879. JEWETT, STANLEY G., and IRA N. GABRIELSON. Birds of the Portland area, Oregon. *Cooper Ornithol. Club Pacific Coast Avifauna* 19. 5-54. 21 fig. 1929.—The area covered by this paper includes the valleys of the Columbia and Willamette Rivers within a 25 mile radius of Portland, but includes no territory on the Washington side of the Columbia. It includes all available records of birds found within this district together with migration and nesting data. A total of 187 spp. are listed, of which 55 are classified as permanent residents, 43 as summer residents, 33 as winter residents, and 56 as transients and casuals. For historical purposes it also contains a list of all spp. of European birds released within the territory, including a considerable number of song birds released between 1889-1895. Of these all save the Ring-necked Pheasant, European Partridge, and the English Sparrow have disappeared.—*I. N. Gabrielson.*

2880. KURODA, NAGAMICHI. On the avifauna of the Riu Kiu Islands. *Proc. Third Pan-Pacific Sci. Congress, Tokyo* 1: 1039-1040. 1926(1928).—From these islands 281 spp. and subspp. of birds, belonging to 52 families and 194 genera, are known. There are 58 endemic forms. Affinities with Japan are much closer than with Formosa. The Riu Kiu chain is divided into 4 regions. The Shichito Sea separates the Oriental and the Palaearctic elements. The avifauna of the islands depends to some extent on their geological structure.

2881. LINDNER, H. Coleus monedula collaris in Sachsen. *Mitteil. Ver. Sächs. Ornithologen* 1(8): 211. 1926.—The first specimen of this eastern subsp. of the Jackdaw to be recorded in northwestern Saxony.

2882. MAYR, ERNST. Zum Vorkommen des Seidenschwanzes, Bombycilla garrulus (L.), in Sachsen. *Mitteil. Ver. Sächs. Ornithologen* 1(8): 212. 1926.—The Bohemian Waxwing is present in Saxony nearly every winter, feeding mostly upon mistletoe berries.

2883. MURPHY, ROBERT CUSHMAN, and JAMES P. CHAPIN. A collection of birds from the Azores. *Amer. Mus. Novitates* 384. 23p. 1 pl. 1929.—From April 13, 1927 to Jan. 15, 1928, 35 spp. were collected in the Azores at Fayal, Terceira, Pico, and San Miguel. Frequency distribution curves show the variation and size relationships in 3 geographic races of *Puffinus kuhlii.* First records for the Azores are listed for *Oxyechus v. vociferus* (L.), *Sterna d. dougallii* Montagu, and *Nyctea nyctea* (L.). *Gallinula chloropus* correiana (p. 7) and *Regulus r.* inermis (p. 15) are described. Data are given on numbers observed, plumage, nesting habits, condition of gonads, numbers of eggs, etc.—*W. A. Dreyer.*

2884. NICHOLS, J. T., Editor. The season. LXXIX. February 15 to April 15, 1930. *Bird-Lore* 32(3): 203-218. 1930.—JOHN B. MAY, for the Boston region, reports many sea birds killed by oil along the Massachusetts coast; first record of *Uria troille troille* for Rhode Island; 10,000 eiders at Martha's Vineyard, April 9; the last heath-hen still surviving on this island; and evening grosbeaks common, including 3 birds banded in Michigan. Nichols, for the New York region, reports a flock of 1000 or more cowbirds wintering on Long Island; a turkey vulture at Kingston, New York; and a purple grackle with a white tail appearing for the 7th consecutive year at Flushing, Long Island. JULIAN K. POTTER, for the Philadelphia region, reports 100,000 white-winged scoters off Cape May, New Jersey, April 6; and 100 snow geese in New Jersey, March 9. H. C. OBERHOLSER, for the Washington (D. C.) region, reports American coot and whistling swan wintering on the Potomac River. FRANCIS M. WESTON, for the Pensacola (Florida) region, reports marsh hawks common, but adult ♂♂ extemely rare, and gives migration and nesting data on many other species. ROBERT L. BAIRD, for the Oberlin (Ohio) region, reports 2 blue geese among 4000 Canada geese at Kingsville, Ontario, April 3 and 4; a northern yellowthroat at Wooster, Ohio, March 15; 5000 whistling swans near Toledo, Ohio, March 30. JAMES S. WHITE, for the Chicago region, reports thousands of Lapland longspurs on April 6. THOS. S. ROBERTS, for the Minnesota region, corroborates W. W. Cooke's view that earliest migrants accompany the isotherm of 35° northward, while later far-traveling species respond to established cyclic prompting from within. W. H. BERGTOLD, for the Denver region, reported large numbers of Hepburn's, brown-capped, and gray-crowned rosy finches, and snow buntings wintering in North Park, Colorado; extraordinary numbers of water birds in Colorado during the winter and spring. IRA N. GABRIELSON, for the Portland (Ore.) region reports a tremendous number of birds perishing during an unprecedented Jan. storm; tens of thousands of migrating water-fowl at Tule Lake, California, Feb. 20. AMELIA S. ALLEN, for the San Francisco region, gives many migration and nesting dates.

2885. NICHOLS, J. T. [Editor]. The season. LXXX. April 15 to June 15, 1930. *Bird-Lore* 32(4): 276-293. 1930.—JOHN B. MAY, for the Boston region, reports turkey vultures in Massachusetts and Connecticut, a black vulture in Conn., a fish crow in Mass., and an orange-crowned warbler that wintered in Mass. J. T. Nichols, for the New York region, reports a Wilson's phalarope on Long Island June 17 and 18, and a song sparrow apparently migrating as late as May 23 in New York. JULIAN K. POTTER, for the Philadelphia region, lists 150 spp. seen in New Jersey on May 18.

HARRY C. OBERHOLSER, for the Washington (D. C.) region, gives various migration and nesting data. ROBERT L. BAIRD, for Oberlin (Ohio) region, reports the Black-poll Warbler as late as June 16; the 1st definite breeding of Bewick's wren in that region; and individuals of various species as much more abundant about Toledo than about Oberlin. FRANCIS M. WESTON, for the Pensacola (Florida) region, reports clear weather as having evidently enabled many spring migrants from across the Gulf of Mexico to pass over Pensacola without stopping. JAMES S. WHITE, for the Chicago region, reports a European widgeon, April 15 and 17; a prairie falcon, May 4; the upland plover increasing as a breeder; a nesting colony of Brewer's blackbird. THOS. S. ROBERTS, for the Minnesota region, reports Hudsonian curlew at Lake Pepin, May 30, Barrow's Goldeneye at Cass Lake, May 5-7, ferruginous rough-leg hawk at Lake Pepin, May 20, Hudsonian godwit at Pipestone May 13, and a vast migration of flickers in Minnesota and North Dakota, on April 10. W. H. BERGTOLD, for the Denver region, reports numerous migration data. IRA N. GABRIELSON, for the Portland (Oregon) region, reports thousands of northern phalarope at Astoria, May 14; tree swallows replacing arctic three-toed woodpeckers as nesters in dead pines about Fish Lake in the Crater National Forest. AMELIA S. ALLEN, for the San Francisco region, reports various migration and nesting data.

2886. NICHOLSON, E. M. Supplementary report on the "British Birds" census of heronries. *British Birds* 23(12): 324-337. 1930.—This report, supplementary to one published in 1929, gives statistics on many existing and extinct heronries in England and Wales, with notes on attacks by various species of Falconidae, Corvidae, and Laridae, fertility, mortality, breeding dates, nesting sites, flights, etc.

2887. SAUNDERS, ARETAS A. The summer birds of the northern Adirondack mountains. *Roosevelt Wild Life Bull.* 5(3): 328-500. 1 map., 2 col. pl. 160 fig., with a reprint of a list of 97 "Summer birds of the Adirondacks in Franklin county, New York," by THEODORE ROOSEVELT, Jr., and H. D. MINOT. pp. 501-504. 1929.—Two summers (1925 and 1926) were spent in portions of Essex and Franklin Counties, New York, making field studies of birds; 108 spp. were found, which, with those previously reported, make a total of 121 spp. for the region. These are listed, and described for the use of field students. *Vireosylva philadelphica* is reported apparently for the first time in New York State in summer. *Vermivora peregrina* was observed feeding young. Previous breeding records of this species in this region have been indefinite. Several records of the occurrence of *Dendroica castanea* have been added to those recently published. All of these are sight records, however, no specimens having been taken. Observations on nesting, food of young, and feeding habits of various species have been added. In Franklin County comparisons are made between bird life at present with that of 50 years ago, as reported by Roosevelt and Minot and reprinted in this bulletin. The larger species of water birds, game birds and birds of prey have evidently decreased. Settlement of the region has increased areas of cleared land and second growth, bringing an increase of species that live in such habitats. The spruce partridge, three-toed woodpecker, and Canada jay have decreased or entirely disappeared. Smaller birds of the mature forests are for the main part in about the same abundance as previously, within areas that are still suitable for them. The inter-relations of birds and forests are discussed and reasons given why birds should be considered of equal importance with parasitic insects in keeping harmful insects in check. The figures are chiefly photographs of scenery and vegetation of the region, but also include photographs of some birds and their nests.—*A. A. Saunders.*

2888. [SHIBANOV, N. V.] ШИБАНОВ, Н. В. К орнитологической фауне Русской Лапландии. (The avifauna of Russian Lapland.] (German summary.) Мемуары Зоологического Отделения Общества Любителей Естествознания, Антропологии и Этнографии (*Mém. Sect. Zool. Soc. Amis Sci. Natur. Anthrop. Ethnogr. Moscou, URSS.*) 3. 3-28. 1 pl. 1927.—This report is based upon the collections and notes of S. S. Tchetwerikow's expeditions of 1921 and 1926 to the Hibiner Mts. and the Murman coast. Among the 78 forms mentioned the following are recorded for the first time from Russian Lapland: *Podiceps nigricollis, Erythropus vespertinus, Asio otus, Certhia familiaris,* and *Turdus atrogularis.* Of these, *Certhia familiaris* is possibly a rare breeder in the Hibiner Mts., but the others are probably accidental visitors. *Emberiza aureola,* first found nesting at Lake Imandra in 1914, is not rare there at present. The author also comments on some peculiarities of the molt in the Picidae and on changes in the first primary with age.—*From author's summary.*

2889. SŬLPIN, L. Notes sur les oiseaux d'Altai. *Mus. Zool. Acad. Sci. URSS.* 29: 15-16. 1928.—The route of the author's travelling in the northern and central Altai and brief remarks on the distribution, occurrence, and ecology of the most interesting birds (68 spp.) observed. —*L. Sŭlpin.*

2890. VAUGHAN, J. H. The birds of Zanzibar and Pemba.—Part II. [Concluded.] *Ibis* 6(1): 1-48. 3 pl. 1930.—*Charadrius marginatus tenellus,* nest and eggs*; *Burhinus v. vermiculatus,* nest and eggs*; *Centropus superciliosus intermedius* Someren and *Halcyon senegaloides ranivorus* Meinertz are not considered valid races; *Caprimulgus f. fossii,* nest and eggs*; the type-locality of *Thripias namaquus decipiens* (Sharpe) is "Shimba Hills, behind Mombasa" and not Zanzibar, where the species does not occur; the type-locality of *Argya rubiginosa heuglini* Sharpe probably is the mainland rather than Zanzibar Isl., where the bird does not appear to occur; *Phedina borbonica madagascariensis* Hartl. is recorded from Pemba (Nov.-March) and this constitutes the first record outside of Madagascar; *Urobrachya axillaris zanzibarica* Shelley was described from the mainland opposite Zanzibar and does not appear to occur on the island.—*W. W. Bowen.*

2891. ZIMMERMANN, RUD. Die Lachmöwe, Larus ridibundus L., in Ostsachsen und in der angrenzenden preussischen Oberlausitz. *Mitteil. Ver. Sächs. Ornithologen* 2(2): 41-56. Map, 1 pl. 1927.—The author gives a historical sketch of 24 present and past colonies of this gull. The constitution of numerous artificial ponds during the past few centuries has created favorable conditions for its nesting. The abandonment of various colonies has generally resulted in an increase in the numbers resting in neighboring colonies or in the establishment of new colonies. An extension of the limit of the egging season from April 30 to May 15 is recommended.

2892. ZIMMERMANN, RUD., und RICH. KÖHLER. Ueber das Vorkommen der Weidenmeise, Parus atricapillus salicarius Brehm, in Sachsen und den nord- bezw. nordöstlich angrenzenden Landschaften preussischen Anteiles. *Mitteil. Ver. Sächs. Ornithologen* 2(6): 235-256. Map, 3 pl. 1929.—Detailed records, with a distributional map, show the occurrence of the willow tit in southwestern and northeastern Saxony and in the adjacent parts of Prussian Saxony and Silesia. There are few records for central Saxony and none for northwestern Saxony. The bird's principal habitat is in damp mixed woods, with a thick undergrowth, near ponds or streams. Some of its typical avian associates are listed.

LIFE HISTORY

2893. ALLARD, H. A. The first morning song of some birds of Washington, District of Columbia; its relation to light. *Amer. Naturalist* 64(694): 436-469. 1930.—The first morning calls or songs of 14 birds common in the vicinity of Washington, have been recorded, and plotted in relation to the curves of Civil Twilight and sunrise. The data indicate that all the birds are highly sensitive to the coming day, some species appreciating very low

light intensities with considerable accuracy. Certain analogies are drawn between this behavior of the birds and the migration urge. The opinion is expressed that the exactness of the migratory movements, like the exactness of the timing of the first morning expressions, is in some manner dependent upon the sun.—*H. A. Allard.*

2894. **BREADY, MARCIA BROWNELL. The European starling on his westward way.** 141p. 1 col. pl., 1 fig. The Knickerbocker Press: New York, 1929.—The food habits and economic status of *Sturnus vulgaris* in the U. S. A. and abroad are reviewed. Its songs and calls are represented by musical notation, and comparison is made with the music of other birds and of man. In this respect it is considered "man's equal, in kind, if not in degree." Imitation of other birds' notes is questioned, but it is considered possible that the species, after hearing human music, has adopted certain features of it. The history of avian taxonomy, with particular reference to the starling, is briefly sketched.

2895. **BRECKENRIDGE, W. J. Breeding of Nelson's sparrow (Ammospiza nelsoni) with special reference to Minnesota.** *Univ. Minnesota Mus. Nat. Hist. Occ. Papers* 3. 29-38. 2 pl., 1 col. fig. 1930.—A review of previous records, including 2 from Minnesota. The juvenal plumage is described, and a colored fig. shows adult and juvenal plumages of both Nelson's and Leconte's sparrows. Photographs of adult, nest with eggs and habitat are represented by musical notation, and comparison is

2896. **BROWN, R. H. The food of certain birds of prey.** *British Birds* 23(10): 269-272. 1930.—Notes on food found at the nests or feeding places of the raven, 3 spp. of owls, 5 spp. of hawks, and the common heron in northern England. Various birds and mammals formed the principal food of all except the heron, the young of which disgorged fishes and frogs as well as some small mammals.

2897. **CHANCE, EDGAR. Notes on cuckoos in 1930.** *British Birds* 24(4): 100-102. 1930.—Descriptions of parasitic relations of *Cuculus c. canorus* with *Turdus m. merula*, the hedge sparrow, *Anthus pratensis*, *Saxicola r. rubetra*, *Motacilla alba yarrellii*, *Sylvia u*[*ndata?*] *dartfordiensis*, *Emberiza c. calandra*, and the reed warbler.

2898. **DROST, RUDOLF. Ueber die Wanderungen der Helgoländer Lummen (Uria aalge helgolandica Lönnberg).** *Vogelzug.* 1(1): 21-29. Map. 1930.—This subsp. is found at the Helgoland nesting-site regularly from mid-April to the latter part of July, but only irregularly at other seasons. From return records of banded birds it appears that in Aug. most of the young move north to southern Scandinavia, and by Feb. a few have wandered to Danzig, England, and western France. During the winter the adults do not seem to wander far from Helgoland, though a few have been taken in Denmark and England. They go in flocks of varying size. Perhaps the movements of the guillemots are correlated with those of schools of sprats and herrings. They are also influenced by ice conditions. The oldest bird recovered was at least 7 years old. Most recoveries have resulted from the birds being hunted for their flesh. Some are caught in fish nets.

2899. **SCHÜZ, E. Aus dem Leben des Mauerseglers, Apus apus (L.).** *Vogelzug* 1(2): 67-69. 1930.—Banding records in Germany show that swifts often change mates, though constancy also is common. This species, with 2 young per year, maintains its numerical status as well as tits, which have about 20 young. It seems to have less mortality and a longer period of reproductive activity than the tits. A banded individual was retaken after 10 yrs.

2900. **DROST, RUDOLF. Untersuchungen an beringten Fichtenkreuzschnäbeln (Loxia c. curvirostra L.).** *Vogelzug* 1(2): 69-72. 1930.—Invasions of crossbills occurred on Helgoland during 2 recent summers. In 1927, 96 birds were banded; in 1929, 57. There was 1 return record from Germany, and 1 from Italy. In each year the adults banded were about 22% of the total. Wings were longer in ♂♂ than in ♀♀, and longer in adults than in juveniles. A similar relation was evident in body weights. Bending of the mandible to the left, compared with bending to the right, was in the ratio 145: 100.

2901. **DROST, RUDOLF. Vom Zug der Amsel (Turdus m. merula L.).** *Vogelzug* 1(2): 74-85. 2 map. 1930.—Birds breeding in Denmark and southern Scandinavia migrate (through Helgoland) chiefly in a southwestward direction to France and Spain. The migration of individuals varies considerably in different years, probably on account of the weather. Returns indicate that about a third of the breeders in Germany migrate, the rest being sedentary. It is not only birds of the 1st year that have the migratory instinct. The general direction of migration of German breeders is southwestward, to Belgium, France, and northern Italy. The oldest bird recovered was at least 4½ yrs. old.

2902. **GEYR von SCHWEPPENBURG, H. Zum Zuge von Sylvia curruca.** *Jour. Ornith.* [*Berlin*] 78(1): 49-52. 1930.—In view of the location of its breeding area in Scandinavia, and the course of its migration southeastward to the eastern Mediterranean, *S. curruca* may be considered to have occupied Europe from the east and southeast after the Glacial Period. In the spring it appears regularly on Fair Isle, evidently migrating from the southeast through England and Scotland, then passing on to its summer home in Scandinavia. In the fall the reverse route is followed. *Lanius collurio* has a similar migration route, at least in spring.

2903. **GORDON, AUDREY SETON. Some breeding-habits of the Goosander.** *British Birds* 23(9): 245-247. 1 fig. 1930.—Observation on a nest in a hollow alder tree in Scotland indicates that the eggs were incubated for at least 31 days before hatching about May 15. The young jumped out of the nest without assistance when about 2 days old, and probably would have remained longer if not disturbed.

2904. **GORDON, SETON. Sea birds and seals.** *Proc. Roy. Inst. Great Britain* 26(2): 222-226. 3 fig. 1930.—Abstract. The great grey or Atlantic seal* produces its young in late autumn on remote islands in Great Brit. The young are land animals during their first 4-6 weeks. Gannets* breeding on St. Kilda journey regularly a distance of about 100 miles to the vicinity of Skye to fish. In making a dive from the air, the gannet usually flaps its wings until the last moment before it touches the water, and swallows its catch before emerging. Stormy petrels being nocturnal, often appear in the gloom preceding a storm; hence the superstition that their appearance presages a storm.

2905. **KILGORE, WILLIAM. Breeding of the Connecticut warbler (Oporornis agilis) with special reference to Minnesota.** *Univ. Minnesota Mus. Nat. Hist. Occ. Papers* 3. 15-26. 2 pl. 1930.—A detailed account of the finding of a nest, and a review of all previous records of the breeding of this species, are given, with a bibliography.

2906. **LAUBMANN, A. Beiträge zur Kenntnis des Verlaufes der Handschwingenmauser bei den Alcedinidae III.** *Verhandl. Ornithol. Ges. Bayern* 18(1/2): 158-160. 1929.—Four specimens of *Monachalcyon* (*Caridonax*) *fulgidus* from Sunda taken from March to May show clearly the course of molt in the primaries; it progresses regularly from the proximal to the distal end as in some other kingfishers—*Halcyon* (*Sauropatis*) *chloris* and *H.* (*Entomobia*) *smyrnensis*. The molt of the tail feathers also begins with the innermost pair and extends outwards.—*M. M. Nice.*

2907. **LAW, J. EUGENE. Down-tree progress of Sitta pygmaea.** *Condor* 31(2): 45-51. 9 fig. 1929.—Down-tree progress is by a series of sidling hops or drops, with one foot up-trunk, its grasp transverse to the trunk-axis, the other foot below for support. Adults search for food and bring it to the nest independently. Fecal sacs are usually deposited on some high tree limb. Flies, resembling *Protocalliphora*, have been seen about nests of this species and of chickadees and bluebirds. A young *Sitta* bodily pulled out of a nest hole by one parent

made off to an adjoining tree where it progressed upward mainly by rapid fluttering of the wings.—*T. I. Storer.*

2908. LUYET, BASILE J. Observations on maternal instincts of birds. *Amer Naturalist* 64(694): 476-480. 1930.—Experiments with nesting birds in Switzerland led to the following conclusions: A sudden fright caused a blackbird to abandon its nest and eggs. A warbler, though frightened by a lizard fastened close to its nest, fed its young ones after a delay of 10 minutes. Repeated disturbances during incubation did not discourage a number of birds. The blindness of maternal instinct is shown by the fact that a bird is not affected by differences of size or color in eggs or young, and does not discriminate easily between a true egg and an empty shell. The movements of food-bringing are considered akin to purely mechanical movements. A bird seems not to have a well-developed knowledge of the specification of different kinds of danger.

2909. MEYER, OTTO. Uebersicht über die Brutzeiten der Vögel auf der Insel Vuatom (New Britain). *Jour. Ornith.* [*Berlin*] 78(1): 19-38. 1930.—Reproductive activity is here more dependent on the weather, which is quite variable, than upon food, which is abundant throughout the year. Molt has very little effect on breeding, and the voices of birds do not always give indication of the season. Traveling from one island to another is a negative sign. Stormy weather, either dry or rainy, has a very unfavorable effect upon breeding. Records of many species, as given in several tables, show that some breed more or less constantly throughout the year, some breed during a longer or shorter season, and some have 2 breeding seasons per year. Most species breed twice per year, chiefly in the transition months between the northwest and the southeast trade winds. These observations agree in general with those of Sody in Java and of Snethlage in Brazil. The small number of eggs laid by most species is considered correlated with the uniformity of the temp., which does not incite the birds to any special laying activity.

2910. RITTER, WM. E. Activities of the California woodpecker. *Scientific Monthly* 31(3): 253-257. 1930.—Adaption and maladaption in activities of these birds are discussed. Adaptive: nest-hole making was transferred from oaks to telegraph poles near Grass Valley, California; 70% of the holes were on the north or lee side, most storms here are from the south; 5% were on the south, or stormy side, remainder on east or west side. Hence protection from storms secured in oaks by placing holes on the undersides of branches was here secured by selecting the lee side of poles. Maladaptive: Desiccation cracks in power-line poles were much used for storing acorns. The swelling of the wood by winter rains closes the cracks and crushes the acorns, thus largely defeating the purpose for which nuts are stored.—*W. E. Ritter.*

2911. RYVES, B. H. The breeding-season of 1929 in N. Cornwall. *Ann. & Mag. Nat. Hist.* 5(29): 564-567. 1930.—A survey of climatic conditions and a study of the effect on fecundity and breeding generally. The conclusion is that the output of the larger species of birds has been about normal, but that of many smaller resident species has been about 30% below the average covered by a period of years. A table of clutches for 1929 is given.

2912. SCHUMANN, AD. Kreuzung zwischen Larus ridibundus L. und Larus canus L. *Zool. Garten* [*Leipzig*] 2(7/9): 199-201. 1 fig. 1930.—This hybridization took place in the Sofia zoo between a *L. canus* (probably ♂) at least 22 yrs. old and a *L. ridibundus* (probably ♀) at least about 10 yrs. old. Both egg and young* showed chiefly the characteristics of the latter species.

2913. SCHÜZ, E. Die Verteilung des Herbst-Vogelzugs im Gebiet des Kurischen Haffs. *Naturwissenschaften* 18(20/21): 480-482. 2 fig. 1930.—Fall migration in the region of the Kurische Haff, Prussia and Lithuania takes place on a broad front. The chief lines of flight (shown on map) are: the coast north of Memel, the Kurische Nehrung, and the eastern coast of the Kurische Haff. Aside from the many birds that fly across the Haff from a projecting point on the eastern coast to the Nehrung, the number of those that venture over large bodies of water is quite limited.

2914. SIEWERT, HORST. Bilder aus dem Leben eines Sperberpaares zur Brutzeit. *Jour. Ornith.* [*Berlin*] 78(2): 245-254. 12 pl., 1 fig. 1930.—These studies of a pair of breeding sparrow hawks (*Accipiter nisus*), were made in Germany. The building of the nest lasted 14 days. The eggs were laid at intervals of 2 days, the ♀ beginning to incubate after laying the 2nd and 3rd egg. The markings of the eggs and the size of the clutch are correlated with the maturity of the birds. Oviposition lasts about 3 minutes. During incubation the ♂ feeds the ♀, the transfer of prey taking place at a regular feeding perch, to which the ♀ is summoned by calls. While the ♀ feeds, the ♂ appears at the nest. The eggs are turned about every 20 minutes, usually with the bill, sometimes with the talons. As soon as the laying is finished, the ♀ begins to molt, but not the ♂, which requires its full power of flight for hunting. The illustrations include photographs of the adults in various poses at the nest.—*From author's summary.*

2915. STEINBACHER, GEORG. Entwicklung und Bau der roten Stirnpapillen bei Dunenjungen von Fulica atra. *Jour. Ornith.* [*Berlin*] 78(1): 53-58. 2 pl. 1930.—The red frontal papillae represent a peculiar modification of the nestling down. As the papilla grows, a red lipochrome enters the sheath and the barbs; it has a differentiating effect on the growth of the intermediary cells and so gives rise to these unusual formations.

2916. YOUNG, C. J. A study of the rhinoceros auklet and other birds in British Columbia, 1929. *Rept. Prov. Mus. Nat. Hist.* [*Victoria, B. C.*] 1929: F 16-F 19. 1 pl. 1930.—The author describes the breeding habits of *Cerorhinca monocerata* and *Ptychoramphus aleuticus* on Pine Isl. in Queen Charlotte Sound, and gives notes on various other birds of that general region.

2917. ALLEN, GLOVER M. Bovidae from the Asiatic expeditions. *Amer. Mus. Novitates* No. 410. 11p. 1930.—Lists 12 spp. and subspp. of the family obtained in Mongolia and China by the Asiatic Expeditions of the American Museum. *Capricornis sumatraensis* **montinus** (p. 5) is described from the Lichiang range, Yunnan Province, China. Three races of goral are recognized from China, and are regarded as subspp. of *Naemorhedus goral.* For the Mongolian gazelle, Heude's name *hillieriana* is revived as probably designating a valid subsp. of *Gazella subgutturosa.*—*G. M. Allen.*

2918. AMSCHLER, JOH. WOLFG. Gengeographische Studie am Hissarschaf. *Zeitschr. Züchtungskunde* 4(7): 336-341. 2 fig. 1929.—The "Hissar" sheep was discovered in Westpamir (Turkestan) in 1927. Its general characteristics are those of the fat-rumped sheep. Genetically it is noteworthy in that it represents a true prototype, with unusual variability as regards all the known characteristics of the domestic sheep. Withers 65-98 cm., weight 45-200 kg. The coat ranges from actual hair to wool, and from dirty white to brownish black.—*J. W. Amschler* (*transl. by J. A. F. Roberts*).

2919. ANTONIUS, OTTO. Beobachtungen an Rindern in Schönbrunn. I. Die Schari-Büffel. *Zool. Garten* [*Leipzig*] 3(4/8): 145-152. 5 fig. 1930.—A description of two young animals (*Bubalus caffer** subsp.) from French Equatorial Africa is followed by a discussion of variation in African buffaloes and its correlation with habitat. The author considers the possibility of such variation arising through interbreeding of forest types with plains types where their ranges meet.

2920. BLACK, DAVIDSON. Further hominid remains of Lower Quaternary age from the Chou Kou Tien deposit. *Nature* [*Gr. Britain*] 120: 954. 1927; also in *Science* 67(1727): 135-136. 1928.

2921. BRANDES, G. Wie kommt das eben geborene Kängaruh in den Brutbeutel? *Zool. Garten* [*Leipzig*] 3(1/3): 68-69. 1930.—According to an observation reported from Australia, the mother, by constant licking, directed the young one from the cloaca to the pouch along her belly.

2922. BRANDES, G. Die Begattung der Orangs. *Zool. Garten* [*Leipzig*] 3(4/8): 216-217. 1930.—Description of the mating of orangs.

2923. CABRERA, ANGEL. Catálogo descriptivo de los mamíferos de la Guinea española. [Descriptive catalog of the mammals of Spanish Guinea.] *Mem. Soc. Españ. Hist. Nat.* 16(1a): 5-121. 1929.—This is a revised edition of the author's previous list of 1908, enumerating the mammals known today from the Spanish possessions in the Gulf of Guinea, especially Rio Muni and Fernando Po. In all, 135 spp. or subspp. are included, with synonymy, a brief description, and a statement of the range in W. Africa. Various comments on terminology are made, and a few changes in nomenclature: *Hipposideros ruber* **guineensis** (*H. caffer g.* Andersen) (p. 19); *Civettictis civetta* **schwarzi** (*Viverra c. orientalis* Mats., not *V. o.* Hodg.) (p. 36); *C. c.* **congica** (p. 36), Upper Congo; *Enoticus elegantulus elegantulus* (Lecomte) (=*Galago elegantulus tonsor* Dollman); the genus *Mandrillus* is represented by *M. sphinx, M. sylvicola,* and *M. poensis* in the area covered, and the synonymy is revised; *Colobus anthracinus,* of Fernando Po, is regarded as distinct from the continental *C. satanas* Schlegel (=*Stachycolobus municus* Matschie); *Anthropopithecus satyrus* (L.) (=*A. niger* Matschie); *A. tschego* (Duvernoy) (=*A. ochroleucus* Matschie). The introduced *Rattus norvegicus* is known from Fernando Po, but all the available continental specimens of the genus proved to be *R. rattus.* The list is intended as a basis for future work on the mammalian fauna of the area and as a guide for naturalists and others for use in identifying the species.—*G. M. Allen.*

2924. CABRERA, ANGEL. A note on the name of the Javanese gibbon. *Proc. Zool. Soc. London* 1930(1): 257. 1930.—*Simia moloch* Audebert, 1797, has priority over *S. leucisca* Schreber, 1799, and *S. cinerea* Latreille, 1804.

2925. CAMACHO, C. El conejo silvestre. [The wild rabbit.] *Chile Min. Fomento Bol. Dept. Agric.* 1(10/12): 3-12. 1 pl., 3 fig. 1929.—A discussion of the wild rabbit, its injury to the crops and methods of its control by means of traps, poisoned water, and fumigation.

2926. CAUVET, G. Dromadaires à 34 dents et Dromadaires à 36 dents. *Bull. Soc. Hist. Nat. Afrique Nord* 20(9): 247-256. 1 fig. 1929.—The breed of camel common in northern Africa, particularly in Algiers, has a total of 34 teeth, and retains only the 1st and 4th of the original 4 premolars in the lower jaw. The camels of the Sudan and southern Sahara commonly have an additional pair, representing the 3rd lower premolars, making a total of 36 teeth. The presence of the additional pair of premolars, with other slight differences in body form, are believed to parallel the Pleistocene *Camelus siwalensis* of the Siwalik Hills and *C. alutensis* of Aluta, west of Bucharest, and to constitute the Sudan camel a breed separate from the Algerian camel. The latter is, therefore, more advanced in the evolutionary scale. The need for further observations on the supposed uniformity of this character in the Sudan camel is suggested. A few notes on tooth anomalies are given, i.e., a lower jaw with supernumerary canine, and another with supernumerary small premolar.—*G. M. Allen.*

2927. CHAPEL, F. de. Vieux souvenirs au sujet des loups. *Bull. Soc. Nat. Acclimat. France* 77(2): 27-28. 1930.—Records of wolves of the 19th century in southern and central France.

2966. MATHIAS, PAUL. Sur la biologie du hérisson (Erinaceus europaeus L.) *Bull. Soc. Zool. France* 54: 463-466. 1929.—Observations on captive individuals show that this species remains active and eats daily while the outside temperature remains above 8°C. With a temp. between +8°C. and −4°C., it is only intermittently active. With a temp. below −4°C., it begins true hibernation. Even then it awakes if disturbed, but does not stir until the night succeeding when it comes out for food. During periods of intermittent hibernation the monthly loss of weight averages 30 grams. Rubbing the tip of the snout does not cause the animal to roll up, but touching one of the long hairs about the face does. The latter are more sensitive than the quills on the back. When active, the animal breathes irregularly, but averages 20 times per minute; in hibernation, 7 to 8 times per minute. It can surmount vertical obstacles. In jumping off a table, it lands on its back, the quills reducing the shock.

2967. MATTHEW, W. D. Critical observations upon Siwalik mammals (exclusive of Proboscidea). *Bull. Amer. Mus. Nat. Hist.* 56(7): 437-560. 55 figs. 1929.—This fauna of northern India, formerly regarded as Miocene, is divided by the author into Upper Miocene, Pliocene, and Lower Pleistocene, and revised lists are given of the faunas with critical discussion of the status and significance of each group. A preliminary review of the Siwalik collections in the Indian Mus. is followed by a critical revision of the Siwalik carnivores, horses, rhinoceroses, chalicotheres, and giraffes, with notes on the hippopotami and rodents. Many of the types are refigured, along with some new material. The taxonomy of the machaerodonts is dealt with. The correlation and dispersal of the Equidae, the taxonomy, phylogeny, and adaptation of the Chalicotheriidae, the affinities of the Siwalik and related Old World species of rhinoceroses, the taxonomy and phylogeny of the Giraffidae are critically considered with a partial review of the hippopotami and some notes upon the few rodents described from the Siwalik beds. The fauna of the Pondaung Eocene of Burma is partially revised. *Enhydriodon* is thought to be related as much to the badgers as to the otters; *E. campani* of Monte Bamboli is decidedly more primitive than the Indian spp. The South American *Arctotherium* differs widely from *Ursus* in teeth as well as skull, approaching *Indarctos* in dentition; but the North American spp. referred to it are a distinct genus, nearer to *Ursus* in dentition. *Indarctos* includes *"H." punjabiensis* Lydekker, and is nearly related both to *Arctotherium* and *Hyaenarctos, I. lagrelii* of China being more primitive than the Indian and American spp. of the genus. The Indian *Amphicyons,* chiefly from the Gaj fauna (Lower Miocene), compare with those of the Middle Miocene of Europe and North America. The 3 described spp. of *Canis* from the Upper Siwaliks are compared with the modern Indian spp.,—*C. curvipalatus* with *bengalensis, C. cautleyi* with *pallipes,* a 3rd sp. with *Aureus;* they agree with Pleistocene and modern *Canis* in lacking a metaconid on m_2. Two spp. of *Viverra* are re-figured. The nomenclature of the hyenas is corrected, the name *H. sivalensis* being restored to Falconer's original type. *Hyaena* **bosei,** n. n. for *H. sivalensis* Bose, not Falconer (p. 493); *H. felina* Bose is a probable synonym. *Lepthyaena* is probably a synonym of *Palhyaena. Felis brachygnatha* Lyd. is close to *F. arvernensis; Cynaelurus pleistocaenicus* of China is probably a synonym. *Metailurus* Zdansky does not appear to be generically distinct from *Pseudaelurus* and is intermediate between that Miocene genus and the Pleistocene *Felis.* The objections that have been raised to the derivation of the true cats from the *Dinictis-Aeluractis* group of the Oligocene are considered briefly and regarded as unsound. *Aeluropsis* of the Middle Siwalik is a true cat, related to *Nimravus,* and *Sivaelurus* (Lower Siwalik) a more primitive sp. of *Aeluropsis.* The machaerodont cats of the Pliocene and Pleistocene appear to include 3 distinct genera, for which the names *Machaerodus* Kaup, *Megantherеon* Croizet & Jobert, and *Smilodon* Lund are available. The rest of the 35 or 40 generic names applied to the later machaerodonts are unavailable or are synonyms or doubtful subgenera. The two Upper Siwalik spp. are referred to *Megantherеon;* but some of the specimens referred by Lydekker to each of these spp. are in reality true cats (*Felis*). A 3rd sp., from the Middle Siwaliks, is true *Machaerodus* (=*Paramachaerodus* Pilgrim). Among the rhinoceroses the so-called *Aceratherium perimense* (=*Rhinoceros planidens*) and *A. lydekkeri* differ markedly from typical *Aceratherium;* they are related to *Chilotherium* in teeth but differ considerably in skull characters. Spp. from the Lower Siwaliks are referred to *Chilotherium* Ringst., Lower Pliocene of China, rather than to the American genus *Teleoceras. "Teleoceras" blanfordi* and *"Diceratherium" naricum* and *shahbazi* of the Gaj fauna are probably congeneric with *"D." pleuroceros* and *asphaltense,* but certainly not with the true *Teleoceras* and *Diceratherium.* The amynodont rhinoceroses from the Eocene of Burma, placed by Pilgrim in *Metamynodon,* are nearer to *Amynodon* but belong in a distinct genus, **PARAMYNODON** (p. 512), type *P.* cotteri (*Metamynodon c.* Pilgrim) (p. 512). *Chasmotherium birmanicum* of the same fauna is probably distinct from the European genus; *Indolophus* is a distinct genus, probably of the American family (or subfamily) Parisectolophidae. A traguloid jaw is figured but not named. The Chalicotheriidae are reviewed at some length and a provisional revision of the classification made. Of the Indian genera, *Phyllotillon* is close to *Moropus,* but *Schizotherium* of the Gaj, *Macrotherium* of the Lower Siwalik, and *Circotherium* of the Upper Siwalik belong to the brachydont chalicotheriine series. The great "claws" of the chalicotheres are adapted for a limited type of digging, used chiefly perhaps for digging water-holes, or rooting for tubers, etc., but could not be used in the manner of the ground-sloth. Of the horses *Hipparion* is found in the Middle Siwalik and in the upper part of the Lower Siwalik, *Equus* only in the Upper Siwalik. Reasons are given for regarding each genus as of American origin; and their bearing on the correlation of the Siwaliks is discussed. *Rhinoceros sivalensis* (=*R. palaeindicus*) is nearly related to the modern Indian and Javan spp.; *R. platyrhinus* is more distantly related to the African genera but probably retained upper and lower tusks. Among the Giraffidae, *Giraffokeryx* is considered a valid but primitive genus, Pilgrim's very fragmentary types are re-identified, and additional specimens referred. *Giraffa* priscilla (p. 537), from Upper Chinji, is new. The Middle Siwalik sp., *Camelopardalis sivalensis* Falc. & Cautley, referred by Bohlin to *Honanotherium* and by earlier writers to *Giraffa,* is of doubtful status, probably referable to *"Orasius"* of the Pontian; and the generic name **BOHLINIA** (p. 546) is provisionally proposed for it. *Hydaspitherium* and *Helladotherium,* Middle Siwaliks, are probably ♂ and ♀ of the same genus, as are *Sivatherium* and *Indratherium* in the Upper Siwaliks; the reference of various specimens in the Indian and British Mus. collections is revised. *Vishnutherium* and *Bramatherium* (Middle Siwaliks) are indeterminate or doubtfully distinct from the *Hydaspitherium-Helladotherium* group. The Giraffidae are derivable from the palaeomerycine group of the Miocene of Holarctica, but probably not from Protoceratidae. Camelidae are found

only in the Upper Siwalik, and the spp. are true *Camelus* nearly related to the modern Bactrian camel. The hippopotami, chiefly known from the Upper Siwaliks, are nearly related to the spp. of the Lower Pleistocene of Europe. The small primitive pigmy hippopotami of the Mediterranean region have not been recorded from India. The family is descended from the true pigs, not from *Merycopotamus* and the anthracotheres, as has been supposed. The Siwalik rodents are revised, but are too fragmentary to afford valuable data for correlation or phylogeny.—*W. D. Matthew.*

2968. **MATTHEW, W. D. The evolution of the mammals in the Eocene.** *Proc. Zool. Soc. London* 1927(4): 947-985. 16 fig. 1928.—Mammals originated from the theromorph reptiles of the Permian and Triassic. Jurassic mammals were minute, and represented a number of orders, including possible ancestors of higher groups. The order Multituberculata was present which does not belong with the marsupials or monotremes, but represents an independent subclass. Most Cretaceous mammals were marsupials or multituberculates, with a few possible placentals. Recently Cretaceous mammals have been discovered in Mongolia, the remains consisting of skulls of one multituberculate and of several placentals, the latter apparently intermediate between primitive Insectivora and Carnivora. The dentition shows the homology of the paracone and metacone of the molars with the principal cusp of the premolars. The Paleocene mammalian fauna did not contain ancestors of the principal Tertiary and modern orders, but consisted of specialized members of archaic groups that later became extinct. This fauna contained the following groups: the last multituberculates; a few opossum-like marsupials; several families of creodonts (primitive Carnivora); primitive hoofed mammals (Condylarthra, Taligrada, Amblypoda); insectivores; edentate-like mammals (Taeniodonta); semi-Primates (Menotyphla?) and tarsioid Primates; bats. At the beginning of the Eocene a new fauna of obscure origin appeared, which contained the ancestors of most of the groups of later mammals. The following is the composition of the lower Eocene fauna: very rare multituberculates at the beginning; a few opossums; several more or less advanced families of creodonts; surviving primitive hoofed mammals (Condylarthra, Amblypoda); abundant perissodactyls; some artiodactyls; primitive rodents and edentates; surviving taeniodonts; few insectivores; supposed Menotyphla; true lemuroid primates; the problematical group Tillodontia. During the Eocene the perissodactyls underwent specialization along several lines, including those leading to the horses, the rhinoceroses, and the titanotheres. The artiodactyls experienced less development, but were divided broadly into suillines and ruminants, with numerous intermediate groups. The condylarths disappeared early, while the amblypods, following two lines of evolution, developed into large forms. The creodonts, with the exception of one family (Arctocyonidae) that became extinct early, developed along several lines of specialization. These became extinct at the close of the period or somewhat later, except one family (Miacidae), which gave rise to the true Carnivora. The history of the Eocene Insectivora is poorly known, but apparently the ancestors of the moles, shrews and hedgehogs were present. The Primates developed lemur-like forms that may have given rise to the South American monkeys. Rodents remained primitive. The edentates developed a line that may have given rise to the modern pangolins. Eocene notoungulates are represented in the northern hemisphere by a single specimen, but in South America they developed many peculiar groups. The curious tillodonts culminated in large, rodent-like, forms. Opossum-like marsupials continued throughout the period. At the beginning of the Oligocene there was a great faunal change. The last ancient groups became extinct, and the modern orders were definitely established. Among perissodactyls, the horses and rhinoceroses became more advanced, while the titanotheres soon died out. Various artiodactyl lines were distinguished, including the ancestors of many modern groups. Creodonts tended to die out, except for the Miacidae, and the cat family appeared. Oligocene Primates are almost unknown, leaving a gap in the phylogeny of the order. In South America, during the Eocene, the mammals developed entirely independently. The fauna here consisted of peculiar hoofed mammals, edentates, hystricomorph rodents and various marsupials. Mongolia, in the Eocene, contained many North American and European groups of mammals, but others are unaccountably absent. Nothing is known of Australia during the Eocene, but its marsupial fauna presumably had begun to diversify at that time.—*L. S. Russell.*

2969. **MATTHEWS, L. HARRISON. The natural history of the elephant seal with notes on other seals found at South Georgia.** *Discovery Repts. Government Dependencies Falkland Isl.* 1: 233-255. 6 pl. 1929.—An account is given of the life and habits of the elephant seal (*Mirounga leonina*) at S. Georgia, and a bibliography is given. There are notes on the occurrence at S. Georgia and habits of the Weddell seal (*Leptonychotes weddelli*), the crab-eater seal (*Lobodon carcinophagus*), the leopard seal (*Hydrurga leptonyx*), and the fur seal (*Arctocephalus australis*).—*L. H. Matthews.*

2970. **MAXSON, JOHN H. Tertiary mammalian fauna from the Mint Canyon formation of southern California.** *Bull. Geol. Soc. America* 41(1): 214-215. 1930.—Abstract.

2971. **MOHR, ERNA. Der angebliche Schaf-Rind-Bastard ("Schafochse") von Husum.** *Zool. Garten [Leipzig]* 3(1/3): 35-39. 6 fig. 1930.—History and description of the animal*, evidently not a hybrid, but an undersized bull.

2972. **[NAUMOV, N. P.]** НАУМОВ, Н. П. Промысловые млекопитающие Туруханского Края. **[Economically important mammals of the Turukhan region (Siberia).]** Советский Север (*Sovetskii Sever*) 1930 (3): 36-55. Map. 1930.—This region includes both sides of the lower Yenisei River. The paper deals primarily with the geographical and ecological distribution of species, chiefly on the eastern side of the river. *Ursus arctos* is most abundant in the wild taiga, ranging to 73°N. in the western Yenisei region, but not so far north in the eastern Yenisei region, where the forest is mixed with tundra vegetation. *Canis lupus turuchanensis* extends to 75°N., especially in the treeless regions about the upper Kotuja and Kureika Rivers; it abounds where deer and elk are found. *Alopex l. lagopus* breeds on treeless rocky slopes about the Kochechumo, Kotuja, and Kureika Rivers and the Norilsk Lakes south to 68° N. Its migrations extend from the Arctic Ocean south to 64°-65°N. *Vulpes vulpes* is characteristic of the forest and forest-tundra region of the Stony Tunguska River. *Gulo gulo* is usually found in the Thunhus region east of the Yenisei, and reaches the northernmost parts of the tundra. *Mustela zibellina* is found only in the western part of the eastern Yenisei region; it lives in the wild taiga. *Mustela s. sibirica* is common in all the Stony Tunguska River region, ranging north to 67°N. *Arctogale erminea* is common north to the Arctic Ocean, including the deltas of the Lena and Yana Rivers; it is usually found in forest-tundra regions. *Arctogale nivalis* is common in the northern part of the region, reaching the lower Yenisei. *Lutra lutra* is common on the Yenisei, Stony Tunguska, and Nentsheschema Rivers. *Lynx lynx* is found only in the western part of the eastern Yenisei region. *Meles meles* may be found between the Angara and Stony Tunguska Rivers, but is commoner farther south. *Lepus timidus* [misspelled *tinidus*] occurs throughout the region, even reaching the Arctic Ocean. *Sciurus vulgaris calotis* occurs mostly in wild taiga along the Yenisei, Heta, and Kotuja Rivers, up to 72°N. *Eutamias asiaticus* is found in the basins of the Stony Tunguska and Lower Tunguska, ranging farther north along the Yenisei; it is restricted to the forest. *Pteromys volans* is very common in forests, chiefly in the southern part of the region. *Rangifer tarandus sibiricus* occurs throughout the Turukhan region. The distribution of *Alces alces* is meridional rather than latitudinal in char-

acter; it occurs only in the eastern part of the eastern Yenisei region, as far as 71°N. *Moschus moschiferus* is not common, found mostly along the Stony Tunguska, up to 67°N. *Ovis nivicola borealis*? is found mostly in mountainous parts of the forest-tundra region, between the Hantaki and Piasina, the Lower Tunguska and Kureika and Kotuja, also the Heta and Kotuja Rivers.

2973. NEWCOMBE, C. L. An ecological study of the Allegheny cliff rat (Neotoma pennsylvanica Stone). *West Virginia Univ. Bull., Proc. West Virginia Acad. Sci.* 3: 63-70. 1929. (Also in *Jour. Mammalogy* 11(2): 2 pl. 204-211. 1930.)—This study was made in West Virginia, and distributional records for the state are given. Most nests are placed deep in crevices of large rocks on mountain ridges. Midden heaps of sticks, leaves, bark, nutshells, fungi, and other materials are invariably present near the nests. The contents of several such heaps are analyzed. Fungi are usually present in significant numbers and may be stored for winter consumption. Food taken by 2 captives included, in order of preference, nuts, sweet potatoes, apples, grapes, and various vegetables. Water was consumed regularly.

2974. [PARAMONOV, A. A.] ПАРАМОНОВ, А. А. К биологии выхухоли. [Biology of desmans.] Труды по Изучению Заповедников. [Contrib. to the Study of Conservation, Moscow]. No. 9. 3-34. Map, 2 pl., 5 fig. 1928.—In Penza Province, Russia, desmans* live in swamps and lakes. Their burrows are about 6 m. long, beginning beneath the water and rising above the water level. The slope of the burrow varies with the soil, water level, and profile of the shore. Descriptions of ♂♂ and ♀♀ are given. Of ectoparasites, only *Silphopsyllus desmanae*, with larvae and eggs, was found. An unidentified nematode was found in the intestine. There are 2 litters per year, the number of young born being 2-4. Sexual maturity is reached probably in the second year. The species is omnivorous. It does not live long in captivity. Smell and hearing are well developed, but not vision. The proboscis serves as a sensory organ. Musk glands are located in the basal part of the tail.

2975. [PARAMONOV, A. A.] ПАРАМОНОВ, А. А. Некоторые вопросы охраны выхухоли. [The conservation of desmans.] Труды по Изучению Заповедников. [Contrib. to the study of Conservation, Moscow.] No. 9. 35-51. Map. 1928.—The isolated distribution of *Galemys pyrenaica* and *Desmana moschata* shows that desmans cannot be considered flourishing genera. But, viewed biologically, neither are they degenerate, although aquatic specialization makes them unadaptable to other environment. They are destroyed annually in great numbers by fur hunters and by such natural causes as ice, floods, etc. Conservation measures are recommended.

2976. PFIZENMAYER, E. W. Vom Wisent, dem untergehenden Wildrind Europas. *Aus der Heimat.* 43 (9): 268-273. 4 fig. 1930.—The author gives a historical sketch of the three important herds of this species*. Before the World War there were 700 animals under the Czar's protection in the Forest of Bialowies in Lithuania, but they were completely exterminated soon after the war. In 1918 the herd of Prince Plass at Meserczitz in Upper Silesia, which had been started in 1865 with a gift of 4 animals by the Czar, numbered 74. In the chaotic conditions following the war this herd was reduced to a small remnant. In the Kuban district of North Caucasus the Grand Duke Sergius had kept a herd of 600. By 1921 this herd had been reduced by poachers to 50, and by 1926 to 10. In 1928 none could be found, but in April, 1930, there was a trustworthy report of a few survivors in one of the least accessible parts of the district. Latest records show a total of 27 ♂♂ and 32 ♀♀ remaining in zoological gardens and nature preserves.

2977. PRELL, H. Über die Fortpflanzungsbiologie der europäischen Bären. *Zool. Garten (Leipzig]* 3(4/8): 168-172. 1930.—Observations, chiefly on captive animals, indicate that the rutting season of *Ursus arctos* falls principally in May and June; of *Ursus maritimus*, in March and April. The former, however, has a secondary rutting period, chiefly in July and August, which plays no part in the preservation of the species. When fertilization takes place during the first rutting season, a rest period of about 3 months ensues before embryonic development really begins. The time of delivery falls chiefly in December, January, and February, after a gestation period of about 7-8 months. Likewise, *Ursus maritimus* has a secondary rutting season in July, and delivery takes place in November or December. This condition of affairs in the European bears corresponds to that in the badger and the martens (*Martes martes* and *M. foina*).

2978. REINHARDT, H. Zuchterfolg beim Steinmarder. *Pelztierzucht* 5(10): 195-197. 4 fig. 1929.—Observation and experiment showed that stone marten has a gestation period of 9 months. The ♀ builds the nest alone. The two young ones developed slowly. Food was carried to the nest 43 days after birth of the litter, which were breast fed for 6 weeks. They were very helpless, lay flat on their bellies when put on their feet, and were blind for 36 days. At the age of 6 weeks they measured 37 and 36 cm., 10 and 12 cm. of which was tail, and weighed 350 and 340 gm. One was ♂, the other, ♀. First independent motions of climbing were observed at 9 weeks. At 4½ months the ♂ showed the first sex activity. Older animals copulate at the end of June, younger ones in August. The same observation was made in America with pine marten. Rather vicious-looking fights do not indicate that the couples need to be separated; and they do not stand separation well.—*B. Bickel.*

2979. REYNOLDS, SIDNEY H. A monograph on the British Pleistocene Mammalia. Vol. 3, pt. 3. The Giant deer. *Palaeontograph. Soc. [London]* 81(paper 1): 1-62. 2 pl. 31 fig. 1927(1929).—The memoir opens with a historical introduction, the earliest reference dating as far back as 1697. Lists of the localities in the British Isles are given where giant deer (*Cervus giganteus**) remains have been found. Then follow short sections on: (a) the co-occurrence of great numbers of skeletons; (b) the special abundance of the giant deer in Ireland; (c) the cause of the preponderance of the skulls of the ♂; (d) the contemporaneity of the giant deer with man in the British Isles; (e) the probable cause of its extinction; (f) its distribution in time. Its origin, races, and affinities are discussed, and the skeleton described. Particular attention is paid to the antlers, of which 32 examples are figured. Lists of skeletons and antlers in public museums and private possession are given, and the memoir concludes with an extensive bibliography. A short account of the fallow deer (*Cervus dama*) also is given.—*S. H. Reynolds.*

2980. RITCHIE, JAMES. St. Kilda and the significance of some of its animal inhabitants. *Scottish Naturalist* 1930(183): 69-74. 1930.—In connection with the probable early abandonment of this island by its human inhabitants, the author calls attention to its endemic spp., *Apodemus hirtensis, Mus muralis*, and *Troglodytes hirtensis*. These must have developed after the last great glaciation of northern Europe. The domesticated sheep of the island are the most primitive known today. Up to about 1877 the human inhabitants consumed the surplus numbers of *Fulmarus glacialis* for food. They then began to import European food-stuffs regularly. With the consequent increase in the numbers of fulmars, the available nesting-sites on St. Kilda no longer sufficed, and the birds have extended their breeding range to Scotland and England.

2981. RODE, P. Contribution à l'étude du fouissement chez les petits rongeurs. *Bull. Soc. Zool. France* 54: 573-588. 2 fig. 1929.—When placed in outdoor cages, *Microtus arvalis, Mus sylvaticus* (2 subspp.), and *Mus musculus* (gray and white varieties) all behave alike: they dig tunnels in the earth and make nests in them. The work of digging is conditioned by the physical properties of the soil, and by such climatological conditions as temperature and solar radiations. Behaviour is, apparently, independent of morphological characters, domestic varieties

of mice proving to be as good diggers as wild species. Climatological conditions react alike on all the species. Variations in the physical environment produce modifications in the digging.—*From author's summary.*

2982. **RODE, P. Méthode de destruction des Rats par la poudre de Scille.** *Rev. Path. Végét. et Entom. Agric.* 16(9/10): 283-289. 1930.—Mixing 5 gr. powdered scilla to 15 gr. sugar, 150 gr. flour and enough water, makes an efficient baiting and poisonous paste for rats.—*J. Dufrenoy.*

2983. **REVERDIN, L. La faune néolithique de la station de Port-Conty (St-Aubin, Neuchâtel), d'après le matériel recueilli de 1928 à 1930.** *Compt. Rend. Séances Soc. Phys. Nat., Genève* 47(2): 83-86. 1930.—The author presents a list of 5 domestic and 23 feral mammals whose bones were found at this station. In an old Neolithic bed 70% of the individuals were domestic; in a Middle Neolithic bed, 50.8%.

2984. **RUHL, HARRY D., and PARISH S. LOVEJOY. Beaver plantings in Michigan.** *Papers Michigan Acad. Sci. Arts & Let.* 11: 465-469. 1929(1930).—Report of beaver plantings in various streams in Michigan, together with a brief discussion as to the colonies established and the probable success of this enterprise.—*C. F. Jackson.*

2985. **RUSCONI, CARLOS. Sobre un húmero de "Arctotherium" y otro de "Felis" de la formación Pampeana. I. Descripción de un húmero de "Arctotherium." II. Descripción de un húmero de "Felis platensis."** *Anal. Mus. Nacion. Hist. Nat. Buenos Aires* 34: 279-297. 4 pl. 1926-1928[1928].—The author refers a humerus* of *Arcototherium* (Buenos Aires, *Ensenadense* beds, upper Pliocene) to *A. latidens* Bravard. Comparisons are made with the humerus of *A. candiottii, Ursus bonariensis* and other genera of North America; several measurements are given. A humerus of *Felis* from the same beds is referred to *F. platensis* Amegh. and several measurements are given.—*C. Rusconi.*

2986. **ST. LEGER, JANE. A new subspecies of Colomys from Kenya.** *Ann. and Mag. Nat. Hist. Ser. 10* 6(34): 527-528. 1930.—*G. goslingi* **denti** (p. 527); type in British Mus.

2987. **SCHAEFER, HELMUT. Sorex alpinus in der schlesischen Ebene.** *Zool. Anz.* 91(1/4): 66. 1930.—Three recent records, at altitudes of 181-230 m.

2988. **SCHMIDT, H. Ein Skelett von Alces latifrons aus der Gegend von Göttingen.** *Palaeontol. Zeitschr.* 12 (2): 135. 1930.

2989. **SCHMIDTGEN, OTTO. Eine Unterkieferhälfte vom Damhirsch aus dem Mosbacher Sand.** *Notizbl. Ver. Erdkunde Hess. Geol. Landesanst. Darmstadt* 5(12): 114-118. 1 pl. 1930.—After detailed comparison with the teeth of *Cervus elaphus* and recent *C. dama,* this specimen*, new to the Mosbach fauna, is referred to *C. dama.*

2990. **SCHULZE, PAUL. Ueber das Vorkommen von Zwergrindern bei Berlin um 1810 und über eine merkwürdige Eigentümlichkeit mazedonischer Pferde.** *Sitzungsber. u. Abhandl. Naturforsch. Ges. Rostock* 2: 5-8. 1 pl. 1927/29(1930).—Dwarf cattle, of the *Bos longifrons* type, a remnant of which has been discovered in Niederlausitz, were still used as draught animals in Brandenburg about 1810. The small Macedonian horse, which, like the Celtic pony, may be a glacial relict, keeps its tail and head in constant movement to ward off flies.

2991. **SCHUSTER, LUDWIG. Im Kampf gegen die Bisamratte. Ein Kapitel aus der Geschichte der Schädlingsbekämpfung.** *Naturforscher* [*Berlin*] 6(12): 458-462. 1930.—Accounts, based on official data, of the muskrat's distribution in Germany, the damage done by it, and control methods. Breeding permits for muskrats are discouraged.—*L. Schuster (transl. by O. J. Murie).*

2992. **SCHWANGART, F. Stammesgeschichte, Rassenkunde, und Zuchtsystem der Hauskatzen.** 59p. illus. Verlag Heber & Co.: Leipzig, 1929.—In this book the early history of the cat is described from the time of its domestication in ancient Egypt, about 2000 B. C. The geographical distribution and description of different members of the cat family are given, and comparisons made between the wild and domestic forms. Results of different crosses between some of the different types are given, pointing out differences in hair length, skull shape, tail length, and other characters, as well as color differences. The most desirable characters for breeding and the different varieties recognized are discussed. A brief discussion of the genetics of cats is followed by a classification and description of some of the recognized varieties bred by fanciers. The classes described are I. Short-haired: 1. Domestic short-haired cat, 2. Short-haired marbled or blotched, 3. Slender formed cats, 4. Siamese. II. Long-haired (Angora): 1. Persian, 2. German long-haired. A bibliography of nearly 60 titles covering genetics, archeology, geographical distribution, anatomy, etc. is appended.—*O. N. Eaton.*

2993. **SCHWARZ, ERNST. Der fehlende Schneidezahn der Primaten.** *Zool. Anz.* 89(1/2): 36-38. 1 fig. 1930.—In a number of Lemuridae a rudimentary medial incisor*, representing the milk dentition (d I^1), has been found. The two large incisors are I^2 and I^3. Reduction begins medially and proceeds laterally.

2994. **SCHWARZ, ERNST. Das Okapi.** *Zool. Garten* [*Leipzig*] 3(4/8): 154-158. 5 fig. 1930.—An account of the 2 living specimens so far brought to Europe, with a description and photographs of the one surviving in the Antwerp zoo.

2995. **SCOTT, WILLIAM BERRYMAN. Extinction of Pleistocene mammals.** *Bull. Geol. Soc. America* 41 (1): 104-105. 1930.—The view that the presence of Pleistocene spp. of mammals always fixes the date of the beds as definitely Pleistocene is untenable. It is pointed out that many Pleistocene spp. survived the last glacial stage, some of them coming down almost to historic times.—*J. W. Gidley.*

2996. **S[OWERBY], A. de C. The Yunnan serow.** *China Jour.* 13(1): 43. 1930.—Notes on the distribution and character of *Nemorhoedus osborni.*

2997. **SZCZERKOWSKI, K. Die Posener Wisente.** *Zool. Garten* [*Leipzig*] 3(4/8): 153-154. 2 fig. 1930.—This Polish zoological garden contains a pair of wisents. The ♂ is of mixed Caucasus-Baltic ancestry, and the ♀ is from the Baltic region. Single calves were born in 1924 and 1928; one that survived is now on a government reserve in Poland.

2998. **TAKASHIMA, HARUO. Standard Japanese names for the mammals of Japan, 1.** *Trans. Nat. Hist. Soc. Formosa* 20(109): 195-217. 1930.

2999. **THOMAS, OLDFIELD. The mammals of Señor Budin's Patagonian Expedition.** *Ann. and Mag. Nat. Hist. Ser.* 10 4(19): 35-45. 1929.—This study shows that the mammals collected by Alcide d'Orbigny in 1828, and until now supposed to be from S. Patagonia, are from the Lower Rio Negro region. Collection consists of about 250 specimens belonging to 22 spp. One ssp. is new: *Abrothrix hirta* **nubila** (p. 40), Argentina, in British Mus. *Conepatus castaneus* d'Orb. and Gerv. has long been considered a synonym of *C. humboldti* Gray. The author considers the northern and southern forms of skunks distinct subspp. and suggests that the southern form be called *C. castaneus castaneus* d'Orb. and Gerv. (=*C. proteus gaucho* Thos.), and the northern form *C. castaneus proteus* Thos. Original specimens of *Caviella australis* Geoff. & d'Orb. are from Lower Rio Negro, not from extreme southern Patagonia. Therefore what the author called *C. a. nigriana* is the true *C. a. australis.* There is doubt as to whether the far southern form is *C. a. australis,* or is distinct and should be called *C. a. kingi* Benn.—*A. R. Shadle.*

3000. **VILLEGAS, VALENTE. Determination of the age of water buffaloes (Bubalus bubalis Lyd.) by the eruption of temporary and permanent incisors.** *Philippine Agric.* 18(6): 371-378. 1 fig. 1929.—Data were secured from 21 carabaos (Philippine water buffaloes), 13 Indian buffaloes, and 21 Philippine-Indian buffalo grades during a period of about 4½ years. The author found that the first 3 pairs of deciduous incisors erupted within 3 weeks while the 4th pair erupted 4½ months after birth. Replacements took place as follows: 1st pair, 3 years; 2nd pair, 3½ years; 3rd pair, 4 years; and 4th pair, 5 years after birth.—*M. Manresa.*

BIOLOGICAL ABSTRACTS

Editor-in-Chief, J. R. SCHRAMM; Associate Editors, FREDERICK V. RAND and MARY JONES FISHER; Assistant Editors, PERCY G. STILES, JOHN E. FLYNN, and FRANCIS HARPER

(See also in B. A. 6(1): Entries 43, 141, 151, 297, 2148, 2343; and in this issue 3106, 3108, 3181, 3223, 3665, 3725, 4608, 5076, 5315, 5593)

GENERAL

3001. **BABCOCK, E. B. Cyto-genetics and the species-concept.** *Amer. Naturalist* 65(696): 5-18. 1931.—Summarizing earlier work bearing on the sp. concept and combining therewith evidence from recent cyto-genetic study, the essentials of the sp. concept are: common structural characteristics which unite certain individual organisms into one group, and a common genetic basis for the group represented by a specific chromosome complex; characteristic features which distinguish such groups from one another, one of these frequently being the chromosome garniture; relative stability combined with variability within the group, this being made possible by high regularity in chromosome distribution, while inherited variations arise from occasional changes in genes and chromosomes; common descent of all individuals of the group from one or more preexisting sp. made possible by the known mechanism of heredity and genetic variation; free intercrossing and high interfertility among the individuals of the group expected in organisms possessing a high degree of genic homology; absence of free intercrossing and usually low fertility if not complete sterility in hybrids between different sp. (with occasional exceptions) resulting from accumulation of genic and chromosomal differences between diverging groups of individuals within a sp.; and subspecific groups, often occupying different geographic areas but connected by intergrading forms, which differ more from one another than do the individuals composing each subgroup, as a result of genetic variability within the sp. plus the influence of environment, isolation, and natural selection. Vavilov holds essentially the same concept when he says "a Linnaean sp. is a separate morpho-physiological system connected in its genesis with a definite environment and area."—*E. B. Babcock.*

3002. **BARTON, OTIS. The bathysphere.** *Bull. New York Zool. Soc.* 33(6): 233-234. Illus. 1930.—Description of a steel sphere which was lowered into the ocean to a depth of 1400 ft. while 2 persons within made observations on near-by marine animals.

3003. **BEEBE, WILLIAM. A quarter mile down in the open sea.** *Bull. New York Zool. Soc.* 33(6): 201-231. Illus. 1930.—Notes on various marine animals observed from within a steel sphere lowered to a depth of 1426 ft. in the Atlantic near Bermuda.

3004. **BEEBE, WILLIAM, and GLORIA HOLLISTER. Log of the bathysphere.** *Bull. New York Zool. Soc.* 33 (6): 249-263. Illus. 1930.—Detailed observations on marine organisms and on penetration of light at various depths (maximum 1426 ft.) during 11 dives in a steel sphere in the Atlantic near Bermuda.

3005. **BLACHLY, CHARLES D. The mechanics of heredity. I.** 18p. A. M. Boles Printing Co.: Oklahoma City, 1929. II. 14p. Enoch Lusk Printing Co.: Oklahoma City, 1930.—This paper attempts to give a comprehensible picture of the origin and mechanics of protoplasm. An organism is considered to be (to a degree) a gigantic molecule because in growth one definitely arranged atomic group determines the arrangement of an adjacent group. An attempt to make a distinction between chemical and physical union in protoplasm is somewhat illogical and confusing. The hypothesis is developed that perhaps life arose out of bilateral right and left handed molecules whose halves under certain conditions separated and, due to the arrangement of the fields of force of the atoms, rebuilt the missing parts so that 2 new bilateral molecules resulted. Through variation these reproducing molecules ("hereditary molecules") reached the complexity of cells and later higher organisms. The gene is considered a reproducing molecule subservient to the "hereditary molecule" of the cell. —*C. D. Blachly.*

3006. **CHAPMAN, FREDERICK. Open-air studies in Australia.** xx+170p. 23 pl. J. M. Dent & Sons: London & Toronto, 1929. Pr. 10s. 6d.—This group of 20 essays introduces the general reader to some scientific facts relating primarily to coastal geology. While based particularly on scientific research in Australia, the explanations and problems included are of universal application and are presented in a popular style. Sample chapter-headings are: Secrets of a sand hill; Devonian marble; Hillside geology; Something about slates; and Buried rivers: their alluvial gold.—*H. Croasdale.*

3007. **COLIN, HENRI. De la matière à la vie.** [2nd ed.] 336p. 43 fig. G. Beauchesne: Paris, 1926.—The introductory section contains a brief historical account of the cell theory, cell division, the structure of protoplasm, and the organology and physiology of the cell. The 2nd chapter is concerned with the chemistry of living matter, the constituent elements, the assimilation of C in photosynthesis, and chemical diastases and catalysers. The 3rd chapter deals with biophysics including osmosis, diffusion, bioenergetics, dissymmetry, and the origin of sugar and of inulin. Chapter 4 is a criticism of transformism, of the inadequacy of the classic factors in evolution, discusses the technique of genetics, the origin of cultured varieties and mutations, and states categorically that the experimental proof of transformism is as yet lacking. The last chapter discusses the relations of life to environment, the evolution of the earth, genesis of life, the progressive desiccation of the globe, and the ultimate extinction of life.—*C. A. Kofoid.*

3008. **CONKLIN, EDWIN G. Contributions of biological research to education.** *School & Soc.* 31(806): 751-753. 1930.—In this address are discussed education as a process of differentiation of the individual; interplay of heredity and environment; significance of fundamental activity in habit formation; uniqueness of the individual and its significance in personal development; conformity to type and its significance in the cultivation of social

unity; non-inheritance of acquired characters and the resulting continuing necessity of education; the duty of education in eugenics as a means of race improvement; and education as the chief hope of human progress.—*C. A. Kofoid.*

3009. **DANSER, B. H.** Over het soortsbegrip in de Plant- en Dierkunde. [Conception of species in botany and zoology.] *Handelingen 4th Nederlandsch-Indisch Natuurwetensch. Congres Weltevreden* 1926: 341-349. 1926.

3010. **GREEN, ETHEL, and ETHEL A. POTTER.** Biology by discovery. (Dent's Modern Science Series.) 369p. 2 pl. 112 fig. J. M. Dent & Sons: London, Toronto, 1930.—This elementary text-book is designed for biology classes in Junior or Senior High Schools.

3011. **GREGORY, HERBERT E.** Types of Pacific Islands. *Proc. 3rd Pan-Pacific Sci. Congress, Tokyo* 2: 1663-1673. 1926 (1928).—The oceanic islands of the central Pacific are geologically young and have experienced no great change in position since the Pleistocene or even the early Tertiary. Man's advent into Polynesia is recent. The manner of dispersal of plants, animals, and men is not the same. A knowledge of the evolution and geologic history of Pacific birds is needed, and the conflicting beliefs of botanists regarding the original home of Pacific plants need to be reconciled. The view of De Vries that endemics are local mutants needs proof or disproof. The distribution of plants and of land shells is difficult to explain on the basis of the present distribution of islands. The net effect of cyclonic storms, both as winds and as currents, is to transport northward and eastward.

3012. **HENDY, E. W.** Wild Exmoor through the year. 320p. 25 fig. Jonathan Cape, London, 1930. Pr. 10s. 6d.

3013. **HESCHELER, KARL.** Über die Sicherheit der Voraussage in der vergleichenden Morphologie. *Verhandl. Naturforsch. Ges. Basel* 40(2): 441-451. 1928-1929.—It is attempted to show, by means of examples from comparative anatomy, embryology, and paleontology, that the certainty of prediction is as great in these disciplines as in any exact natural science, but is dependent upon the completeness of the evidential data.—*K. Hescheler* (*transl. by E. L. Rice*).

3014. **KOTSOVSKY, D.** La vieillesse, comme problème fondamentale de la biologie. *Riv. Biologica* [*Milan*] ii(5/6): 632-655. 1929.—Comparative description of the biological conditions of senescence may be presented in the Protista as intoxication by vital products accumulating in culture; in plants as intoxication by the agrosterole accumulated in the soil; and in tissue cultures as intoxication by-products of vital activity accumulated in culture. Where investigation of diverse forms of life is referred back to the primary elements—to the cellular protoplasm—one is impressed by the salient features of resemblance in the origins of senile changes. Senescence is a fundamental problem in general and experimental biology.—*D. Kotsovsky* (*transl. by J. W. MacArthur*).

3015. **MJÖBERG, ERIC** [Transl. from Swedish by ANNA BARWELL]. Forest life and adventures in the Malay Archipelago. 202p. Wm. Morrow: New York; George Allen & Unwin: London, 1930. Pr. 12s. 6d.

3016. **MUFFITT, TREVOR S.** Biological foundations in education. A textbook for teacher training institutions and schools of education. 394p. 40 fig. P. Blakiston's Son & Co.: Philadelphia, 1930. Pr. $2.00.—Part I deals with the general principles of biology such as the nature and origin of life; the cell; growth and heredity of the individual; evolution; and classification. Part II deals with the application of those principles to the development of the child from infancy to late adolescence. The educational problems of play, physiology, behavior, eugenics, birth control, and the fundamentals of study and the physical environment are discussed in the light of modern science. Lists of books for reference are given at the end of each chapter.—*M. Halushka.*

3017. **PETERSEN, JES.** Erde und Mensch. Eine gemeinverständliche kurze Entwicklungsgeschichte der Erde und des Menschen. 185p. Illus. Columbus-Verlag. (Paul Oestergaard): Berlin-Lichterfelde, 1929. Pr. 3.50 M.—Astronomy, geology, paleontology, and national relations are treated. Maps showing climatic zones and population densities are included.—*O. A. Stevens.*

3018. **PYCRAFT, W. P.** Random gleanings from nature's fields. xiv+210p. Hale, Cushman & Flint: Boston, 1930. Pr. $2.50.

3019. **SAPPER, KARL.** Biologie und organische Chemie. In: JULIUS SCHAXEL. Abhandlungen zur theoretischen Biologie. Heft 28. 50p. Gebrüder Borntraeger: Berlin, 1930. Pr. 3.80 M.—The author takes issue with the present practice of presenting organic chemistry as depending upon the same laws as inorganic chemistry. An attempt is made to establish an analogy between organic molecules, particularly stereoisomerism, and life forces. This theory is suggested as a means of bridging the gap between vitalistic and mechanistic concepts of life.—*R. M. Hixon.*

3020. **SCHLIEPER, HANS.** Das Raumjahr. Die Ordnung des lebendigen Stoffes. 360p. Eugen Diederichs: Jena, 1929. Pr. 15.50 M.—This book is based upon the earlier work of Wm. Fliess and postulates the cosmic conditioning of organic forms. It is maintained that there is an invariable conformity of life processes to daily and annual influences. Data from the growth of plants, from vital statistics, from the annulations of the carapace of the armadillo, and the genetics of *Drosophila* are assembled to prove influences of the cosmic divisions of time upon the forms and functions of organisms.—*C. A. Kofoid.*

3021. **SCOTT, GEORGE G.** Laboratory manual of general biology. [Rev. ed. 123p. Thomas Y. Crowell Co. New York, 1930. Pr. $1.—This laboratory guide and quiz-book is revised to accompany the author's "Science of Biology." It covers types of plants and animals and the elements of the various subdivisions of animal biology.—*C. A. Kofoid.*

3022. **SODDY, FREDERICK.** Science and life. xii+229p. E. P. Dutton: New York, 1926.

3023. **STEVENSON-HAMILTON, J.** The low-veld: its wild life and its people. 288p. 16 pl. Cassel & Co.: London, 1929. Pr. 12s. 6d.

3024. **STRONG, RICHARD P.** The African Republic of Liberia. In: The African Republic of Liberia and the Belgian Congo, based on the observations made and material collected during the Harvard African Expedition 1926-27. Vol. 1. (*Contr. Dept. Trop. Med. & Inst. Trop. Biol. & Med.* No. 5) Part 1. p. 1-209. 4 maps, 78 pl., 7 fig. Harvard Univ. Press: Cambridge, 1930.—Part I consists of a general survey of conditions in Liberia, with sections on Agriculture, farm and forest products (p. 116-134); Travel in the interior and care of personnel (p. 140-162); Geology and flora (p. 163-178); Zoology (p. 179-190); Sanitary and medical conditions, and prevailing diseases (p. 198-203). Section IX (p. 116-134), "Agriculture, farm and forest products," gives a summary of crops, economic wild plants, and agricultural practices in the republic. Agriculture is extremely primitive. Crops are: rice, an introduced crop; cassava, 2 varieties of *Manihot utilissima* being found; and *Colocasia,* plantains, Indian corn, beans, peanuts, sweet potatoes, and sugar cane. Kola nuts are collected and exported. Some of the wild fruits used for food are identified. Palm oil, obtained from *Elaeis guineensis,* fiber from *Raphia vinifera,* and rubber (wild and Para rubber) are among the important economic crops and products. Section XI, "Travel in the interior and care of personnel," discusses some of the hygienic precautions to be observed. The flora (Section XII, p. 163-178) is typically West African. It includes a coastal belt known as the Upper Guinea subregion and characterized by heavy rainfall. In many parts the primeval rain forest has given way, through settlement and agriculture, to dense scrub and secondary growth. Notes are given on some of the more striking features of the vegetation. Section XIII, "Zoology," is a general report on some of the main features of the mammalogy, ornithology, herpetology, and entomology. These subjects

are treated more extensively in special reports by other authors in vol. 2. Section XIV, "Sanitary and medical conditions: Prevailing diseases," summarizes briefly the public health conditions in the Republic.

3025. **TALLON. Réserve zoologique et botanique de Camargue. Rapport d'ensemble du 15 mars au ler mai 1929.** [Zoological and botanical reserve of the Camargue, France.] *Bull. Soc. Nat. Acclimat. France* 76(9): 143-149. 1929.—The extreme cold of February, 1929, killed many of the sedentary small birds. A beaver with 5 embryos is recorded. The vegetation was damaged by frost, high wind, and flooding with salt water.

3026. **TURNER, FRANCIS M., THOMAS C. GREGORY, and ISABELLE M. WELCH [editors]. The condensed chemical dictionary.** [2nd ed.] 551 p. Chemical Catalog Co.: New York, 1930.

3027. **WARTHIN, ALFRED SCOTT. The creed of a biologist: a biologic philosophy of life.** 62p. Paul H. Hoeber: New York City; Constable & Co.: London, 1930. Pr. 6s. 6d.

3028. **WHEELER, WILLIAM MORTON. Present tendencies in biological theory.** *Sci. Month.* 28(2): 97-109. 1929.—The historical and philosophical residuum are analysed, with the theoretical and doctrinal cross-currents in the fields of biology, and the indictments brought against them. Every branch of science develops its own vehicles of ideation or theoretical concepts which are neither mutually equivalent nor interchangeable. A horizontal non-subordinating tabulation of the sciences shows their necessary inter-relationships and non-exclusiveness. Organicism is capable of resolving the Historism-Naturalism duality into an "emergent whole" through the inspiration of "investigative love."—*C. T. Reed.*

3038. **LUNA, EMERICO. L'architettura degli organismi animali.** [The architecture of animal organisms.] *Monitore Zool. Ital.* 40(11/12): 409-418. 1930.—The fundamental plan of all animal organisms is segmentation, whether this be in members one following another (metamery) or rayed like the spokes of a wheel (cyclomery). The former probably represents the more advanced evolution, but is continually liable to complete or partial suppression.—*P. Popenoe.*

3039. **LYELL, D. D. Hunting and spoor of African game.** Seeley Service: London; J. B. Lippincott Co.: Philadelphia, 1929. Pr. 1 £. 11s. 6d.

3040. **PERCIVAL, A. BLAYNEY (edited by E. D. CUMING). A game ranger on Safari.** 305p. Map. 24 pl. Nisbet & Co.: London, 1928.—The author draws upon his long experience in East Africa to present detailed accounts of numerous native animals, their habits, distribution, and economic relations. While chief attention is devoted to the game mammals, there are many notes on birds and reptiles, including a chapter on the crocodile. Periodic fluctuations in numbers, migrations of game, and effects of disease and drought are among the topics discussed.

3042. **POCHE, FRANZ. Dr. Stiles' "American referendum" on three propositions in nomenclature.** *Verhandl. Zool.-Bot. Ges. Wien* 79(2/4): 273-283. 1929(1930).—The author seriously challenges the fairness of this referendum. He criticizes in detail various points brought out in Stiles's report on the referendum, and maintains that the latter's interpretation of the term "binary nomenclature" is wrong.

3043. **POCHE, FRANZ. Zur Beseitigung von Übelständen in der zoologischen Nomenklatur.** *X^e Congrès Internat. Zool. Budapest* 1927. Part 2: 1534-1558. 1929.—Consistency and stability of nomenclature can not be approximated as long as well-established rules are overthrown without theoretical necessity or practical advantage. Until 1910 there was no difference of opinion as to what was understood by "binomial nomenclature." In 1910, Stiles announced, contrary to his previous standpoint, a new version of this concept according to which even the old polynomial works had a binomial nomenclature. This view has proved as a whole to be untenable. Moreover, this interpretation occasions troublesome changes of names. By the "arbitrary designation of type," introduced into the rules at the Boston Congress, any author can, in genera without original type, designate as the type of *A* a sp. that long since has been removed from the genus *A* and placed in the more recent genus *B*. The name *A* must then be transferred to *B*, and for *A* in the previous sense a new name must be introduced. The elimination procedure, however, forbids such a maneuver, and possesses preponderating theoretical and practical advantages over the arbitrary designation of type as well. A motion on the part of 646 zoologists expresses clearly the validity of the elimination procedure and erects exact rules for its application which make it independent of the changing systematic interpretation. The Internat. Comm. on Nomenclature has reported to the Congress since 1907 only concerning such propositions to which all of its members, present in the Congress, have concurred (principle of liberum veto). Stiles has erected 4 propositions which conflict with the facts. 649 zoologists have demanded the repeal of this liberum veto; among the signers are found advocates of the nomina conservanda as well as those of the most stringent priority.—*F. Poche (transl. by J. E. Lynch).*

3044. **RAMME, W. Tiergrotesken.** 10p. 80 pl. Brehm Verlag: Berlin, 1931. Pr. 9 M.—The plates are illustra-

tions of grotesque forms and features in the animal kingdom. Mammals, fishes, birds, insects, arachnida, reptiles, and amphibia are represented. Many of the illustrations show mimicry clearly, and a question is raised as to whether the spp. are conscious of their grotesqueness, and as to what purpose, if any, is served by the evolutionary development of such forms.

3045. **REED, H. D., and B. P. YOUNG.** Laboratory studies in zoology. 121p. 4 fig. McGraw-Hill Book Co.: New York, 1930. Pr. $1.—This manual begins with a detailed study of a familiar type, the frog, follows with the development of the egg, and proceeds with shorter studies of representatives of the *Protozoa, Coelenterata, Platyhelminthes, Annelida, Mollusca, Arthropoda,* and *Chordata,* concludes with a review of all the phyla, subphyla, and classes of animals.—*C. S. Brimley.*

3046. **SELENKA, E., und R. GOLDSCHMIDT.** Zoologisches Taschenbuch für Studierende. [8th ed. rev. by J. SEILER.] Heft 1: Wirbellose und allgemeine Zoologie. [Manual of zoology for students. I. Invertebrate and general zoology.] 159p. Georg Thieme: Leipzig, 1931. Pr. 7.20M.

3047. **STEMPELL, W.** Repetitorium der allgemeinen Zoologie. [General zoology.] 268p. 249 fig. Gebrüder Borntraeger: Berlin, 1929. Pr. 7.60 M.

3048. **VIGNON, PAUL.** Introduction à la biologie expérimentale. Les êtres organisés. Activités, instincts, structures. *Encyclopédie Biol. VIII.* 731p. 24 pl. (3 col.) 890 fig. Paul Lechevalier: Paris, 1930. Pr. 210 Fr.—Instances are narrated of intelligent or quasi-intelligent behavior in mammals, insects, and protozoa. The industries and inventive instincts of magpies and bower-birds, ants and wasps are described, as well as the use of various objects as tools, e.g., wasps tamp the soil with pebbles; ants sew; an infusorian carries a sprawling diatom as a fender. Specialized organs and instincts are described, e.g., spittle insect, yucca moth, black-fly larva's suckers. An egg-eating snake's saw (vertebral hypophyses penetrating the esophagus) for opening shells is critically examined. Aristotelian idealism is the exclusive viewpoint. In protozoology interpreted by idealism, morphogenesis involves artistic design and utility. Many Foraminifera and Difflugias choose materials for their shells. The neatly arranged platelets in secreted shells have their physico-chemical basis, but even in the crystal nothing is fortuitous. "Physics raises itself in each type of atom to the specific level of that atom. It does the same in the organism." The morphological interrelations between Rhizopods and Flagellates, form changes in Suctoria, modes of fixation in Infusoria, trichocysts, nematocysts, and spontaneous recombination of cell-fragments into organic wholes, illustrate the inherent organ-forming tendency. The gastropod *Xenophora* agglutinates against its mantle edge, for disguise, stones and shells; crabs (*Oxyrhynchus,* etc.) use recurved dorsal spines to hook upon themselves algae and sponges. The instrument and instinct to use it are developed inseparably. Protective resemblances and instincts in Lepidoptera are described. The large discal "eye-spots" of *Caligo* are partly for ornament, though possibly terrifying like those of certain sphingids which are displayed warningly, with appropriate vibrations. The ambuscade of the spider simulating a bird-dropping, the terrifying serpent-like caterpillar of *Panacra* (*Chaerocampa*) *mydon,* protective resemblances in caterpillars, and imitation of flowers by mantids, are depicted. The bizarre growths upon the prothorax of membracids are disguises. "Here caprice competes with utility; and this caprice is not without its special artistry." The climax of the book is the section on leaf-like South American grasshoppers, the Pterochrozas, the elytra of which have curiously notched margins, are marked as if with patches of parasitic fungi and, both in form and color, resemble dry and withered leaves. Other highly colored grasshoppers (*Pycnopalpa*) have leaf-like wings with even contours but blotched with patches like those gnawed out by the elm-leaf beetle. These resemblances, some useful, some merely decorative, are due to the "initiative" (psychic, instinctive, physiological, morphogenic) of the insect, an unexplained internal urge. Mutations and "orthogenetic" series in the wings of *Pterochroza*-like orthoptera, and their phylogenetic changes since the Carboniferous (loss of nervure Cu A_2, present in *Archaeacridites*), and the transformations which the wing muscles of Odonata have undergone, are discussed. The types of Radiolaria are reviewed, examples of art in Protozoa. How the tentacles of Suctoria and the strange metamorphosis of *Sacculina* arose by mutation, the change of the reptile's jaw into the bird's toothless beak, reptilian scale into a feather (eventually a plume of the bird of Paradise), of the pine cone into the types of inflorescence of the higher plants, are described. Leaving physical forces and calculations to followers of Descartes, the Aristotelian constructs his world out of atoms which control their electrons and protons, of organisms which control their atoms. How such organization is effected is an unfathomable mystery. Several indices (biological, philosophical, systematic, bibliographic) are provided.—*J. H. Gerould.*

TECHNIQUE

3049. **AINSLIE, M. A.** Contribution to the discussion on the formation of the microscopical image. *Jour. Roy. Microscop. Soc.* 49: 129-131. 1929.—The Abbé theory does not give adequate explanation of dark-ground illumination. Diffraction spectra do not cease to exist with large cone illumination, hence their disappearance does not weaken the theory. The equivalence theory is not satisfactory since varying the tube length does not equally impair the definition of all details. The 2 theories are not mutually destructive, but neither explains everything.—*M. B. Garnett.*

3050. **CONN, H. J.** Progress in the standardization of stains. *Stain Tech.* 6(1): 1-2. 1931.—This note calls attention to the drawbacks of the frozen-section procedure (lack of permanency of mounts and difficulty of applying double or triple stains) and calls attention to the way these drawbacks have now been overcome.—*Author* (*courtesy Wistar Bibl. Serv.*).

3051. **ELLINGER, PHILLIPP, und AUGUST HIRT.** Eine Methode zur Beobachtung lebender Organe mit stärksten Vergrösserungen im Luminiszenzlicht (Intravitalmikroskopie). *In: Handbuch der biologischen Arbeitsmethoden. Abt. V. Methoden zum Studium der Funktionen der einzelnen Organe des tierischen Organismus. Teil 2. Heft 15. Lief. 341.* Urban & Schwarzenberg: Berlin, 1930.—The difficulties of observing living objects too thick to allow the passage of light through the tissue are such that a new method is here proposed which gives excellent results. Luminescent dyes, fluorescein (Na salt), and trypaflavin in Ringer's solution were used as vital stains which were taken up by the cells and plasma of the blood without injury to the tissues. The paper describes the apparatus for observing the tissues after the dye has been injected. The source of illumination is an arc lamp. There are filters and a cooling bath which allow a band of u. v. of 300-390 mμ to pass through. This light is reflected by a vertical illuminator in a compound microscope down through the objective onto the living tissues, and the fluorescence produced is observed through the microscope in a darkened room. Water immersion lenses of highest magnification are used. The lens is immersed in Ringer's solution kept at proper temp. and flowing. Wherever fluorescein is present a greenish luminescence is produced varying from a brilliant green on the alkaline side toward yellow on the acid side. This dye is taken up in the plasma of the blood and in the cytoplasm of the tissues. Trypaflavin penetrates the nuclei, but does not stain the blood plasma. The progress of the entrance of the dye into the cells can be watched for a number of hrs. without injury to the tissues. Colored plates of the liver and lung of the frog, stained with trypaflavin and observed in lumines-

cent light, show the nuclear elements beautifully. It is necessary to use drawings of the tissues inasmuch as the reflected light is not intense enough to take a picture in less than 1 sec. However, emulsions are being prepared sensitive to the wave length used in these experiments. A theoretical discussion is given of the physical chemical processes involved in the entrance and union of the dyes with the tissue elements.—*S. I. Kornhauser.*

3052. **FISCHER, F. P. Über eine optische Methode zur Darstellung von Gewebsoberflächen.** *Naturwiss. Zeitschr. Lotos* 77(5/12): 86-91. 1929.—A description is given of the method of "reflection-photography," which the author worked out to show the surface of the cornea and its changes in reflection picture. "Reflectography" may also be used with other tissue surfaces because it ignores similarity in the sense of a true image, and in its place uses the adequate surface image—that is the "reflected representation." There is practically no lower limit in resolving power, and the fineness of the image is only dependent on the cross-section size of the pencil of light used. Therefore the minuteness of the object also has no lower limit.—*J. E. Gullberg.*

3053. **FRENCH, R. W. Practical methods for the control of hydrogen-ion concentration in staining procedures—the use of "buffers."** *Stain Tech.* 5(3): 87-90. 1930.—Data are given for the simple preparation of dry chemical mixtures to be used in the easy preparation of buffer solutions for use in the control of stain procedures. Two of these mixtures of special value in practical staining operations are: 4.539 gm. KH_2PO_4, 5.940 gm. $Na_2HPO_4.2H_2O$ (pH=6.8); 7.262 gm. KH_2PO_4, 2.376 gm. $Na_2HPO_4.2H_2O$ (pH=7.4). H-ion control has been found necessary in order to obtain consistent results with the compound blood and tissue stains, such as Wright's and Giemsa preparations. The more general use of a predetermined pH in staining procedures is indicated; several possible methods of application are suggested.—*Author (courtesy Wistar Bibl. Serv.).*

3054. **HAUPT, ARTHUR W. A gelatin fixative for paraffin sections.** *Stain Tech.* 5(3): 97-98. 1930.—As a substitute for Mayer's albumen fixative the writer proposes one prepared as follows: Dissolve 1 gm. of gelatin in 100 cc. of distilled water at 30° C. Then add 2 gm. of phenol crystals and 15 cc. of pure glycerin. Stir well and filter. The original formula calls for 1 cc. of a 2% solution of Na-salicylate instead of the phenol, but phenol is a more satisfactory preservative, especially against the growth of molds. Only the best grade of gelatin should be used, and the temp. should not exceed 30°. Gelatin which dissolves at a higher temp. is not satisfactory. If 1-2 days are required for the gelatin to dissolve, decomposition will probably begin; and if the phenol is added too soon, the undissolved gelatin will turn white and harden.—*Author (courtesy Wistar Bibl. Serv.).*

3055. **HOLMES, W. C., and A. R. PETERSON. The analysis of neutral red and of the pyronins.** *Stain Tech.* 5(3): 91-96. 1930.—Neutral red and the pyronins cannot be evaluated by means of reduction with titanous chloride, and market supplies of the stains contain nitrogenous dye intermediates which render other chemical methods of determining dye content unreliable. Data given in the present paper will enable the analyst to obtain reliable dye-content values with samples of these dyes by means of a convenient spectrophotometric technic.—*Author (courtesy Wistar Bibl. Serv.).*

3056. **KINNEY, ETHEL MAY. A simple method for staining reticulum.** *Arch. Path. & Lab. Med.* 5(2): 283-284. 2 fig. 1928.—The tissue is cut in slices several mm. thick, placed in a 1% solution of Na sulphantimonate for 18 hrs., carried through to paraffin as usual, but not allowed to remain in the clearing agent (cedar oil or xylene) for more than 1-2 hrs. The fixer stains the reticulum a dark brown and other tissue yellow. It is stable in 70% alcohol and is unaffected by subsequent staining with hematoxylin or eosin.—*C. A. Kofoid.*

3057. **KORNHAUSER, S. I. Hematein—its advantages for general laboratory usage.** *Stain Tech.* 5(1): 13-15. 1930.—The advantages of hematein over hematoxylin are that it is easy to prepare, easy to use, and saves time, while it gives equally good results. The writer has been employing for some time a prewar imported hematein, and until within the last few mo. has been unable to locate a satisfactory product of recent manufacture, either domestic or foreign. At the request of the Biological Stain Commission, however, an American manufacturer has at last put on the market a C.P. hematein which gives splendid results. The technic is as follows: Paraffin or celloidin sections of Bouin or Zenker-formol material are run down to water and stained about 5 min. in Mayer's hemalum (0.5 gm. hematein ground up in a glass mortar with 10 cc. 95% alcohol and added to 500 cc. of 5% aqueous solution K alum). Rinse 1-3 sec. in tap-water. Dip 1-3 sec. in eosin B (1 part 0.5% solution in 20% alcohol added to 2 parts distilled water; filtered from time to time). Wash several min. in running water or in several changes of tap-water. Dehydrate and mount; with unattached celloidin sections this may be done by running up to 95% alcohol, spreading on slide, blotting, wetting with absolute alcohol, draining, and mounting in euparal.—*Author (courtesy Wistar Bibl. Serv.).*

3058. **LA CORTE, J. G. Influence of pH dans les colorations par la méthode de Giemsa.** *Compt. Rend. Soc. Biol.* 98: 1579-1580. 1929.—Distilled water for diluting Giemsa staining solution was buffered with enough NaH_2PO_4 to obtain a pH range of 6.6-7.8. For staining, 1 drop of Giemsa solution was added to 1 cc. of the buffer solutions. Blood smears of guinea-pig experimentally infected with *Trypanosoma gambiense* were stained with these solutions 0.5-24 hrs. Optimum staining was obtained with solutions at pH 7.4 for 1 hr. With solutions at pH 6.6, 6.8, and 7.2 a reddish staining was obtained and differentiation was poor. With solutions at pH 7.6 and 7.8 the color was too blue.—*Author (courtesy Wistar Bibl. Serv.).*

3059. **MARTIN, L. C. The theory of the microscope.** *Phys. Soc. [London] Proc.* 43(2): 186-211. 13 fig. 1931.—Purely physical.

3060. **MILLER, E. G. Frozen section technique.** *Jour. Roy. Microsc. Soc.* 50(3): 302-306. 1 fig. 1930.—Author fixes in 40% formaldehyde up to 20 min. and cuts on CO_2 microtome. Slides are coated with 2% solution of "Gold Label" sheet gelatin at 60° C., applied as for making blood smears, and dried on end 15 min. Sections are mounted and pressed flat by cigarette paper method. For general work stain in Ehrlich's hematoxylin + eosin 0.2% aq. sol.; for rapid diagnosis, Hollande-chrome-carmine-iron; for fat, Hollande method + sudan III and mount in glycerin jelly. After vital staining in trypan blue, stain in neutral red 30 sec., wash rapidly in aq. dist. and abs. alcohol. For tubercle bacilli carbol fuchsin at 50° C.—*C. A. Gunns.*

3061. **RACOVITZA, EMILE G. Photothèque à classement vertical. Essai pour trouver une méthode rationelle et pratique de conservation, de manipulation et de classement des collections de clichés et de documents photographiques. [Practical method of storing and classifying collections of slides and photographs.]** *Bul. Soc. Ştiinţe Cluj [Rumania]* 5(Fasc. 3, Part 2): 73-114. 1 pl., 12 fig. 1930.

3062. **RHAMY, B. W. Quick celloidin method for preparing tissues.** *Arch. Path. & Lab. Med.* 5(2): 282. 1928.—The preparation of celloidin sections can be completed in 48 hrs. as follows: fixation in 10% formalin for 10 min.; acetone (20 times volume of tissue) ½-2 hrs., 2 changes; absolute alcohol-acetone-ether equal parts, ½-2 hrs.; thick celloidin 24 hrs. Mount and harden in full strength denatured alcohol.—*C. A. Kofoid.*

3063. **RHEINBERG, JULIUS. The mode of formation of the image in the microscope.** *Jour. Roy. Microsc. Soc.* 49: 132-142. 1929.—The Abbé theory and the Airy theory and its variants do not in any way conflict since the former deals with objects so illuminated as to lack self-luminosity to the maximum extent, and the latter deals with self-luminous objects. A gradual but strictly limited

approach toward self-luminosity is presented by the structural elements of objects according to the way they may be illuminated. All cases can be most conveniently dealt with by the Abbé theory. The chief objections to the Abbé theory are discussed, and suggestions are made to account for the effects of dark-ground illumination held to be at variance with that theory.—*M. B. Garnett.*

3064. **STEARN, ALLEN E., and ESTHER WAGNER STEARN. The mechanism of staining explained on a chemical basis. II. General presentation.** *Stain Tech.* 5(1): 17-24. 1930.—At present the division of the factors influencing staining into those supporting a chemical mechanism or those supporting what is known as "adsorption" mechanism is questioned because the latter term cannot be definitely defined from general usage. In this paper the nature of adsorption is discussed. Data indicating definitely a chemical mechanism are not directly considered; but in many cases often cited by other writers as necessitating a non-chemical mechanism, the validity of such mechanism is questioned.—*Author (courtesy Wistar Bibl. Serv.).*

3065. **TUAN, HUS-CHUAN. Picric acid as a destaining agent for iron alum hematoxylin.** *Stain Tech.* 5(4): 135-138. 1930.—A saturated aqueous solution of picric acid is used to differentiate paraffin sections and smeared pollen mother cells stained in Heidenhain's and Delafield's hematoxylins. The method proceeds as usual, except that the iron alum in the destaining process is replaced by picric acid. Mixtures of picrosulphuric acid and dilute Delafield's hematoxylin and mixtures of picric acid and aqueous hematoxylin have also been tested; the latter yields the better result, but is not so good as the other method described here.—*Author (courtesy Wistar Bibl. Serv.).*

3066. **VOIGT, MAX. Das Mikroskop im Dienste des biologischen Unterrichts. Ein Handbuch für Lehrer aller Schulgattungen, für Schülerübungen und für Liebhaber mikroskopischer Arbeit. Teil C, "Praxis der Naturkunde."** [3rd, fully rev. and enlarged ed.] viii+528p. 1 pl. 184 fig. *Dieterich'sche Verlagsbuchh.: Leipzig, 1929.* Pr. 14 M.—There are sections devoted to the structure of the microscope, to its selection for different purposes, to the uses of its various parts, and to the methods of illumination. Suggestions for equipping the workroom and desk, and also for carrying out the various general techniques required in microscopic anatomy are given. These sections occupy 256p. There follows a series of special techniques dealing with fungi, algae, liverworts, ferns, and flowering plants. Methods for studying the living cell, protoplasmic inclusions, and different plant organs close this part (83p.) In 108p. are directions for the study of Protozoa and various classes of invertebrates and vertebrates, including specialized methods for various tissues and organs. Finally there are directions for drawing, measuring, and photographing microscopic structures. There are bibliographic references and an index.—*C. E. McClung.*

3067. **YASUZUMI, G. Über das Fixierungsmittel. 2. Mitteilung. Diffusionsbeobachtung der Fixierungsmittel in Gelen nach Kohlrausch'scher Widerstandsbeobachtungsmethode.** *Folia Anat. Japonica* 8(2): 173-188. 9 fig. 1930.—Fixation of a cell causes diffusion of the fixing solution. Observations on conditions of diffusion, therefore, are very important in a study of fixing solutions. When the fixing solution used is that of electrolytes, the electric resistance rises together with diffusion in the remaining solution. The conclusions from this study are: With a definite concentration, diffusion of the fixing solution in gels and the exudation of protein, salts, and other things from gels are regular. The loss of substance by fixation with a sublimate solution can be represented by the following equation: $C-R=aT^b$. (C, electric resistance before diffusion; R, electric resistance; T, time (in minutes); a and b are constants.) The exudation curve by which the electrolytes go out of the gels in the upper layer of distilled water can be represented thus: $R=aT^{-b}$. The diffusion phenomena of a saturated picric-acid solution run parallel to the time: $R=a+bT$. The diffusion of a 3.44% solution of $K_2Cr_2O_7$ can be represented by the equation $R=C+T/(a+bT)$. The structure or constitution of any tissue is greatly modified by fixation.—*Author (courtesy Wistar Bibl. Serv.).*

3074. **BOUIN, P. Auguste Prenant (1861-1927).** *Arch. Anat. Microscop.* 26(1): 1-42. Portrait. 1930.—A sketch of Prenant's life and a review and bibliography of his work, which lay chiefly in the fields of vertebrate embryology, histology, and cytology.

3075. **BRIERLEY, WM. B. Science of the year—1929. The biological sciences.** *Ann. Register, Rothamsted Exp. Station.* 7p. 1929.

3076. **BRUCH, CARLOS. La obra entomológica del Rev. P. Erich Wasmann. [The entomological work of P. E. Wasmann.]** *Rev. Soc. Ent. Argentina* 2(5): 283-285. Portrait. 1929.—An appreciation of this German entomologist upon the occasion of his 70th birthday.

3077. **C[ABRERA], A. Elogio de Thomas [1859-1929].** *Physis [Buenos Aires]* 10(35): 215-216. 1930.—A tribute to the distinguished British mammalogist, Oldfield Thomas.

3078. **CALVERT, P. P. Dr. George Dimmock [1853-1930].** *Ent. News* 41(8): 280. 1930.

3079. **CALVERT, PHILIP P. Ezra Townsend Cresson. A contribution to the history of entomology in North America. With estimates of Cresson's work on the**

Hymenoptera, by H. T. FERNALD, S. A. ROHWER, L. O. HOWARD, H. L. VIERECK, T. D. A. COCKERELL, and J. C. BRADLEY. *Trans. Amer. Ent. Soc.* 52(Suppl.): i-lxiii. Portrait. 1928.—Cresson was born in Philadelphia, 1838, and died at Swarthmore, Pennsylvania, 1926. He was one of the founders, on February 22, 1859, of the Ent. Soc. of Philadelphia, whose name was changed, in 1867, to that of the American Ent. Soc. After an attempt, unsuccessful on account of financial straits, to act as curator of the society, he became connected with the Franklin Insurance Co. of Philadelphia in 1869 and was secretary thereof from 1878 to 1910. His continued interest in the Ent. Soc. is shown by the facts that he edited its Transactions from 1867 to 1913 and served as treasurer from 1874 to 1924. He was the author of 72 papers on insects, 70 of which deal with the taxonomy of the Hymenoptera and describe 2737 sp. as new. His most important work is the "Synopsis of the families and genera of the Hymenoptera of America north of Mexico together with a catalogue of the described species and bibliography," published in 1887. He formed a collection of 87,775 specimens of this order, representing 3511 sp., which he presented in 1901 to The Amer. Ent. Soc. Many hitherto unpublished letters of Cresson to other entomologists are contained in this biography.—*P. P. Calvert.*

3080. CHAPMAN, FRANK M. Joel Asaph Allen. [1838-1921.] *Jour. Mammalogy* 11(2): 105-117. Portrait. 1930.—Biography of this American mammalogist and ornithologist.

3081. CHMELAŘ, F. Životaí dílo prof. B. Erbena v pěstování rostlin. (K 70. ranozeninám dne 9. března 1931.) [Work of Bohdan Erben in plant culture.] *Věstník Československ. Akad. Zem.* 7(3): 237-238. 1931.—Biographical sketch of Erben on his 70th birthday.

3082. COLOSI, G. L'attività scientifica della stazione zoologica di Napoli durante l'ultimo quinquennio (1925-1929). [Scientific activity of the Naples zoological station 1925-1929.] *L'Universo* 11(12): 1237-1251. 7 fig. 1930.

3083. CUATRECASAS, J. En Romualdo González Fragoso [1862-1928]. *Bul. Inst. Catalana Hist. Nat.* 9 (1/2): 49-51. 1929.—This Spanish botanist, director of the section of Botany of the Museo Nacional in Madrid, worked particularly in mycology. Some of his publications are listed.

3084. DALLAS, E. D. Biografía de Félix Lynch Arribálzaga. *Rev. Soc. Ent. Argentina* 2(1): 5-10. Portrait. 1928.—Note of appreciation of this South American entomologist (1854-1894) upon the occasion of the establishing of a prize in his honor. A list of his 15 publications is given.

3085. DALLAS, E. D. Dr. Juan Brèthes [1871-1928]. *Rev. Soc. Ent. Argentina* 2(2): 103-107. Portrait. 1928.—An appreciation of this French born entomologist of the Mus. Nacional de Hist. Nat., Buenos Aires. He described more than 1100 new sp., and his published works number 220.

3086. DALLAS, E. D. Arturo G. Frers [1900-1925]. *Rev. Soc. Ent. Argentina* 2(5): 289-292. Portrait. 1929.—Appreciation of this entomologist, with a list of his 15 publications.

3087. DAMPIER-WHETHAM, WILLLIAM CECIL DAMPIER. A history of science and its relations with philosophy and religion. 514p. Macmillan Company: New York; University Press: Cambridge, England, 1929. Pr. $4.—Evidently first printed in England in 1929, revised and reprinted in America 1930 and 1931. While primarily a history of scientific thought in the exact sciences and its interaction on religion and philosophy, the contributions of biological thought, especially from the medical fields, are briefly but thoroughly summarized for each epoch. The contributions of biology and allied sciences in the 19th and 20th centuries are much more fully treated, especially the fields of evolution and anthropology. The work concludes with a survey of modern philosophical trends, many of them intimately connected with biological thought.—*C. W. Dodge.*

3088. FORBES, A. C. Augustine Henry: an obituary sketch. *Empire Forestry Jour.* 9(1): 129-131. 1930.—This late prof. of forestry in the Royal College of Science, Dublin, 1857-1930, published numerous papers on botanical as well as forestry subjects.—*A. P. Kelley.*

3089. FREY, R. Irmer Forsius [1892-1930]. *Notulae Entomologicae* [*Helsingfors*] 10(4): 105-106. Portrait. 1930.—Brief note on the death of this Finnish naturalist, forester by profession.

3090. FROGGATT, W. W. John Brazier [1842-1930]. *Australian Nat.* 8(4): 87. 1930.—Author of many papers on conchology, and former conchologist of the Australian Museum.

3091. GAGER, C. STUART. Report on a European trip of the Director. *Brooklyn Bot. Gard. Rec.* 20(1): 1-24. 6 fig. 1931.—This contains historical matter on various botanic and other gardens in Italy, Switzerland, France, and England; references to the 9th Internat. Hort. Congress, London, and the 5th Internat. Bot. Congress, Cambridge (England); and an account of the unveiling of the tablet to Sir Joseph Hooker in St. Mary's Church, Halesworth (his birthplace).—*C. S. Gager.*

3092. GINZBURG, BENJAMIN. The adventure of science. 487p., 8 portraits. Simon and Schuster, New York, 1930. Pr. $5.—This work presents biographies of a score of scientists, of which Aristotle, Harvey, Lamarck, Darwin, Pasteur and Mendel are of especial interest to the biologist. Following the biography is a summary of the scientific work with an attempt to trace its influence on subsequent thought.—*C. W. Dodge.*

3093. GOODEY, T. J. G. de Man (1850-1930). *Jour. Helminthol.* 8(2): 65-68. 1930.—Obituary and bibliography.

3094. GULLAND, G. LOVELL. The circulating fluid. *Edinburgh Med. Jour.* 37(10): 569-581. 1930.—A review of the history of the development of the modern conceptions of the blood, and an outline of the problems remaining for solution.

3095. HANKE, V. Ernst Fuchs [1850-1930]. *Wien. Med. Wochenschr.* 80(49): 1575-1576. Portrait. 1930.—Fuchs was a great anatomical pathologist and teacher, interested especially in the eye, among whose outstanding works were those on sarcoma of the uveal tract, septic endophthalmitis, and sympathetic ophthalmia.

3096. HERVÉ, GEORGES. John Hunter [1728-1793] et ses travaux de génétique. *Bull. Soc. Franç. Hist. Méd.* 24(7/8): 229-238. 1930.—Discusses Hunter's theories on the phenomenon of the free-martin; ♂ secondary sexual characters in the ♀ pheasant; and the relationship of the wolf, jackal, and dog.

3097. HORN, WALTHER. Otto Leonhard (†27. März 1929 in Dresden-Blasewitz)—ein letzter Gruss und ein letzter Dank! *Ent. Blätter* 25(3): 113-118. Portrait. 1929.—An appreciation of this German coleopterist.

3098. ILTIS, HUGO. Charles Naudin. *Der Züchter* 1 (8): 248-250. 1929.

3099. IREDALE, TOM. John Brazier, conchologist [1842-1930]. *Australian Mus. Mag.* 4: 142-143. Portrait. 1930.—Brazier was an experienced collector in Australia and the South Seas, and published a number of papers on Mollusca.

3100. JESPERSEN, P. Dänische ozeanographische Expedition um die Erde 1928-1930. *Naturwiss.* 19(10): 231-233. Map. 1931.—Itinerary.

3101. JURADO, MARTÍN DOELLO. 75° aniversario del natalicio de Florentino Ameghino. [75th anniversary of the birth of F. Ameghino.] *Physis* [*Buenos Aires*] 10(35): 210-213. 1930.—A eulogy.

3102. KANAMARU, T. A history of Japanese conchology (5). [In Japanese.] *The Venus* [*Japan*] 2(4): 185-190. 1931.

3103. K[LOSS], C. B. Herbert Christopher Robinson 1874-1929. *Jour. Fed. Malay States Mus.* 16(1/2): 1-12. 1930.—This British zoologist, formerly Director of Museums, Federated Malay States, specialized in birds and mammals, but also published papers on other

branches of zoölogy and on anthropology. A bibliography of about 150 titles is appended.

3104. KOPPERS, WILHELM. Das Problem der Entstehung der Tierzucht. *Schrift. Ver. Verbreit. Naturwiss. Kenntnisse Wien* 69: 31-68. 1928/1929.—Animal breeding is an expression of the performance of a definite cultural cycle, and is therefore a definite achievement in human history. The home of this nomadic culture originally included the early Samoyedic and the early Turko-Tartaric societies, which indicates that there at least originated the motives and impulses for the domestication of the various farm animals. The dog is perhaps the only exception for, although he is today represented everywhere in primitive society, his dissemination shows such gaps (originally he was not found on the islands of Adaman and Tasmania) that his domestication can not be ascribed to the very early periods. However, breeding the dog did not carry with it such an important change in the social and economic community life as was the case in the utilization of the reindeer and later of the horse in Arctic-Baltic cultural regions. The breeding of cattle occurred in more highly developed, "tertiary," matronymic, society which had its home in the regions of southern and central Asia. In agreement with the findings of the older social history it has been determined that the domestic swine belongs to matronymic society. Breeding the mule is essentially only a substitute for breeding horses. The emergence of nomadic society into conditions of classic culture brought about a period of very advanced development of social and economic division of mankind, the beginning of real feudalism. Thus the investigation of the problem of animal husbandry leads to the actual and authoritative laboratory of the history of human culture.—*W. Koppers* (*transl. by A. H. Kuhlman*).

3105. KORSCHEFSKY, R. Die entomologischen Publikationen von Julius Weise. *Ent. Blätter* 24(4): 175-186. 1928.—A chronological list of the 449 publications, extending from 1872 to 1926, of this specialist on Coccinellidae and Chrysomelidae, who died in 1925, age 81 yrs.—*M. H. Hatch.*

3106. KOULE, LOUIS. Lamarck et l'interprétation de la nature. 245p. Ernest Flammarion: Paris, 1930(?).

3107. K[RAGLIEVICH], L. Santiago Pozzi [1859?-1829]. *Physis* [*Buenos Aires*] 10(35): 213-215. 1930.—A paleontological collector and preparator from Argentina.

3108. LAMEERE, AUG. L'année zoologique. 1.—1927. *Recueil Inst. Zool. Torley-Rousseau* [*Bruxelles*] 1(2): 179-234. 21 fig. 1928.—This is an extensive, critical review of zoological works published in 1927, particularly those dealing with natural history, or matters of phylogenetic and evolutionary interest. The works discussed are arranged by animal groups, from Protozoa to Vertebrata.

3109. LIU, J. C. Important bibliography on the taxonomy of Chinese plants. *Bull. Dept. Biol. Yenching Univ.* [*Peping*] 1(2): 17-32. 1930.—A list of books and serials that deal systematically with descriptions and discussions of Chinese plants.

3110. MORELAND, W. H. The agrarian system of Moslem India. An historical essay with appendices. 296p. W. Heffer & Sons: Cambridge, 1929. Pr. 15s.—Chapter 1 deals with the antecedents of the Moslem Agrarian System and its relation to the Hindu Sacred Law. Succeeding chapters discuss the 13th and 14th centuries, the Sayyid and Afghan Dynasties, the Reign of Akbar, and the 17th century. The body of the work closes with a consideration of Northern India, the Deccan, and Bengal. Extensive appendices explain the technical terms employed, amplify points mentioned in the body of the book, and give the list of authorities cited. —*R. H. True.*

3111. NEUBURGER, MAX. Oldest investigations on origin of dropsy. *Med. Rev. of Rev.* [*New York*] 36 (8): 497-501. 1930.—A review of the experimental work of Richard Lower (1631-91) in investigating the etiology of stasis edema, and of Stephen Hales (1677-1761) on hydremic or cachectic edema.

3112. NEWELL, WILMON. Comments on entomology in the South during the past twenty-five years. *Jour. Econ. Ent.* 22(5): 732-735. 1929.—Accounts of the early boll weevil investigations of W. D. Hunter, H. A. Morgan, and others; of Argentine ant studies by Foster and Biever; and of the whitefly work of Gossard and H. J. Webber are the chief points touched upon. Recent work, especially from the standpoint of entomological organizations, in the South (U. S. A.) is also mentioned.

3113. NITSCHE, J. Josef Franz Berger [1860-1928]. *Zeitschr. Österr. Ent.-Ver.* 14(1): 2-3. Portrait. 1929.—Brief account of the activities of this German entomologist, Principal of one of the public schools for boys of Vienna, and President, since 1916, of the Austrian Ent. Soc.

3114. NITSCHE, J. Robert Zusanek [1895-1929]. *Zeitschr. Österr. Ent.-Ver.* 14(7): 69-70. Portrait. 1929.—This Austrian, a teacher in a public school in Vienna, was specially interested in the Brephidae and contributed to the literature on Lepidoptera through this journal.

3115. O., E. Albert Jesionek. *Brit. Jour. Actinotherapy* 5(7): 152-153. Portrait. 1930.—Albert Jesionek (born 1870) is known as the propounder of the theory that the healing effect of light on the body is due to entrance into the circulation of substances produced by epidermal absorption of light, which are then carried to tuberculous foci by the lymph stream—the most likely substance of this kind being the melanotic pigment.

3116. OCHS, GEORG. Nachruf. [Obituary notice of Hermann Bücking.] *Ent. Blätter* 24(3): 97-98. Portrait. 1928.—This German coleopterist and dye manufacturer died in 1928, aged 73 yrs. His collection of 150 boxes is deposited in the Nat. Hist. Mus. at Mainz. He prepared a supplement of Heyden's "Die Käfer von Nassau und Frankfurt" to be published in this journal.—*M. H. Hatch.*

3117. OLIVER, WADE W. (foreword by THEOBALD SMITH). Stalkers of pestilence. The story of man's ideas of infection. P. B. Hoeber: New York, 1930.

3118. PIGHINI, GIACOMO (preface by GUGLIELMO BILANCIONI). Viaggi ed escursioni scientifiche di Lazzaro Spallanzani (con documenti inediti ed illustrazioni). [Travels and scientific excursions of Spallanzani (with unpublished documents and illustrations).] 441p., frontispiece, 25 fig. L. Cappelli: Bologna, 1929. Pr. 40 L.—This book contains accounts of the travels of this famous Italian naturalist from 1761 to 1792 in central and southern Europe. An account is given also of the Spallanzani Museum in Reggio Emilia. His accounts of the marine life of Italian coasts are reviewed. A bibliography dealing with his life and scientific work contains 82 titles.—*C. A. Kofoid.*

3119. PITFIELD, ROBERT LUCAS. Sir Ronald Ross: the man who flunked and became famous. *Med. Life* 37(5): 246-268. Portrait, 5 pl. 1930.—An account of Ross's early life and the story of his discovery of the malarial plasmodium in the stomach of the ♀ *Anopheles,* with reproduction of the page from his notebook on the day of discovery, Aug. 20, 1897.

3120. POTIER de la VARDE, R. Max Fleischer (1861-1930). *Ann. Cryptogamie Exotique* 3(4): 161-167. *Portrait.* 1930.—An account of the life and work of this Upper Silesian bryologist, with a list of his publications.

3121. PRENDERGAST, J. S. The background of Galen's life and activities and its influence on his achievements. *Proc. Roy. Soc. Med.* 23(8): 1131-1148. 1930.

3122. RAPP, OTTO. Franz Maass†. *Ent. Blätter* 26 (1): 1-4. Portrait. 1930.—This Thüringian coleopterist and railway engineer, b. Oschersleben 1850, resided since 1890 in Erfurt, where he died 1930. A list is given of 65 sp. of Coleoptera taken first by him in Thüringia.—*M. H. Hatch.*

3123. REICHENSPERGER, A. [Erich Wasmann, 1859-1931.] *Zool. Anzeiger* 93(11/12): 336. 1931.—Brief notice of this well-known myrmecologist.

3124. RENKEMA, H. W., and JOHN ARDAGH. Aylmet

Bourke Lambert and his "Description of the genus Pinus." *Jour. Linn. Soc. London, Bot.* 48(324): 439-466. 1930.—A detailed description of the various editions of this work (1803-1842), with lists of contents; also biographical notes on Lambert, a bibliography of his other works, and extracts from his correspondence.

3125. **ROSENFELD, ARTHUR H.** La estación experimental de la industria azucarera de Java. [The sugar experiment station of Java.] *Bol. Unión Panamericana* 64(10): 1054-1068. 1930.—History, organization and administration, personnel, publications, services rendered, and résumé of work done.

3126. **ROWSWELL, BASIL T.** Joseph Sinel [1844-1929]. *Soc. Guernesiaise Rept. and Trans.* 10(4): 369-371. 1931.—A well-known naturalist of the Channel Islands and author of works on the local fauna.

3127. **[RUTHERFORD, ERNEST.]** Address of the president, at the anniversary meeting, December 1, 1930. *Proc. Roy. Soc.* [*London*] *B* 107(752): 348-368. 1931. Also in *Proc. Roy. Soc. A* 130(813): 239-259. 1931.—The address contains brief obituary statements and appreciations of the Earl of Balfour (1848-1930); Edwin Tulley Newton (1840-1930), British palaeontologist; William Diller Matthew, Prof. of Palaeontology (1871-1930), in the Univ. of California; and many other scientists [not biologists]. There is also a review of the research and program of the Royal Society since the World War.

3128. **S., A.** Franz Perneder [1865-1928]. *Zeitschr. Österr. Ent.-Verein.* 13(6): 57-58. 1928.—Obituary of this Austrian entomologist.

3129. **SANCTIS, S. de.** Commemorazione di Giovanni Mingazzini. *Bull. e Atti R. Accad. Med. Roma* 56(6/7): 161-167. 1930.—Mingazzini's great work was devoted to various phases of the pathologic anatomy of the nervous centers. He was born in 1859.

3130. **SANTESSON, C. G.** Carl Tigerstedt (1882-1930). *Skand. Arch. Physiol.* 61(1/3): 20-22. Portrait. 1931.—Of the Univ. of Helsingfors.

3131. **SCHUCHERT, CHARLES.** William Diller Matthew, February 19, 1871–September 24, 1930. *Amer. Jour. Sci.* 20(120): 483-484. 1930.—Matthew was one of the 3 foremost American workers in vertebrate paleontology. The majority of his more than 200 publications deal with Cenozoic mammals. His paper on "Climate and evolution" was especially noteworthy. He had been a member of the staff of the American Museum of Nat. Hist. for 32 yrs., and had held the chair of paleontology at the Univ. of California since 1927.

3132. **SCHW[APPACH].** Dr. phil. et Dr. hon. c. Max Kienitz. *Deutsche Forstztg.* 46(25): 618-619. Portrait. 1931.—This distinguished forestry educator (1849-1931) specialized in physiological studies, including investigations of the significance of source of seed, and the production of turpentine and rosin from German trees.—*W. N. Sparhawk.*

3133. **SERGENT, ÉMILE.** Laënnec, clinicien et médecin. [1781-1831.] *Rev. Gén. Sci. Pures et Appl.* 42(6): 169-177. 1931.—An appreciation of the distinguished French pathologist and anatomist.

3134. **SEURAT, L. G.** Exploration zoologique de l'Algérie, de 1830 à 1930. 708p. illus. Masson et Cie: Paris, 1930.—This historical summary is arranged according to animal groups, with complete bibliography and a list of all zoologists and explorers who have contributed to the knowledge of the fauna of Algeria.—*L. G. Seurat* (*transl. by A. O. Weese*).

3135. **STORCH, T. C. von.** An essay on the history of epilepsy. *Ann. Med. Hist.* 2(6): 614-650. 1930.

3136. **STRELNIKOV, I. D.** The expedition of G. I. Langsdorff to Brazil in 1821-1829. *Proc. 23rd. Internat. Congress Americanists* (*New York*) 1928: 751-759. Portrait. 1930.—The expedition (1821-1829) studied the botany, zoology, ethnography, etc. of Brazil, and apparently made rich collections; but because of the illness and subsequent mental derangement of the leader, most of the records and collections were lost. Itinerary of the expedition is given in part, and the biography of Langsdorff (1774-1852), with a brief account of the parts of his records that are extant.

3137. **THUNBERG, T. Hjalmar Öhrvale (1851-1929).** *Skand. Arch. Physiol.* 61(1/3): 1-19. Portrait. 1931.—Biography of the 2nd occupant of the chair of physiology at Upsala, including bibliography of his most important works.

3138. **TRAUB, HAMILTON.** Tendencies in the development of American horticultural associations, 1800-1850. II. *Nation. Hort. Mag.* [*Washington, D. C.*] 9(3): 134-140. 1930.

3139. **TULLI, A.** Un altro contributo agli studi sulla mummificazione degli antichi Egiziani: analisi chimica de una mummia vaticana. [Mummification of ancient Egyptians; chemical analysis of a Vatican mummy.] *Atti R. Accad. Naz. Lincei Rend. Cl. Sci. Fis. Mat. e Nat.* 9(12): 1111-1114. 1929.—Chemical tests indicate that this mummy had been preserved by styrax and other balsams rather than by inorganic compounds.—*G. A. Bica and T. T. Job.*

3140. **T[URNER], HY. J.** Obituaries: E. A. Atmore (1855-1930); Selwyn Image (1849-1930); G. T. Lyle (1873-1930). *Ent. Rec. Jour. Var.* 42(11): 160. 1930.

3141. **VELICH, ALOIS.** Prof. Dr. Otakar Srdínko život a činy. [Life and work of Otakar Srdínko.] *Věstník Československ. Akad. Zem.* 7(3): 225-236. 8 portraits. 1931.—Biographical sketch and bibliography of this Czechoslovakian histologist and embryologist (1875-1930).

3142. **VIDAL, CHARLES.** Quelques mots sur P. Borel, Médecin du Roi en Languedoc. *Bull. Soc. Franç. Hist. Méd.* 24(5/6): 155-169. 1930.—Pierre Borel (1620-1689) was learned in the natural science of his day, as well as a physician.

3143. **W., D. M. S.** Hans Friedrich Gadow—1855-1928. *Proc. Roy. Soc.* [*London*] *B* 107(750): i-iii. Portrait. 1930.—Born in Germany, Gadow joined the staff of the Zoological Dept., British Mus. (1880), later becoming Strickland Curator of Birds in the Univ. Mus. Zoology, Cambridge [England] and still later lecturer in vertebrate morphology in Cambridge. A disciple of Gegenbaur, he is known chiefly for his studies on the anatomy of birds, the comparative morphology of the vertebral column of the vertebrates, and similar studies.

3144. **W., T. S.** Foramen of Winslow [1669-1760]. *Amer. Jour. Surg.* 11(1): 133. Portrait. 1931.—Jakob Benignus Winslow, a Dane educated in the Netherlands and France, demonstrated the communications of the foramen now bearing his name. He is also an eponym of other organs (Winslow's ligamist and Winslow's stars). He is credited with having been the first to use the term "omentum" in its present sense and also did much to systematize the anatomic knowledge of his day.

3145. **WONG, K. CHIMIN.** The early history of leprosy in China. *China Med. Jour.* 44(8): 737-743. 1930.—Traces the references to leprosy in Chinese literature back to the 6th century B.C., the time of Confucius.

3146. **ZINSSER, HANS.** The award of the Nobel Prize in medicine to Dr. Karl Landsteiner. *Sci. Monthly* 32(1): 93-96. Portrait. 1931.

3147. **ANONYMOUS.** Commémoration du centenaire de la naissance d'Ollier [1830-1901]. *Lyon Méd.* 146(49): 693-732. 2 portraits; (50): 733-757. 1930.—A collection of short papers of appreciation of Leopold Ollier's work, by various authors, with a biography of the life of this noted surgeon, botanist, and embryologist of Montpellier, who was particularly interested in microscopic anatomy.

3148. **ANONYMOUS.** Die Liste der Entomologen die sich bis zum 1. Mai 1930 als Mitglieder der Internationalen Vereinigung der Ipidologen angemeldet haben. [List of entomologists who have enrolled as members of the Internat. Soc. of Ipidologists previous to May 1, 1930.] *Ent. Blätter* 26(2): 92-94. 1930.—54 names and addresses.

3149. **ANONYMOUS.** Waldemar Mordecai Wolff Haffkine, C. I. E. (R. R.) [-1930.] *Science Progr.* [*London*] 25(99): 498-499. 1931.—Attention is called to Haffkine's discovery of vaccines against cholera and plague, in India, in 1893 and 1896, and to his subsequent troubles due to careless preparation, by others, of a quantity of

one of these vaccines. The author pleads for full publicity of the facts to clear Haffkine's reputation from unjust charges based on this incident.

EVOLUTION

(See also in this issue Entries 3001, 3005, 3011, 3017, 3038, 3044, 3106, 3108, 3234, 3305, 3326, 3910, 5275, 5853)

3158. **CUNNINGHAM, J. T.** Adaptive evolution, with special reference to metamorphosis and sex-limited characters. *Proc. Linn. Soc. London* 142: 165-186. 1929/30 (1931).—Nothing which has been discovered with regard to genetics and mutation, together with the process of selection, explains the evolution of metamorphosis and recapitulation, and the fact that metamorphosis in structure corresponds to a change of adaptation to external conditions, as in the case of the frog. Still less does the theory of mutation explain the influence of thyroid secretion on metamorphosis and development. There is no evidence of a new mutation dependent on the thyroid gland. In sex-limited characters, like the antlers of stags, absence or inferiority in the ♀ are known to depend on the influence of hormones from the gonads. No mutation having such a relation to the sexual hormones has been observed. All these phenomena can be explained on the hypothesis that the structures concerned are the effect of external stimuli on local growth occurring when the particular hormones were present, and that the gametes have been modified by the tissue-hormones produced by the local growth.—*J. T. Cunningham.*

3159. **HOOTON, ERNEST ALBERT.** Up from the ape. 626p. 28 pl. 58 fig. Macmillan Co.: New York, 1931. Pr. $5.—The book is composed of material used in lectures for an undergraduate class and is written in non-technical language and rather informal vein. Part I (41p.) entitled "Man's relations" gives the characters of mammals and descriptions of various primates, indicating the probable taxonomic and serologic relationships. Part II (161p.) "The primate life cycle," is phylogenetic and deals with the evolution of man, first the paleontological evidence, then that from comparative anatomy, citing various theories of the invertebrate progenitor (segmented worm, *Nemertean, Limulus*). The course of man's evolution is traced in considerable detail through the quadrupeds, especially the anthropoids. Part III (82p.) "The individual life cycle," treats of the reproductive organs, embryology, growth, puberty changes, sex differences and mating. Part IV (105p.) "Fossil ancestors," describes the history of the hominid fossils, their discovery, interpretation and importance. Part V (211p.) is entitled "Contemporary races: what they are; how they developed; their evolutionary meaning." A bibliography of 81 titles is given, with an index of authorities cited, together with an alphabetic subject index.

3160. **KOCH, F.** Ursprung und Verbreitung des Menschengeschlechts. Eine Neubegründung des Darwinismus auf Grund der Polwanderungen und im Anschluss an die Theorie Wegeners. [Origin and distribution of the human race. A new foundation of Darwinism, on the ground of polar migrations in relation to Wegener's theory.] 174p. 14 maps. 42 figs. Gustav Fischer: Jena, 1929. Pr. 13 M.

3161. **MacBRIDE, E. W.** Habit: the driving factor in evolution. *Nature* [*London*] 127(3216): 933-944. 3 fig. 1931.—There are 3 sources of proof of evolution. In wide ranging species the members of which do not wander about much, the species are divisible into local races; but in spp. whose migrants intermingle, races are not formed. If the minute differences between races are the first steps in secular evolution, they demonstrate that habit is the driving force of evolution. The 2nd type of evidence is derivable from fossils especially where the various modifications are found in successive strata in the same series of deposits. As an example the author cites the modifications which have taken place in *Micraster* from *M. cor-bovis** to *M. praecursor**, *M. cortestudinarium**, *M. cor-anguinum**, and the modern *Echinocardium**. The 3rd type of evidence is in the recapitulation of the history of the race seen in the life-history of the individual. The author cites numerous cases of transmission of acquired characteristics, especially of habits, secondarily of characters.

3162. **PHILLIPS, JOHN.** Mortality among plants and its bearing on natural selection. *Nature* [*London*] 127 (3214): 851-852. 1931.—Studies of plant mortality in East Africa indicate that mortality is greatest in flowers, fruits and young regeneration. A study of the principal biological features of 63 more important spp. shows the following factors to be primarily responsible for high mortality: inherent low degree of fertility in flowers and fruit; defeat in competition for pollination; irregular occurrence of flowering and fruiting seasons; low capacity for germules to lie dormant; unsuitable aerial and edaphic conditions; insects and fungi attacking flowers and fruits; birds and mammals feeding on flowers, fruits and seed; mammals browsing on young regeneration; certain strong reactions to habitat factors as light-intensity, soil moisture, etc.

3163. **PYCRAFT, W. P.** Darwinism versus Lamarckism. *Sci. Progr.* 24(95): 441-450. 1930.—Evolution, as the expression of many factors, requires for its interpretation a more intensive study of the adjustment of animals to meet the conditions of their environment. Structural

modifications to suit these conditions are only found where organs concerned are used intensively. That changes of form are responses to continuous and persistent needs and that the size and shape of organs are directly related to their use dynamically are more reasonable interpretations than that they originated through Natural Selection acting on small variations. Natural Selection is the final arbiter of what shall survive of these processes of adjustment to environment. Much can be explained on the assumption that tissues are not mere substances formed afresh in ontogeny, but are so many entities, each moulded in course of its history by conditions of existence to which it has been subjected. The close correlation between structure and function is interpretable on the assumption of the effects of use and disuse, and recognition of the inheritance of acquired characters follows as a consequence.—*P. Kirtisinghe.*

3164. WILLEY, ARTHUR. Lectures on Darwinism. 198p. 1 pl., 5 fig. Richard G. Badger: Boston, 1930. Pr. $2.—This book is chiefly a discussion of adaptation and adaptive processes in their relation to evolution. The excellent treatment of many examples of adaptation is followed by a discussion of natural selection and associated processes. The writer concludes that natural selection accounts for the maintenance of constancy in species rather than for the origin of species, and that "its work is mainly accomplished, both as a factor and as a theory" and "It cannot contribute any more than it has done already to solve the riddle of human life nor to improve the status of wild life."—*A. W. Lindsey.*

PLANT

3165. AVERY, PRISCILLA. Cytological studies of five interspecific hybrids of Crepis leontodontoides. *Univ. California Publ. Agric. Sci.* 6(5): 135-167. 18 fig. 1930.—Hybrids between *Crepis leontodontoides* and species belonging to 3 subgenera were studied cytologically in both somatic and meiotic phases (subgenus *Eucrepis*) F_1 hybrids were made between *C. leontodontoides* (n=5) and *Eucrepis* species *tectorum* (n=4), *parviflora* (n=4) and *capillaris* (n=3), the *Barkhausia* species *marschalli* (n=4), and the *Catonia* species *aurea* (n=5). The chromosomes of the two parental species can be distinguished in somatic figures in all the hybrids, although the distinction is slight in the F_1 *C. leontodontoides-aurea.* The somatic chromosomes of *C. leontodontoides* and *aurea* are of the same morphological types, but those of *aurea* are slightly larger. The chromosomes of *C. tingitana,* a *Catonia* species close to *aurea,* are of the same number and shape as those of *leontodontoides* and *aurea* but are considerably larger. Efforts to secure hybrids between *C. leontodontoides* and *tingitana* were unsuccessful. The satellite disappears from the D-chromosome of *leontodontoides* in the F_1 hybrid with *tectorum, parviflora, capillaris,* and *marschalli,* but is sometimes evident close to the D-chromosome in the F_1 *leontodontoides-aurea.* All the chromosomes can be identified as belonging to one or the other of the parental genoms in F_1 *capillaris-leontodontoides* and F_1 *leontodontoides-tectorum,* owing to the great size difference between the chromosomes of the two complements. In F_1 *leontodontoides-parviflora* and F_1 *leontodontoides-marschalli,* all but one or two of the chromosomes of the species with larger and fewer chromosomes can be identified in the meiotic divisions. The number of bivalents formed in meiosis varied in different pollen mother cells from complete conjugation between the parental chromosomes to its entire absence in all hybrids except the F_1 *leontodontoides-aurea.* In this hybrid, the greater extent and regularity of chromosome conjugation indicate that the morphological similarity of the chromosomes bears some relation to genetic homology. In all other hybrids the pairing is obviously between chromosomes of dissimilar morphology. The variable pairing characteristic of these hybrids may be a reflection of the transformational processes responsible for differentiation of the specific genoms. —*Author's summary.*

3166. BECKER, WŁADYSŁAW A. Wpływ barwników, stosowanych za życia, na charakter kinezy somatycznej. [Influence of vital stains on somatic division.] [With French summary.] *Acta Soc. Bot. Poloniae* 6(3): 214-229. 3 pl. 1929.—*Stratiotes, Hydrocharis,* as well as the germinating seeds of *Nuphar,* grown in solutions of neutral red at 1:150000-1:20000, show no disturbance of the normal course of mitosis. More concentrated solutions of the same dye (1:1000-1:500) likewise have no influence upon the morphological character of mitosis. Onion, grown in the same solutions, uniformly shows mitotic disturbances. The anomalies consist of the union and fusion of metaphase chromosomes into shapeless groups. Following this fusion, the anaphase and the resulting nuclei have a pseudomitotic aspect.—*F. X. Skupiensky (transl. by P. Avery).*

3167. BLAKESLEE, ALBERT F., and RALPH E. CLELAND. Circle formation in Datura and Oenothera. *Proc. Nation. Acad. Sci., U. S. A.* 16(3): 177-183. 1930.—A summary is given of the analysis of chromosomes in *Datura* by means of extra chromosomal types, trisomic ratios, attraction between chromosomes and the formation of circles of 4 to 6 attached chromosomes in hybrids between selected races from nature. Several lines of evidence strongly support the hypothesis that in *Datura* races which induce circle formation in hybrids with a standard line have originated through segmental interchange between non-homologous chromosomes. Segmental interchange is believed also applicable to circle formation in *Oenothera.* The desirability is suggested of establishing a species of *Oenothera* with 7 pairs of chromosomes as a standard and of securing in this species primary, secondary, and tertiary (2n+1) types which might be used as testers for the study of the more complicated species characterized by large circles.—*Authors.*

3168. BURSTRÖM, H. Zytologische Studien innerhalb der Gattung Eremurus. *Acta Horti Bergiani [Upsala]* 9: 293-302. 2 fig. 1929.—In 4 species and 1 hybrid n=7. The chromosomes are of 4 size classes: A, B, C, D. *E. robustus* has 1A, 4B, 1C, 1D; *E. himalaicus,* 5B, 2D; *E. spectabilis,* 3B, 2C, 2D; *E. altaicus,* 1B, 4C, 2D. In *himalaicus* × *robustus* there are 7 gemini (5 large and 2 small) and the meiotic divisions proceed normally. Anaphase II figures show either 5 long, 1 medium long and 1 short chromosome (10 cells) or 5 long and 2 short chromosomes (6 cells). Evidently the C chromosome of *robustus* pairs with a D of *himalaicus,* and the A chromosome of *robustus* is represented by one of the B length in the hybrid. Measurements of B and D chromosomes indicate that the absolute chromosome length of *himalaicus* dominates that of *robustus.* Phylogenetically the chromosomes of *Eremurus* have undergone (1) increase or decrease in size for the whole genom and (2) individual increase or decrease for single chromosomes.—*L. W. Sharp.*

3169. BUSCALIONI, L., e F. BRUNO. Sui rapporti fra amido e lipoidi endoclorofilliani nel corso dell'anno. 2a nota preventiva. [Interrelations between starch and endochlorophyl lipoids in the course of the year.] *Giornale Sci. Nat. Econ. Palermo* 35: 113-136. 1 pl. 1927/28/29 (1930).

3170. CARTER, KATHLEEN M. A contribution to the cytology of the ovule of Orobanche minor. *Jour. Roy. Microsc. Soc.* 48(4): 389-403. 6 pl., 6 fig. 1928.—The embryo sac develops from the innermost of the 4 megaspores. Meiosis is described. In the heterotypic divison 19 bivalents are formed.

3171. CHIARUGI, ALBERTO. Diploidismo con anfimissa e tetraploidismo con apomissa in una medesima specie: "Nigritella nigra" Rehb. [Diploidy with amphimixis, and tetraploidy with apomixis in N. nigra.] *Boll. Soc. Ital. Biol. Sper.* 4: 659-661. 1929.—Careful cytological study of the alpine *Nigritella nigra* shows the life cycle to be normal, and the haploid chromosome number to be 19 for both this species and for *N. rubra*. Afzelius has reported specimens of *N. nigra* from northern Sweden in which he found adventitious embryogeny and a haploid number of more than 30. It is suggested that these were probably tetraploid plants with haploid number 38. The significance of the occurrence of apogamous tetraploids at the extreme boreal limit of a meridional species is discussed, and the polyploidy attributed to environmental influence.—*A. Chiarugi (transl. by H. S. Wolfe).*

3172. CHIARUGI, ALBERTO, e ELEANORA FRANCINI. Apomissia in Ochna serrulata Walp. [Apomixis in O. serrulata.] *Nuovo Gior. Bot. Ital.* 37(1): 1-250. 17 pl., 6 fig. 1930.—With 35 somatic chromosomes, this is the first apomictic pentaploid discovered. Meiosis is most irregular, with chromosomes conjugating in pentavalents, quadrivalents, trivalents or gemini, or remaining unpaired: the last divide twice, and therefore the number of chromosomes in the spores is always greater than the theoretical gametic number. Binucleate microspore mother cells are often found which can give rise, by endoduplication, to gigantic syndiploid gonotoconts. Semiheterotypic divisions may take place with the formation of restitution nuclei and diploid gametes. Sometimes microspore mother cells become sexually inverted, and apomeiotic ♀ gametophytes of the *Antennaria* type are found in the anthers. Further, degeneration of the microspores occurs in various ways. This is a most favorable plant for the study of apomixis, in that it exhibits concurrently many processes of apomictic reproduction previously found in different plants. Megasporogenesis with development of a haploid gametophyte which degenerates is sometimes to be seen. More frequently the megaspore mother cell is transformed directly, without trace of meiosis, by gonial apospory into a diploid ♀ gametophyte of the *Antennaria* type. At other times, following the degeneration of the gonial elements, diploid gametophytes arise from somatic cells by somatic apospory, cf., *Hieracium* and *Artemisia*. Sometimes the differentiation of sporogenous cells in the sporophyte becomes gradually lost, resulting in the final stage, in only an undifferentiated nucellus. On one occasion 8 aposporous gametophytes were found in a single ovule. Very frequently the ♀ gametophytes are lacking in polarity and present a score of different teratological types, which are not only described in the text, but classified in an attempt to treat methodically the teratology of the ♀ haploid generation of the Angiosperms. The endosperm is of the nuclear type and can develop after the initiation of the embryo. The embryo originates by apogamy from the diploid egg cell, but if it degenerates (50% of cases) an embryo is formed directly from cells of the integument by adventitious embryony. This is the first time that both somatic apospory and adventitious embryony have been observed upon the same plant, which moreover also displays interesting transition stages correlating the two processes and recalling the sporophytic proliferation and obliteration of the degenerated gametophyte in the parthenocarpic forms of *Ananassa*. It can therefore be demonstrated in *Ochna* that adventitious embryony is actually the final stage of somatic apospory. Several types of polyembryony are met with and the embryogeny sometimes lacks morphogenetic direction. An interpretation is presented of the various abnormalities observed in the different stages of development, based upon the existence of an excess of vegetative factors which have invaded sexual functioning, active through the agency of hormones. The genetic situation of the plant is discussed. It shows both auto- and allopolyploidy at the same time. The significance of multiple conjugation of the chromosomes is discussed.—*A. Chiarugi (transl. by I. Manton from authors' abstract).*

3173. CLAUSEN, J. Male sterility in Viola orphanidis. *Hereditas* 14(1): 53-72. 33 fig. 1930.—*V. orphanidis* is a species of the *Melanium* section, related to *V. cornuta* and *V. orthoceros*. The last 2 species have the chromosome number $n=11$, and in *V. orphanidis* the somatic numbers 20, 21, 22, were found; as the 20 chromosome plants were pollen sterile, 22 is probably the actual number. The variation in chromosome number was not connected with any visible morphological variation. Male sterile plants were found among all 3 chromosome types, but the 20 chromosome plants were always pollen sterile. The pollen mother cells in the latter are usually not developed as far as heterotypic metaphase; if the meiotic division is carried through, there is no pairing. In the embryo mother cells of the same plants, however, there is complete conjugation of all chromosomes. The pollen sterile plants were segregated out in varying ratios, in all cases less than 25%. Trisomes and irregular conjugation were seen in the plants that segregated out pollen-sterile plants. Both 10 and 11 chromosome gametes are viable, but there is a large deficit of 20 chromosome plants. A final decision as to the cause of the pollen-sterility is not given, but absence of a certain chromosome, lost by trisomic or tetrasomic distribution, is supposed to be the most probable.—*H. Wexelsen.*

3174. CLAUSEN, J. Genetic studies in Polemonium. III. Preliminary account on the cytology of species and species hybrids. *Hereditas* 15(1): 62-66. 6 fig. 1931.—Seven species of *Polemonium* have the somatic chromosome number 18 and regular meiosis, namely, *P. carneum* Gray, *P. coeruleum* L. (with its subspecies *himalayanum* Baker), *filicinum* Greene, *mexicanum* Cerv., *pauciflorum* Wats., *pulcherrimum* Hook., and *reptans* L. All somatic chromosomes except one pair have a median constriction and two have a satellite. In meiosis various configurations are found; chiasmas are usually formed near the end of the chromosomes. Variation within *P. coeruleum* is due to genic segregation and not to chromosome aberrations. Meiosis was studied in the following F_1 species hybrids: *P. reptans* (Lyon race) × *reptans* (Brooklyn race), *P. mexicanum* × *pauciflorum*, *P. filicinum* × *coeruleum*, and *P. pulcherrimum* × *reptans*. Polysomic chromosome groups were formed in meiosis, with various numbers of chromosomes forming mostly open zigzag-shaped chains. 22 F_2 plants from *mexicanum* × *pauciflorum* had $2n=18$; apparently only types with complete chromosome complexes are viable. Although morphologically alike, the chromosomes of the different *Polemonium* species may differ in regard to pairing ability. Translocations and inversions are probably the kind of changes that have been most effective in the chromosome differentiation of this species.—*H. Wexelsen.*

3175. CLAUSEN, J. Viola canina L., a cytologically irregular species. *Hereditas* 15(1): 65-88. 30 fig. 1931.—*Viola canina* is a cytologically irregular species with oscillating chromosome number. The type earlier published as having $n=36$, has proved to have $2n=47$ and a very irregular meiosis, in which the univalents arrange themselves in the equatorial plane resembling bivalents. Several populations were examined which consisted of morphologically typical *Viola canina* plants, but which had a variable chromosome number and a variable degree of meiotic irregularity and fertility. The most regular type had 20 bivalents and 3 fragments, and was very fertile. *V. canina* probably maintains itself as an irregular species by intercrossing between cytologically different types and by outcrosses with *V. riviniana*. A review is given of cases of variation in chromosome number

within one species and of species with oscillating chromosome number.—*H. Wexelsen.*

3176. DARLINGTON, C. D. Ring-formation in Oenothera and other genera. *Jour. Genetics* [*Cambridge*] 20(3): 345-363. 1929.—Ring-formation in *Oenothera,* as in *Tradescantia, Rumex,* etc., is compatible with a parasynaptic interpretation. Synapsis occurs near the ends of chromosomes, resulting, in diakinesis, in an end to end union. The formation of rings or chains on this assumption, however, implies that the parts of any given chromosome have their homologues divided between 2 adjacent chromosomes. The origin of chromosomes thus capable of pairing with 2 others is ascribed to segmental interchange, or the mutual exchange of parts between non-homologous chromosomes. In *Oenothera,* therefore, a continuation of the process actually observed in *Datura* is postulated. The building of large circles, however, would not occur were it not advantageous to the plant. It is suggested that heterozygosis is of widespread advantage, and that the ability to bring more and more heterozygous gene-pairs under the protection of a single set of balanced lethals has assisted the plant, in that increase of heterozygosity has been attained without corresponding increase in sterility. The hypothesis of segmental interchange is discussed in its bearing upon the cytological behavior of species, mutants and hybrids, and the conclusion is reached that segmental interchange is capable of providing a physical basis for this behavior. A brief summary of the situation in *Tradescantia* and *Rhoeo* leads to the hypothesis that parasynapsis and interchange are responsible for ring-formation in these plants also. In an appendix to the paper it is shown that the origin of "half-mutants" may be explained on the basis of segmental interchange.—*R. E. Cleland.*

3177. DELAUNEY, L. N. Kern und Art. Typische Chromosomenformen. *Zeitschr. Wiss. Biol. Abt. E. Planta* 7(1): 100-112. 4 fig. 1929.—Three morphological characteristics of chromosomes are discussed. (1) Kinetic constrictions. These are the points of spindle-fiber attachment, and are sensitive to external forces, as opposed to the rest of the chromosome. Such constrictions are found in different chromosomes at different points, and may even be very close to the end. True terminal attachments, however, are unknown. In any given chromosome the position of the kinetic constriction is definitely fixed. (2) Akinetic constrictions, the rôle of which is entirely unknown. (3) Trabauts or satellitis. The characteristics of these, and their behavior in hybrids is discussed.—*R. E. Cleland.*

3178. EICH[H]ORN, ANDRÉ. Sur la mitose somatique des Pinacées. *Arch. Anat. Microsc.* 25: 489-492. 1 fig. 1929.—Mitotic figures in 7 genera show striking uniformity. Nucleoli diminish in number by fusion but do not contribute to formation of chromosomes. No sign of chromosome splitting appears until metaphase in contrast to the typical prophasic splitting in Angiosperms, constituting possibly a fundamental karyological difference between the 2 sub-divisions of Spermatophytes.—*R. H. Lindsay.*

3179. EICHHORN, ANDRÉ. Sur la notion de prochromosomes et de chromocentres. *Compt. Rend. Soc. Biol. Paris* 104: 854; **Aperçus sur le noyau à l'état quiescent.** *Rev. Gén. Bot.* [*Paris*] 42(500): 449-456. 1930.—Hitherto the terms prochromosomes and chromocenters have been used indifferently to designate the formations for which the latter term alone is proper. Studying comparatively the living cells of plants with small chromosomes, such as the squash, and those with long chromosomes, such as the gymnosperms, it is concluded that nuclei of the first type have, in the resting stage, a homogeneous aspect while those of the second type show structure. In the first type it is possible, however, to distinguish after fixation the small chromosomes all situated against the membrane, and to see that these develop at the beginning of mitosis in such a way that they can be considered as real prochromosomes. In the second type, in both living and fixed cells, the reticulum bears rather large numbers of small granules which function as centers of condensation of the chromatin as the chromosomes are developed. To these constituents, which are found only rarely in angiosperms, it is proposed to apply the term chromocenters. It is further pointed out, contrary to the ideas of Kühn, who for want of a clear definition confuses the two terms and uses them indiscriminately, but in agreement with those of Schiller, that the prochromosomes are never obliterated and do not pass through the thin thread stage characteristic of the nuclei of angiosperms.—*A. Eichhorn* (*transl. by L. W. Sharp*).

3180. EVREINOFF, V. Sur le caryotype du genre Eryobothrya Ldl. *Rev. Gén. Bot.* 42(501): 513-516. 1930.—In *Eryobothrya japonica* Ldl., $n=16$, chromosomes are uniform, small, slender, separate, and satellites absent. These results furnish a basis for cytological comparison of this species with the genera *Photinia* and *Sorbus,* and for a study of the relationships between the three genera.—*Author's summary* (*transl. by R. C. Friesner*).

3181. GEITLER, LOTHAR. Zwei einfache Methoden zur Untersuchung pflanzlicher Chromosomen. *Züchter* 1(8): 243-247. 3 fig. 1929.—To replace the tedious paraffin method, Heitz's modification of Bellings aceto-carmine method is described. The object is first fixed in a mixture of 2 parts alcohol and 1 part glacial acetic acid and then stained with a solution of aceto carmine. Heat is used both in fixing and staining. The aceto carmine is made up to 45% and filtered. If desired the object may be dehydrated with alcohol, cleared with xylol and mounted in Canada Balsam. Or one may use Bêlar's modification of the Flemming-Benda fixative (4 cc. 2% osmic acid, 15 cc. 1% chromic acid and 2-3 drops of acetic acid). The pollen mother cells are crushed on a slide and fixed in this solution twelve hours, then washed in H_2O_2 and stained. For staining, one may use a concentrated safranin solution in water and light green in alcohol. Permanent mounts can be made by both methods.—*F. V. Owen.*

3182. GHIMPU, V. Contribution à l'étude chromosomique des Acacia. *Compt. Rend. Acad. Sci.* [*Paris*] 188(22): 1429-1431. 9 fig. 1929.—Counts in root meristem cells showed 26 chromosomes in *A. cyanophylla, A. dealbata,* and *A. podalyriaefolia.* In *A. arabica, A. nilotica, A. horrida* and *A. farnesiana* some cells showed ± 52, while others in the same root showed ± 104. The author discusses the connection between the tetraploid anomaly and the geographical distribution of the species in which it occurs.

3183. GREGUSS, PÁL. A kétlaki és egylaki növények virágporszeme. [**The pollen of dioecious and of monoecious plants.**] [German summary.] *Math. es Természettudományi Értesitö* (*Math. u. Naturwiss. Anz. Ungarischen Akad. Wiss.*) *Budapest* 44: 378-394. 1927.—More than 1000 pollen grains from each of a number of plants were measured in fresh condition and in concentrated formalin. Of 17 dioecious plants, 9 gave distinctly bimodal curves, 6 gave curves suggesting bimodality, and 2 (*Salix caprea* and *Populus alba*) gave unimodal curves. The author suggests that in these last 2 species the females may be heterogametic. The 12 monoecious plants investigated gave unimodal curves. The pollen of dioecious, anemophilous plants is obviously smaller than that of entomophilous, monoecious plants; 82% of the pollen of dioecious, anemophilous plants and only 45% of the pollen of the monoecious plants was smaller than 33μ.—*H. M. Pearson.*

3184. GUILLIERMOND, A. Quelques remarques sur l'appareil de Golgi et les méthodes employées pour sa différenciation. *Arch. Anat. Microsc.* 25: 493-505. 6 fig. 1929.—The methods of Bensley, Da Fano and Kolatchev were applied to the roots and cotyledons of peas and the root of *Cucurbita.* The first two methods revealed a vacuome agreeing in form and growth changes with that stained supravitally with neutral red. Kolatchev's method gave irregular results. The vacuome is rarely blackened. The chondriome is usually black and vacuome is nega-

tive. The chondriome may be converted into vesicles resembling Bowen's osmiophilic platelets, or into strings of vesicles like the animal Golgi apparatus. Transitions between chondrioconts and vesicles are figured. Sometimes a dense network appears, which may be due to unmasking of lipoprotein complexes of the cytoplasm. It is concluded that animal Golgi apparatus is usually due to impregnation of the vacuome, but may sometimes be an artifact due to alteration of chondriome or cytoplasm by osmic methods which should therefore be avoided.—*R. Palmer.*

3185. **HAGERUP, O. Morphological and cytological studies of Bicornes.** *Dansk Bot. Ark.* 6(1): 1-26. 45 fig. 1928.—The haploid number of chromosomes found in the flower buds of 34 representative species of *Bicornes* (=*Ericales*) form (1) a very good 6 series: 6, 12, 18, 24, 30, 36 and 48; (2) a small 13 series: 13 and 26; and (3) an 8 series: 8 and 16. In the case of 4 pairs of species, the species with the higher number of chromosomes were always the ones growing farther north. The flower buds in the reduction stage were collected in the field on various journeys in the Arctic region and supplemented by collections in Denmark. In most cases the flower buds hibernate at the stage immediately preceding reduction division, thus the development of the flower itself covers 2 of the brief vegetative periods. The carpels possess a hollow style, in which the channel connects the lumen of the ovary with the open air. The pollen tubes grow through this channel without any disorganization of adjacent tissue. The median leaf of the calyx is often placed at the back of the flower, as is usual in other dicotyledons, but sometimes the median leaf of the calyx appears on the fore side of the flower, as in the real "*Lobelia*" diagram. —*W. H. Emig.*

3186. **HÅKANSSON, ARTUR. Zytologische Beobachtungen an S. G. Speltoidheterozygoten beim Weizen.** *Svensk Bot. Tidskr.* 24(1): 44-57. 5 fig. 1930.—Meiosis of some speltoid wheat mutants was studied. Speltoid-heterozygotes of B-type from cultures of Åherman and Nilsson-Ehle had 41 chromosomes, 20 bivalents and 1 univalent, the univalent mostly splitting in the first anaphase. Fragmentation and the forming of a trivalent was observed occasionally.—In a subcompactum plant from the cultures of Åherman the same number of chromosomes was present, but the univalent was always segmented into 2 fragments of very different sizes. Both fragments behaved as independent univalents, splitting in the first anaphase. The smaller fragment, however, was mostly eliminated during the second division. Very seldom the two fragments were united by a thread.—In two heterozygotic types of Åherman's, there was an excess chromosome. This was only about ⅓ the length of an ordinary chromosome, and was always united in the first division with another, forming a trivalent in metaphase and a compound chromosome in the ana- and telophase. The behavior of this chromosome in the second divisions, somatic divisions and in the progeny could not be ascertained.—*A. Håkansson.*

3187. **HÅKANSSON, ARTUR. Zur Cytologie trisomischer Mütanten aus Oenothera Lamarckiana.** *Hereditas* 14(1): 1-32. 6 fig. 1930.—A study of chromosome arrangements in diakinesis and first meiotic metaphase of several trisomics from *Oenothera lamarckiana.* In *lata, dependens, stricta, longepetiolata* of Heribert-Nilssons' cultures, and in *lata, pallescens* and *liquida* of De Vries, there was an open ring of 13 chromosomes and 1 free bivalent. A triple arrangement at the end of the chain was found in some cases. These trisomics, which all segregate *lamarckiana,* are called primary trisomics and are supposed to have originated through non-disjunction of one of the ring chromosomes. The trisomic *curta* has a chain of 11 and 2 bivalents; it does not segregate *lamarckiana,* and has probably arisen through non-disjunction and exchange of one chromosome from *gaudens* to *velans.* In *nitens,* which is also a constant trisomic, there was a chain of 9 and 3 bivalents. In a secondary form from *pulla* the arrangement was a closed ring of 6, 3 bivalents and 1 trivalent. This trisomic had presumably arisen from *pulla* through chromosome exchange. A secondary form of *cana* of De Vries had 14½ chromosomes, viz.: 2 bivalents + an open chain of 11, the half chromosome being at the end of the chain. Every degree of pairing has been found in *lamarckiana* mutants, except no pair. In many trisomics, the chain in metaphase was segmented into shorter chains. Chain and ring chromosomes are arranged in zigzag; alternate chromosomes pass to the same pole in anaphase. The chromosome arrangements in trisomic Oenotheras can be understood if each of the ringforming chromosomes pairs with two different chromosomes. The view that the rings in Oenotheras have arisen through interchange between non-homologous chromosomes is supported.—*H. Wexelsen.*

3188. **HÅKANSSON, ARTUR. Über Chromosomenverkettung in Pisum.** *Hereditas* 15(1): 17-61. 35 fig. 1931.—In Hammarlund's *Pisum* material, the F-line (*A* and *Gp* independent), and the K-line (*A* and *Gp* linked) both have 7 pairs of chromosomes. F × K (F_2) showed half the plants with 7 pairs, and half with a ring of 4 (amphibivalent) and 5 pairs. The double recessive (*aa gpgp*) had 7 pairs. K × double recessive showed an amphibivalent in all plants, whereas F × double recessive showed 7 pairs in all plants. All plants with an amphibivalent had regular zigzag arrangement of the ring chromosomes in 50% of the cases, and other arrangements in 50%. They also showed 50% pollen and ovule sterility. Probably the regular zigzag arrangement leads to fertility, the other arrangements to sterility. All plants with an amphibivalent showed linkage between *A* and *Gp.* On the other hand, plants with 7 pairs were completely fertile, and showed independence between *A* and *Gp.* These results can be explained on the theory of segmental interchange between non-homologous chromosomes. In the F-line, *A* and *Gp* are in different chromosomes. In the K-line, non-homologous chromosomes have undergone interchange, so that *A* and *Gp* lie in the same chromosome, and hence are linked. All plants with a ring of 4 will show linkage between *A* and *Gp* because the same chromosomes and chromosome segments pass together to the poles in all cases where fertility results,—namely, in cases where the regular zigzag arrangement has been attained. Detailed descriptions are given of the cytology of bivalents and amphibivalents.—*R. E. Cleland.*

3189. **HAMMETT, FREDERICK S. Cell division and cell growth in size.** *Protoplasma* 7: 535-540. 1929.—The coefficient of correlation between cell length and percentage mitosis in root-tips of *Zea mays* was found to be high and negative: $r = -0.577 \pm 0.075$. This value with correlated data justifies the generality that cell division and cell size are inversely related. An analysis of the relation brings the conclusion that in an increasing cell population, where increase in cell number and growth in cell size are taking place simultaneously, cell division is the independent and cell size the dependent variable. Other things being equal, the size of the cells is a result of the rate of cell multiplication.—*Author's summary.*

3190. **HEITZ, E. Der bilaterale Bau der Geschlechtschromosomen und Autosomen bei Pellia Fabbroniana, P. epiphylla and einigen anderen Jungermanniaceen.** *Zeitschr. Wiss. Biol. Abt. E. Planta* 5(5): 725-768. 1 pl., 18 fig. 1928.—Both ♂ and ♀ of *Pellia fabbroniana* have 9 chromosomes, of which 1 is very small. The very small chromosome of the ♀ is sharply bent and apparently approximately symmetrical; the corresponding chromosome of the ♂ is somewhat smaller, straight or slightly bent, and strongly asymmetrical. These small chromosomes are therefore to be considered as respectively X and Y (sex chromosomes). The X chromosome is heteropycnotic. Showalter's observation of a large chromosome in the ♀ of *P. neesiana* is confirmed; only part of this chromosome, however, is heteropycnotic. The gametophyte in most strains of *P. epiphylla* has 9 chromosomes; a few diploid races (with 18 chromosomes) were found. Six chromosomes seem to be symmetrical, 1

being smaller than the other 5; 3 are asymmetrical, 2 of these being noticeably long. No trabant is found. One of the longer symmetrical chromosomes is heteropycnotic, save for a small part of one arm; it is considered homologous with the sex chromosomes of *P. fabbroniana*. Certain parts of 4 or 5 other chromosomes are also heteropycnotic; these parts are also thought to be concerned in sex-determination. In diploid races of *P. epiphylla*, two chromosomes are largely heteropycnotic. In *Blasia pusilla*, *Makinoa crispa*, and *Moerckia hibernica* there are 9 chromosomes, including 1 very small. *Androcryphia confluens* has 18, of which 2 are very small; of the larger ones, 8 are symmetrical, 8 asymmetrical. *Aneura pinguis* has 10, of which 4 large and 1 small are symmetrical; the other 5 are large and asymmetrical. The small chromosome in *Plagiochila asplenioides* and in *Trichocolea tomentella* is heteropycnotic.—In mosses, including species of *Polytrichum*, *Pogonatum*, *Catharinea*, *Mnium*, and *Hypnum*, the chromosomes are bilateral and either symmetrical or asymmetrical. One chromosome is always heteropycnotic, except that in polyploid species such as *Catharinea undulata* and *Fissidens adianthoides* 2 or more chromosomes are heteropycnotic. It is held that in mosses, as in hepatics, the heteropycnotic chromosome is a sex chromosome.—*C. E. Allen.*

3191. **HEITZ, E. Heterochromatin, Chromocentren, Chromomeren.** (Vorläufige Mitteilung.) *Ber. Deutsch. Bot. Ges.* 47(4): 274-284. 1 pl. 1929.—Chromocenters were found in the telophase and prophase in meristematic cells of 86 genera of plants belonging to widely different families. They were not found in 21 genera of which a relatively large proportion had large chromosomes. In mature tissues fusion of chromocenters may occur. Chromosomes are composed of sections of heterochromatin and of euchromatin attached end to end. Chromocenters are identical with chromomeres and consist of heterochromatin, the deeply staining component of the chromosomes, but the faintly staining euchromatin is believed to be at least equally important. The number of chromocenters does not invariably correspond to the number of chromosomes since more than one section of heterochromatin, or in *Crocus asturicus* none, may be present in a chromosome.—*J. W. Lesley.*

3192. **HOLLINGSHEAD, LILLIAN. A cytological study of haploid Crepis capillaris plants.** *Univ. California Publ. Agric. Sci.* 6(4): 107-134. 3 pl., 13 fig. 1930.—Five *C. capillaris* haploid plants were found in populations of *C. capillaris-tectorum* F_1 hybrids numbering over 3000 plants. A sixth haploid was one of two plants resulting from a *C. capillaris-C. setosa* cross. They doubtless resulted from the parthenogenetic development of *capillaris* egg cells. The haploids resembled reduced diploids but differed noticeably from diploids in leaf shape and habit of growth. Root tips usually showed the haploid chromosome complex of 3 individually different chromosomes but parts of some root tips in each haploid were diploid and some root tips were wholly diploid. A few parts of most of the plants above ground were also diploid, giving rise to diploid and chimeral heads and branches. The haploid portions of the plants were sterile, but achenes were obtained from diploid parts of one haploid plant. The progeny, presumably completely homozygous, were remarkably uniform in appearance. In meiotic behavior (♂) the haploids were irregular and variable. They resembled other haploids previously described in the occurrence of a random segregation of univalents at the heterotypic division, and of a rare division of all univalents followed by separation of the daughter halves to different poles, or "non-reduction." New or unusual features were (1) the occasional division of univalents at diaphase, (2) the frequent division of univalents but the inclusion of most pairs of daughter halves in the same nucleus, and (3) the omission of the homeotypic division. As a result, microspores of normal chromosome constitution were rarely formed and very little good pollen was produced. In diploid tissue on a haploid plant 3 bivalents were formed in many pollen mother cells but non-conjunction of one or more chromosome pairs was a frequent occurrence. This lack of pairing between presumably completely homologous chromosomes is of great theoretical interest, for it shows that complete homology does not necessarily result in bivalent formation at meiosis.—*Author's summary.*

3193. **HORNE, A. S. Nuclear division in the Plasmodiophorales.** *Ann. Bot.* [*London*] 44(175): 199-230. 3 pl. 1930.—The forms studied were *Spongospora*, *Sorosphaera*, and *Plasmodiophora*. The author divides the nuclear phenomenon into 3 phases. (1) In the somatic phase, there are 4 haploid chromosomes, which at metaphase unite end to end to form a ring around the persistent nucleolus. This band divides into 2 daughter bands, which, as they move toward their respective poles, break up into 4 chromosomes each. (2) In the transitional stage, the nuclei are achromatic and the cytoplasm stains more densely because of numerous chromidia. The author assumes that there occurs a fusion of coenocytic growth forms, and that, following this, nuclei of opposite sex fuse in pairs. (3) The post-transitional phase shows well-developed asters and centrosomes, an inconspicuous nucleolus, and diploid nuclei. Four chromosomes are organized in the neighborhood of each pole and the nucleolus disappears. The 2 groups of chromosomes assemble together, thereby producing the effect of contraction. The next stage observed is diakinesis. There are 4 chromosomes; one, ring-shaped. The heterotypic spindle shows 4 chromosomes. The nucleole reappears in telophase. Except that the nucleole is inconspicuous, the homotypic division resembles the somatic divisions. Sometimes the meiotic divisions are followed by a third mitosis, which immediately precedes spore formation.—*H. J. Sax.*

3194. **KATER, J. McA. Structure of the nucleolus in the root-tip cells of Nicotiana longiflora.** *Univ. California Publ. Bot.* 14(12): 319-322. 1 pl. 1928.—Nucleoli fixed in Karpechenko's solution show a vacuolar portion surrounded by a cortical layer. In this layer, a reticulum is present, continuous with the nuclear reticulum and disappearing when the latter disappears to form the chromosomes. The vacuoles are gradually expelled, giving rise to an "amphinucleolus," which would seem to be a true plasmosome. The vacuoles are less basophilic than the reticulum.—*R. E. Cleland.*

3195. **KATER, J. McA. Morphology and division of Chlamydomonas with reference to the phylogeny of the flagellate neuromotor system.** *Univ. California Publ. Zool.* 33(7): 125-168. 6 pl. 7 fig. 1929.—*C. nasuta* Korschikoff is typical in general morphology of the family Chlamydomonadidae. The pyrenoid is located along the main axis of the body, posterior to the nucleus, and is not a part of the chloroplast. At the onset of mitosis it disappears and is reformed in late telophase by modification of cytoplasmic alveoli, from which it may be deduced that alveoli, apparently structureless, are diphasic systems. The nucleus is shown to be of the metazoan and metaphytan type. Nucleus and nucleolus resemble those of higher organisms. The 8 chromosomes are formed by condensation of the chromatin of the nucleolus and the nuclear reticulum. The nuclear membrane persists until late anaphase, whereafter it disintegrates and the division figure becomes metazoan in type. The neuromotor system consists of two flagella and blepharoplasts, a rhizoplast, and an intranuclear centrosome, the system typical of the Chlamydomonadidae and Volvocidae. In the immobile stage the cell usually divides twice. A period of growth intervenes between the two divisions. The neuromotor system disappears except for the centrosome, and is later regenerated from this organ. The bearing of these facts on the phylogeny of the flagellate neuromotor system is discussed.—*F. M. Scott.*

3196. **KENDALL, JAMES. An aberrant Nicotiana with 91 chromosomes.** *Amer. Jour. Bot.* 18(2): 114-115. 1 pl. 1931.—Among the progeny of the back cross F_1 (*N. rustica* × *N. tabacum*) × *N. tabacum*, there appeared a number of aberrants. One had 78 somatic chromosomes

and was self fertile. Of the offspring grown from seeds of this plant when selfed there was one plant with 36-38 chromosomes in its first meiotic metaphases. Plants grown from seeds set by the latter plant when selfed gave a variable progeny of which one plant was outstanding. This was an aberrant having 91 somatic chromosomes and showing a blend of the morphological features of the 2 spp. involved in its origin. Both of its meiotic divisions were accompanied by marked irregularities and, apparently, polyvalency. Dyads, triads, many unequal tetrads, and some pentads were formed; this led to the formation of a high percentage of abortive pollen (Ca 80%) and viable pollen grains of various sizes. Irregularities were also observed in the mitotic process in the root tips. It was slightly self fertile and its capsules also became swollen when pollinated with *N. langsdorffii* (n=9).—*J. Kendall.*

3197. **KOSTOFF, DONTCHO.** A fertile triple hybrid, Nicotiana tabacum × (Nicotiana sylvestris × Nicotiana rusbyi). A preliminary report. *Amer. Jour. Bot.* 18(2): 112-113. 1 pl. 1931.—Plants of the cross *N. sylvestris* × *N. rusbyi* were self-sterile and showed usually 24 univalent chromosomes in the first meiotic division. They occasionally formed 24 dyad chromosomes as a result of omission of the first meiotic division under certain environmental conditions. The triple hybrids [see title] are evidently formed as a result of a fusion of normal egg cells of *N. tabacum* (n=24) with generative nuclei arising from such dyads. In the progeny of the triple hybrids there were plants intermediate in character as well as some closely resembling one or the other of the parental plants. The former type was fully fertile, formed entirely normal gametes, and had 48 somatic chromosomes; the latter showed irregularities in meiosis, was only partially fertile, and had usually 48+1, or 48+2 somatic chromosomes. This case appears to be the first on record of a fertile triple hybrid composed of complete contributions from the 3 different species combined.—*J. Kendall.*

3198. **KOSTOFF, DONTCHO, and JAMES KENDALL.** Irregular meiosis in Datura ferox caused by Tetranychus telarius. *Genetica* 12(1): 140-144. 5 fig. 1930.—Earlier reported observations on *Lycium halimifolium,* where striking irregularities occurred in the meiotic process as a result of injuries to the anthers by Eriophyid mites infesting the floral buds, have now an analog in *Datura ferox,* which was attacked by another acarinous parasite, *Tetranychus telarius.* In the anthers of affected buds meiotic divisions were accompanied by abnormalities similar to those reported in the case of *Lycium* resulting in pollen grains of three types: (1) smaller than normal and usually abortive; (2) about equal in size to the normal grains and viable; (3) 2, 3 or 4 times larger than the normal grains and viable. The majority of grains in these last two groups were able to germinate on the stigma; the plants derived from such fertilization are now being raised for further researches.—*M. J. Sirks.*

3199. **LESLEY, MARGARET M., and J. W. LESLEY.** The mode of origin and chromosome behaviour in pollen mother cells of a tetraploid seedling tomato. *Jour. Genetics* 22(3): 419-425. 2 pl. 1 fig. 1930.—A tetraploid seedling tomato (2n=48) appeared in the F_1 of a cross between a double trisomic and a diploid (2n=24). In general the plant resembled Winkler's tetraploid bud variant, but no significant difference was found in plastid size in tetraploid and diploid plants. Since the extra chromosomes of the double trisomic parent are absent in the tetraploid it probably originated from doubling the chromosome number after fertilization. Triploids evidently originate from union of diploid and haploid gametes. One triploid plant originated from a diploid gamete formed by reduction of a tetraploid mother cell. In the tetraploid seedling there are 7-12 tetravalents at diakinesis as compared with 1-2 observed by Jørgenson and outstandingly normal reduction observed by Winkler in tetraploid bud variants. Tetraploid, when selfed, sets seeds sparingly; tetraploid × diploid seldom succeeds, and diploid × tetraploid failed entirely. This may be partly due to the fact that reduction is slower in tetraploid than in diploid pollen mother cells. Tetraploid pollen mother cells in simple and double trisomic plants and non-reduction in pollen mother cells have been observed.—*M. M. Lesley.*

3200. **LEWIS, FREDERIC T.** A volumetric study of growth and cell division in two types of epithelium,—the longitudinally prismatic epidermal cells of Tradescantia and the radially prismatic epidermal cells of Cucumis. *Anat. Rec.* 47(1): 59-99. 13 fig. 1930.—Topics discussed on the basis of these measurements include the antithesis of cell growth and cell division: the quasi independence of tissue growth and cell growth: the significance of cell patterns in distinguishing between cell division initiated in the epithelium and in the subepithelial layer: the stimulus to division and the retardation of growth in the vicinity of the stoma, with the local reversal of Minot's law of senescence: stomatal patterns illustrating Graustein's theorem: the derivation of the prismatic epithelial cells in *Tradescantia,* with an average of nine and two-thirds surfaces, from the tetrakaidecahedron: the changes in cell pattern resulting, respectively, from a transverse and a longitudinal division in cells of rectangular hexagonal outline: the special growth of two epithelial cells adjacent to the one which divides, followed by the division of cells thus enlarged: the dependence of cell size upon the rate, and of cell shape upon the planes, of cell division.—*Author (courtesy Wistar Bibl. Serv.).*

3201. **LIETZ, J.** Beiträge zur Zytologie der Gattung Mentha. *Heil- u. Gewürz-Pflanzen* 12(3): 74-86. 2 pl. 1929; (4): 113-130. 1 pl. 1930.—The haploid chromosome numbers of *M. longifolia, M. aquatica, M. verticillata* and *M. arvensis* are 9, 18, 27 and 36 respectively. The development of the microspore and megaspore has been described and abnormalities observed in *M. verticillata* and *M. arvensis.* The abnormalities of the former have led to the conclusion that it is a hybrid between an 18-chromosome and a 36-chromosome species. The status of *M. arvensis* is uncertain, for both the pollen and the embryosac mother cell fail to develop to maturity. In the scheme proposed by Gams, *M. arvensis* is ranked as a pure species. This scheme, in general, is in harmony with the conclusions from cytological studies of Mentha species by the author and his colleagues.—*A. E. Longley.*

3202. **MAEDA, TAKESHIGE, and KAZUO KATO.** Chromosome arrangement. 7. The pollen mother cells of Spinacia oleracea, Mill. and Vicia faba, L. *Mem. Coll. Sci. Kyoto Imp. Univ. Ser. B* 4(3): 327-345. 1 pl., 23 fig. 1929.—The 6 chromosomes assume in meiosis the arrangement of Mayer's floating magnets in 69.7% and 71.1% respectively of cases examined. In each species there is 1 large chromosome and it is a matter of chance whether it or a small one shall be in the centre. In *Vicia* the data refer to points of spindle fiber attachment, the matter being more complex if whole chromosomes are considered. Exceptional cases are regarded as transition stages. The larger chromosomes behave like floats with more magnets than the smaller.—*R. O. Earl.*

3203. **MORINAGA, T.** Interspecific hybridization in Brassica. I. The cytology of F_1 hybrids of B. napella and various other species with 10 chromosomes. *Cytologia [Tokyo]* 1(1): 16-27. 4 pl. 1929.—Hybrids were made between *B. napella* (n=19) and each of the following species: *B. pekinensis* (n=10), *B. rapa* (n=10), *B. chinensis* (n=10), and *B. japonica* (n=10). In all F_1 plants there were 29 somatic chromosomes and at meiosis there were 10 bivalent and 9 univalent chromosomes. The bivalents divide regularly while the lagging univalents are irregularly distributed and some of them may be excluded from the daughter nuclei.—*K. Sax.*

3204. **NAWASCHIN, M.** Ein Fall von Merogonie, infolge Artkreuzung bei Compositen. *Ber. Deutsch. Bot. Ges.* 45: 115-126. 3 fig. 1927.—A natural hybrid was found between *Crepis tectorum* and *C. alpina.* These species belong to very different sections of the genus. All the chromosomes of *tectorum* are morphologically distinguishable from those of *alpina.* The hybrid was

intermediate in plant characters and nearly sterile but gave 3 seedlings from open pollination. One of these contained 2 sets of *tectorum* chromosomes, another 1 set of *tectorum* and 1 of *alpina*, the third 2 sets of *alpina* chromosomes. Only egg cells of the hybrid containing a set of *tectorum* and of *alpina* chromosomes were viable. The plant with 2 *alpina* sets originated from an egg composed of the protoplasm of *tectorum* and a set of *alpina* chromosomes fertilized by a male gamete of *alpina*. This is the first instance of interspecific "merogony" in higher plants. Except that the rosette stage was tuft-like and the organs generally rather smaller, the plant was indistinguishable from *alpina* and fertile but died after setting a few seeds. The nuclei therefore determine all the differences between *alpina* and *tectorum* since the nucleus of *alpina* (even when in the protoplasm of *tectorum*) gave rise to all the *alpina* characters. There is no specificity of cytoplasm in different species of the same genus.—*J. W. Lesley.*

3205. **NEBEL, B. Zur Cytologie von Malus und Vitis.** *Gartenbauwiss.* 1(6): 549-592. 55 fig. 1929.—The basic (diploid) chromosome number of the genus *Malus* is 34. *M. ioensis, fusca, coronaria* and *glaucescens* have 64 (2n). *M. spectabilis* and *"prunifolia"* (Borkh.) probably have the somatic number 51. In *Vitis* the basic number is 38. Two grape varieties (Muscat gigas and Sultanina gigas) have 76. It is contended that the greatest diversity in genetic characteristics exhibited by the apple is in the eastern part of Central Asia, whence the various species have spread east and west.—*A. E. Murneek.*

3206. **NĚMEC, B. The mechanism of mitotic division.** *Proc. Internat. Congress Plant Sciences, Ithaca, N. Y.* 1926. 1: 243-249. Geo. Banta Publishing Co.: Menasha, Wisconsin, 1929.—A general review of the forces at play during cell division, as determined especially by the author's experiments over many years. The movements of cytoplasmic bodies, as well as of the chromosomes and nucleoli, during mitosis, viscosity changes, the nature of the spindle and of the phragmoplast, and the mechanics of cytokinesis are some of the subjects treated.—*O. H. Pearson.*

3207. **NĚMEC, B. Ueber Struktur und Aggregatzustand des Zellkernes.** *Protoplasma* 7: 423-443. 48 fig. 1929.—From observation on living and fixed material of *Zea* and *Cucurbita*, the author concludes that there is a preformed reticulum in the nucleus. Nucleoli are hung on the reticulum. The nucleus has a ductile, elastic membrane. The meshes of the reticulum are filled with a liquid sap. The nucleolus is liquid and is, like the nuclear reticulum, of greater specific gravity than the nuclear sap. These results were obtained by the use of a centrifuge.—*L. Moyer.*

3208. **NOGUCHI, YAKICHI. Cytological studies on a case of pseudogamy in the genus Brassica.** *Proc. Imp. Acad.* [*Tokyo*] 4(10): 617-619. 1 fig. 1928.—In the cross *B. campestris* ♀ × *B. olerocea* ♂ inheritance is found to be maternal. The male nuclei enter the egg apparatus but play no part other than stimulating the development of an embryo.—*D. R. Cameron.*

3209. **OEHLER, E. Cytologische Untersuchungen an Kern- und Steinobstsorten.** *Züchter* 1(1): 25-30. 1929.—A review of sterility relations due to sterile pollen, and of chromosome numbers in varieties of apples, pears and prunes.—*F. V. Owen.*

3210. **OHASHI, HIRO. Cytological study of Oedogonium.** *Bot. Gaz.* 90(2): 177-197. 3 pl., 21 fig. 1930.—In *O. grande* the mitotic process, especially the behavior of chromosomes, shows a remarkable resemblance to that of higher plants. The number of chromosomes is 13, an uneven number. In spermatogenesis all important phases of mitosis in the formation of antheridia and sperms have been traced. In mitosis of the antheridial cell, the figure is oriented along the horizontal axis, while the cell division is to be transverse. This seems to be an unusual condition in cell division and has never been described in *Oedogonium*. Spermatogenesis in the dwarf male of *O. nebraskense* was also followed. There are two types of oogenesis, one with a suffultory cell (*O. nebraskense*) and the other without (*O. americanum*). The behavior of the nucleus in oogenesis in these species is described. Zoospore formation is described in an unknown species. The escape of the zoospore takes only a few minutes. Of the factors which stimulate the formation of zoospores, change of temperature seems to be the most effective.—*From author's summary.*

3211. **PASSMORE, SARA F. Microsporogenesis in the Cucurbitaceae.** *Bot. Gaz.* 90(2): 213-223. 40 fig. 1930.—Microsporogenesis proceeds in like manner in *Cucurbita pepo, C. maxima, Citrullus vulgaris, Luffa cylindrica, Cucumis melo,* and *C. sativus,* except that at diakinesis in the genus *Cucurbita,* in which the nuclei are about four times the size of the nuclei of the other genera, the nucleolus disappears before the nuclear membrane does, and many small, darkly staining bodies appear among the paired chromosomes. In the other genera the nucleolus remains intact until the nuclear membrane disappears and may be present at the multipolar stage of spindle formation. The haploid chromosome number in *Cucurbita pepo* and in *C. maxima* is 20. It is 11 in *Citrullus vulgaris* and in *Luffa cylindrica.* It is 12 in *Cucumis melo,* 7 in *C. sativus.* The chromosomes at anaphase go promptly to the poles in all species except *Cucumis sativus* where there is a tendency to lag on the spindle.—*S. F. Passmore.*

3212. **PETO, F. H. Cytological studies in the genus Agropyron.** *Canadian Jour. Res.* 3(5): 428-448. 2 pl. 1930.—An examination of 18 species of this genus native to Canada, Russia, Siberia and Denmark, reveals a polyploidal series with chromosome (2n) numbers of 14, 21, 28, 34 and 35, 42, 56 and 70, which is attributed to natural hybridization.—*C. E. O'Neal.*

3213. **POLJANSKY, GEORG, und GEORG PETRUSCHEWSKY. Zur Frage über die Struktur der Cyanophyceenzelle.** *Arch. Protistenk.* 67(1): 11-45. 1929.—A review of the literature is followed by an account of the technique employed on the following species: *Oscillatoria tenuis* Ag., *O. splendida* Grev., *Spirulina jenneri* (Stiz.) Geitler, *Tolypothrix tenuis* (Kuetz.) Schmidt, *Gloeotrichia intermedia* (Lemm.) Geitler, and *G. natans* (Hedw.) Rabh. Some of the conclusions of previous investigators are confirmed, others rejected. In general, the author's conclusions are that the cell is differentiated into a central and a peripheral portion, differing from each other in structure and function. The central area is not definitely delimited from the peripheral. The ground substance of the central area is likened to cytoplasm and contains:—(a) chromatic substance in the form of a net-like or sponge-like body stainable with basic dyes and corresponding to nucleoproteid; (b) "metachromatin" granules whose ground substance is "volutin"; and (c) certain products for assimilation, e.g., glycogen. In some species the chromatic substance in division undergoes a primitive mitosis. The peripheral portion, subject of less study, contains the coloring substance, diffused and not held in chromatophores. It also was found to contain the "cyanophycin" granules.—*N. L. Gardner.*

3214. **RICHARD, J. Sur le contenu cellulaire des Fucus.** *Rev. Gén. Bot.* 41(484): 209-212. 1929.—Using living cells, the author investigated successively vacuoles, pheoplasts, "fucosan particles," oil droplets, and "chondriosomes inactive in photosynthesis." All cells, except those of the colorless hairs of the cryptostomata, contain pheoplasts, which are flat, elongated, with somewhat rounded ends and very easily deformed. He rejects, for the "fucosan particles," the designation "phenol precipitates." The oil droplets are morphologically the most variable component. The "chondriosomes inactive in photosynthesis" of Mangenot were not observed by the author in living cells.—*M. Guinochet (transl. by R. C. Friesner).*

3215. **SAX, HALLY JOLIVETTE. Chromosome numbers in Quercus.** *Jour. Arnold Arboretum* 11: 220-223. 1930.—Sixteen American, and 10 Asiatic and European species belonging to the subgenera *Erythrobalanus* and *Lepidobalanus* were studied. The number of chromosomes determined from the divisions in the pollen mother

cells, was 12 or 12 ± 1. No significant difference was found in pollen sterility between species and hybrids.—*A. Rehder.*

3216. **SAX, KARL.** Chromosome structure and the mechanism of crossing over. *Jour. Arnold Arboretum* 11: 193-220. 2 pl. 1930.—Chromosome structure during meiosis was studied in *Secale, Lilium* and an Orthopteran, *Melanoplus femur rubrum*. The structure seems to be essentially the same in plants and animals, except that in the plants examined the chromatids are closely associated and form a spiral chromonema at certain stages of meiosis. The coiling of the chromonema is not a mechanism essential for the preservation of the linear order of the genes, as some investigators have suggested, but is apparently due to differences in the rate of contraction of the chromosome and the chromonema. Due to the close association of the chromatids and the coiling of the chromonema the tetrad nature of the paired chromosomes is not clearly evident until late metaphase, although doubtless each of the homologous chromosomes is divided into chromatids from early prophase. The nodes or chiasmata formed at diplotene represent points where the chromatids exchange partners, so that there is usually an alternate association of homologous and sister chromatids. Between early diplotene and diakinesis the number of chiasmata is reduced, due primarily to breaks in the chiasmata. Such breaks would result in crossing over between two of the four chromatids. A cytological interpretation of crossing over is presented which seems to be in accord with the rigid genetic requirements.—*K. Sax.*

3217. **SAX, KARL.** The origin and relationships of the Pomoideae. *Jour. Arnold Arboretum* 12(1): 3-22. 1 pl. 1931.—The genera *Cotoneaster, Mespilus, Crataegus, Sorbus, Aronia, Photinia, Eriobotyra, Chaenomeles, Cydonia, Malus, Pyrus* and *Amelanchier* all have 17 chromosomes as the basic haploid number. A few species are tetraploids, and triploids are commonly found in *Crataegus* and *Malus*. Many of the genera of Pomoideae are closely related, as indicated by the frequency of generic hybrids. The cytological and genetic evidence suggests that this subfamily originated in Asia from a 17 chromosome ancestor and that various degrees of differentiation now exist among the present genera.—*K. Sax.*

3218. **SAX, KARL, and D. A. KRIBS.** Chromosomes in Caprifoliaceae. *Jour. Arnold Arboretum* 11(3): 147-153. 1 pl. 1930.—The chromosomes of representative species of 8 genera of Caprifoliaceae have been examined and 9 appears to be the basic number of the family, though *Abelia* and *Kolkwitzia* have 16. Polyploidy exists in *Lonicera,* but most species have 9 chromosomes. The species examined of *Viburnum* and *Symphoricarpus* have 9 chromosomes; those of *Sambucus* and *Diervilla,* 18. The length of chromosomes of *Viburnum* and *Sambucus* is 4 and 5 microns; those of *Lonicera* are about ½ and those of *Diervilla, Abelia* and *Kolkwitzia* about ¼ as long. The wood structure is relatively primitive in *Viburnum, Diervilla* and *Kolkwitzia,* intermediate in *Abelia, Symphoricarpus* and *Lonicera* and highly specialized in *Sambucus.* There appears to be no correlation between either chromosome number or size and vascular specialisation.—*A. Rehder.*

3219. **SCHIEMANN, ELIZABETH.** Zytologische Beiträge zur Gattung Aegilops. Chromosomenzahlen und Morphologie. *Ber. Deutsch. Bot. Ges.* 47(3): 164-181, 1 pl., 5 fig. 1929.—New chromosome counts are as follows: $2n=14$ in *A. mutica,* 2 varieties; *A. bicornis; A. sharonensis; A. longissima.* $2n=28$ in *A. variabilis* (7 sibs from 5 varieties); *A. kotschyi* (2 sibs from 5 varieties). Percival's counts of $2n=14$ for *A. squarrosa* and $2n=42$ for *A. crassa* are confirmed. A complete chromosome list is given. Variations in number occur within sections. *Pachystachys* and *Pleionathera,* the former containing species with $n=7$, 14 and 21 chromosomes. In Pleionthera *A. umbellulata* has $n=7$, *A. triaristata* $n=14$ or 21 (2 sibs). The other 6 species in the section have $n=14$. Selfed material of *A. triaristata* was examined cytologically, and classified on the basis of ear characteristics. Six morphological types were found. The length-breadth index of the spike gives a quite unnatural arrangement for these types. On the other hand the spike outline is important. In the author's group A, the spike is suddenly reduced, and all grains above the three fertile spikelets are pygmies. Group A corresponds to *A. triaristata* ssp. *typica.* In group B, the spike is more gradually reduced and the fourth spikelet contains small grains, the fifth pigmy grains (ssp. *elongata* Sch.). In group C, almost all grains are large, small only in the fifth and pigmy in the sixth spikelet, and the spike is still more gradually reduced (ssp. *attenuata* Sch.). All other characters are subordinate to these. All plants examined cytologically in group A had $n=14$; all in group B $n=21$; but in group C plants with $n=14$ could not be distinguished from those with $n=21$. It is thus quite impossible in *triaristata* to relate certain characters to the hexaploid condition. The author considers *contracta* (not examined cytologically), *elongata* Sch. and *attenuata* Sch. as derived from *typica. Elongata* corresponds to ssp. *recta* Zhuk.; *attenuata* to *intermixa* Zhuk. Mendelian characters like hairiness, ripening time, and plant habit were found in all combinations in *triaristata.* These should be described and experimented upon but not named. *Elongata* and *attenuata* appear to belong to the eastern part of the range of *triaristata* and might possibly be grouped as ssp. *asiatica.* The material studied was chiefly from Maltepe, the variation center of the species. —*M. M. Lesley.*

3220. **SELIM, A. G.** A cytological study of Oryza sativa L. *Cytologia* 2(1): 1-26. 47 fig. 1930.—In all 5 races of rice plant examined, $n=12$. The resting nucleus of the pollen mother-cells generally has a single nucleolus. The synizetic knot in most cases is very compact and the threads are extremely delicate and not distinct. No continuous spireme is formed at the loosening of the synizetic knot, but the reticulate character of the threads is retained until later. Two firmly and permanently attached nucleoli are seen during the early prophase stage in three of the races. The other two have a single large nucleolus each. The single or double nucleolus is attached to the thread at more than one point. Dark stained bodies are seen scattered all over the reticulate thread. Chromatin is aggregated around these bodies, the thread is constricted and the chromosomes are formed. The secondary nucleolus disappears during the development of the chromosomes, and the primary one remains spherical throughout diakinesis. At late diakinesis the primary nucleolus fades away gradually until it disappears; at the same time fibrilla-like structures appear between the chromosomes. The above facts suggest that when the nucleolus divides it separates two different materials; and supports the view that the secondary nucleolus contributes material to the chromosomes, while the primary may contribute to the spindle. No resting nuclei are formed during interkinesis; and at homotypic telophase twelve chromosomes could be distinguished.—*Author's summary.*

3221. **SIMONET, MARC.** Sur l'étude cytologique de quelques hybrides d'Iris (groupe Pogoniris). *Bull. Mens. Soc. Nation. Hort. France* 2(1929): 455-463. 2 pl. 1929.—The author describes the behavior of the chromosomes in the reduction divisions in pollen mother cells of certain hybrids. n equals 20 in *Iris chamaeiris* Bertol. and usually in *I. pumila* Hort. A horticultural variety of *I. pumila* L. has $2n=36$ (9 bivalents and 18 univalents). The hybrid × Zwanenburg has $2n=42$ (12 bivalents and 18 univalents). In the garden Iris (*I. germanica* Hort.) are to be found diploids, triploids, tetraploids, and pentaploids with 24, 36, 48 and 60 chromosomes respectively. In all these plants many nuclear anomalies were noted as well as the presence of supernumerary chromosomes, and sometimes also, the absence of a chromosome: $(2n+1)$, $(3n-1)$, $(4n-1)$, $(4n+1)$, $(4n+2)$, and $(5n+2)$. In addition the author has noted a close relation between chromosome complement and gigantism; the largest plants and those having the best developed flowers, have the highest number of chromosomes. *I.*

germanica L. and intermediate forms have 2n=44 (14 bivalents and 16 univalents).—*M. Simonet (transl. by A. M. Wolfson).*

3222. **SINOTO, Y. The chromosomes of Makinoa crispata, Miyake.** *Cytologia* 2(1): 81-84. 5 fig. 1930.—The chromosomes of the ♂ plant of this liverwort seem to be the same in number, shape, and size as those of the ♀, except that the smallest chromosome in the former shows telomitic attachment of spindle fibres. This difference, as suggested by Heitz, is probably related, at least in part, to sex differentiation in the species.

3223. **TUAN, HSU-CHUAN. A new method for safranin differentiation.** *Stain Tech.* 5(3): 103-107. 1930.—A new method of differentiating safranin in pollen-mother-cell smears and paraffin sections is described in detail. Slides stained in safranin are dehydrated in a series of alcoholic solutions containing 1.5% picric acid with constantly decreasing percentages of water. Differentiation is principally effected in 83% alcohol containing 1.5% picric acid and completed in the final dehydration and clearing. Counterstains may be applied in clove oil if desired.—*Author (courtesy Wistar Bibl. Serv.).*

3224. **TURESSON, G. Studien über Festuca ovina L. III. Weitere Beiträge zur Kentnis der Chromosomenzahlen viviparer Formen.** *Hereditas* 15(1): 13-16. 1 fig. 1931.—A study of 10 viviparous forms of *F. ovina,* showing the chromosome series 21, 28, 42. Excepting the unusual type *tennforsiensis,* all forms from the Scandinavian inland are triploid. Types from Scotland and the islands are tetraploid.—*H. Wexelsen.*

3225. **VANDENDRIES, RENÉ. La tétrapolarité et les mutations sexuelles chez Hypholoma hydrophilum Bull.** *Bull. Soc. Roy. Bot. Belgique* 63(1): 26-35. 1 fig. 1930.—The author describes experiments with sex mutants of *Hypholoma hydrophilum* (Agaricaceae). Since these mutants are carried in culture and paired with others to determine sexual reactions, it appears that the mutations are of a permanent nature. In all, he reports on 18 that respond positively as monosexual haplonts. The haplonts may have various combinations of the factors represented by *a, b, a', b'* in which *ab* reacts positively with *a'b'* or *a'b* with *ab'*. In addition to the 18 seemingly unisexual cultures there are certain anomalous ones, as for example No. 1 reacts with *a'b* and *a'b'* and another anomalous form, No. 11, which reacts with all other forms. No. 12 reacts with no other forms except No. 11. In another unexplained case, No. 21 behaves as of the composition *a'b'* but fails to react with No. 1 which in turn reacts with other haplonts of the formula *a'b'*.—*E. A. Baird.*

3226. **WAGNER, N. Le chondriome des embryons des graines au cours de la maturation et de la germination.** *Arch. Anat. Microscop.* 26(3): 419-432. 1 pl., 1 fig. 1930.—Seeds of *Phaseolus multiflorus* and *Cucurbita pepo* showed the constant presence of chondriosomes during all the phases of development of the embryo and during germination. A relation was found between the aspect of the chondriome in embryo cell and the processes of hydration and dehydration.

3227. **WAKAYAMA, K. Contributions to the cytology of fungi. II. Cytological studies in Morchella deliciosa Fr.** *Cytologia* 2(1): 27-36. 2 pl. 1930.—The young ascus is binucleate. After fusion of the two nuclei, meiosis occurs. The first division is heterotypic, and a typical synaptic knot with a large nucleolus is clearly observed. The meiotic spindle is of intranuclear origin, and at each pole is a centrosome with well developed astral rays. The behavior of chromosomes in the anaphase is irregular. Twenty-four univalents are found. The second division is homotypic, giving rise to four daughter nuclei. Twelve chromosomes are present, and the 24 univalents are scattered irregularly in the spindle. In the third division, there are clear indications of "brachymeiosis," as far as the numerical diminution of chromosomes occurs, but the writer is uncertain whether the latter represents a true reduction or not. Accordingly, the number of chromosomes in meiotic division is reported for the present as 12. In exceptional cases, tetraploid asci were met with, and about 48 univalents were found. After the third division, 8 daughter-nuclei with intensively radiating astral rays are formed; radiations proceed until the astral rays meet at opposite poles, sweeping round the nucleus and delimiting the spore by the formation of a spore membrane. A typical mitosis takes place in the spore, 6 chromosomes being observed in the telophase, so that the spore becomes binucleate.—*Author's summary.*

3228. **WEST, GERTRUDE. Cleistogamy in Viola riviniana with especial reference to its cytological aspects.** *Ann. Bot.* [*London*] 44(173): 87-109. 2 pl. 4 fig. 1930.—In *V. riviniana* the first flowers of the season are chasmogamous; then come a few semi-cleistogamous flowers and finally cleistogamous ones. The cleistogamous flowers set good seed; the chasmogamous ones often fail to do so. The anthers of chasmogamous flowers contain both large pollen grains, which are shed, and smaller ones, which germinate in the anther as in cleistogamous flowers. Degeneration of pollen may set in at any stage in cleistogamous flowers. Meiotic phenomena in the anther are in general of the usual type. The embryo sac has 8 nuclei. The pollen tube enters the sac through a synergid and discharges 2 male cells; double fertilization follows. The haploid number of chromosomes is 20.—*L. W. Sharp.*

3229. **WETZEL, GERHARD. Chromosomenstudien bei den Fagales.** *Bot. Arch.* [*Leipzig*] 25(3/4): 257-283. 1 pl., 49 fig. 1929.—Chromosome numbers were obtained from 11 genera, as follows: *Carpinus, Ostrya, Corylus, Betula, Alnus, Fagus, Castanea* and *Quercus*. The haploid number was 8 in *Carpinus betulus* and *Ostrya carpinifolia;* 11 in *Corylus* spp., *Castanea* spp., *Fagus silvatica, Quercus* spp.; 14 in *Alnus* spp. Reduction divisions were normal in all genera. There exists in nature a threefold sexual rhythm in the *Fagales*. In the circumpolar type (*Corylus, Alnus, Betula*), the reduction division occurs as a rule in the year previous to flowering. In the middle European type (*Carpinus, Ostrya, Fagus, Quercus*), the reduction division occurs in the same year with the resultant flower. In the Mediterranean type (*Castanea*), the reduction division and flowering are in the same year, but are delayed until mid-summer.—*R. E. Cleland.*

3230. **WHITAKER, THOMAS W. Chromosome numbers in the cultivated cucurbits.** *Amer. Jour. Bot.* 17 (10): 1033-1040. 1 pl. 1930.—The chromosomes of 8 spp. of cultivated cucurbits were counted during the meiotic divisions of the pollen mother cells. The haploid numbers were as follows: *Cucumis sativus*=7, *C. anguria*=11, *C. melo*=12, *Citrullus vulgaris*=11, *Lagenaria vulgaris*=11, *Cucurbita pepo*=20, *C. maxima*=20, *C. moschata*=24.—*T. W. Whitaker.*

3231. **WOLF, PAUL. Zytologische Untersuchungen über verschiedene Formen der Mentha piperita. [Cytology of M. piperita.]** *Beitr. Biol. Pflanzen* 17(3): 351-392. 7 fig. 1929.—*M. canadensis* L. var. *piperascens* has 27 (haploid) chromosomes; *M. piperita* L. var. *crispa* and 5 distinct forms of the *M. "aquatica* × *viridis* group" have 18 (haploid). All the plants examined are considered to be hybrids; all showed essentially the same behavior during micro- and macrosporogenesis. During meiosis of pollen-mother-cells, aberrant chromosomes fail to reach the poles with resultant formation of microcytes at the tetrad stage. Much dwarf pollen is produced. Most of the normal pollen degenerates in the anthers. Macrosporogenesis is also defective. *M. "aquatica* 3 × *viridis* 1" gave no seed; the other plants produced seed in varying quantities. The author is of the opinion that *M. piperita* is not a form intermediate between its putative parents, *M. aquatica* and *M. viridis;* it consists rather of a series of intermediate forms which show varying resemblances to each parent type. Meiotic irregularities have produced gametes whose 9 chromosomes are partly maternal, partly paternal in origin. The zygote then will show greater resemblance to that parent which contributed the greater number of chromosomes. On account of the variability of *M. piperita* it is necessary to plant the field with entirely new cuttings of a good

M. piperita at least every 5 years in order to secure a good quality of oil.—*A. D. Bergner.*

3232. **WOODWORTH, R. H.** Cytomyxis. *Jour. Arnold Arboretum* 12(1): 23-25. 1930.—The extrusion of chromatin from the nucleus of one pollen mother cell to another has been considered a normal process by some cytologists. A critical study of cytomyxis shows however that it is caused by mechanical injury to the cells during the preparation of the tissue for fixation.—*K. Sax.*

3233. **WOODWORTH, R. H.** Meiosis of microsporogenesis in the Juglandaceae. *Amer. Jour. Bot.* 17(9): 863-869. 2 pl. 1930.—*Juglans regia, J. rupestris, J. nigra, J. cinerea, J. mandshurica, J. sieboldiana* var. *cordiformis,* all have n=16, and all show normal meiosis. *Juglans notha* is a known hybrid. It shows the irregularities of meiosis characteristic of heterozygous plants. It is emphasized that these abnormalities are natural, not being due to the technique employed. Cytomyxis is accompanied by chromosome migration. *Carya ovata, C. laciniosa, C. cordiformis,* have n=16, and exhibit regular meiosis. *Carya alba, C. glabra, C. ovalis,* are tetraploid species with n=32. Meiosis is normal. *Carya laneyi* var. *chateaugayensis* is a known hybrid. It is diploid as are both its parents. Meiosis is abnormal as in other hybrids. *Pterocarya rehderiana* is a known hybrid ($n=16$). Meiosis is somewhat abnormal, due to its heterozygous nature. Cytomyxis is accompanied by chromosome migration. *Betula, Alnus* and *Corylus* with 14, and *Carpinus, Ostrya,* and *Ostryopsis* with 8 chromosomes as the respective fundamental numbers, form two rather distinct groups in the Betulaceae. The Juglandaceae with 16 chromosomes may have a phylogenetic connection with the second of the above groups.—*Author's summary.*

GENERAL

3234. **FORD, E. B.** The theory of dominance. *Amer. Naturalist* 64(695): 560-566. 1930.—Fisher's theory of the origin of dominance, through natural selection of the gene-complex, is reviewed. It receives confirmation from recent work on the multiple effects of single genes. Haldane's supplementary suggestion, that dominance may arise through natural selection of multiple allelomorphs, is also discussed. It is pointed out that this is also ultimately dependent upon selection of the gene-complex. Evidence is cited that mutations are sometimes due to changes at a given locus and sometimes to actual losses of genic material. But such losses provide no explanation of the recessive state and do not necessarily lead to the recessive condition. Dominance modification will be particularly rapid in polymorphic forms, for in these the heterozygotes form a large proportion of the population. —*E. B. Ford.*

3235. **ZWARENSTEIN, H.** Bridges' genic balance theory of sex determination. *Nature* [*London*] 127 (3216): 927. 1931.—Gives a table to represent the genotypic differences of the various sex types.

PLANT

3236. **BACH, FRIEDRICH.** Kreuzungsversuche bei weissem Winterkalvill. Eine neue Apfelxenie. *Gartenbauwiss.* 1(6): 615-618. 1 fig. 1929.—Crossing of White Winter Calville (♀) × Kalterer Böhmer (♂), with 80-90% of the pollen germinating in 10% sucrose solution, and × Gravenstein (♂), with 30% germination, gave a 23-23.5% and 16-17% fruit set respectively. Only 1.5% of flowers set fruit when White Winter Calville was self-fertilized. This variety is largely self-sterile. Eight cases of zenia were observed in Winter Goldpermain (♀) × White Winter Calville (♂) crosses, in which the pollen parent influenced the form of the fruit.—*A. E. Murneek.*

3237. **BARNES, B.** Induced variation in fungi. *Jour. Quekett Microscop. Club* 16(97): 167-176. 1931.—In experiments on *Eurotium herbariorum, Botrytis cinerea,* and *Thamnidium elegans,* transfer of spores by a hot platinum wire was followed by the appearance of numerous variant forms in the cultures. Some of the abnormalities have persisted through about 100 consecutive sub-cultures. The variants are almost always slower growing than the normal; colonies are denser, with closely approximated branches; the variants are unstable for some time after their appearance. In young colonies of variants, pigmentation and growth sometimes approximate those in old colonies of the normal species.

3238. **BRITTINGHAM, WILLIAM H.** Oenothera lamarckiana mut. acutifolia, a new mutant type produced by a gene outside the first linkage group. *Amer. Naturalist* 65(697): 121-133. 2 fig. 1931.—*Oenothera lamarckiana* mut. acutifolia* appeared [at Princeton University] in the spring of 1929 in a cross-bred line of *O. lamarckiana* which had been maintained for 23 yrs. This new gene mutation is characterized by a narrower, more sharply pointed rosette leaf and a reduction in the amount of crinkling. Plants of *acutifolia* grow much more slowly than the typical *lamarckiana* and are several weeks later, on the average, in coming to bloom. When *acutifolia* first appeared it made up 21.4% of the population of 3 segregating families. Self-fertilized *acutifolia* ($a_f a_f$) has bred true. In a segregating family, 31 phenotypic *lamarckiana* plants were tested and shown to be of 2 genetic constitutions: 8 plants ($A_f A_f$) gave typical *lamarckiana* progenies; 23 plants ($A_f a_f$) threw segregating families. *Acutifolia* is completely recessive. When it was crossed with $A_f A_f$ *lamarckiana,* no *acutifolia* appeared in the F_1; when it was crossed with *lamarckiana* heterozygous for *acutifolia* a 1:1 segregation resulted. The occurrence of typical monohybrid ratios in self-fertilized *lamarckiana* indicates that the gene for *acutifolia* (a_f) is not in linkage-group I with the balanced zygote lethals. Either it is in group II with b_r; or in group III with *v, sp* and b_u; or in group IV for which it would be the first known gene. Mut. *acutifolia* has 14 chromosomes ($2n$), which at diakinesis appear to be arranged in a circle or chain of 12 and a single pair. Thus the configuration in *acutifolia* seems identical with that found in its parent species, *O. lamarckiana.* The cytological work is being continued. The importance of new genes in *lamarckiana* which give typical Mendelian ratios is stressed as providing a means towards solving the problem of the significance of chromosome cohesion in *Oenothera.*—*Author's summary.*

3239. **BUXTON, B. H., and C. D. DARLINGTON.** Behaviour of a new species, Digitalis mertonensis. *Nature* [*London*] 127(3194): 94. 1931.—*D. mertonensis* arose in 1926 by crossing F_1 hybrids of *D. purpurea* and *D. ambigua* inter se. Chromosome number is 112; the hybrid evidently arose by suppression of reduction division in

its parents (each with 56). The sp. is giant and tetraploid; it has been carried on for 5 generations.

3240. **CAYLEY, DOROTHY M. The inheritance of the capacity for showing mutual aversion between mono-spore mycelia of Diaporthe perniciosa (Marchal).** *Jour. Genetics* 24(1): 1-63. 1 pl. 1931.—A large number of tests with mono-spore mycelia of the haplo-heteroecious form of *D. perniciosa* have shown that the capacity for mutual aversion is inherited, and segregates in the 2nd and subsequent ascospore generations. There are 2 forms of aversion, inter-racial and intra-perithecial, macroscopically indistinguishable. The paper deals mainly with intra-perithecial aversion, a form of self-sterility dependent on 2 or possibly 4 pairs of factors, which segregate independently of sex. The mycelia fall into 4 groups. All members of one group show aversion towards all members of the other 3, and yet one group can throw mycelia belonging to another group. These conflicting results are explained by an adaptation of Kniep's 4-group scheme for sex in the Basidiomycetes. In *Diaporthe* 2 mono-spore thalli of like genetical constitution meet and show no aversion, but no zygote is possible in such a combination. When 2 mono-spore thalli of opposite sexes having no factor in common are combined, the mycelia meet and produce fertile perithecia. Aversion occurs only when the total of the allelomorphic pairs carried by the opposing thalli is unbalanced. The occurrence of aversion or no aversion among the mycelia from a single perithecium, or from different perithecia in the same culture, therefore depends upon the type of segregation which has taken place in the asci of the parent perithecium. Different perithecia in the same culture can give different types of segregation, and the same types of segregation can occur in the different groups. The results also indicate that both sex and the self-sterility factors can segregate either at the 1st or the 2nd meiotic division in the ascus. Cases of aversion in other groups of fungi are discussed, and an attempt is made to classify the different forms of heterothallism now known in the fungi, in order to distinguish between true sex heterothallism and other forms in which the sexual affinity of the mycelia is controlled by factors other than sex factors. The paper includes numerous charts and a comprehensive bibliography.—*D. M. Cayley.*

3241. **COLLINS, J. L., LILLIAN HOLLINGSHEAD, and PRISCILLA AVERY. The Crepis setosa chromosomes present in Crepis artificialis; a correction of Tischler's statement concerning autosyndesis among setosa chromosomes.** *Amer. Naturalist* 65(697): 191-192. 1931.

3242. **CRANE, M. B., and W. J. C. LAWRENCE. Sterility and incompatibility in diploid and polyploid fruits.** *Jour. Genetics* 24(1): 97-107. 1931.—In the sweet cherry, *Prunus avium* (diploid), incompatibility is comparatively simple. Self-compatibility is the rule, cross-incompatibility common and always reciprocally expressed. Among established varieties 9 intra-sterile, inter-fertile groups have been found. Investigations with seedlings show that this incompatibility is an orderly phenomenon based on a series of oppositional factors and amenable to the genetic interpretation advanced by East and Mangelsdorf in *Nicotiana*. In the sour cherry (*P. cerasus*) and the "Dukes" (tetraploids), different degrees of compatibility occur. In plums, *P. domestica* (hexaploid), incompatibility is complex. Self- and cross-compatibility, self- and cross-incompatibility, degrees of self- and cross-compatibility and differences in reciprocal matings, both complete and in partial degree, occur. In apples, compatibility is common in partial degree, but rarely completely expressed. "Triploid" varieties are characterised by a high degree of sterility, but it is expressed in the formation of imperfect seeds and weak offspring rather than by failure to form fruits. The expression of incompatibility is more complex and variable in polyploids than in diploids. This is attributable to the polysomic condition of the factors determining incompatibility in polyploids and consequent interactions favorable to great variation in pollen tube growth.—*M. B. Crane.*

3243. **HUSKINS, C. LEONARD. Origin of Spartina townsendii.** *Nature [London]* 127(3212): 781. 1931.—Considered to be an allopolyploid derived by the natural crossing of *S. alterniflora* and *S. stricta.*

3244. **IMAI, YOSHITAKA. Creased flowers of Pharbitis Nil.** *Zeitschr. Indukt. Abstamm.- u. Vererb.* 58 (2): 248-258. 10 fig. 1931.—Creased is an old variation occurring under intense cultivation. Cotyledons are a little crumpled; leaves nearly flat or slightly crumpled; and corollas creased and irregularly split, with supplementary petaloid pieces, like those of feathered; fertility is low. Notwithstanding the fact that creased dates far back of feathered, the former has nearly disappeared in Japanese gardens, while the latter is popular among cultivators. This is due evidently to the easy identification of feathered seedlings by their cotyledons, which are considerably curved upwards. Creased constitutes one of a triple series of allelomorphs with normal and feathered, the order of their dominance being normal, feathered and creased. The other six cases of multiple allelomorphs are described. Creased is linked very closely with cordate, as feathered is, with 1.2% of crossing over. The recessive gene crumpled-1 acts as a dominant when working on the genotypes creased, delicate, crêpe and deformed, and therefore exhibits "reversal of dominance." —*Author's summary.*

3245. **JAGANNATHA RAO, C. The immediate effect of artificial self-fertilization on some economic characters of the cotton plant.** *Madras Agric. Jour.* 19(3): 113-119. 1931.—No appreciable differences are observed in the flowering and bolling curves obtained from plants, the flowers of which are partly selfed and partly left for natural pollination. The 8 boll characters studied, namely, ovules per lock, seeds per lock, fertility index, lint length, kapas weight per seed, lint weight per seed, weight per seed, and ginning %, are not affected by selfing the flowers.

3246. **KOSTOFF, DONTCHO, and JAMES KENDALL. Variants and aberrants of Nicotiana obtained experimentally.** *Biol. Generalis* 7: 271-282. 3 pl., 27 fig. 1931.—By operating on the anthers of *Nicotiana tabacum* var. *macrophylla* (inbred for 4 generations) with a sterile needle before or during the process of meiosis, irregularities were induced in this process that resulted in the formation of viable pollen grains of various sizes as well as a high percentage of abortive grains. The flowers, in which about 70-85% of the pollen was abortive and the viable grains varied greatly in size, were selfed; the resulting capsules yielded about 10-25 seeds per capsule. From seeds so obtained about 800 seedlings were raised. Of this number there were about 100 divergent plants; differences from the normal controls and parent plants were evident not only in the morphological characters of the leaves and flowers but also in certain physiological processes. The plants varied markedly in their rates of growth, and a study of the nicotine content showed significant differences. Cytological study of the pollen mother cells and root tips in a number of the outstanding plants is reported. Plants with abnormal morphological characters were found having the normal chromosome number ($n=24$, $2n=48$), and others with an aberrant number ($n=25$-27, $2n=50$-54). Among the 1st group, the variants, in some cases the meiosis was almost normal, while in others it was irregular and led to formation of considerable abortive pollen and viable pollen grains of varying sizes. In the case of the 2nd group, the aberrants, meiosis was irregular and the pollen contained a high percentage of abortive grains and viable grains of different sizes. Many of the large, and also some of the small, grains in the pollen of these plants were found to germinate on their own stigmas. There appears to be a positive correlation between the percentage of viable pollen grains and the number of seeds set after selfing.—*J. Kendall.*

3247. **KOTILA, JOHN ERNEST. Some chimeras of Solanum tuberosum L.** *Papers Michigan Acad. Sci. Arts*

& *Let.* 11: 219-224. 5 pl. 1929(1930).—A chimera of fasciated stem and one of an abnormal leaf reproduced themselves from tuber cuttings. One involving skin color, found in single tuber clons, reproduced itself through two generations of cuttings. Russet Rural probably is a chimera of Rural New Yorker.—*T. M. Currence.*

3248. **LEWIS, M. T. Inheritance of heading characteristics in lettuce varieties.** *Proc. Amer. Soc. Hort. Sci.* 27: 347-351. 1930(1931).—Heading does not lend itself to precise genetic analysis beyond the fact that it is a quantitative character depending upon multiple factors. This difficulty exists in a degree greater than would be expected in a self-fertilized plant. In not all cases did an intermediate form appear in F_1, while in F_2 a wide range of types was recovered. In the one instance observed, reciprocal crosses gave in F_1 and F_2 similar results except as to non-heading, in which there was a disagreement of about 30%. In general in New York crosses, from 60% to 90% of non-heading plants occur in F_2. For commercial purposes, of the varieties studied, the crosses holding the greatest promise are New York by Hanson and Golden Yellow Stonehead by Early Butternut. In crosses involving varieties of the crisphead group, F_2 types superior to existing commercial strains were rarely recovered, while in the cabbage-butterhead group superior F_2 individuals have been observed.—*Author's conclusions.*

3249. **McCLELLAND, C. K. The genetics, breeding and improvement of corn and cotton.** 74p. Publ. by the author: Univ. of Arkansas, Fayetteville, 1930. Price of complete list $1; for list of corn 75c; for cotton, 60c.—A bibliography of 1300 titles of work published in the U. S. A. and elsewhere during 1889-1929, on the genetics, cytology, breeding and inheritance in the 2 crops mentioned. References to abstracts in the Experiment Station Record of the U. S. D. A and in Botanical and Biological Abstracts are given for most of the articles. The linkage groups of maize as of 1929 are listed.—*J. O. Ware.*

3250. **[NAVASHIN, M. S.]** НАВАШИН, М. С. Случай мерогонии вследствие межвидового скрещивания у сложноцветных. **[A case of true merogony induced through species-crossing in Crepis.]** [German summary.] Журнал Русского Ботанического Общества при Академии Наук СССР. (*Jour. Soc. Bot. Russie, Acad. Sci. URSS*) 12(1/2): 87-98. 6 fig.; also in German in *Ber. Deutsch. Bot. Ges.* 65(2): 115-126. 3 fig. 1927.—The author chanced to find among descendants of an F_1 interspecific hybrid, *Crepis tectorum* ♀ × *C. alpina* ♂, 1 individual which possessed the pure chromosome complement of the ♂ parent, *C. alpina.* Due to very low chromosome numbers (*C. tectorum* and *C. alpina* have only 4 and 5 pairs respectively) and low viability of recombination products, zygotes containing parental chromosome complements should be relatively frequent. Since the ♂ gametes of Compositae bear no cytoplasm, the ♀ parent only supplies the latter to the offspring. The reduction division represents an ideal mechanism for "transplanting" chromosomes of one species into cytoplasm of another, thus giving rise to merogony. The F_1 individual obtained in this case was in all respects identical with ordinary plants of *C. alpina,* despite the fact that only its chromosomes belonged to this species, the cytoplasm obviously being derived from *C. tectorum,* which served as the ♀ parent. This first established case of true merogony in higher plants led to the conclusion that specific characters depend on the nature of the chromosome complex and that the cytoplasm has no influence on the transmission or expression of specific characteristics.—*E. B. Babcock.*

3251. **NICOLAISEN, W. Beitrag zur Immunitätszüchtung des Hafers gegen Ustilago avenae (Pers.) Jens.** *Zeitschr. Zücht. Reihe A, Pflanzenzücht.* 16(2): 255-278. 1 fig. 1931.—The method of Reed, unmodified, was found best suited in inducing smut infection, in comparison with the vacuum process of Zade or the flower inoculation method. The immune Black Mesdag was crossed with 4 susceptible varieties. Resistance was dominant and segregation was single-factored. In a cross between Black Mesdag and a resistant variety, resistance was dominant. Calculation of factors was difficult but probably segregation was on a 3-factor basis. A very few plants were highly susceptible. The F_3 families were grouped in but 4 classes. The cross between the immune Red Rustproof and a susceptible variety showed 2 factors present. In Red Rustproof × Lochow's Gelbhafer (the latter resistant), the former showed 2 factors for immunity (dominant) and the latter 1 factor for resistance. In the 4th cross the same Gelbhafer was crossed with a mildly susceptible *A. byzantina* variety, Fulghum. From this cross arose a large number of immune, as well as a number of susceptible, selections. Black Mesdag seedlings, after becoming infected, appeared much injured and in a near-lethal condition. Recovery followed and no infected mature plants ever appeared. The Lischower variety showed no corresponding injury but many plants died before maturity. By means of a series of inoculations, geographical races of smut were isolated, and these were found to have different infective capacities with different varieties. The reaction of (mature) Black Mesdag was always zero.—*L. R. Waldron.*

3252. **NILSSON-EHLE, H. En ny växtförädlingsgren vid Sveriges Utsädesförening. [A new line of plant breeding at the Swedish Seed Association.]** *Sveriges Utsädesför. Tidskr.* 41(2): 67-69. 1931.—The Swedish Seed Association has received funds for establishing a laboratory for chromosome investigations, and a review is given of the possibilities of artificially increasing chromosome numbers in field crops.—*G. Nilsson-Leissner.*

3253. **PEARSON, O. H. Further observations on the type of sterility in Brassica oleracea var. capitata.** *Proc. Amer. Soc. Hort. Sci.* 27: 337-342. 1930(1931).—By inbreeding, lines of cabbage plants incompatible to their own pollen and to that of their sibs can be isolated. Certain combinations of these incompatible lines can be made so that perfect sets of seed will be secured. In a few generations such self incompatible lines probably could be isolated and by planting these lines side by side in cross compatible combinations, commercial qualities of F_1 seed, with all the vigor and uniformity characteristic of hybrids, could be obtained.

3254. **PORTER, D. R. Some effects of inbreeding in watermelons.** *Proc. Amer. Soc. Hort. Sci.* 27: 554-559. 1930(1931).—Preliminary report. The variety Klondike may be inbred for at least 4 successive generations without marked decrease in number of fruits or total yield per plant. Inbreeding tends to isolate strains which produce either larger or smaller fruit than the commercial variety. Strains, inbred for 4 successive generations, have been isolated which produce fruit equal in weight to those of the parent variety but which excel the latter in fruit uniformity, flesh color, texture, and quality.—*Author's conclusion.*

3255. **RAUM, H. Über die Vererbung von Ähreneigenschaften bei Kreuzungen zwischen Emmer- und Dinkelreihe des Weizens.** *Zeitschr. Zücht. Reihe A, Pflanzenzücht.* 16(2): 161-254. 13 fig. 1931.—This work, in part, is a continuation of that already reported (See Biol. Absts. 5(4): 10359), *A* and *B* in this article replacing L_1 and L_2 of the previous article. A 3rd lengthening factor *L* is introduced. These 3 are responsible for rachial internodal length [not spikelet length as stated in the earlier abstract] while *C* shortens the internodes to produce *T. compactum.* In the present work 16 crosses were made between tetraploids and hexaploid wheats, and analyses continued to the F_3, and later, generations. The F_1 plants from *dicoccum* and *dicoccoides* × *hexaploids* showed markedly less fertility than did the F_1 plants from *durum* and *polonicum* × *hexaploids.* Fertility in the F_2 was generally less than in the F_1. The wholly heterozygous individual is *densum* with the formula *AaBbCcLl.* The head types, in order, consist of *hypercompactum, compactum, capitatum, densum, sublaxum* and *laxum.* The *C* factor is present only in *T. compactum* of the hexaploids and in all the tetraploids used except the true emmers and *T. polonicum.* The factors

listed are evidently present in the 28 pairing chromosomes found in the 2 wheat series but not present in the 7 extra chromosomes of the hexaploids.—Factors *S* and *B* are assumed to be responsible for glume tightness and rachial brittleness, respectively, and they are further assumed to be in a dominant condition in all tetraploid and hexaploid chromosome sets of the wheats studied. Inhibiting factors are assumed to be present in the tetraploid (pairing) chromosomes, either dominant or recessive. In addition a dominant (or occasional recessive) inhibiting factor *H* is found in the univalent chromosomes of the hexaploids. The close-glumed tetraploids would be *sshh* and the loose-glumed tetraploids (durums and poulards) *SSIH*. Hexaploids would be *SShh*[*HH*], *SSIH*[*HH*] and *SSHH*[*hh*]. Corresponding formulas are assumed for rachial brittleness. The 1st hexaploid formula would give 1:1 close to open glumes; the 2nd would give 5:3 close to open and the 3rd 3:1 close to open. Due to sterility, these ratios were followed only approximately. The above formulas would explain the presence of "speltoids" which occurred rather freely and which were always heterozygous in the F_2. Novel plants, loose-glumed with brittle rachises, appeared in certain crosses and were named "vulgoids." A *T. turgidum* × *T. vulgare* cross (both with open glumes and tough rachises) yielded an apparently true *dicoccum*. It was not studied cytologically. A *T. dicoccoides* × *T. spelta* cross (both with brittle rachis) resulted in brittle rachis segregation. This might be expected as the breaking of the rachis in the 2 wheats is different.—Four genes are held to be concerned with awnedness: *F* and *G* induce awning while *H* and *I* inhibit the presence of awns. The *I* gene is of an activating nature. All bearded forms are given 1 grouping except the heterozygous tip-bearded wheats. [At least some of the so-called awnless hexaploid parents carried tip awns.] The ratios of awned to awnless are various and range from 3:1 to 165:91. Results from the 16 crosses confirm, in general, the hypothesis. The general closeness of fit to the assumed formulas furnishes strong evidence that the genes concerned are located in the tetraploid (pairing) chromosomes of the hexaploids and not in the univalents. In 2 crosses additional awning genes appeared necessary to account for the splitting in the F_2, but all F_2 plants tested showed normal segregation in the F_3. Only 1 of the awning genes, designated *F*, was assigned to the tetraploids while the hexaploids carried the *G* genes, except for *T. spelta* where both genes were recessive. *H* and *I* were both present in the awnless hexaploids. Difficulty arose in some instances in ascribing the proper formula to a parent due to the nearness of certain ratios; the difference in the expected awned plants in one instance was but 4.3%.—*L. R. Waldron.*

3256. TJEBBES, K. Interfertile Gruppen innerhalb einer selbststerilen Form von Portulaca grandiflora Lindl. *Bot. Notiser* 1930(1): 48-52. 1 fig. 1930.—Ordinarily *Portulaca* is self-fertile but a race originating from Vilmorin Andrieux et C^ie^ in Paris, "pourpre à grandes fleurs de Paraná," and differing only in color from other forms of the species, proves to be self-sterile. The pollen is regularly good, and the reduction division takes place without disorder ($n=9$, as is general in *P. grandiflora*). Each perpetuated plant of this race is the result of crossing between 2 self-sterile plants. The result of 166 cross-pollinations among 20 self-sterile plants are tabulated: 2 flowers of each plant were crossed; 34 combinations gave seeds, 82 were sterile. There appear to be at least 2 intrasterile, interfertile groups in this race.—*H. K. Svenson.*

ANIMAL

3257. AGAR, W. E. A Lamarckian experiment involving a hundred generations with negative results. *Jour. Exp. Biol.* 8(1): 95-107. 1931.—Experiments were devised to determine whether regeneration of the dorsal branch of the 2nd antenna of *Simocephalus* and *Daphnia*, repeated for many generations, would result in an improvement in the regeneration (which is very imperfect) or in any alteration in the process. Neither the character nor extent of the regeneration was influenced in any measurable degree in any of the experiments, even after 100 generations, nor was the normal growth of the antenna affected. A similar experiment, except that selection was practiced in addition, also produced negative results, confirming both the lack of Lamarckian effect and the inefficacy of intraclonal selection.—*J. M. Robson.*

3258. ASTAUROFF, B. L. Studien über die erbliche Veränderung der Halteren bei Drosophila melanogaster Schin. *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 115(3): 424-447. 16 fig. 1929.—Recessive mutant "tetrapter" (*tr*), located at 51.3 in chromosome III. Development is usually asymmetrical and highly variable. Majority of homozygotes appear wild-type. Stages of manifestation: (1) Head of halteres develops a row of bristles corresponding to costals of normal wing; (2) flattened lamellae and pronounced costal vein; (3) area larger; radial appears; alula differentiates; (4) still larger; costal, radial, medial present; sense organs on medial; (5) length ½ normal; all veins present; very rare. Transitional stages strongly support idea that halteres represent a reduced second pair of wings. Tetrapter is believed to be non-allelomorphic to earlier similar mutants, bithorax and bithorax-b.—*C. B. Bridges.*

3259. CUÉNOT, L. Génétique des souris. *Bibliographia Genetica* 4: 179-242. 1928.—A review. Sections treat of methods of raising mice, chromosome number, genetical studies in the pre-Mendelian period, in the Mendelian period, the genetic factors, cancer in mice and its inheritance, general facts of heredity, wild mice and their natural sub-species, attempts to produce mutations in mice, attempts to demonstrate the inheritance of acquired characters, and telegony. Bibliographies, mostly extensive, are given for each section.

3260. DRIVER, ERNEST C. Temperature and gene expression in Drosophila. *Jour. Exp. Zool.* 59(1): 1-28. 1931.—In homozygous inbred races of bar and ultrabar mutants of *D. melanogaster* the facet number varies inversely with the temp. in geometrical progression. This rate remains constant for ultrabar through a range of temp. extending from 15° to 30°C., but in the bar race the rate changes abruptly in the neighborhood of 21°C. Temp.-effective periods have been worked out for bar temperatures at 15, 17, 20, 22, 27, and 30°C. and for ultrabar at 15, 17, 20, 22, and 27°C. In ultrabar the effective period covers approximately 26% of the larval life at all the temp. used. In bar the effective period covers approximately 25% of the larval life at temp. below 21°, and 16% at higher temp. Attempts at an analysis of the curves for rate of facet formation in both stocks show that it cannot be compared to a simple chemical reaction nor to a catenary series in which one is the limiting or controlling reaction. It is concluded that facet formation is the resultant of 2 or more opposing forces, the formation of facets being initiated by the whole gene complex and the mutant series of bar genes exerting a retarding influence upon this process. The facet-forming reaction and the reaction retarding it do not have the same temp. characteristic, so that at different temp. a different point of balance is reached and therefore different facet numbers result.—*Author* (*courtesy Wistar Bibl. Serv.*).

3261. GREEN, C. V. Size inheritance and growth in a mouse species cross (Mus musculus × Mus bactrianus). III. Inheritance of adult quantitative characters. *Jour. Exp. Zool.* 59(2): 213-245. 1931.—The 2 forms differed qualitatively as well as quantitatively, the large *musculus* (average weight about 30 gm.) carrying the genes *d, b,* and *a,* while the small *bactrianus* (average weight about 15 gm.) possessed their dominant allelomorphs, *D, B,* and A^w. Ten quantitative indices, body length, tail length, relative tail length, number of caudal vertebrae, adult weight, skull width, and the lengths of skull, humerus, femur, and tibia, were studied. The F_1 animals tended to be intermediate in size, although equaling or exceeding the large parent in some skeletal

measurements. The back-cross generations ($F_1 \times$ *musculus*) were more variable than the F_1, and in some skeletal measurements the means likewise exceeded those of the large race. The inheritance of size probably took place through a number of chromosomal genes, not all of which may have been general in their action. In addition, there were strong indications in the back-cross of linkage between quantitative characters and the qualitative characters *d*, *b*, and *a*.—*Author (courtesy Wistar Bibl. Serv.).*

3262. **GREEN, C. V. Size inheritance and growth in a mouse species cross (Mus musculus × Mus bactrianus). IV. Growth.** *Jour. Exp. Zool.* 59(2): 247-263. 1931.—The curves of growth in weight of a small species of mouse, *Mus bactrianus* (*DBA*^{w}), a large inbred strain of *Mus musculus* (*dba*), and their F_1 and back-cross hybrids show no marked differences in form. The 2 spp. and their hybrids agree in that the greatest relative increase occurs between the 3rd and 5th days. Growth then takes place more slowly until the low point, concomitant with the change in food habits (weaning), is encountered. Thereafter the curves again rise more rapidly, and this accelerated growth continues until after puberty, when the increments become smaller and more irregular. The curves of the back-cross animals present some indications that more genes—or genes of greater potency—affecting growth in weight may be located on the chromosomes with *a* and *b* than on that with *d*.—*Author (courtesy Wistar Bibl. Serv.).*

3263. **GREGORY, PAUL WALLACE, and WILLIAM ERNEST CASTLE. Further studies on the embryological basis of size inheritance in the rabbit.** *Jour. Exp. Zool.* 59(2): 199-211. 1931.—Eggs from a race of rabbits of large adult size are more advanced in development at 40 and 41 hrs. after mating (as well as at all subsequent ages) than eggs from a race of small adult size. But at 30½ hrs. after mating no significant differences can be detected, yet it is probable that a potential if not an actual difference already exists. It is suggested, based on Hammett's postulate, that "the -SH group is the essential chemical stimulus to growth by increase in cell number," that a greater richness of the nucleus in such compounds may be responsible for the more rapid growth rate of eggs and embryos from large-race matings. Whether or not such compounds occur as genes located in particular chromosomes is unknown.—*Authors (courtesy Wistar Bibl. Serv.).*

3264. **JOYCE, P. T. A pedigree study of high-producing Ayrshires.** *Jour. British Dairy Farmers' Assoc.* 43: 42-65. 1931.—A summary was made of the systems of milk recording in 3 countries. High milk-producing cows of the Ayrshire breed were chosen from the records of Canada, Scotland and the United States. The pedigrees were traced to the 4th generation. Thirty-two frequently recurring individuals were chosen and their pedigrees traced further. All except 1 of these animals traced to 3 sires referred to as foundation sires, viz., "Hover-a-Blink of Drumjoan" (1892), "Adjutant of South Cumberland" (1819), and "Craigs of Kyle of Drumjoan" (1793). The inbreeding coefficients of the cows studied were calculated and charted. About 20% of the cows had been inbred in 4 generations, about 5% fairly highly inbred and 20% slightly inbred. Inbreeding was neither good nor bad, and in itself gave little indication of breeding value. A review of sex-linked inheritance applying to milking and fat-producing qualities was made. Sex-linkage did not play an important part in the inheritance of milking qualities.—*Author's summary.*

3265. **KING, HELEN DEAN. Studies on the inheritance of structural anomalies in the rat.** *Amer. Jour. Anat.* 48(1): 231-260. 2 fig. 1931.—Four structural anomalies, which appeared spontaneously in various strains, were studied to determine whether they were somatic or heritable variations. Taillessness and anophthalmus were found to be somatic variations, due, probably, to inhibition to development in early embryogeny. Deficiency in the thyroid apparatus occurring in thirteen generations of a strain of captive gray rats was probably transmitted from parent to offspring, but its mode of inheritance could not be determined. A strain of microphthalmic rats was developed from an anomalous individual in the fourth generation of an extracted albino race. Evidence from extensive series of breeding tests indicates that this eye defect was inherited as a recessive character, and that it was caused by the interaction of several genetic factors. The mode of inheritance was greatly obscured, however, by overlapping between normals and defectives. Microphthalmic eyes were about one-third the size of normal eyes, and they showed degenerative changes in the retina, lens, and iris. There was no significant correlation of the defect with sex. Analysis of data suggests that the direction of asymmetry in asymmetrical young was inherited, the tendency being to a transmission of the defect to the right side. A résumé is given of some recent work on mammals in which eye defects have been induced in the young, seemingly by treatment to which parent forms were subjected.—*Author (courtesy Wistar Bibl. Serv.).*

3266. **LAMBERT, W. V., and C. W. KNOX. The inheritance of leg-feathering in the chicken.** *Proc. Iowa Acad. Sci.* 36: 383-384. 1929(1930).—Inheritance of leg-feathering in crosses of Black Langshan with the White Plymouth Rock and Buff Orpington breeds is dependent upon 2 dominant duplicate factors (S_1 and S_2). Black Langshan is often heterozygous for at least 1 pair of these factors. Neither S_1 or S_2 is linked with the gene producing pigmented plumage (*C*). No tendency was found for F_2 and backcross males to have a higher degree of feathering than the females.—*F. A. Stromsten.*

3267. **PUNNETT, R. C. A sex-linked character in ducks.** *Nature [London]* 126(3185): 757. 1930.—Sex-linked characters were obtained by crossing mallards with Indian runner ducks.

3268. **RICHARDS, MILDRED HOGE. The influence of environment on inheritance of two characters in Drosophila.** *Bull. Univ. Oklahoma (Proc. Oklahoma Acad. Sci.)* 9(456): 28-30. 1929.—Treatment of ten stocks of *D. melanogaster* to reduced temp. brought out 2 new mutations—blistered wings and abnormal abdomen. These characters appeared frequently among the progeny of iced flies. One of the 2 blistered wing stocks depends partly on reduced temp. for fulfillment and 1 abnormal abdomen stock similarly depends somewhat on a moderate amount of moisture for fulfillment.—*Author's summary.*

3269. **SCHOTT, R. G. The sex ratio in guinea pigs.** *Proc. Iowa Acad. Sci.* 36: 383. 1929(1930).—The sex ratio for males in a colony of 2014 animals was 49.4%. The number of males dead at birth is greater than the number of females.—*F. A. Stromsten.*

3270. **SCHULTZ, WALTHER. Methoden zur Darstellung versteckter mendelnder Erbanlagen durch ihre Aktivierung ohne Kreuzung, besonders die Kältepigmentierung weisser Haare und roter Albinoaugen. In: EMIL ABDERHALDEN. Handbuch der biologischen Arbeitsmethoden. Abt. IX. Methoden zur Erforschung der Leistung des tierischen Organismus, Teil 3, Heft 6, Lief. 356.** p. 1055-1112. 2 col. pl., 20 fig. Urban & Schwarzenberg: Berlin, 1931.—The Himalayan type of albino (rabbit, guinea-pig or cat) with pigmented extremities can be made to develop pigment in parts of the coat normally unpigmented, if the temp. of the skin in those parts is reduced below 37.5° C. The presence of genes affecting the character of the pigmentation (as grey, black, blue, brown, yellow) or the presence of color patterns may thus be demonstrated more fully than they are shown by the pigmentation of the extremities alone. The demonstration may be made in vitro by removing pieces of skin to tubes of oxygen maintained at appropriate temperatures. The iris of the eye responds in a similar way but to a less extent to treatment in vitro or in transplants to the ear. The Marder rabbit (a non-agouti chinchilla allelomorph of albinism) and the Thuringian rabbit (non-agouti yellow) can also be darkened or lightened in regions of the coat by appropriate tem-

perature control in the presence of oxygen.—*W. E. Castle.*

3271. **TAIBELL, ALULA.** Osservazioni di genetica su Fringillidi. *Natura* 20(2): 65-68. 1929.—Results of crosses between certain species of canaries, chiefly *Serinus hortulanus* × *S. canaria,* are presented. Fecundity in male or female and somatic inheritance as regards color of plumage, size, etc., are discussed.—*J. G. Edwards.*

3272. **TIMOFÉEFF-RESSOVSKY, H. A.** Röntgenbestrahlungsversuche mit Drosophila funebris. *Naturwissenschaften* 18(20/21): 431-434. 15 fig. 1930.—An F_1 of 7083 flies was obtained from 380 matings of normal females with x-rayed males (dosage about 3600 to 4800 r). An F_2 of 58,375 flies and an F_3 of about the same number were examined. 1137 cultures gave 84 sex-linked lethals and 8 visible mutations against 2 sex-linked lethals and no visible mutations from 1986 control cultures. Eight sex-linked and 11 autosomal mutations are briefly described. These show characteristic peculiarities of this species and are mainly bristle and wing mutants (especially interrupted venation). There is weak phenotypic manifestation and a high percent of dominants.—*A. H. Hersh.*

3273. **WHITING, P. W.** The relation between gynandromorphism and mutation in Habrobracon. *Zeitschr. Indukt. Abstam.- u. Vererbungsl. Supplementb.* 2: 1591-1593. 1927.—Five impaternate ♀ are explained by suppression of 2nd oöcyte division; 3 biparental diploid mosaics (1 ♂, 2 ♀), by somatic mitotic irregularity; 14 haploid mosaic ♂ from heterozygous mothers, by egg binuclearity resulting from failure of extrusion of 2nd polar body; 18 gynandromorphs by fertilization of 1 nucleus in a binucleate egg (♂ parts matroclinous, ♀ parts biparental); 1 gynandromorph with ♂ parts patroclinous, by fertilization of both nuclei in binucleate egg; orange eye-color in 10 cases from black-ivory parents, by mutation correlated with mosaicism. Evidence indicates that prereduction and postreduction may occur simultaneously for different loci.—*P. W. Whiting.*

MAN

3275. **BALLIN, LUDWIG.** Die Lehre von der Minderwertigkeit der Organe in biologischer Beleuchtung. *Arch. Frauenk.* 16(2): 117-138. 1930.—A review of recent investigations, particularly in heredity, would indicate that the principal criteria of Adler's theory of organ inferiority have little biological foundation.

3276. **BALYEAT, RAY M., and MILDRED HOGE RICHARDS.** Inheritance of hay fever. A preliminary report. *Bull. Univ. Oklahoma (Proc. Oklahoma Acad. Sci.)* 9(456): 31-34. 2 fig. 1929.—Some family histories are reported. Susceptibility to hay fever is incompletely dominant, depending partly on the environment for fulfillment.

3277. **CURTIUS, FRIEDRICH, und GUSTAV KORKHAUS.** Klinische Zwillingsstudien. *Zeitschr. Ges. Anat. Abt. II, Zeitschr. Konstitutionsl.* 15(2): 228-267. 1930.—In 52 pairs of uniovular twins and 46 of biovular, 36 of which were like- and 10 unlike-sexed, Korkhaus found that in uniovular twins the predominantly exogenous as well as endogenous dermatoses showed an astounding homology in localisation, course, and other respects. The predominantly genotypic limitation of thyroid structure (discrepancy in uniovular twins in 2.5%, in biovular in 11.5%) was verified. Average heart-size coincided more in the uniovular twins; cardiac outline was highly similar in ¾ of uniovular and ¼ of biovular twins. The biovular cases showed that in circulatory insufficiency the iris can participate in the general stasis. Development of cutaneous veins is strongly influenced by the genotype, although paratypic factors play a part. The polyphenia of status varicosus was corroborated. Naevi vasculosi seemed to be more frequent in twins than in the general population. Inherited tendencies played a considerable part in the development of hernia. Lung tracings were much more similar in uniovular twins (63: 18%). Pulmonary affections in 1 of a pair were less frequent in uniovular (1: 43) than in biovular twins (9: 28). In pathological conditions involving both of a pair, the ratio was reversed: 5: 43 in uniovular, and 1: 28 in biovular. Heredity was thus an important factor. It contributed also to catarrhal jaundice, and strongly conditioned the functions of the autonomic nervous system; respiratory arhythmia, height of blood pressure, pulse frequency, reaction to adrenalin supply and absorption (Hb-rarefaction, urine concentration and reaction); these were far more uniform in uniovular partners. The difference in sedimentation rate was 5 times as great between biovular partners. In numerous cases infections in uniovular twins coincide; difference in reaction in them is due primarily to immunobiological factors; in biovular, perhaps primarily, to constitutional ones. The same infection (diphtheria, scarlet fever) can develop in uniovular twins very different symptoms.

3278. **JACOBOWICZ, MELA.** Über eine Exostotikerfamilie. *Zeitschr. Konstitutionsl.* 13(6): 699-703. 1928.—Records a typical case of hereditary deforming chondrodysplasia, with a characteristic family tree—7 affected, out of a total of 11, in 3 generations.—*A. Ehrenfried.*

3279. **KORKHAUS, GUSTAV.** Die Vererbung der Zahnfarbe. Beitrag zur Zwillingsforschung. *Zeitschr. Ges. Anat. Abt. II, Zeitschr. Konstitutionsl.* 15 (2): 127-133. 2 fig. 1929.—In 3 of 51 pairs of uniovular twins slight differences in color of teeth were found, though the ground color was the same (30 ground colors in scale). In 33 pairs of like-sexed, biovular twins, 11 were the same, 6 showed slight differences, 16 pronounced ones; in 9 pairs of unlike-sexed, 2 were the same, 2 showed slight differences, 5 pronounced ones. The color was thus almost exclusively genotypic; no relation to the general pigmentation of the body was found.

3280. **[LIAKHOVETSKIĬ, A., and M. ROZANOVA.]** ЛЯХОВЕЦКИЙ, А., та М. РОЗАНОВА. Матеріяли до питання про спадковість кров'яних груп. [**Heredity of blood groups.**] [German summary.] *Ukrainisches Zentralbl. Blutgruppenforsch.* 4(3): 156-168. 1930.—Author investigated families of bacilli-carrying patients from tuberculous dispensary in Moscow. 79 families were examined, comprising 376 persons. Results of the investigation fully agree with the present theories of blood-group heredity of Dungern-Hirzfeld and Bernstein-Faruhata.—*B. Van Rosen.*

3291. GODFREY, M. J. The pollination of Coeloglossum, Nigritella, Serapias, etc. *Jour. Bot.* 69(821): 129-130. 1931.—Notes on some pollinators of various orchids growing in Europe.

3292. GRAHAM, R. M. Notes on the mangrove swamps of Kenya. *Jour. East Africa & Uganda Nat. Hist. Soc.* 1929(36): 157-164. 3 pl. 1931.—These swamps are estimated to cover 180 sq. miles. Of the principal trees and shrubs, 10 are described with notes on some of their special adaptations for aeration, e.g., stilt roots, knee roots, ribbon roots, and pneumatophores. The seed of some germinate on the trees, so that they waste no time in taking root when they fall. The trees are utilized for housebuilding, fuel, tanning, and shipbuilding. Brief notes are given on the fauna of these swamps.

3293. GUENTHER, KONRAD. Das Antlitz Brasiliens. Natur und Kultur eines Sonnenlandes. Sein Tier- und Pflanzenleben. 360p. 32 pl., 40 fig. R. Voigtländer: Leipzig, 1927.—An account is given of a year's journey through eastern and southern Brazil, in which are recorded many observations and notes about the plant and animal life. Special chapters consider the strand, the original forest, and the arid interior; lianas, epiphytes, and stranglers of trees; floral display and its significance; animal voices (bird, batrachian, and insect); maternal care; habits of wasps, bees, ants, termites, snakes, blood-sucking insects, and bats. A chapter discusses the history of the Brazilian biota and its geologic background, while a concluding chapter considers the Brazilian people themselves. The index or "register" also serves as glossary, and gives identification characters of plants and animals mentioned.—*F. W. Pennell.*

3294. HÖEG, OVE ARBO. Pollen on humble-bees from Ellesmere Land. *Kgl. Norske Vid. Selsk. Forh.* 2(16): 55-57. 1929.—Pollen was found on 11 out of 21 humble-bees brought home by the 2nd Fram expedition. Pollen from *Salix* predominated, but a small number of other plants were also identified.—*O. A. Höeg.*

3295. KABURAKI, TOKIO. Effect of the Kwanto earthquake upon marine organisms. *Proc. 3rd Pan-Pacific Sci. Congress, Tokyo* 2: 1523-1527. 1926(1928).—This great earthquake of 1923 resulted in extensive destruction of fishes and other marine life in Sagami and Tokyo Bays. The agencies included tidal waves, explosion of oil tanks, generation of deadly gases, contamination of water, and human consumption of edible forms. Algae, worms, mollusks, echinoderms, and other littoral forms were destroyed by uplifting of the land. Some spp. have become reestablished, and an isopod, *Ligia exotica,* increased in numbers. Commercial mollusks suffered from exposure, oil, and being buried under mud. Even deep-sea fishes were found dead.

3296. **MILOST, PIETRO de. Modificazioni tecniche al processo clorometrico di Knudsen nell'analisi delle acque salate e salmastre.** [Modification of Knudsen's chlorometric analysis.] *R. Comitato Talassografico Italiano, Mem.* 151. 1-18. 6 fig. 1929.—For work on small vessels, an English burette (Binks) is proposed to replace the usual Knudsen burette, which is complicated, easily broken, and cleaned with difficulty. There is no glass stop-cock for filling and emptying; the scale permits direct reading (‰); a small tared glass flask is substituted for the automatic pipette, which is filled as a picnometer; the burette and a reservoir for $AgNO_3$ solution are mounted on a suitable base, with a suitable arrangement for filling pipette; to facilitate determination of correction of the $AgNO_3$ solution, a graph has been added, which abolishes tables; $AgNO_3$ accurately titred to 37.11‰ gives the salt content "in situ." The method represents a technical adaptation of Broudon-Boudet's method of determining water hardness.—*P. de Milost (transl. by R. H. M'Gonigle).*

3297. **OMER-COOPER, JOSEPH. Dr. Hugh Scott's expedition to Abyssinia. A preliminary investigation of the freshwater fauna of Abyssinia.** *Proc. Zool. Soc. London* 1930(1): 195-207. 2 maps, 8 pl. 1930.—This fauna is poor in both genera and spp. The absence of Peracarida throughout tropical Africa may indicate a widespread destruction of the fresh-water fauna by desiccation during the Pleistocene. The presence of Eucarida in northern Abyssinia is ascribed to immigration along the Nile tributaries. An account is given of 26 collecting stations, with brief notes on topography, vegetation, and fauna.

3298. **RENSCH, BERNHARD (mit Beiträgen von G. HEBERER und W. LEHMANN). Eine biologische Reise nach den Kleinen Sunda-Inseln.** xii+236p. Map. 33 pl. (1 col.), 4 fig. Gebrüder Borntraeger: Berlin, 1930. Pr. 14 M.—A collecting trip to the islands of Lombok, Sumbawa, Flores, and Bali in 1927 is described. Observations are given on the fauna and flora and ecology of the coral reefs, mangrove swamps, high plateaus, and high mountains of Lombok, the rain forests and the plankton of the blue, red, and green lakes of Flores, and on the Wallace Line and the bat caves of Bali. A study of the coloration of the tropical birds of the Little Sunda Islands lends support to the idea of predominance of brilliant coloration in tropical birds as compared with the non-tropical ones. There is also an increase in green and in yellow colors in the tropics, due to the direct action of climatic factors, resulting in an increase in the dark eumelanine, a widening of the feather radii, and a resulting play of interference colors. Protection coloration is apparent in many sp. Birds of prey are abundant both as to sp. and individuals. The perennial vegetation affords more continuous shelter than occurs in temperate forests, but the scant leafage, brilliant lighting, and diversities of tropical forests permit a high degree of diversified coloration among birds living therein. Natural selection is more potent than direct climatic influences in producing the more brilliant birds in the tropics as compared with the temperate zones. Races of birds on the smaller islands are relatively larger than those on larger islands, as a result of the lower average temp. The ratio of the wt. of the heart to that of the body of the bird falls with the increase in altitude, and also with the decrease in size of sp. The smaller sp. and the bird in higher altitudes requires a large heart to compensate for lower temp. at higher elevations and for their relatively greater surface. German field sparrows have a relatively larger stomach and a relatively larger intestine than those of Malayan races? an adaptation to the climatic extremes of the climates of the temperate zone. Tropical land snails have ova with a relative thick calcareous shell, an adaptation to the high temp. (30-71°) of tropical soil. The number of sp. of snails increases with the altitude, moisture, vegetation, and favorable substrate. The proportion of prosobranchs is high. Fresh-water mollusks are more evenly distributed. Snails are brilliantly colored, protectively colored green when living in foliage, and often banded or flecked with diverse colors as a direct result of climatic conditions.—*C. A. Kofoid.*

3299. **SCHOSTAKOWITSCH, W. B. Die periodischen Schwankungen einiger biologischen Erscheinungen.** *Internat. Rev. Ges. Hydrobiol. u. Hydrogr.* 23(1/2): 139-149. 2 fig. 1929.—Physical and biological phenomena are periodic. This periodicity takes the form of a sine curve. The amplitude and length of the periods are discussed and the curve is treated mathematically.—*Will Scott.*

3300. **[SMORODINTSEV, I. A., and A. N. ADOVA.]** СМОРОДИНЦЕВ, И. А., и А. Н. АДОВА. Железистый режим торфяных вод. [Iron in peat waters.] [French summary.] Русский Журнал Тропической Медицины. [*Russ. Jour. Trop. Med.*] 7(2): 143-153. 1929.—Peat waters contained less Fe than other artificial or natural waters. Sphagnous waters were 4 times as rich in Fe as waters of *Carex* regions. An inverse ratio exists between concentration of Ca and of Fe, but Fe increased with the concentration of H ions. In sphagnous waters, comparatively rich in Fe and H ions and poor in Ca, larvae of *Anopheles* were very rare. On the contrary, in waters of *Carex* regions such larvae were very numerous.—*B. van Rosen.*

3301. **SNYDER, L. L. A faunal investigation of the Lake Abitibi region, Ontario. General Introduction.** *Univ. Toronto Studies Biol. Ser. No.* 32. 3-6. Map, 1 pl. 1928.—Notes on topography, vegetation, climate, and faunal position, introducing separate papers on mammals and birds by Snyder, on amphibians and reptiles by **J. R. DYMOND,** on Odonata by **E. M. WALKER,** and on spiders by **J. H. EMERTON,** all abstracted separately. The region lies in the Algonquian faunal area of the Canadian zone.

3302. **TIDELSKI, FRITZ. Untersuchungen über spät- und postglaziale Ablagerungen in Becken der kuppigen Grundmoränenlandschaft Schleswig-Holsteins.** *Arch. Hydrobiol.* 20(3): 345-398. 1929.—In deposits from a number of these basins remains of algae as well as of the higher plants were found. The late glacial deposits did not contain any pollen, but small amounts of pollen were found in the preboreal period. Pollen of birch, hazel, pine, and mixed oak forests was found in the boreal and atlantic periods. Shells of Cladocera and of several sp. of Mollusca were also found.—*C. Juday.*

3303. **TIWARY, N. K. A note on the flowers of Tecoma radicans.** *Jour. Indian Bot. Soc.* 8(1): 78-81. 1 pl. 1929.—Older buds and open flowers were punctured near the base by sun birds, *Arachnecthra asiatica,* in search of nectar. The mechanism for pollination is described. Small insects visit the flowers, but no effective pollinators were observed. Self-pollination is presumed.—*W. Dudgeon.*

3304. **VARGA, LUDWIG. Ein interessanter Biotop der Biocönose von Wasserorganismen.** *Biol. Zentralbl.* 48(3): 143-162. 1 fig. 1928.—The bases of the leaves of *Dipsacus silvester* Huds. are cup-shaped so that they hold water, and aquatic organisms populate these miniature aquaria. The temp. of the water is correlated with that of the air; the pH varied from about 7.5 to 8.1. The plant forms living in these waters consisted of bacteria, algae, and fungi; animal forms were represented by protozoa, nematodes, rotifers, tardigrades, water mites, and diptera larvae. The different sp. of plants and animals are indicated, and the biological problems involved in such a limited and temporary habitat are discussed.—*C. Juday.*

3305. **VERNADSKY, W. La biosphère.** 232p. Félix Alcan: Paris, 1929.—The 1st part of this book discusses the biosphere in the cosmos, the 2nd part the domain of life, and an appendix treats of the evolution of sp. and living material.—*C. Juday.*

3306. **WALCH, E. W., and C. J. SCHUURMAN. Salt-water fishponds and malaria.** *Mededeel. Dienst Volksgezondheid Ned.-Indie* 18(3): 341-366. 8 pl. 1929.—The rearing of *Chanos chanos* Forsk is an industry of some importance on the coast of Java. For this purpose ponds

are constructed and, after flooding with seawater by canals, they are closed and stocked with young bandeng caught in the sea. This fish is principally herbivorous and feeds almost wholly on algae, at least, when confined in ponds. The reservoirs furnish excellent breeding conditions for Anopheline mosquitoes (*A. ludlowi* and *A. rossi*), but, when their surfaces become covered with floating mats of green algae in which the mosquito larvae find protection from *Hoplochulus panchox* (Ham Buck), a small larva eating fish, they become a serious hygienic problem. The green algae, although eaten by the fish, are not of such great importance that the animals cannot be grown without them, providing sufficient "bottom algae," consisting chiefly of blue-green algae, are present. Accordingly a method of exploitation has been devised whereby the green algae may be destroyed in large part and the growth of the bottom algae encouraged. This is done by draining the ponds to kill the green algae, afterwards flooding them with a thin sheet of water which encourages the growth of the bottom forms. To do this successfully the bottom of the ponds, of course, must be above the level of the usual low tides, yet low enough to admit flooding on high tides. Mosquito breeding may be controlled by draining the ponds, which, however, destroys a profitable industry; also by dusting with Paris green, but this requires considerable supervision and the authors prefer temporary drainage whenever necessary (once or twice a yr.), the fish being "harvested" before drainage.—*S. F. Hildebrand.*

3307. **WARD, F. KINGDON. Botanical exploration: Mishmi Hills, Assam.** Proc. Linnean Soc. London No. 142. 60-62. 1929/30(1931).—The relation of prehistoric geology to the distribution of plants and animals in southeastern Asia is discussed. The Himalayan uplifts between the Eocene and Miocene cut off Central Asia from the Indo-Malayan region and provided a bridge across Asia at least from Sikkim to Formosa. The glacial epoch drove many sp. and genera southward and sealed Central Asia. Also interesting extensions of the ranges of certain plants are noted.

3308. **YONGE, C. M. A year on the Great Barrier Reef. The story of corals and of the greatest of their creations.** 246p. 6 maps, 69 pl., 17 fig. Putnam: London & New York, 1930. Pr. $6.00.—A nontechnical account is given of the building of coral reefs and islands, with special emphasis on the Great Barrier Reef, Queensland. There are notes and numerous photographs of the variety of animals and plants—corals, clams, snails, chitons, sea urchins, starfish, worms, crustaceans, plankton, fishes, and algae—which compose it, or live on and around the reef; and its influence on the culture of the natives is discussed.

3310. **AGERSBORG, H. P. K. The influence of temperature on fish.** *Ecology* 11(1): 136-144. 4 fig. 1930.—Gizzard-shad, carp, crappies, bluegill, sunfish, chub, steel-colored minnow, shiner, and bullhead catfish that enter a tributary contaminated with warm starch-waste water in early fall before the lake receiving the tributary is cooled, become accustomed during winter to a temp. of 28-30° C., dissolved O between 5 and 6 p. p. m.; while the temp. of the lake is around 0° C., the dissolved O is 12.8 p. p. m., saturation 90%. They live in the warm starch-waste water for some time, feeding on the sludge of fission fungi and slime algae. Some die from the effects of the high temp. and the toxicity of the water. Such dead fish have the bronchial apparatus partially coagulated and some blood vessels ruptured, and may remain in a warm room for several days without any indication of decay. In winter, when fish which live in such semi-polluted starch-waste water are suddenly brought into contact with stream or lake water having the season's temp., they manifest O hunger by surface swimming and by gulping air. Continuous exposure in cold, pure water is fatal. Fish recover if they are returned to the warm semi-polluted water. Death in the cold pure water seems to be due to lack of gill-function, although the cold water actually contains more than twice as much dissolved O as the warm water.—*H. P. K. Agersborg.*

3311. **ANDREW, BESS J. Method and rate of protozoan refaunation in the termite Termopsis angusticollis Hagen.** *Univ. California Publ. Zool.* 33(21): 449-470. 2 fig. 1930.—Termites of this Californian sp. were defaunated by oxygenation and pressure and attempts at refaunation made by various methods. Anal contact with the Protozoa was not a natural method of faunation. Feces from faunated animals failed to reinfect but cannibalism brought about faunation. Refaunation occurs by the feeding of material containing living Protozoa. The transfer is effective by the eating of feces as they drop. Liquid droppings and the fresh nest structure made with fresh intestinal fluid as cement may account in part for normal refaunation. Reinfection did not occur from eating the intestinal lining at molts.—*M. W. Kamm.*

3312. **BARRETT, CHARLES. Wild nature on the Nullarbor Plain.** *Australian Mus. Mag.* 4(4): 115-121. 1 pl., 8 fig. 1930.—A popular account is given of general natural history (chiefly insects, spiders, lizards, and mammals) in this little-explored region of So. and Western Australia. Torrential rains in 1930 caused a great increase in plant and animal life.

3313. **BEAUGÉ, L. Rapport de mission au Gröenland et à Terre-Neuve (Campagne 1929).** *Rev. Trav. Office Pêches Maritimes [Paris]* 2(4): 369-411. 12 fig. 1929.—The points discussed are: hydrological and meteorological situation of Davis Strait and of Baffin Bay; position of the polar current; the turning back of the polar current from the Strait of Belle Isle to Fyllas Bank; the hydrographic situation of the Fyllas Banks in 1929; the pushing in of the warm water from the open ocean toward the land; character of the bottom; hydrography; fishing charts; and history and future of fishing in Greenland, which is an excellent complement to the Newfoundland fisheries in summer, and in the bad yrs. at Newfoundland.—*L. Beaugé (transl. by W. M. Gersbacher).*

3314. **BEAUGÉ, L. Rapport de mission sur la pêche à Terre-Neuve en 1929.** *Rev. Trav. Office Pêches Mari-*

times [*Paris*] 3(1): 79-101. 14 fig. 1930.—Hydrographic researches and the condition of the fisheries in March-June 1929 on the Accores des Chalutiers (S. E. of the Grand Bank) show the importance of atmospheric conditions in spring. The channels of the continental shelf serve as automatic distributors of cold and warm water after the period mentioned. Maps are given of distribution of temp. and salinities on the banks at 50 m. and on the bottom. The swordfisheries are intimately connected with the presence of "cod water" which only covers a small portion of the bottom.—*L. Beaugé* (*transl. by A. O. Weese*).

3315. **BINI, GIORGIO. Sugli effetti tossici sui pesci delle sostanze contenute nelle acque di rifiuto industriali.** [Toxic effects of industrial wastes on fresh water fish.] *Boll. Pesca, Piscicolt. e Idrobiol.* [*Roma*] 5(6): 982-1014. 1929.—The physiological effects of chemical substances contained in industrial wastes on freshwater fish are reviewed. A table shows the minimum lethal doses for different sp. as obtained experimentally by Weigelt, Belding, Smolian, and others. Another table contains analyses of refuse from various industries.—*G. Bini* (*transl. by R. A. Muttkowski*).

3316. [**BIRULÍA, A. A.**] ВИРУЛЯ, А. А. К вопросу о нижнем теченни р. Волги, как зоогеографической границе. [The lower course of the Volga as a zoogeographic limit.] Доклады Академии Наук СССР. Сер. А. (*Compt. Rend. Acad. Sci. URSS. Ser. A.*) 1928(16/17): 338-340. 1928.—*Bulthus eupeus thersites* (C. Koch) is usually found in Transcaucasus, Central Asia, and Mongolia, but 1 ♂ was found in 1927 on the right bank of the lower Volga River. As the actual moving of the insect over the river seemed impossible, the author agrees with Sviridenko's hypothesis that the course of the river changed during the recent geological epoch.

3317. **BJERKAN, PAUL. Fluctuations in the abundance of the various year-classes of food fishes. XIX. Fluctuations in the stock of young sprat off the west coast of Norway and its relation to the sprat population as a whole.** *Conseil Perm. Explor. Mer Rapp. et Proc.-Verb. Réunions* 65: 173-181. 1 map. 1929.—The sprat fishing districts of Norway are divided into a small eastern one and a larger western one. The yield displays large fluctuations having a maximum of over 250,000 bl. and a minimum of 25,000 bl. since 1900. Some of the fluctuations are due to technical improvements in fishing but natural fluctuations are also apparent. On the west coast of Norway the 1-yr. old sprat provided 95% of the yield in ordinary yrs. since 1920. The annual renewal depends on immigration from the spawning districts on the Skagerrack and North Sea coasts. Sizes of sprat are variable; those from mixed sprat and herring shoals average larger than those from pure sprat shoals. The spawning season extends through a long period; fry 15-25 mm. long are found March-Sept. and during Sept. some individuals from the same spawning season are 8 cm. long. The largest are marketable in their 1st autumn. First arrivals on the coast are mixed with herring and later arrivals are in pure shoals. Growth continues until Nov. The autumn immigration provides the fiord stock; in most yrs. there is a spring migration that later mixes with the fiord stocks. Generally the spring arrivals are smaller. Fluctuations in the fishery depend on these immigrations. Since 1920 the yield of the fishery was affected by industrial conditions (1920, 1921, and 1925); hydrographical and biological conditions affecting local runs; richness of the yr.-classes; and more or less favorable drift conditions from the spawning grounds especially during the autumn preceding the fishing season under consideration. Two-yr.-old sprat leave the fiords during spring and autumn and constitute the stock in the sherries. They are fished for only occasionally when they penetrate into the fiords. Some yrs. contingents of this class ripen and spawn in the outer fiords. The bulk of the class loiter in the outer fiords till the next spring when they migrate south to the spawning grounds as mature 3-yr.-olds. Sometimes they strike the outer parts of southern fiords en route but leave very soon. A young stock fished so far from the spawning grounds is not likely to be threatened by overfishing.—*O. E. Sette.*

3318. **BROWN, L. A. The natural history of Cladocerans in relation to temperature. II. Temperature coefficient for development.** *Amer. Nat.* 63(687): 346-352. 3 fig. 1929.—Summer and southern sp. of cladocerans have a higher temp. coefficient for development than those of general distribution. This is in conformity with the data for the duration of a single adult instar and with the lethal temp. for the same sp.—*Author's summary.*

3319. **COWLES, R. P. A biological study of the offshore waters of Chesapeake Bay.** *Bull. U. S. Bur. Fish.* 46: 277-381. 15 fig. 1930.—Some 30 areas widely distributed were investigated, usually during all seasons, over 2-3 yrs. and in a quite uniform manner. The salinity of the bay as a whole decreases markedly in the early part of the yr., increases gradually during the middle of the yr., and reaches a maximum toward the latter part of the yr., when an in-going saline under-current of a more or less non-tidal character makes its way up the bay. The stratification of waters of different salinities is least marked in the early part of the yr. It increases later in the yr., and a region of saline discontinuity at about 20 m. deep becomes more evident. The temp. of the surface water varies with the seasonal air temp., as does the bottom water to a less degree, but its maximum summer and winter temp. are attained rather late. The ocean water temp. is lower than that of the bay during the summer, and warmer than that of the bay during the winter. The distribution of some organisms indicates their dependence on the degree of salinity and temp., while that of others indicates their practical independence of such factors. There are other factors, however, such as amount of food and light and strength of current, which must be considered, so that a satisfactory determination of this dependence or independence can only be made by carefully controlled laboratory experiments. Certain organisms which are usually considered to be marine make their appearance in the spring far up in the northern part of the bay and it is probable that this condition is partly dependent on the dominating autumn and winter in-going bottom currents. The groups represented in the distributional data include diatoms (especially extensive), Protozoa, Porifera, Coelenterata, Ctenophora, Nemathelminthes, Chaetognatha, Bryozoa, Annelida, Crustacea (extensive), Xyphosura, Pycnogonida, Echinodermata, Prochordata.—*R. P. Cowles.*

3320. **CREASER, CHARLES W. Relative importance of hydrogen-ion concentration, temperature, dissolved oxygen, and carbon-dioxide tension on habitat selection by brook trout.** *Ecology* 11(2): 246-262. 1930.—The maximum temp. for natural self-sustaining brook-trout waters is 19° C. This is the voluntary toleration limit for waters of ordinary aeration and is the deciding factor in determination of habitat of brook-trout. Streams with water at the maximum temp. are more favorable for growth than very cold water; therefore the best trout streams are in a delicate balance. The effect of temp. is not an indirect result of the influence on dissolved O content, since in natural streams the variation in dissolved O content was not correlated with temp. but seemed to be most influenced by the relative abundance of O-consuming materials. Dissolved O content cannot be used as an index for brook-trout streams. The range of pH for brook-trout extends from 4.1 to 9.5, a range greater than the maximum and minimum values found in natural waters. CO_2 tension has little influence since a range of 0.21 to 1.62 (mm.) recorded for brook-trout streams is little different than the non-brook-trout stream range from 0.28 to 1.99. The effect of these factors upon the temp. limit is very slight.—*C. W. Creaser.*

3321. **DAMMERMAN, K. W. A comparison of the fauna of Krakatau with [that] of Christmas Island.** *Proc. 3rd Pan-Pacific Sci. Congress, Tokyo* 1: 966-972. 1926(1928).—Krakatau, 41 km. from Java, has a fauna less than 50 yrs. old, while that of Christmas Isl., 300 km.

from Java, dates at least from the Pleistocene. Each island has a fauna of several hundred sp., and although only 16 sp. are common to both, the numbers of sp. in the different animal groups match each other almost exactly. Apparently the number of animals on an island is directly proportional to the time it has existed and inversely proportional to the distance between it and other land. Thus Krakatau in 40 yrs. has attained a fauna equivalent to that which has been developing on Christmas Island since the Pleistocene. Dispersal through the air is most important in building up a new island fauna. Plant-feeders establish themselves with much less trouble than predaceous and parasitic sp. Hypothetical land connections have been used too freely in explaining the presence of certain animals on islands.

3322. **FRASER, C. McLEAN.** International cooperation in the investigation of pelagic fish eggs and larvae. *Proc. 3rd Pan-Pacific Sci. Congress, Tokyo* 1: 306-309. 1926(1928).

3323. **FUCHS, V. E., and W. F. WHITTARD.** The East Greenland pack-ice and the significance of its derived shells. *Geogr. Jour. [London]* 76(5): 419-425. Map, 2 pl. 1930.—8 Lamellibranchiata, 3 Gastropoda, and also Spongida, Bryozoa, Hydrozoa, Algae, pieces of wood, and mud are recorded from pack-ice off the east coast of Greenland. There is evidence that this material was transported on the ice by drift from the No. Siberian coast. Eventual melting of the ice results in deposition of the shelly muds of Pleistocene age on the sea floor a long distance from their place of origin.

3324. **GALADZIEV, M., et E. MALM.** L'influence de quelques facteurs physico-chimiques sur les Protozoa marins. Доклады Академии Наук СССР. Сер. А. (*Compt. Rend. Acad. Sci. URSS. Sér. A.*) 1929(18): 433-436. 1929.—Protozoan succession was studied over 3 mo. in 9 cultures, in which pH varied from 7.20 to 8.55, and the tension of O_2, CO_2, and H_2S was varied; 2 cultures had normal gas pressure; 4 were without O_2 for some time, H_2S being completely lacking; 2, putrefying, had low pressure (O_2) and high H_2S (up to 25 cc. per liter). *Lionotus iamella, Euplotes harpa, Plagiopyla nasuta, Metopus sigmoides,* et al. (not named) survived anaerobiosis; *Strombidium* disappeared with the exhaustion of O_2. Those which survive anaerobiosis give a positive paraglycogen reaction; evidently the decomposition of paraglycogen confers on the organism the ability to live in the absence of O_2. O_2 tension has no considerable effect on most marine protozoa. Accumulation of H_2S (in putrefaction) likewise has little effect on the existence and on the diversity of protozoa in cultures. Within the limits observed in these experiments (pH 7.2-8.55) effect of variation of pH was slight. Succession went on without change in pH. The direct effect of variation of pH is negligible; whatever effect pH has is chiefly indirect, physico-chemical, in consequence of pH effects on the ion equilibria, etc.; even as such the pH effect was of secondary importance, the main factors governing the population being the intensity of putrefaction, the degree of mineralization and the presence of minimal amounts of O_2 and H_2S. Other experiments, not here reported in detail, were performed on 70 sp. of protozoa cultured in water saturated with CO_2 up to pH 5.2 (the greatest depression of pH, ascribable to CO_2, occurring naturally in the Black Sea). Most of the protozoa were highly sensitive to CO_2. Parallel experiments, in which the acidity was produced by adding HCl, showed they were able to tolerate a range of pH 3.2 to 10.0. It is concluded that the most important ecological factors in "acidity" of carbonic acid, at least as concerns the ecology of marine protozoa, are the carbonate ion (HCO), CO_2, and the undissociated molecule, not the H ion.

3325. **GALTSOFF, PAUL S., and R. H. LUCE.** Oyster investigations in Georgia. U. S. Bur. Fisheries Doc. 1077. 61-100. Map. 9 fig. 1930.—The origin and development of the oyster reefs of coastal waters of Georgia are described, and data are given on the changes in temp. and salinity of the water and velocity of the tidal currents. Biological observations are confined to the time of spawning and distribution, and the attachment (setting) of the oyster larvae.—*P. S. Galtsoff.*

3326. **HEIKERTINGER, F.** Die Frage der Schutzanpassungen im Tierreich mit besonderer Berücksichtigung der Färbungsanpassungen. [In: Wissen und Wirken. Einzelschriften zu den Grundfragen des Erkennens und Schaffens. Bd. 57.] 100p. G. Braun: Karlsruhe in Baden, 1929. Pr. 3 M.—After a discussion of the various types of protective resemblance and warning coloration generally considered of survival value and an examination of data as to food habits of predators, the conclusion is reached that protective resemblance is unimportant in the preservation of sp.—*A. O. Weese.*

3327. **HEIKERTINGER, FRANZ.** Über "Transformative Schutzfärbung" und ihre wissenschaftliche Begründung. *Biol. Zentralbl.* 50(4): 193-219. 3 fig. 1930.—An article by H. H. Karny on a new case of "transformative" protective coloration of a grasshopper (Tettigonidae) is criticized. The larva of the tettigonid *Asthatomina wasmanni* (Karny) is similar in color to certain sp. of the cerambicid genus *Asthates,* which Karny considers as a case of protective resemblance and for which he cites as authority R. Shelford, who asserts that *Asthates* are inedible, protected forms. Shelford at one time considered the *Asthates* as protected, and again as unprotected, and really knows nothing whatever concerning their edibility or their enemies. Research on stomach contents shows that *Asthates,* as well as Galerucinae, are not protected, but are devoured by birds in large quantities. It is therefore a mistake to speak of "protective" resemblance or "mimicry."—*F. Heikertinger (transl. by R. T. Young).*

3328. **HNATEWYTSCH, BOHDAN.** Die Fauna der Erzgruben von Schneeberg im Erzgebirge. *Zool. Jahrb. Abt. Syst. Ökol. u. Geogr. Tiere.* 56(3/4): 173-268. 1 map., 3 pl., 16 fig. 1929.—The geology of Erzgebirge, the history of the mining section of Schneeberg, the topography, and the ecological factors of the mines in this section are discussed. The Metazoa found in the interior of the various mines were studied to trace the responsibility of an epidemic outbreak of a cancerous disease of the lungs of all miners employed in these mines. Metazoa, three sp. of Turbellaria, 3 Oligochaeta, 5 Rotatoria, 20 nematodes, 1 bryozoan, 38 Arthropoda, and 3 Mollusca are individually described with data on their habitats. The Nematoda, *Rhabditis* de mani* (p. 199), *R.* cobbi* (p. 200), *Macrolaimus* maupasi* (p. 204), *Diplogaster* mikoletzkyi* (p. 207), *D.* ditentatus* (p. 208), *D.* subterraneus* (p. 209), and *D.* dubius* (p. 211); the Crustacea, *Niphargus puteanus* Koch; and the Arachnid (Opiliones) *Nemastoma* spinosa* (p. 231) are described in considerable detail. Only *Niphargus puteanus* and *Lepidocyrtus cavernarum* are considered true cave dwellers (troglobionts). Most of the 75 spp. found are troglocoles,—shade-inhabiting spp. ordinarily living in leaf mold, ravines, deep woods, etc., above ground, or living under stones or in soil. A few are "guests" or recent accessions. Food is more abundant than in caves, hence the number of individuals of most spp. is great. As to food habits, 4 groups occur; omnivorous animals (the nematodes, copepods, *Niphargus,* the spring-tails, and the Staphylinidae *Tricophya pilicornis* Marsch. and *Quedius mesomelinus* Gyll); those feeding on detritus and organic remains (the Oligochaetes, many nematodes, the diplopods, mollusks, *Trichocera* larvae, *Sciara* spp., *Lipsotrix* and *Miastor* larvae); those feeding on fungi, *Arion subfuscus* Drap., *Lepidocyrtus cavernarum* Monz., larvae of the Dipterans *Phthinia winnertzi* Mik. and of *Sciara* spp., and apparently the mite *Linopodes;* and the predacious animals (Turbellaria, many nematodes, *Theorus uncinatus* (rotifer), *Lithobius lucifugus* (Myriapod), *Nemastoma spinosa,* the water beetles and mites). In several spp. there is evidence that lack of food may diminish the body size. Distribution of this fauna is passive in the case of most aquatic and amphibian forms; running and seeping water is a frequent means; and is active in most other

forms. *Niphargus,* a typical cave dweller, may have gained entrance to mines by fissures in rock. Since the mines are scarcely 500 yrs. old, and since forms from the outer world have probably retarded the development of a peculiar fauna, morphological adaptation to subterranean life is scarcely noticeable; loss of coloration, regression of eyes, and compensatory hyperdevelopment of the other sense organs, were absent or imperceptible; the chief adaptation consisted in an appreciable limitation of egg production, perhaps a response to the monotony of climatic conditions.—*C. Zeimet.*

3329. **HODGSON, W. C. Fluctuations in the abundance of the various year-classes of food fishes. XV. Fluctuations in the herrings of the southern North Sea.** *Conseil Perm. Internat Explor. Mer Rapp. et Proc.-Verb. Réunions* 65: 129-133. 3 fig. 1930.—Data on the age composition of the East Anglian fishery cover 1923-1928, inclusive. Herrings first appear in the shoals when 3 yrs. old and disappear at the age of 11. Proportions of the older yr.-classes suggest that the rate of mortality acts equally on all groups. Five important yr.-classes were observed: 1915, 1918, 1919, 1921, and 1924, the last 2 having their incidence during the period of investigation. Alternate explanations are offered for the success of the 1921 brood: (1) that during 1921 and 1922 there were abnormal plankton and salt water movements causing herring shoals to depart from the usual grounds, thus evading capture and providing a larger stock of spawners; (2) that the unusual hydrographical conditions had provided good conditions for survival of the young. By calculating the lengths of the herring at the time of formation of 1st water-ring on the scales, it is possible to tell respectively the approximate numbers coming from summer, autumn, and winter spawnings. The 1921 class came mainly from 1 spawning (the winter of 1921-22); the 1924 class came from 3 spawnings: summer (1924), autumn (1924), and winter (1924-25).—*O. E. Sette.*

3330. **ISSEL, RAFFAELE. Oasi di "optimum" relativo e insetti visitatori dei Cirsium nel territorio di Bolzano. [An oasis of relative "optimum"; insect visitors on Cirsium in the region of Bolzano.]** *Atti Accad. Sci. Veneto-Trentino-Istriana* 20: 93-101. 1929.—In the highland of Renon above Bolzano, Italy, *Cirsium arvense* var. *horridum* grows in thickets along the edge of the fir forest. The abundance of insect visitors has been noted, especially as regards number of specimens, of sp., and of groups represented (Lepidoptera, Hymenoptera, Coleoptera, Diptera, and others besides Hemiptera and Orthoptera). In other localities of the same region *Cirsium, Carduus,* and other flowering plants are much less visited. The thickets are interpreted as a relative optimum owing to the existence of a small favorable zone adjacent to a large unfavorable zone.—*R. Issel (transl. by R. A. Muttkowski).*

3331. **JÄRVI, T. H. Fluctuations in the abundance of the various year-classes of food fishes. XX. On the fluctuations in abundance exhibited by the stock of lake-herring (Coregonus albula) in Lake Keitele, Finland.** *Conseil Perm. Internat. Explor. Mer Rapp. et Proc.-Verb. Réunions* 65: 182-188. 2 fig. 1930.—The lake-herring concentrate in certain places to spawn in Oct. and Nov. The fertilized eggs sink to the bottom where they remain over the winter. A considerable portion of the fishery takes place on the spawning grounds. The stock consists almost entirely of the 4 most recent yr.-classes with usually 90-95% composed of 2 yr.-classes. Good yr.-classes resulted from the spawnings of 1906, 1909, 1911, 1914, 1917, 1921, 1922, 1923, and 1926. Failure of spawning to produce good yr.-classes is ascribed to windy weather during the critical period when the newly-hatched fry rise to the surface and may be driven to the shores by wind and waves. A good yr.-class may result from the spawning of a very reduced stock if the critical period of development be favorable. Since the possible number of yr.-classes in the catch is very small and the fluctuations in the yr.-classes are violent, the yield of the fishery is capricious. The growth rate of individuals in good yr.-classes is lower than in poor ones averaging around 10 and 13 cm. respectively in 2-yr.-old fish.—*O. E. Sette.*

3332. **LEA, EINAR. Fluctuations in the abundance of the various year-classes of food fishes. XII. Mortality in the tribe of Norwegian herring.** *Conseil Perm. Internat. Explor. Mer Rapp. et Proc.-Verb. Réunions* 65: 100-117. 6 fig. 1930.—By calculation of a "remanence coefficient," i.e., the ratio that the number of spawners of a yr.-class in a certain yr. bears to the numbers of spawners in that yr.-class during the previous yr., it is possible to arrive at an approximation of: the mortality rate; the relative numerical importance of the various yr.-classes; and a selection curve expressing the portion of a yr.-class entering the spawning stock in successive yrs. A consideration of the consequences of applying different average values for the remanence coefficient indicates that the true value lies in the neighborhood of 0.77-0.81; on either side of these values the results of calculation rapidly approach absurdities.—*O. E. Sette.*

3333. **LE GALL, JEAN. Travaux à la mer du Laboratoire de Boulogne pendant l'année 1928.** *Rev. Trav. Office Pêches Maritimes [Paris]* 3(2): 127-135. 3 maps. 1929.—Results obtained in hydrology at the western opening of the English Channel are given, with practical consequences of the capture of herring and mackerel, and observations on herring fishing in the North Sea.—*J. Le Gall (transl.).*

3334. **LISSNER, H. Fluctuations in the abundance of the various year-classes of food fishes. XVI. Fluktuationen in der deutschen Trawlheringsfischerei.** *Conseil Perm. Internat. Explor. Mer Rapp. et Proc.-Verb. Réunions* 65: 134-144. 3 fig. 1930.—On the Fladden ground the 1918 class dominated the trawl fishery for herring 1922-1924. In 1922 they were below optimum size and adversely influenced the fishery, but the following 2 yrs. they were larger and the fishery was better. In 1925 when the 1918 class had disappeared, the fishery had its worst yr. since the War. Only the 1921 and 1922 classes were then present and in 1926 and 1927 these provided a good fishery. In the latter yr. the 1924 class appeared and by 1928 the fishery was good. On Dogger Bank the situation was similar except that the 1920 class dominated in 1924, and the 1924 class in 1928. On Fladden the herring appear at 3 yrs. of age and on Dogger 2-yr. fish (unripe) appear. On the latter ground the yr.-classes appear 1 yr. earlier and the herring have a lower average size. Other conditions affecting the fishery are the nourishment of the herrings, the length of the fishing season, and the weather. The stock of Bank herring has a relatively quick turn-over, a yr.-class influencing the stock for 3 yrs. and remaining in evidence for 8 yrs., as against Norwegian herrings that influence the stock 8 yrs. and are present 10-15 yrs.—*O. E. Sette.*

3335. **LUNDBECK, JOHANNES. Die Bodenbevölkerung im Baltischen und im Alpensee.** *Naturwiss.* 18 (32): 709-714. 2 fig. 1930.—A study was made of 105 lakes with a quantitative bottom sampler. The lakes of the North German plain are on a typically "eutroph" organic mud, richly populated by the saprobe—*Chironomus*—community (747 kgm./ha. live wt.), whereas the "oligo" or "mesotroph" alpine lakes with predominant mineral bottom are much poorer populated by katharobe—*Tanytarsus, Sergentia,* etc.—communities (234 kgm./ha.). In the first, nourishment is in excess, lack of O only working as the limiting factor; in the latter, on the contrary, nourishment is in minimum, and every increase of organic content causes an enrichment of bottom animals.—*J. Lundbeck.*

[Preliminary report on the character of the insect fauna of the Tschapli nature preserve.] [German summary.] Всеукраїнська Академія Наук, Труды Фізично-Математичного Відділу (Збірник Праць Зоологічного Музею ч. 7). (*Acad. Sci. Ukraine, Mém. Cl. Sci. Phys. et Math.*) (*Trav. Mus. Zool. No. 7*) 13(1): 21-24. 1929.—The results obtained from a study of the insect fauna agree in general with those obtained from a study of the vertebrate fauna, in establishing the lower course of the Dnieper as the border between 2 zoogeographical areas.—*From author's summary.*

3341. NEEDHAM, JOSEPH. On the penetration of marine organisms into fresh-water. *Biol. Zentralbl.* 50 (8): 504-509. 1930.—The eggs of many marine invertebrates are very dependent on the medium in which they develop, since the only stuff with which they are adequately supplied by the parent organism is the organic material (proteins, fats, and carbohydrates). In one egg there is not sufficient ash to construct one finished embryo ready to hatch. This dependence of the egg on the inorganic material of its environment, shown in several recent investigations, seems to be a significant limiting factor, making it impossible for marine animals to colonise the fresh water, until, by some chance mutation, perhaps, the capacity of providing enough ash within the eggs is acquired. To the factors defined by Sollas and by von Martens we must add the importance of the fresh-water egg being supplied with materials that its inorganic surroundings cannot be expected to give it.—*Author's summary.*

3342. O'MALLEY, HENRY. Fur-seal industry of Pribilof Islands, Alaska. [*U. S.*] *Bur. Fisheries Econ. Circ.* 71. 15p. 6 fig. 1930.—A general account is given of the fur-seal industry of the Pribilof Islands, with a summary of the distribution of the various fur-seal herds. —*C. F. Jackson.*

3343. PEARSE, A. S. Ecology of the ectoparasites of Nigerian rodents and insectivores. *Jour. Mammalogy* 10(3): 229-239. 1929.—Fleas were most abundant on large mammals living in a dry climate and frequenting more or less permanent homes. Ticks were most prevalent among low scattered shrubs in dry climates, but were also numerous in wet climates. Mites were abundant where there was a ground cover of low vegetation and were infrequent in the steppe.—*L. R. Dice.*

3344. PELSENEER, PAUL. Quelques phénomènes d'autorégulation. *Ann. Soc. R. Zool. Belgique* 59: 95-111. 3 fig. 1928(1929).—Among the Mollusca occur known cases of regulation, both in normal morphology and in embryonic and adult regeneration. In the different groups of mollusks "constancy of population" is due to what is essentially regulation between the number of eggs or embryos and the probability of destruction of eggs, embryos, larvae, and young. Among the Rachiglossa in which the young emerge from the capsule in the form of the adult (*Purpura lapillus* and others), the eggs, and especially the embryos, are notably few. Likewise with incubatory and oviparous forms the embryos are very few and may be reduced to the "limit": one. In all cases where the eggs are few, their size is proportionally great.—*P. Pelseneer* (*transl. by J. S. Gutsell*).

3345. POULSEN, ERIK M. Fluctuations in the abundance of the various year-classes of food fishes. IV. On the fluctuations in the abundance of cod fry in the Kattegat and the Belt Sea and causes of the same. *Conseil Perm. Internat. Explor. Mer Rapp. et Proc.-Verb. Réunions* 65: 26-30. 3 fig. 1930.—The average number of cod fry taken per 30-min. haul with a 2-m. ring trawl in the Belt Sea and the Kattegat was as low as 2 and 5 and as high as 67 and 153 in certain yrs. during 1923-1928. They were found preeminently in the lower layers of water. There is a marked correlation between high average temp. of the water in these layers in March-May of certain yrs. and the good average catches of larvae during the same period. Whether this high temp. favors survival of the larvae directly or indirectly through providing plankton food was not proven but through analogy with plaice fry the latter was considered most probable. There also was a marked correlation between high salinity during Nov.-Jan. and large catches of fry during the following spring. This may be explained by the movements of the adult cod which usually migrate into the Belt Sea in autumn and leave again during the winter or early spring. In yrs. of unusual penetration of salt water into the Belt Sea the return of adult cod may be delayed until after they have spawned in the Belt Sea thus providing an unusually good stock of fry in that area. The fluctuations in the numbers of fry developed in the spring affect the stock of cod in subsequent yrs. as shown by the strong correlation between the number of larvae in the spring, O-group in the summer, I-group the following year, and II-group the next following year in otter-trawl catches in Danish waters.—*O. E. Sette.*

3346. RICHARDS, O. W. The animal community inhabiting rotten posts at Bagley Wood, near Oxford. *Jour. Ecol.* 18(1): 131-138. 1 fig. 1930.—This article is based upon 6 yrs. of study of about 70 posts, which extended about 100 yards. On one side of the posts were hay fields; on the other side cereals and beans. Most of the posts were willow; the others were ash and elm. The animal community found on these posts consisted of moth larvae and psocids feeding on lichens on the posts; beetles, Collembola, and spiders under the bark; beetles feeding on fungus; wood-eating moth and beetle larvae; bees, wasps, and ants nesting in the posts; and various other forms that the author calls "post-users," such as jumping and orb-weaver spiders, moths, flies, hibernating beetles and earwigs, and aestivating snails. Some of the willow posts sprouted, giving rise to an additional community living on the leaves. This consisted of aphids, which were accompanied by ants and preyed upon by syrphid larvae, ladybirds, and lacewings; leafhoppers, moth and sawfly larvae, and beetles feeding on the leaves; gall-making midges and sawflies; mating insects, predaceous flies, and spiders occurring on the leaves. The composition of these communities varied with the season and the age of the posts.—*D. J. Borror.*

3347. RÖDER, RICHARD. Die anthropogeographische Bedeutung der Malaria. *Janus* 34(2): 38-64; (3): 71-96. 1 map; (4): 121-128; (5/6): 142-176. 1930.—Within a belt defined by the isotherms of 16° for the coolest mo. in both hemispheres, malaria is not only endemic but active the yr. through. To the north and south of this tropical malaria belt are strips of the earth's surface, defined poleward by the isotherms of 16° for the warmest mo., where malaria is only a seasonal visitant; but within these isothermic lines are regions where malaria is severe, other malaria-free districts, and still others where malaria is only an occasional epidemic visitor. Regions without mosquitoes are free from malaria. Almost all Europe north of the Alps, however, has mosquitoes without malaria. Certain industries are also more or less identified with malaria, such as fishing, reclaiming waste land, production of linen, and culture of hemp, rice, and bananas.

3348. ROUBAUD, E., et C. TOUMANOFF. Intoxications d'encombrement, chez les larves de Culex vivant en milieu non renouvelé. *Bull. Soc. Path. Exot.* 23(9): 978-986. 1930.—The accumulation of toxic excreta in small breeding places where the water is not changed was experimentally shown to retard or prevent the develop-

ment of mosquito larvae, producing an especially heavy mortality in the 4th stage. The survivors were generally ♂. A long sojourn at a low temp. tended to enable larvae weakened by such toxic action to recover and resume their development. This phenomenon is regarded as the physiologic parallel of the spontaneous "diapause" that requires the reactivation of winter.

3349. **[SAINT-HILAIRE, C.]** СЕНТ-ИЛЕР, К. Экспедиция на Дон летом 1928 г. **[The hydrobiological expedition along the River Don in summer 1928.]** [English summary.] Труды Научно-Исследовательского Института при Воронежском Государственном Университете. (*Trav. Inst. Rech. Sci. Univ. d'État, Voronèje, URSS.*) 1929(3): 62-105. 1929.—In the summer of 1928 the Inst. for Sci. Res. in Voronezh organized a hydrobiological expedition along the River Don, from the mouth of the river Voronezh south. The expedition went down the Don for about 400 km., studying its water-fauna. The depths, swiftness of current, temp., transparency, colour of waters, and content of O were measured. Samples of the earth from the bottom of the river were taken. Bottom fauna and plankton were collected. The material obtained is partly worked through, but not yet sufficiently for making any general deductions. The most interesting sp. discovered are some Crustacea which up to that time had been found but in the lower parts of the Don, namely: *Chaetogammarus tenellus* (Sars), *Dikerogammarus villosus* (Sow.) Mart., *Pontogammarus maeoticus* (Sow.), *Corophium curvispinum* Sars., *C. chelicorne* Sars., *Paramysis baeri* Czern., *Diamysis mecznikowi* (Czern.).—*Author's summary.*

3350. **SCHREIBER, GIORGIO. Il contenuto di sostanza organica nel fango delle grotte di Postumia. [Content in organic substances of the mud of the caves of Postumia, Northern Italy.]** *Atti Accad. Sci. Veneto-Trentino-Istriana* 20: 51-53. 1929.—In the waters of the cave of Postumia there is a lack of vegetable life (on account of the darkness) and protozoa. The animals which live there (e.g., *Planaria cavatica* and *Gordium* ?) are nourished chiefly by the mud which contains 0.237% of organic N.

3351. **SELYS-LONGCHAMPS, MARC de. Observations limnobiologiques faites dans les Alpes Maritimes.** *Recueil Inst. Zool. Torley-Rousseau [Bruxelles]* 1(1): 11-30. 1927.—In this region *Salmo fario* has a discontinuous distribution; some parts of the alpine streams are unsuitable for it by reason of floods, deforestation, etc. It maintains itself the year round in lakes at an altitude of 2200 m. Its food here includes winged ants (*Camponotus herculeanus*). In Belgium, where thousands of trout were examined, this sp. was never found practicing cannibalism in streams, though it may in ponds. In general, it feeds upon *Lumbricus* but not upon other worms such as leeches, planarians, Gordius, and small oligochaetes. *Gammarus* and *Limnaea* are important foods, and Phryganeidae and subimaginal Ephemeridae are especially appreciated. Diptera, Coleoptera, and Orthoptera are eaten, but Lepidoptera are disdained. Miller's thumbs, the young of many other fishes, and small frogs are taken, and there is one case of a water shrew being eaten. The trout is sedentary and solitary in a stream, but in quiet water, such as a lake, it moves about in bands. The trout is able to surmount waterfalls up to about 2 m. high, in part by leaping and in part, it is surmised, by swimming upward through the vertical sheet of water. In the Tinée, a mountain stream of Alpes Maritimes, there appears to be no fish other than the trout above 1000 m. In this region the only amphipod found was *Niphargus*, in a spring at 1800 m. *Gordius aquaticus* is abundant in summer in a nearly dry mountain torrent of this region, and *Branchipus* occurs in a temporary pool at 2000 m. Some forms of phytoplankton and of Cladocera are recorded from Lac de Rabuons, at 2515 m.

3352. **SUND, OSCAR. Fluctuations in the abundance of the various year-classes of food fishes. II. The renewal of fish population studied by means of measurement of commercial catches. Example: the Arcto-Norwegian cod stock.** *Conseil Perm. Internat. Explor. Mer Rapp. et Proc.-Verb. Réunions* 65: 10-17. 6 fig. 1930.—The age of cod is difficult to determine from the scales after it is 6 yrs. old, but it is possible to arrive at an approximation of the relative numbers of cod of various ages in the catch by means of the Petersen frequency method when the data are weighted according to average catch per fishing unit and treated to show % departures from the normal frequency distribution as determined by the average of a large series of yrs. From this it appears that the Norwegian catch of cod has been maintained since 1913 largely by the 1904, 1912, 1919, and, to a less extent, 1915 and 1917 classes. Some of these classes continued important in the catch up to the age of 10-14 yrs. Some classes became evident in the fishery so late in life that they may have been hiding in places not subject to commercial fishing. No notable class has appeared since 1925, indicating the improbability of substantial recruitment of spawning fish before 1932, and the possibility of serious decline 2 or 3 yrs. hence even if a rich brood does appear in summer fishing of 1929.—*O. E. Sette.*

3353. **THOMPSON, D'ARCY W. Fluctuations in the abundance of the various year-classes of food fishes. III. On fluctuations in the abundance of cod.** *Conseil Perm. Internat. Explor. Mer Rapp. et Proc. Verb. Réunions* 65: 18-25. 6 fig. 1930.—Statistics of the cod landed in Aberdeen since the year 1901, treated according to areas of origin, show that the average catch per 100 hrs. trawling has been 60-70 cwt. northwest of the Faroes, 31-37 cwt. southeast of the Faroes and Shetlands, 20-24 cwt. in the middle portions of the northern part of the North Sea, and 13-17 cwt. in the areas off the east coast of Scotland and in the northernmost portions of the North Sea. There is usually a seasonal maximum (sometimes double) during March-June or July, and a minimum July-Dec., depending upon the area under consideration. The fluctuations in average annual catch are parallel in certain areas. There is no evidence of diminution in average catch in the long run except in the Faroes where the averages in recent yrs. no longer equal those at the beginning of the period.—*O. E. Sette.*

PLANT

3354. **[BALABAIEW, G. A.]** БАЛАБАЕВ, Г. А. Вертикальное распространение сорных растений в горах Средней Азии. **[Vertical distribution of weeds over the mountains in Central Asia.]** (English summary.) Известия Главного Ботанического Сада СССР. (*Bull. Jard. Bot. Princ. URSS.*) 27(5/6): 459-519. 1928.—The study was made in the Ura-Tubinsk district (Samarkand) and in some upland regions along the upper Zeravshan River, at elevations of 400-2600 m. The rate of frequency of the weeds at the elevations studied was determined by mathematical formulae. In general, the botanical composition at different altitudes as well as changes in the rate of frequency of particular sp. was due to the unequal distribution of heat and moisture over mountain slopes. Certain sp. and groups of weeds keep to definite altitudes, the southern forms occupying the lower belts and the northern forms the higher. The amount of common annual weeds did not decrease with altitude, but increased 2½ times as regards the number of sp. and 2 times as regards the vegetative mass. It is concluded that the seed of common weeds at the higher elevations have a low optimum germination temp. The occurrence of lowland weeds at the higher elevations is explained by the faculty of their seed to germinate in an immature condition.—*M. C. Merrill.*

3355. **BOMMER, M. Quelques aspects de la végétation marocaine.** *Ann. et Bull. Soc. Roy. Sci. Med. et Nat. Bruxelles* 1928(2/7): 37-42. 1928.—A brief introduction describes the topography and climate of Morocco. This is followed by a detailed description of the distribution and composition of the arborescent vegetation. The forest flora of Morocco, as well as that of Algeria and Tunis, is practically the same as that of Mediterranean Europe. This similarity is explained as a result of the

immigration of the Miocene flora of Europe into northern Africa in the Tertiary epoch when the great alpine foldings gave birth to the north of Africa. In the east the connection was established through the Appenines and Sicily; in the west through the Baetic Cordilleras and the upheaval of the Rif. The colonization of the new emergent surfaces was somewhat different due to the 2 paths of immigration thus established. In the east the Corsican pine and the maritime pine show a relationship with the flora of Italy and Corsica, while in the west the argan (*Argania sideroxylon*) indicates a relationship with an earlier flora of Madeira and the Canary Islands. "The proper elements of the north-African flora, the cedars, and to a certain extent the 'thuja' (*Tetraclinis*) are also some of the elements of the Tertiary European flora or, perhaps for the argan and the gum, of the 'macronesian' group from which they have since disappeared. The distinctive character of the North-African flora resides in the more complete persistence here than in Europe of the Tertiary forest types and the Moroccan flora presents in the case of argan and the gum, the accentuation of this peculiarity of composition."—*P. D. Strausbaugh.*

3356. **BONKER, FRANCES,** and **JOHN JAMES THORNBER.** (Introduction by **HAROLD BELL WRIGHT.**) **The sage of the desert and other cacti. Studies of that fantastic clan, the cactus of the desert, and other interesting and peculiar desert growths.** 106p Illus. Stratford Co: Boston, 1930.

3357. **BORGESEN, F. Notes on the vegetation at Dwarka on the west coast of India, with reference to Raunkiaer's "life-forms" and statistical methods.** *Jour. Indian Bot. Soc.* 8(1): 1-18. 3 pl. 1929.—At Dwarka, temp. ranges from about 21° C. in Feb. to 35.2° in June; about 32 cm. of rain falls June-Aug., 1.3 cm. in Feb., and very little the remainder of the yr. Low rainfall, high insolation, and strong winds combine to suppress all tree growth. *Euphorbia nereiifolia,* 2 m. high, is the largest plant. A small area near the coast was visited in Jan., and 28 sp. of flowering plants collected; they are described and their life-forms indicated. They give a biological spectrum of S 4, E 0, MM 0, M 0, N 14, Ch 50, H 7, G 4, HH 0, Th 21; this is compared with spectra of other places, and with Raunkiaer's normal spectrum. The vegetation at Dwarka is considered very xerophytic.—*W. Dudgeon.*

3358. **BUYS, D. W., H. WITKAMP, F. H. ENDERT, H. C. SIEBERS (assisted by D. F. K. BOSCH). Midden-Oost-Borneo Epeditie 1925.** Uitgave van het Indisch comite voor wetenschappelijke onderzoekingen. 423p. illus. G. Kolff & Co.: Weltevreden, Java. 1927.—This expedition mapped the water courses and made observations on the geology, topography, zoology, botany, population, and economic resources of the region. The floristic ecology of the vegetation adjoining the streams is specially well treated, with a wealth of detail. The plant collections totalling 4000 numbers are believed to comprise about 2500 sp. Most of these are designated by genus or family and collection number, and await further study. Many of these are either identical with or very similar to sp. found in the Philippine forests. Collections were also made of 41 or 42 sp. of mammals, besides birds and insects. Along the lower reaches of the rivers, the lakes are bordered by great areas of grassy marshlands and floating masses of *Eichhornia,* etc. On the river banks, the inundated areas (rapak) are grown up to small misshapen trees, *Coccoceras sumatrana, Ixora* sp., and *Shorea balangeran* (Kahoi) being dormant sp. Epiphytes and vines are poorly represented. The occasionally overflowed lands have a similar but better developed and more varied woodland cover. The Dyak population evidently subsists primarily by fishing, hunting, and a primitive, shifting agriculture, resulting in large areas of grassland and second growth in abandoned fields on the higher ground similar to those of the Philippines. The vegetation of the marshy grasslands and river swamps, as well as the broad areas of overflow lands is described. In the middle and upper reaches of the Telen River where the land is higher, with steep slopes and many rapids along the river, large trees of the Dipterocarpaceae, strangling figs, rattans, ferns, epiphytes, and lianas become more prominent features of the vegetation, though no such extensive areas of heavy timber were apparently encountered as characterize the forests of North Borneo and the Philippines. Gutta percha, rattan, rubber, and gums are important products. At higher elevations above 800 m. in the interior are forests composed of *Agathis borniensis.* Above 1000 m. are tree ferns, many epiphyte ferns, climbing *Freycinethia* sp., an orange-flowered epiphytic *Rhododendron,* sp. of *Vaccinium,* etc., and some interesting hemi-parasites, *Elythranthe, Loranthus, Viscum, Ginalloa.* On the volcanic summits above 1500 m. in the wet forest, where the trees and branches are covered with thick masses of mosses and epiphytes, are a dozen or more sp. of epiphytic rhododendrons with bright rose, violet, dark red and yellow flowers; and *Aeschynanthus* with handsome dark red and violet flowers. *Elatostema, Coelogyne, Eria, Nepenthes, Coleus,* and *Hymenophyllum* are conspicuous. The book gives a detailed account of the explorations and descriptions of many of the characteristic plants in the different types of vegetation; the lake marshes (koempai); submerged lands covered with woodland (rapak); forests of overflow lands (Klan); the old clearings (padang); the hill forests; and mossy forest of high elevations.—*F. T. McLean.*

3359. **COTT, HUGH B. The natural history of the Lower Amazon.** *Ann. Rept. & Proc. Bristol Nat. Soc.* 7(3): 181-188. 6 pl. 1930(1931).—General notes on plant and animal life in the rain forest about Pará and on the open plains of Marajó Isl.

3360. **COWAN, J. M. The fortunes of a botanist on the Persian frontier.** *New Flora & Silva* 3(4): 219-227. 4 pl. 1931.—A general account of the pasture-lands of the Urumia District in N. W. Persia is given. The vegetation of the Urumia Plateau (4,500 ft.), the Plains of Mergavar and Tergavar (6,500 ft.), and the frontier mt. range (6,500-9,000 ft.) is described with special reference to plants of horticultural interest. Several indigenous sp. of tulip, the possible parents of varieties in cultivation, sp. of *Colchicum, Fritillaria, Allium, Ixiolirion, Muscari,* and *Ornithogalum* are recorded as common. *Iris barnumae* is noticed in clumps; *Iris* aff. *ewbankiana, I. reticulata,* and *I. bakeriana* are noted as rare. *Puschkinia hyacinthoides, Gagea* sp., *Colchicum* sp., and a *Ranunculus* fringe the snow-drifts. *Papaver orientale* Linn. and the bracteate *P. bracteatum* Lindl. are regarded as synonyms, both forms being found on the same plant. Other sp. noted are *Delphinium speciosum, Verbascum phoenicium, Aubretia kotschyi, Vicia tenuifolium, Stachys lavandulaefolia, Globularia trichosantha, Aethionema pulchellum, Thymus kotschyanus, Onobrychis cornuta, O. buhseana,* and sp. of *Astragalus.* The country is treeless except near some of the streams where a few stunted willows, poplars, ash, hawthorn, almond, *Elaeagnus angustifolia,* and *Berberis densiflora* are found. Clumps of *Rosa foetida* and its variety *bicolor* are occasionally conspicuous.—*J. M. Cowan.*

3363. **EMBERGER, LOUIS. La végétation de la région méditerranéenne. Essai d'une classification des groupements végétaux.** *Rev. Gén. Bot.* 42(503): 641-662; (504): 705-721. 2 fig. 1930.—In this condensed article the author emphasizes the principle that a natural classification of plant communities should be based on ecological criteria and that among these criteria climatic data occupy a foremost place. Vegetation is a response to

climate and the author has sought a systematic formula in which precipitation, temp., and evaporation are recognized as the most important expressions of climate. On this basis he has established for the Mediterranean climate the formula: $P/2[(M+m) \times (M-m)] \times 100$ in which P indicates the annual precipitation, M the mean maximum temp. for the warmest mo., and m the mean minimum for the coldest mo. of the yr. As no direct measurements of evaporation are available it is approximated by the expression $(M-m)$ on the assumption that evaporation varies with temp., being greater with higher temp. From this formula there results a series of precipitation-temp. or "pluviothermic" quotients characteristic of different localities. Then in order to express more accurately the efficiency of the climate of various localities for vegetation, these pluviothermic quotients as ordinates are plotted against the values of m as abscissae and the results expressed graphically in a table where the different localities are seen to group themselves according to similarities of their climatic summations and hence according to similarities in vegetation. The importance of m lies in the fact that low temp. has a restricting influence on vegetation. —Noting the grouping of localities with similar climates and similar vegetation, 5 climatic subregions are distinguished within the climate of the Mediterranean region: arid, semiarid, temperate, humid, and high montane, each of these involving corresponding divisions of the vegetation, divisions which agree ecologically in spite of floristic differences. Each climatic subregion has a corresponding stage of vegetation. These stages are comparable to families in taxonomy and are subdivided into substages and groups corresponding to genera and sp. The 2nd part of the article is devoted to a brief consideration of the vegetation of the various stages and substages, delimited by the formula, and found within the Mediterranean region, together with a brief consideration of the limits of the region.—*From author's abstract (transl. by B. McAvoy).*

3364. ERDTMAN, O. G. E. On the immigration of some British trees. *Jour. Bot.* [*London*] 64: 71-74. 1926. —This note is based chiefly on a statistical investigation of pollen from 2 series of peat samples collected from Chat moss near Manchester and from West House Peat moss from Yorkshire, from which it appears that the forest trees must have reached the middle of England in the following order: birch, pine, willow, hazel, elm, oak, alder, lime, and beech.

3365. FINNELL, H. H. Some effects of wind injury to growing plants. *Bull. Univ. Oklahoma (Proc. Oklahoma Acad. Sci.)* 9(456): 24-27. 1929.—Preliminary observations in Oklahoma showed that next to temp., wind velocity is the most important factor affecting crop yield, and that the effect of wind is not due entirely to its influence on transpiration. In greenhouse experiments on marigolds, exposure of potted plants to artificial "wind" (about 20 mi. per hr.) reduced growth rate and yield, but seemed to increase the number of leaves formed. With sorghum and barley, yield was reduced 30% and 24%, respectively; with marigold, 48%. Blooming of marigold was retarded about 10 days in wind.

3374. HUGUET del VILLAR, EMILO. Sur la méthode et la nomenclature employées dans mon étude géobotanique de l'Espagne. *Proc. Internat. Congress Plant Sci., Ithaca, N. Y., 1926* 1: 541-564. Geo. Banta Publ. Co.: Menasha, Wisconsin, 1929.—Geobotany is a more limited term than ecology which has many meanings. Synoecia (Latin) is utilized to indicate an individualized botanical cohabitation. The formation is the synoecia from a biomorphologic viewpoint, and the association is the synoecia from a systematic viewpoint. Remainder of article explains many other new terms that are suggested and applied in studying ecological successions, climaxes, subclimaxes, life forms, and environment.—*L. K. Henry.*

3375. IVERSEN. J. Studien über die pH Verhältnisse dänischer Gewässer und ihren Einfluss auf die Hydrophyten-Vegetation. *Bot. Tidsskr. (København)* 40(4): 277-333. 2 pl. 9 fig. 1929.—The author investigated the H ion relations of 50 Danish lakes and placed them in the following categories: I. Permanently acid lakes: (1) permanently very acid, pH<5.3; and (2) changing from very to slightly acid. II. Lakes fluctuating from acid to alkaline: (1) predominantly acid lakes, pH—minimum <5.3; (2) predominantly neutral-alkaline, pH minimum >5.3. III. Permanently alkaline lakes. The acid lakes are fewer, are found on sterile soil, are poor in lime, and often contain humus. Their acidity is not dependent upon CO_2. On the other hand in the fluctuating lakes the pH is partly dependent upon the CO_2 content; hence they are influenced by autotrophic plants. Alkaline lakes are numerous, are rich in lime, and also contain other buffers; humus is found in some of them, in others not. All sp. of plants found are enumerated, and their occurrence in water of different reaction is stated. A comparison of the occurrence of different types of aquatic plants shows that the alkaline lakes represent the most favorable reaction type for the higher aquatic vascular plants; in the very acid lakes only about 20% of the sp. are found.—To determine whether this relation between reaction and vegetation rests upon causality, culture experiments with the different sp. should be made, but it is thought that the reaction itself is of

vital importance for the composition of the vegetation. The following types of lakes are recognized, and the main features of their vegetation given: (1) acid lakes with limpid water; (2) acid humus-lakes; (3) alkaline lakes with limpid water; and (4) alkaline humus-lakes. The paper ends with short descriptions of the 50 Danish lakes investigated.—*Ove Paulsen.*

(2 col.) 1929.—Attention is drawn to the biological phenomenon of the desert plants *Titanopsis calcarea** (Marl.) Schwantes, *Lithops lesliei** N. E. Br., *Argyroderma testiculare** (Thunb.) N. E. Br., and *Didymaotus lapidiformis** (Marl.) N. E. Br. as regards their similarity, in shape as well as color, to the ground and the stones among which they grow.—*R. H. Marloth.*

3382. MARSHALL, ROBERT. An experimental study of the water relations of seedling conifers, with special reference to wilting. *Ecol. Monographs* 1(1): 37-98. 1930.—Seedlings were grown in greenhouse and sand beds for about 24 days after emerging from soil and then allowed to wilt and die without further watering. The sp. studied were *Abies grandis, Picea excelsa, P. glauca, Pinus caribaea, P. echinata, P. monticola, P. resinosa, P. ponderosa, Pseudotsuga taxifolia, Thuja occidentalis, T. plicata,* and *Tsuga heterophylla.* Progress of wilting and drying was followed by means of measurements of water contents and dry wts. of seedling tops and by atometer and soil-point readings. A diurnal fluctuation in water content of tops was observed and taken into account. Two stages of drying of seedlings were recognized: (1) a 1st critical stage, probably corresponding to the onset of permanent wilting (Briggs and Shantz); (2) a 2nd critical stage, when leaves and stems became brittle. For Norway-spruce and Norway-pine seedlings the 1st critical stage was attained when the mean water-content % of tops had decreased by 15-20% of the corresponding % for healthy plantlets. At this time the water-supplying power of the soil (at depth of 3-5 cm.) had decreased to about 2 mgm. per sq. cm. for 1st hr. of absorption. This supplying-power index is about ¼ as great as that found necessary to maintain growth in Kentucky blue grass on a Baltimore lawn in summer.—*Author (courtesy Wistar Bibl. Serv.).*

3384. MELIN, ELIAS (Transl. from German by PAUL W. STICKEL). Investigations of the significance of tree mycorrhiza. An ecological-physiological study. 147p. 48 fig. Edwards Brothers: Ann Arbor, Michigan, 1930. Pr. $2.25.—This book contains the author's results of experiments with the mycorhiza of *Pinus silvestris, P. montana, Picea abies,* and *Larix europea.* Pure cultures of the root fungi are described; and the behavior of these fungi towards phosphatides, various sources of N including the free N of the air, and towards pH is indicated. No evidence of the utilization of free N was found. It is demonstrated that the mycorhiza possess a very vital significance for seedlings and trees in raw humus and related soil types.

3385. NEUSTADT, M. Einige Resultate von pollenstatistische Untersuchungen im Osten des Gouvernements Wladimir. [Some results of pollen analysis in eastern Vladimir, U. S. S. R.] *Geol. Fören. Stockholm Förhandl.* 50(3): 436-442. 2 fig. 1928.

3386. PFEIFFER, HANS. Über die ökologischen Bedingungen des Formationswandels an Schlagflächen. [Ecological conditions of succession on clearings.] *Bot. Arch.* 31(3/4): 543-552. 1931.—A review.

3387. RAUP, LUCY C. The lichen flora of the Shelter Point Region, Athabasca Lake. *Bryologist* 33(5): 58-66. 4 pl. 1930.—Four associations are discussed, with primary

and secondary sp. found in each: lake shore, upland, arboreal, and muskeg (or bog).—*A. M. Taylor.*

3388. SABNIS, T. S. A note on the ecology of the flora of Sind. *Jour. Indian Bot. Soc.* 8(4): 263-286. 1929.—Except for the central alluvial plain, Sind is desert, continuous with the great desert of north-west India. Topography and soil conditions are varied: sandy plains with moving dunes; barren sandstones and volcanic hills; an extensive coast; a few lakes; and alkali soil areas. The flora is correspondingly varied. Rainfall is scanty; temp. ranges from a mean monthly max. of 114.1° F. in June to a min. of 73.2° in Jan. (at Jacobabad); rel. humidity (at 8 A. M.) ranges from 44% in May to 71% in Aug. (at Jacobabad), and 57% in Dec. to 85% in Aug. (at Karachi). Much of Sind is uncultivated, due to lack of irrigation facilities. The flora consists of 540 sp. in 302 gen. and 76 fams.; 498 sp. in 268 gen. and 70 fams. are indigenous; 450 sp. in 253 gen. and 69 fams. are Dicots; and 90 sp. in 48 gen. and 6 fams. are Monocots. There is 1 Gymnosperm. The flora is closely related to that of the western deserts, and is larger than that recorded for the Indus Delta (to the west) or for the Rajputana Desert (to the east). The western deserts are much drier, and the vegetation shows more pronounced xerophytic characters than that of Rajputana. There is evidence for a gradual plant migration toward the east. Ecological conditions are described under Schimper's formations: halophytic and semi-halophytic, aquatic and semi-aquatic, kalar soil (alkali), sand, gravel, rock, and ruderal. Lists of characteristic plants are given. Crop plants, fruit trees, and common village trees are also mentioned.—*W. Dudgeon*

3389. SAMPAIO, A. J. de. Phytogeographia do Brasil. *Bol. Mus. Nac.* [*Rio de Janeiro*] 6(4): 272-299. Map. 1930.—Adopting Engler's classification with a little terminological modification, the Brazilian flora is divided into 2 provinces: Amazonian flora and Extra-amazonian flora or General flora. Lists of plants are given to show clearly that the flora of the Brazilian "Ilha da Trinidade" is similar to that of the continent and that the Brazilian general flora embraces the Amazonian flora in the north. —*A. J. de Sampaio.*

3390. SAMPSON, HOMER C. Succession in the swamp forest formation in northern Ohio. *Ohio Jour. Sci.* 30(5): 340-357. 1930.—The swamp forest formation in northern Ohio comprises several forest communities of which the willow-poplar, elm-black ash-soft (red & silver) maple, and the elm-white ash-soft maple communities have been most generally recognized. Transitional phases of the elm-white ash-soft maple community become evident by the invasion of certain secondary sp. as drainage increases. The bur oak-big shellbark hickory, red oak-linden-shagbark hickory, and the walnut-tulip-magnolia transitional phases—listed in the order of increased drainage—are recognized. Several variants of this community are also brought about by the relative abundance of these secondary sp. which reach the rank of dominants in certain habitats. Characteristic secondary communities following clearing also occur. Numerous small local differences in topography result in a mosaic of communities. The paper includes a chart of the relative abundance and range of distribution of 33 sp. of trees within the forest communities of the area surveyed.—*H. C. Sampson.*

3391. SAMPSON, HOMER C. The mixed mesophytic forest community of northeastern Ohio. *Ohio Jour. Sci.* 30(5): 358-367. 1930.—The mixed mesophytic forest community in northeastern Ohio is limited to local habitats —principally slopes—characterized by soils with a good supply of water and with good internal drainage. Slopes with heavier soils and poorer internal drainage are covered by a beech-maple community. The dryest habitats are occupied by an oak-chestnut community. The principal sp. are beech, sugar, black and red maple, tulip, magnolia, chestnut, white and red oak, and white ash. Somewhat less abundant, but decidedly more abundant than they occur as secondary sp. in the beech-maple community are red and American elm, black and white walnut, linden, black cherry, sour gum, bitternut, pignut, mockernut, and shagbark hickories. Variants are noted, particularly a dryer phase of the community in which beech and hard maple are rare to absent. The paper includes a chart showing the relative abundance and range of distribution of 34 sp. of trees within the forest communities of the region surveyed.—*H. C. Sampson.*

3392. SCHMID, EMIL. Vegetationskarte der oberen Reusstäler. [In: *Beitr. z. geobot. Landesaufnahme der Schweiz.*] 16: 64p. 1 col. map, 2 pl. 8 fig. Hans Huber: Berlin 1930. Pr. 9.50 M.—This contribution to the geobotanical survey of Switzerland consists of a map of upper Reusstäler with the vegetation climaxes in color on a contour map of the region. The principal sp. are put on the map in symbols. The floristic history of the sp. in each climax is discussed and man's part in the distribution of sp. is considered.—*B. McAvoy.*

3393. STEIGER, T. L. Structure of prairie vegetation. *Ecology* 11(1): 170-217. 26 fig. 1930.—An 800 acre tract of natural prairie near Lincoln, Neb., gave this data on the structure of prairie vegetation. The topography is rolling with little or no erosion. The mean annual rainfall is 27.9 in. of which 70% falls in the spring and summer. The soil is glacial silt loam with high water retaining capacity. Data on the hygroscopic-coefficient, moisture equivalent, plastic limits, pH values, and % of N and CO_2 were taken to a depth of 6 ft. on soil profiles of the high and low prairies. The xeric conditions of the uplands are indicated by such sp. as *Stipa spartea, Koeleria cristata,* and *Bouteloua oligostachya.* Usually there is plenty of soil water to support growth in all parts of the prairie. The temp. and relative humidity of the air during the day were the same over both high and low prairies. At night, air temp. over the upland was 8° F. less and the relative humidity 10.5% less than over the lowland. The mean soil temp. at a 6 in. depth was 2° F. higher on the upland than the lowland June-Oct. The wind velocity averaged 7.7 mi. per hr. over the uplands and 5.8 on the low. The average daily water loss was 28.4 cc. on the high and 16.7 cc. on the low prairie. The plant associations vary from wet meadows through mesophytic ravines, north slopes, and low prairies, to xeric uplands. The transitions are usually gradual. A few mesophytic herbs with trees and shrubs occupy the ravines. A transect 30 cm. wide and 100 m. long from a hilltop to the base showed the following variations: dominant grasses at top *Bouteloua gracilis* and *Sporobolus heterolepsis;* on upper slope *Andropogon scoparius;* on the lower slope *A. scoparius* and *A. furcatus;* at the base *A. furcatus.* Height of vegetation at top was 20 cm.; on upper slope 30; on lower slope 35; at base 65. The % of available water at 6 in. deep at the top was 0.2; on upper slope 1.3; on lower slope 1.3; at base 3.8. Soil temp. 6 in. deep at top was 86° F.; on upper slope 83°; on lower slope 80°; at base 73°. The yield in gm. green wt. per sq. m. at top was 336; on upper slope 551; on lower slope 887; at base 964. The wet meadow is an early stage of prairie development. More than 300 sp. from the area are listed. The place of growth and time of flowering are given for 250 sp. The anthesis for the high prairie is late May, for the low late July, and for ravines and wet meadows Aug. Quadrat studies show the order of abundance of grassy and non-grassy sp. The average yield per sq. m. air dry wt. was 215 gm. on the uplands and 391 on the low. The water content of the upper 2 ft. of soil was from 1-4.6% greater on the unmowed than on the mowed prairie. The upper layer of soil on the upland has less H_2O and a more rapid rise in temp. than the same layer of the lowland on account of the greater amount of plant debris. The absence of the upland sp. from the lowland is chiefly because of the lack of light. Light on the soil surface under a dense cover was 1-20% of that on a more open one. The usual method of propagation of prairie plants is vegetative. Of 337 plants only 10 are annual. *Andropogon scoparius* is the dominant grass on the high prairie, covering 26% of the area occupied by grasses and sedges. *A. furcarus, Poa pratensis,* and *A. scoparius*

take first rank in the low prairie covering 34, 30, and 25% of the area respectively.—*C. E. Montgomery.*

3394. **THOMSON, WALLACE A. The photo-electric cell and electric clock as a means of recording the daily hours of bright sunshine.** *Canadian Jour. Res.* 4(3): 299-303. 2 fig. 1931.—Sun's rays, falling on the cathode of a photoelectric cell, start an electric clock by the action of a relay; when sunlight ceases to fall directly on the cathode, the clock stops. Total number of hrs. and min. is thus shown, accurately, but there is no record of the time during which the sun shone.

3395. **TUORILA, PAULI. Wirkung der Kalziumkarbonat- und Schwefelsäurezugaben auf die Azidität von verschiedenen Torfarten.** *Wiss. Ver. Finnische Moorkulturver.* No. 8: 1-75. 1928.—Determinations of pH were made with the quinhydrone electrode in thick suspensions of peat in water. CO_2 was dissolved by this peat-suspension in less than 5 days, so long as the acidity remained greater than pH 6. In general the increase in pH was directly proportional to the amount of $CaCO_3$ added, one part to 100 parts of peat reducing the acidity 0.7 pH. In *Sphagnum fuscum* peats, however, the reduction was only 0.5 pH. The plant composition, degree of humification, and ash content had no appreciable effect on these results. Data are given as to the amounts of $CaCO_3$ required in field applications to yield desired pH values to a depth of 20 cm. per ha. H_2SO_4 will increase the acidity of peats, whether added in pure solution or along with superphosphate, although in the latter case secondary effects may result in ultimate return to the original acidity. There is some evidence that, especially in humus-rich soils, the yield of crops is not directly related to the pH value, but to the condition of the lime or other substances.—*E. T. Wherry.*

3396. **TURRILL, W. B. The flora of Foula.** *Bot. Soc. & Exchange Club British Isles* 8(5): 838-850. 1929.—The island of Foula is the most westerly of the Shetland group and attains an altitude of 1373 ft. Previous accounts of the flora and vegetation are very meagre. 129 sp. of Phanerogams and vascular Cryptogams are now recorded. The flora is analyzed into the following groups: aquatic and marsh sp.; sp. of sea-cliffs, rocks, and sea-strand; arctic-alpine sp.; heath-moor sp.; relicts of woodland ground flora; modified vegetation; weeds of cultivated ground; ruderals; and cultivated plants or ones escaped from cultivation. The dominant category is that of heath-moor sp. A discussion of the physiography and geology shows that the main ice-sheet of the Ice Age reached the island without completely over-riding it. On the basis of Raunkiaer's life-form system the following composition of the total vegetation is obtained: N/2 Ch/13 H/74 G/10 HH/12 Th/26. This yields the following biological spectrum calculated as a % of the whole flora: N/1.4 Ch/9.5 H/54 G/7.3 HH/8.8 Th/19. Paleontological evidence shows that the island was formerly wooded, but though climatic changes are probably concerned in the known vegetational changes it is also probable that man by using wood for fuel and by introducing domestic animals, especially sheep, may have been a subsidiary cause in the disappearance of trees in Foula. The heath-moor flora and the aquatic and marsh flora very probably survived the Ice Age in situ in places free from ice, but the arctic-alpine element was then relatively more important than it is now. Tree sp., especially birch, came in from the south as conditions became more favorable. Local topographical changes, natural succession, and small meteorological changes caused alternations of treeless heath-moor and birch woods, as well as modifications of the latter. The arctic-alpine element became reduced to mere vestiges. Finally the advent of man, the introduction of sheep, and, perhaps, increase of wind storms, destroyed all traces of natural woodland.—*W. B. Turrill.*

3397. **TURRILL, W. B. The plant-life of the Balkan Peninsula, a phytogeographical study.** xxiv+490p. 10 pl., 11 maps. Oxford Univ. Press, American Branch: New York, 1929. Pr. $10.00.—The peninsula covers 187,856 sq. miles and extends north to the head of the Adriatic and the rivers Kulpa, Sava, and Danube. A large proportion of the area is mountainous or hilly. In geological history the area was long connected with Asia Minor; local glaciation scarcely affected it. A great variety of rocks and consequently of edaphic environments exist. Mediterranean climate with hot dry summers predominates near the coast, while much of the interior shows the Central European type with no pronounced dry season. The flora includes 6530 sp., mostly Mediterranean or Central European in relation, and these determine 2 general types of vegetation. In the Mediterranean type xerophytes tend to predominate and the characteristic communities, especially at low altitudes, are sclerophyllous forest, macchie, and phrygana. The Central European type is marked by forests of oak, beech, and conifers, and by extensive areas of brush, grassland, heath, and open rock vegetation. Long occupation of the land by man has made him a very important factor in the vegetation and the great expanses of treeless areas are due to him, although their vegetation now seems to be natural. This effect has apparently extended to the evolution of sp., since the genera characteristic of open areas are highly speciated and often contain an unusually high proportion of endemics. Since the peninsula was connected with central Europe during the Ice Age, it served as an important area of refuge and many relict sp. persist. It has also been a center for sp.-making and emigration into surrounding lands. Available evidence indicates that mutation, hybridization, direct action of the environment, and change of a sp. en masse have all been concerned in evolution; for the latter type the term hamagenesis is suggested. Numerous analyses of the flora and vegetation are presented in detail. In vegetative form hemicryptophytes lead and constitute 44% of the flora, or still more where the Central European element predominates. In the Mediterranean flora annuals may amount to as much as 38%. The flowering season covers the whole yr., with its peak in June and July. A classification of habitats shows the greatest number of sp. in dry stony places (2127) and grassland (1691). The most important trees, arranged with the lowland sp. first are for the Mediterranean region *Pinus halepensis, P. pinea, Quercus ilex, Q. aegilops, Laurus nobilis, Abies cephalonica,* and *Pinus nigra;* for transitional areas *Fraxinus ornus,* various sp. of *Quercus, Aesculus hippocastanum, Juglans regia, Fagus orientalis,* and *Ostrya carpinifolia;* for the Central European region various sp. of *Quercus, Castanea sativa, Fagus silvatica, Pinus nigra, Picea omorika, P. abies,* and *Abies alba.* All communities are described in detail. The history of forest destruction from the earliest times to the present is discussed in extenso. More than 1000 sp. behave as weeds or ruderals. A brief chapter summarizes the cultivated crops, which vary widely through the peninsula. The largest families are Compositae (913 sp.), Leguminosae (545), Caryophyllaceae (418), Labiatae (371), and Gramineae (358). The largest genera are *Centaurea* (171), *Silene* (103), *Dianthus* (101), *Trifolium* (94), and *Campanula* (93). The distribution both within and beyond the peninsula is analyzed in detail. Endemics include 1754 sp., with the greatest number in Greece. The application of the Age and Area hypothesis is considered judicially within general neutral conclusions.—*H. A. Gleason.*

3398. **URBAN, OTTO. Estudios sobre la biologia de algunas plantas endémicas. [Biology of some endemic plants.]** *Rev. Chilena Hist. Nat. Pura y Aplicada* 31: 41-52. 1 pl., 4 fig. 1927(1928).—The author describes pollination and the evolution of the spur in *Tropaeolum speciosum,* pollination in *Alstroemeria aurantiaca,* and the ray and disc flowers of *Leptocarpha rivularis.*

3399. **WEAVER, J. E., and W. J. HIMMEL. The environment of the prairie.** *Conserv. Dept. Conserv. & Surv. Div. Univ. Nebraska Bull.* 5. 1-50. 1931.—The physical factors of the environment of both upland and lowland prairie have been measured at Lincoln, Nebraska, for 12 yrs. The upland is dominated by *Andropogon scoparius* and the lowland by *A. furcatus.* The soil is a deep, fertile, fine-textured silt loam of high

water-holding capacity and is circumneutral in reaction. It readily absorbs water and the subsoil is moist to great depths. Upland grass roots penetrate 2-5+ ft. and those of the lowland approximately 3-10 ft. The roots are thus more extensive than the parts above ground. The mean annual precipitation is 28 in. of which nearly 80% falls during the growing season. Periods of drought are liable to occur at any time and especially after mid-summer. Water-content in the surface 6 in. of upland soil varied widely and rapidly, often 10% or more during a single week. It was reduced to less than 5% 1-4 times during 11 of the 12 yrs., but only twice to the hygroscopic coefficient. Available water-content in the 6- to 12-in. soil layer exceeded 5% ¾ of the time, but fell to 2-3% at 17 different intervals. At no time was the water available for plant growth entirely exhausted. In the 2nd, 3rd, and 4th ft. the water-content was less variable. In general, there was a gradual decrease in the supply with the advance of the summer. This was frequently temporarily interrupted, especially in the 2nd ft., by heavy rains. The available supply usually was 5-15%. The maximum was 21% and a few times the minimum fell to 1-3%. On the lowland available water-content was 3-10% greater in the surface foot and often 5-11% in excess of that of the upland in the deeper soil. Average day air temp. sometimes reached 90° F. but were more usually 75°-85°. They were usually 10° or more higher than those for the night. Soil temp. showed a daily variation of 15° to 18° F. at 3 in. but only 1° to 3° at 12 in. Temp. of air and soil during the long growing season are well within the ranges critical for plants of the prairie and are probably of secondary importance. The average day humidity varied between 50-80% during yrs. of greater rainfall but fell frequently to 40-50% during drier yrs. Low humidity nearly always occurred during periods of low water-content of soil and usually also during periods of high temp. Wind movement was fairly constant and often high. It is an important factor in promoting water loss. Evaporation varied greatly from year to year. It rarely fell below an average weekly loss of 10 cc. per day and was usually 20-30 cc., but during periods of drought it sometimes reached 40-55 cc. High evaporation was correlated with low humidity and both of these with low water-content of soil. Water-content of soil and humidity are the master factors of the environment of the prairie. The climax vegetation is remarkably well adapted to these water relations.—*J. E. Weaver.*

3400. **WILCZEK, ERNEST, GUSTAVE BEAUVERD, et DANIEL DUTOIT. Le comportement écologique du** Bromus erectus Beibl. [Ecological behavior of B. erectus.] *Vierteljahrsschr. Naturforsch. Ges. Zürich* 73(15): 469-508. 1928.

3401. **WILSON, ERNEST H. Plant hunting.** Vol. 1: 29+248p. pl. 1-62. Vol. 2: 9+276p. pl. 63-127. The Stratford Co., Boston. 1927. Pr. $15.00.—The author, who from 1899 to 1922 traveled over a large part of the world in quest of plants, presents in this book a vivid description, mainly from a horticultural point of view, of the vegetation of the regions he visited. The work is divided into 4 parts: South and Central Africa, Australia and New Zealand, the Tropics, and the Orient. The account of each region is preceded by a short history of its discovery and especially of the exploration of its flora, with biographical sketches of the earlier prominent plant collectors. The general features of the vegetation are discussed, the more remarkable and ornamental plants enumerated and briefly described in non-technical language. The numerous plates, mostly reproductions of photographs taken by the author, picture the most striking and important plants or in a few instances represent general views of the vegetation or portraits of plant collectors.—*A. Rehder.*

DISEASES CAUSED BY FUNGI

3402. **ATWELL, E. A. Occurrence of Cadophora fastigiata in Canada.** *Phytopath.* 21(7): 761. 1931.—*C. fastigiata* was isolated from stained sapwood of *Picea canadensis, Pinus strobus, P. banksiana,* and *Pseudotsuga taxifolia.* In culture, the organism produced an intense grey-green stain on sapwood blocks of *Pinus strobus* and *P. resinosa,* but less intense on *Picea mariana.*—*W. A. Whitney.*

3403. **AYYANGAR, C. RANGASWAMI. Study of a Fusarium isolated from wilted plantains.** *Madras Agric. Dept. Year Book* 1929: 16-21. 1 pl. 1930.—Cultural characters on maize agar, malt-extract agar, and French bean agar are described. Both micro- and macroconidia are produced, the latter being very rare. The fungus was identified as *F. cubense* var. *inodoratum.*

3404. **[BONDARTSEVA-MONTEVERDE, V. N., and N. I. VASIL'EVSKI.]** БОНДАРЦЕВА-МОНТЕВЕРДЕ, В. Н., и Н. И. ВАСИЛЬЕВСКИЙ. Аскохитоз гороха и других бобовых. **[Ascochytose in the pea and other leguminosae.]** [With English summary.] Болезни Растений [*Bolezni Rastenii*] 19(1/2): 8-11. 1930.—Besides *Ascochyta pisi* and *Mycosphaerella pinodes,* a *Mycosphaerella* differing in culture from *M. pinodes,* and an *Ascochyta* differing from *A. pisi* and *A. pinodella,* were isolated from peas.—*From authors' summary.*

3405. **BRAUN, HANS. Der Wurzeltöter der Kartoffel,** Rhizoctonia solani K. *Monographien zum Pflanzenschutz (Morstatt) No. 5.* 136p. 17 fig. Julius Springer: Berlin, 1930.—A monograph of the organism and the disease it produces, treated under the general headings of economic importance, systematics of *R. solani,* geographical distribution of the organism, host plants, symptoms, morphology and physiology of *R. solani,* relation of host and parasite, and control. An 11-p. bibliography is appended.—*W. A. Whitney.*

3406. **BROOKS, A. N. Anthracnose of strawberry caused by Colletotrichum fragariae, n. sp.** *Phytopath.* 21(7): 739-744. 3 fig. 1931.—Strawberry anthracnose has been found under field conditions mainly on runners and occasionally on petioles. The disease has been observed only in the strawberry-growing area of central Florida. It is characterized by dark brown to black lesions on the runners and causes considerable damage by girdling them and preventing the development of new plants. The causal fungus is *C. fragariae** (p. 742). Bordeaux 4-4-50, applied at 10-day intervals during the summer, checks the spread of the disease, but will not completely control it because of the abundant rainfall at that time.—*Author's summary.*

3407. **BUISMAN, CHRISTINE J. Een wortelziekte van Calla, veroorzaakt door een Phytophthora-soort.** *Tijdschr. Plantenziekten* 33(2): 17-22. 1 pl., 2 fig. 1927. —*Phytophthora* richardiae* (p. 17) was isolated from the roots of diseased callas, and was shown by infection experiments to be pathogenic. As a method of control treatment of the corms with 1:49 formalin for 1 hr. is recommended.—*From author's summary.*

3408. **DANA, B. F., and S. E. WOLFF. The occurrence of violet root rot in central Texas.** *Phytopath.* 21(5): 557-558. 1 fig. 1931.—The following are reported as hosts for *Rhizoctonia crocorum: Ambrosia aptera, Diapedium brachiatum, Malvaviscus drummondii, Melia azedarach,*

Morus sp., *Parthenocissus quinquefolia, Phytolacca decandra, Rhus radicans, Rulac texana, Salix, nigra, Sambucus canadensis, Smilax bona-nox, Solanum elaeagnifolium, Verbesina virginica,* and *Viola missouriensis.* The perfect stage, *Helicobasidium purpureum,* was also found. —*W. A. Whitney.*

3409. **EDGERTON, C. W. Entyloma meliloti McAlpine in Louisiana.** *U. S. Dept. Agric. Bur. Plant Indust. Plant Dis. Reptr.* 15(4): 31. 1931. [Mimeographed.]—This smut observed on *Melilotus indica* in sugar-cane since 1929 is increasing in severity.—*W. A. Whitney.*

3410. **[EDGERTON, C. W., J. G. GAINES, and N. E. STEVENS.] Downy mildew of tobacco.** *U. S. Dept. Agric. Bur. Plant Indust. Plant Dis. Reptr.* 15(4): 32. 1931. [Mimeographed.]—Edgerton reports a severe epiphytotic of *Peronospora hyoscyami* in Louisiana during March and April, the first record from this state. Gaines and Stevens found the disease also in Coffee, Colquitt, and Tift Counties, Georgia.—*W. A. Whitney.*

3411. **FRITZ, EMANUEL, and LEE BONAR. The brown heart rot of California redwood. Part I. Notes on the development of the causal fungus, by EMANUEL FRITZ. Part II. The etiology of the causal fungus, by LEE BONAR.** *Jour. Forest.* 29(3): 368-380. 7 fig. 1931. —I. Sporophores of *Poria sequoiae* have been found associated with the common brown heart rot of redwood. They require moderately cool and even temp. and a high relative humidity for their best development, and they may be quickly spoiled by molds [*Penicillium* spp.] after wetting by rain. Sporophores were found in hollow butts, in a rift crack, and on log ends; the latter type occurs only where logs lie very close together, end to end. This is the most destructive disease in redwood, causing a loss of 12-15% of the merchantable part of a stand. Though it does not kill trees, it weakens them mechanically and promotes the spread of fire in the trunk, causing many trees to fall during fires. It commonly enters through fire scars. A dry rot, similar to this brown heart rot, was found, but the connection between them was not established.—II. A brief description is given of *Poria* sequoiae* (p. 377) together with experimental and observational proof of its causal relation to brown heart rot.—*I. from author's summary; II. W. A. Whitney.*

3412. **HURST, R. R. Late blight and rot of potatoes caused by the fungus Phytophthora infestans (Mont.) de Bary.** *Dept. Agric. Canada Bull.* 119. 3-13. 2 col. pl., 6 fig. 1929.—A general treatise on the disease and its control.

3413. **JENKINS, ANNA E. Additional data on the range and prevalence of Lima-bean scab.** *Phytopath.* 21(5): 559. 1931.—Mexico is added to the range that includes Cuba and Porto Rico as the only other stations. *Elsinoe canavaliae* is responsible.—*W. A. Whitney.*

3414. **LEPAGE, E. Le mildiou en Anjou en 1930. [Grape mildew in Anjou, France, in 1930.]** *Progrès Agric. et Vitic.* 95(3): 65-69. 1931.

3415. **LIESE. Der Kienzopf auf der Choriner Provenienzfläche.** *Zeitschr. Forst- u. Jagdw.* 62(12): 836-838. 1930.—In the experimental plantations, stock from southern France exhibited greatest susceptibility to blister rust (*Peridermium pini*), Scotch stock somewhat less, and that from Brandenburg next, while other lots from various geographical localities remained relatively clean. In 1926, about 300 artificial inoculations were made on trees all but 4 of which were clean; 3 yrs. later, infection was most successful on previously diseased trees. The fungus can exist as a true parasite only on well-developed and thrifty shoots, not on undernourished, sickly sprouts. The pathogen does not exhibit racial specialization as other rusts do. Inoculation of healthy trees was without effect. The results point to an individual variation of susceptibility and immunity, and it appears probable that susceptibility is heritable.—*J. Roeser, Jr.*

3416. **"McGINTY, ALOYSIUS T." [WESTON, WM. H., Jr.] Professor McGinty re Pharmacien Frechou.** *Phytopath.* 21(7): 760-761. 1931.—Critical note on the history of *Sclerospora graminicola* antedating 1876 (see also this issue, Entry 5046). A plea for "more attention to strict accuracy in the details of their publications rather than to imaginative speculations as to the activities of pharmacists long since dead." In an appended note, WILLIAM H. WESTON, Jr., accepts the criticism.—*W. A. Whitney.*

3417. **[MILOVTSOVA, M. A.] МИЛОВЦОВА, М. А. Образ жизни и история развития Taphridium umbelliferarum Lagerh. et Juel.** (Предварительное сообщение.) **[Development of T. umbelliferarum.]** [Preliminary report.] [With English summary.] Болезни Растений [*Bolezni Rastenii*] 19(1/2): 15-22. 9 fig. 1930.—The author describes the life cycle of *T. umbelliferarum* on caraway (*Carum carvi*). The source of the primary infection is spores formed the previous year, which germinate at the end of summer or may over winter. The parasite usually affects the first leaves close to the roots, after which the plant grows normally. Development of the fungus has been observed under natural conditions and in pure culture. Inoculations on *Carum* gave positive results.—*Author's summary.*

3418. **MORITZ, OTTO. Studien über Nectriakrebs. [Studies on Nectria canker.]** *Zeitschr. Pflanzenkr. Pflanzenpath. u. Pflanzenschutz* 40(5): 251-261. 1930.—The "perthophytische" [E. Münch] virulence of 22 *Nectria* spp. investigated was found to differ markedly. No correlation between species and virulence was observed, nor any evidence of specialization. Strains which were "perthogen" on *Malus,* were equally so on other very different trees. On this basis, as a pathogenic principle an agent harmful to all cells and as a resistance principle a high rate of regeneration are postulated. In testing fruit tree varieties for canker resistance strains of known average virulence should be used. Infection of uninjured stems was successful on trees kept under very moist conditions.—*Author's summary (transl. by I. Mounce).*

3419. **NANNFELDT, J. A. En skadesvamp å Mahonia, Uropyxis mirabilissima, stadd i stark spridning. [Rapid spread of a parasitic fungus on Mahonia.]** [With English summary.] *Bot. Notiser* 1930(5): 371-379. 1930.—*Uropyxis mirabilissima* is known to occur in Scotland, Germany, Denmark, Finland, Norway, and Sweden. In Sweden it is found at Malmö, Linköping, Upsala, and Västerås. It is probable that the fungus was introduced into Germany before 1914. It is chiefly dispersed by diseased plants sold from nurseries.—*Author's summary.*

3420. **OGILVIE, L., and B. O. MULLIGAN. A leaf spot disease of lettuce due to Pleospora herbarum.** *Gard. Chron.* [*London*] 89(2298): 35. 1 fig. 1931.—An apparently undescribed disease, common in the west of England. The organism (imperfect stage=*Macrosporium sarcinula*) and the disease are briefly described.—*W. A. Whitney.*

3421. **PILÁT, ALBERT. Nová sypavka na tisech v Čechách—Sphaerulina taxi (Cooke) Pilát. [A new species of Sphaerulina on yew in Bohemia.]** [Bohemian, with French résumé, p. 419-420.] *Lesnická práce* 5(9): 409-420. 4 pl. 1 fig. 1926.—The fungus infects the leaves of yew one by one to such an extent that very few healthy leaves are to be found. The disease shows up at the beginning of the summer; in the autumn and winter the aspects of the trees do not change, but in the following spring the fungus begins to grow and in the summer and autumn perithecia are formed. The invaded leaves at first become dark green, then lighter and yellowish, occasionally taking on an intense red or orange color. A key to the Mycosphaerellaceae is given. The organism is *S. taxi* (p. 414) (*Sphaerella taxi;=Metasphaeria t.*).—*A. Pilát (transl. L. Shaw).*

3422. **RUDOLPH, B. A. Verticillium hadromycosis.** *Hilgardia* 5(9): 197-353. 4 pl., 9 fig. 1931.—In California a great group of widely unrelated plants (such as stone fruits, bush fruits, truck crops, ornamentals and weeds) may become affected with hadromycosis caused by a single species of *Verticillium.* The common practice of interplanting young stone fruit orchards with tomatoes is deprecated, as the tomato is very susceptible, readily contracts the disease and passes it on to the trees. A

digest of the world's literature on the subject of *Verticillium* hadromycosis has been prepared, together with a sufficiently comprehensive bibliography and a history of the disease in over 130 plant species. The paper is designed as a source of ready reference for plant pathologists.—*B. A. Rudolph.*

3423. **SCHAFFNER, JOHN H.** Injurious fungus parasite of Equisetum. *Amer. Fern Jour.* 21(2): 75. 1931.—*Stamnaria americana* has done much damage to *Equisetum praealtum* near Columbus, Ohio.—*C. A. Weatherby.*

3424. **[SCHULTZ, Z. M.]** ШУЛЬЦ, З. М. О грибках, наблюдающихся на семенах при их прорашивании. [Fungi found on germinating seeds.] [With German summary.] Главный Ботанический Сад, Записки по Семеноведению (*Jard. Bot. Princ. USSR., Ann. Essais Semences* [*Leningrad*]) 7(2): 51-57. 1930.—The author lists the fungi (parasitic and saprophytic) found in or on economic seeds and doing injury to the seeds or resulting seedlings during the years 1924-29.—*W. Crocker.*

3425. **SMITH, ERNEST C.** Trametes hispida a destructive parasite in apple orchards. *Mycologia* [*New York*] 22(5): 221-222. 1 pl. 1930.—*T. hispida* was observed on a living apricot tree and on living apple trees in Colorado.

3426. **TAUBENHAUS, J. J., and WALTER N. EZEKIEL.** Late blight on tomatoes in the lower Rio Grande valley of Texas. *U. S. Dept. Agric. Bur. Plant Indust. Plant Dis. Reptr.* 15(6): 53-54. 1931. [Mimeographed.]—Unusual weather conditions, spreading *Phytophthora infestans* from potato to tomato, explain the serious outbreak of late blight, which in some fields in Cameron County attacked 80% of the crop and averaged 50%. Only traces of the disease were found in the 2 adjoining counties, and none at all in northeast, east, and east central Texas.—*W. A. Whitney.*

3427. **TISDALE, W. B., and R. F. WADKINS.** Brown spot of tobacco caused by Alternaria longipes (E. & E.) n. comb. *Phytopath.* 21(6): 641-660. 5 fig. 1931.—A leaf spot disease of bright (flue-cured) tobacco, commonly known as brown spot, has been prevalent for several yrs. in the Florida-Georgia tobacco districts. The disease first appears on the lower leaves as small spots which rapidly enlarge and become brown. If the spots are numerous, coalescence takes place and the entire leaf may turn brown. Under very favorable conditions the disease spreads rapidly to the upper leaves and causes a complete loss of the crop. Tobacco is the only known susceptible plant, and very little difference in the susceptibility of the different varieties of bright tobacco has been noted. The organism hibernates on the stalks which remain in the fields. Proof of pathogenicity has been established by numerous inoculation experiments. Infection occurs by direct penetration of the epidermal cells, and through stomata, wounds being unnecessary. The organism produces catenulate spores, comparable in size to *Macrosporium longipes,* and the character of the spots is almost identical. Because of catenulate spore formation, however, the name *A. longipes** (E. & E.) n. comb. (p. 653) is proposed. The minimal temp. for infection is about 20-22°C. Medium infection was produced when the average temp. was 23-25°, and severe infection at 26.5°C. and above. The optimum temp. for development on culture media was 25-28°, the maximum is near 34-35°C. Maximal amount of growth on potato-dextrose agar was secured at pH 5.5. There was a slight decrease in growth with pH values 6.0 and 6.5, but an increase again with pH 7.0 and 7.5. The stalks of tobacco should be cut and turned under immediately after the crop is harvested to minimize the source of inoculum the following year. Good fertilization, together with crop rotation and frequent cultivation, is advisable. The leaves should be primed when they reach the proper stage of maturity.—*Authors' summary.*

3428. **TOCHINAI, YOSHIHIKO, and SHOICHI SHIMADA.** Sporotrichum narcissi sp. n. parasitic on narcissus bulbs. *Trans. Sapporo Nat. Hist. Soc.* 11(3): 121-127. 1 fig. 1930.—A diseased condition of *Narcissus pseudo-narcissus* was observed in Tokio in the spring of 1930. Affected plants were stunted and barren, the foliage reaching a height of only 3-6 cm. above ground. Adjacent *Crocus* plants were similarly affected. The bulbs of both plants were invaded by a fungus which consumed the fleshy scales and produced dark green acervuli on the surface. Internally the rot spread along the surface of the scales, but not across them except in advanced stages. Even slightly affected plants were weak and barren. 2 slightly different fungi, both of the type of *Sporotrichum,* were isolated from cultures of diseased parts. One of these agreed in general with *S. radicicolum,* described as a saprophyte or weak parasite on the roots of various plants. This is the first record of its occurrence in Japan. The other form differed in general appearance and effects on the bulbs, and also in morphological features in artificial cultures, and is described as *S.* narcissi* (p. 124). Inoculation experiments confirmed the pathogenicity of both species for injured narcissus bulbs, infection occurring through wounded leaves or bulb scales. *S. narcissi* was the more virulent.—*F. Weiss.*

3429. **TUNSTALL, A. C.** Vegetable parasites of the tea plant. Blights on the root. *Indian Tea Assoc. Quart. Jour.* 1930(1): 28-36. 1930.—The author describes blight caused by *Fomes lamaoensis, F. applanatus, F. lucidua,* and *F. lignosus.*—*W. A. Whitney.*

3430. **WORMSER, G., et H. BARAT.** Une maladie de l'Hevea en Cochinchine. *Rev. Path. Vég. et Ent. Agric.* 17(2): 15-20. 2 pl. (1 col.) 1930.—An anthracnose on *Hevea* stems, causing hypertrophy of lenticels and browning of the bark, results from joint infection by a *Gloeosporium* and *Botryodiplodia theobromae.*—*J. Dufrenoy.*

3431. **ANONYMOUS (Published by NORDISKE JORDBRUGSFORSKERES FORENINGS FJERDE CONGRESS).** Potatiskräftproblemet inom de skandinaviska länderna. IVAR LIRO;** Bekaempelsen af Kartoffelbrok (Synchytrium endobioticum) i Danmark [Control of potato wart in Denmark] by **O. NIELSEN.** Discussion of papers follows.

DISEASES CAUSED BY BACTERIA

3432. **ALLEN, T. C.** Bacteria producing rot of apple in association with the apple maggot, Rhagoletis pomonella. *Phytopath.* 21(3): 338. 1931.—The characteristic decay accompanying the work of the "railroad worm" is attributed to a pink bacterium (unnamed) which appears to be distributed by the adult fly and spread by the larva. The bacterium has been isolated from the adult apple-maggot fly.—*W. A. Whitney.*

3433. **BRYAN, MARY K.** Color variations in Aplanobacter michiganense. *Phytopath.* 21(5): 559. 1931.—A shell-pink variant of the tomato canker organism is briefly described. It is characterized by its color and slightly lower virulence yet produces typical cankers. As previously reported, a white strain developed from the normal yellow organism, but the pink strain has thus far remained unchanged.—*W. A. Whitney.*

3434. **BRYAN, MARY K.** Bacterial canker of tomato reported from Mexico. *U. S. Dept. Agric. Bur. Plant Indust. Plant Dis. Reptr.* 15(3): 20. 1931.—[Mimeographed.] *Aplanobacter michiganense* reported for the first time from Mexico.

3435. **EMERY, HENRI, et HENRI PRAT.** Étude d'une tumeur du chrysanthème cultivé (Pyrethrum sinense Sab.=Chrysanthemum indicum L.). [Chrysanthemum tumor.] *Bull. Mens. Soc. Nation. Hort. France* 4(Avril): 182-193. 4 fig. 1931.—In addition to a general discussion of the subject, and comparison with witches' broom, the authors conclude, as a result of inoculation experiments with *Bacterium tumefaciens,* that the tumors remain localized, but are perpetuated by cuttings.

3436. **[KOKHANOVSKAÏA, L.]** КОХАНОВСКАЯ, Л.

Исследования над эпидемической рябухой махорки. ["Ryabookha," an epidemic leaf spot disease of Nicotiana rustica.] Труды Детскосельской Акклиматизационной Станции при Ленинградском Сельско-Хозяйственном Институте (*Bull. Sta. Acclim. Leningrad Agric. Inst. Detskoe Selo*) 11. 1-10. 2 pl. 1930.—A leafspot of *Nicotiana rustica*, which is called locally "ryabookha," has appeared in epidemic form at the time of topping the crop. The disease has been especially severe in recent years and reduced considerably the commercial value of makhorka (*N. rustica*). The causal agent is a grayish-white unipolar flagellate, which liquefies gelatine slowly, and does not form spores or reduce nitrate. It is gram-negative and is non-acid fast. Average size 1.8μ×0.5μ. Culturally and morphologically it is very similar to *Pseudomonas tabaci* (*Bacterium tabacum*), differing from them by its slight ammonia formation and by its behavior in milk cultures. With pure cultures of this organism the typical disease was reproduced in the greenhouse and in the field. A list of susceptible species of *Nicotiana* and varieties of *Nicotiana rustica* is given.—*From author's summary.*

3437. **TAKIMOTO, SEITO.** A soft rot of sugar beet and its causal organisms. [In Japanese, with English summary.] *Ann. Phytopath. Soc. Japan* 2(4): 350-356. 1931.—This disease occurs in Heijô, northern Korea, and causes a yellowish soft rot with a characteristic odor. The causal organism is described as *Bacillus* betivorus (p. 356). Inoculation experiments proved it pathogenic on carrot root, radish root, potato tuber, and tomato fruit.—*From author's résumé.*

3438. **WELLENSIEK, S. J.** De vatbaarheid voor slijmziekte van 32 geïmporteerde aardappelrassen. [Bacterial wilt-disease susceptibility of 32 imported potato-varieties.] [With English summary.] *Landbouw* [*Buitenzorg*] 6(6): 698-702. 1930.—The susceptibility to bacterial wilt (*Bacterium solanacearum*) of 32 potato varieties, imported from Holland, was investigated by artificial and natural inoculations, of which the latter only gave satisfactory results. All varieties were susceptible, though Botergele (no. 7) and Dauer Rages (no. 10) contract the disease in a late stage of development and are to this extent less susceptible.

DISEASES CAUSED BY PHANEROGAMS

3439. **HARTLEY, ISAAC, and HOLMES ELLIS.** Can Lathraea squamaria have a saprophytic existence? *North Western Naturalist* 6(1): 29-30. 1931.—7 new hosts are recorded: *Fagus sylvatica, Larix decidua, Almus rotundifolia, Sambucus nigra, Ilex aquifolium, Urtica dioica,* and *Rumex obtusifolius.* The discovery of numerous active haustoria penetrating dead and decaying roots in 2 widely separate stations supports the conviction that *Lathraea* may be capable of existing as a saprophyte.

3440. **TUBEUF [v.].** Die zahme Kastanie als Wirt von Viscum album und Loranthus europaeus in Italien. [Chestnut as host of V. album and L. europaeus in Italy.] *Zeitschr. Pflanzenkrank. (Pflanzenpath.) u. Pflanzenschutz* 41(4): 202-203. 1931.

DISEASES CAUSED BY ANIMAL PARASITES (INSECTS, NEMAS, PROTOZOANS, ETC.)

3441. **GODFREY, G. H.** The host plants of the "burrowing" nematode, Tylenchus similis. *Phytopath.* 21(3): 315-322. 4 fig. 1931.—The edible canna (*Canna edulis*) and sweet potato are added as new hosts of importance. Symptoms on these are irregularly shaped, dark brown to black spots from a few mm. to 5 cm. in diam. and 2-10 mm. deep. Roots are likewise affected, as with the previously known hosts. The presence of the lesions hastens decay in storage. Symptoms on nut grass (*Cyperus rotundus*), a previously reported host, are similar. *T. similis* has not been found in the pineapple. Control measures are suggested.—*Author's summary.*

3442. **GODFREY, G. H.** Some techniques used in the study of the root-knot nematode, Heterodera radicicola. *Phytopath.* 21(3): 323-329. 2 fig. 1931.—Root-knot susceptible cowpeas, grown in warm, heavily infested soil, develop an abundance of superficial egg masses. These are removed and "incubated" separately on slides or in Syracuse dishes; thus freshly hatched larvae suitable for laboratory studies are obtained. For large-scale operations, roots containing egg masses in abundance are incubated in bulk and larvae are obtained by the millions.—*From author's summary.*

3443. **GODFREY, G. H.** Nematology observations on station experiment No. 15. *Pineapple Quart.* [*Hawaii*] 1(1): 50-52. 1931.—A summary of nematode infestation readings for pineapple "fallow field" plots for the entire inter-cycle period showed survival until planting time in all plots; and data from all plots after 16 months in pineapples showed no decrease in infestation for the fallow plots.

3444. **GODFREY, G. H.** Tylenchus dipsaci on Hypochaeris radicata in Hawaii. *U. S. Dept. Agric., Bur. Plant Indus., Plant Dis. Reptr.* 15(6): 59-60. 1931. Also in *Phytopath.* 21(7): 759-760. 1 fig. 1931.—Notes on the occurrence of this nematode in the flower heads.—*W. A. Whitney.*

3445. **KEMNER, N. A.** Potatisnematoden och dess framträdande i Sverige. [The potato nematode and its importance in Sweden.] (Beretning Nordiske Jordbrugsfor. Foren. Fjerde Kongr. Helsingfors, July 1929). *Nordisk Jordbrugsforskning* Hefte 4/7. 560-567. 1929.

3446. **MOSZYŃSKA, MARJA.** Galasy (zoocecidia) drzew i krzewów półwyspu Helskiego. [Zoocecidia of trees and shrubs of Hela peninsula, Poland.] [French résumé.] *Kosmos* [*Lwów*] 55(1/2): 273-292. 1930.—Of the 80 spp. listed, the following are new for Poland: On *Acer pseudoplatanus, Eriophyes macrorrhynchus cephaloneus* (Acarina); on *Almus glutinosa, Jaapiella clethrophila* (Cecidomyidae); on *A. incana, J. clethrophila* and *Eriophyes bistriatus typicus;* on *Betula pubescens, Hamamelistes betulinus* (Aphidae); on *B. verrucosa, H. betulinus, Anisostephus betulinum* (Cecid.), *Chaitophorus annulatus* (Aphid.), *C. tricolor, Eriophyes laevis lionotus,* and *Plemeliella betulicola* (Cecid.); on *Picea engelmani, Chermes abietis* (Aphid.), recorded on this host for the first time; on *Pinus nigra, Evetria buoliana* (Lepidopt.), and *E. resinella,* both new for this host; on *Pinus rigida, E. buoliana,* new for this host; on *Pinus silvestris, Adelges corticalis* (Aphid.); on *Populus nigra, Chaitophorus leucomelas;* on *Rubus plicatus, Amphorophora rubi* (Aphid.); on *Salix cinerea, Pontania joergenseni* (Tenthredinidae) and *P. leucaspis;* on *Salix daphnoides, Euura laeta* (Tenthr.), *Pontania puellia,* and *P. piliserra.*

3447. **PAINTER, R. H.** A study of the cotton flea hopper, Psallus seriatus Reut., with special reference to its effect on cotton plant tissues. [*U. S.*] *Jour. Agric. Res.* 40(5): 484-516. 7 fig. 1930.—The anatomy and histology of the alimentary tract and associated glands of the cotton flea hopper, *P. seriatus,* are described. Of especial interest are the salivary glands with their complicated accessory glands, the salivary pump and pharyngeal pump. A peculiar gland was also found at the base of the labrum, communicating with the pharynx through 10 openings in the chitinous roof. The salivary secretion in the glands contained bodies suggestive of parasites. In a study of the cotton, the plant cells on which the insects have fed are emptied of their contents or show signs of disintegration of nucleus and chloroplasts. The surrounding cells often contain great numbers of small round bodies. The swellings resulting from the bite of the hoppers show an enlargement of the cells and a displacement of the tissue elements. Certain cells are filled with granules or homogeneous material which suggests a developing parasite. Fresh cotton from Mississippi, Louisiana and Texas on which the hopper had fed was found to contain in the cells similar material to that found in preserved specimens. Moving, oval, shining bodies were found in cells near which the hopper had recently fed.—*R. H. Painter.*

3448. **[STEINER, G.] Tylenchus pratensis parasitizing yams [Dioscorea sp.] from West Africa.** *U. S. Dept.*

Agric. Bur. Plant Indust. Plant Dis. Reptr. 15(3): 21. 1 fig. 1931. [Mimeographed.]

3449. **[STEINER, G.] Tylenchus dipsaci found on new host.** *U. S. Dept. Agric. Bur. Plant Indust. Plant Dis. Reptr.* 15(3): 21. 1931. [Mimeographed.]—Identified from specimens of Sweet William (*Dianthus barbatus*) from Portland, Oregon.—*W. A. Whitney.*

3450. **SZULCZEWSKI, J. W. Wyrośle (zoocecidia) Gdyni i okolicy. [Animal galls of Gdynia and vicinity.]** [German summary.] *Kosmos [Lwów]* 55(1/2): 249-272. 1930.—The author lists 214 cases of galls found on various plants in July. Few of the galls were numerous, but those caused by Hymenoptera were noticeably rare. Some forms may have succumbed during the previous severe winter. Abundance of *Philaenus spumarius* (Cicada) in the woods explained the discovery of 4 new galls caused by it, on *Maianthenum bifolium, Fragaria vesca, Glechoma hederacea,* and *Tragopogon pratensis.* The following more or less numerous forms are characteristic for the vicinity: malformation on *Papaver rhoeas* caused by *Aylax papaveris;* galls of *Didyomyia reaumurianus* (Diptera) on *Tilia cordata;* blossom malformation on *Erigeron acer;* blossom galls on *Tanacetum vulgare* caused by *Rhopalomyia tanaceticolla;* stem-thickening on *Thlaspi arvense* caused by *Ceuthorrhynchus contractus;* galls of *Epiblema lacteana* (Lepidoptera) on *Artemisia campestris.*—*From author's summary.*

3451. **THORNE, GERALD. Aphelenchus helophilus, a new parasite of Lilium sargentiae [in New York].** *U. S. Dept. Agric. Bur. Plant Indust. Plant Dis. Reptr.* 15(6): 60-61. 1931. [Mimeographed.]

INFECTIOUS CHLOROSES (MOSAIC, YELLOWS, CURL, ROSETTE, ETC.)

3452. **BEWLEY, W. F. The nature of the virus principle in mosaic disease.** *Nature [London]* 127(3203): 442. 3 fig. 1931.—Experiments with *Aucuba* mosaic virus of tomatoes indicate that the virus is of the bacteriophage type.

3453. **BOLAS, BERNARD D., and W. F. BEWLEY. Aucuba or yellow mosaic of the tomato: a note on metabolism.** *Nature [London]* 126(3178): 471. 1 fig. 1930.—The mosaic infection results in mottled distribution of the starch.

3454. **CALDWELL, JOHN. The physiology of virus diseases in plants. I. The movement of mosaic in the tomato plant.** *Ann. Appl. Biol.* 17(3): 429-443. 1 pl. 1930.—Sections of the stem in the middle of tomato plants were killed either by chloroform or steam, leaving the upper and lower parts of the plant connected by dead stem tissue. The xylem elements were not materially affected and water traveled across the dead tissue since the portion above the dead stem remained turgid. When inoculated with mosaic, however, symptoms appeared only in the portion of the plant inoculated and the virus did not pass through the dead stem. There was no evidence of occlusion of the xylem vessels nor of adsorption of the virus by cell remains, since eosin and Chinese ink in solution passed to the upper portions of the plant. It is therefore assumed that the virus did not travel in the xylem stream. Inoculation of uninjured plants showed no localization of movement of the virus such as would be expected if it were passing through the vascular system. It is concluded that the virus movement takes place through the living ground tissue of the plant.—*S. P. Doolittle.*

3455. **DOBROSCKY, IRENE D. Studies on cranberry false blossom disease and its insect vector.** *Contr. Boyce Thompson Inst.* 3(1): 59-83. 11 fig. 1931.—The leafhopper, *Euscelis striatulus,* was found to carry cranberry false blossom. Adults of this species collected in apparently healthy bogs did not transmit the disease. A description of the disease together with an account of the life history and habits of the insect vector are given. A cytological study of the salivary glands and alimentary tract of *Euscelis striatulus* revealed no differences between healthy and viruliferous individuals nor was any foreign organism found that could be associated with the disease. A survey of leafhoppers found in cranberry bogs includes 44 species. Insect experiments to transmit the disease with *Phylloscelis atra, Gypona octolineata,* and *Platymetopius magdalensis* were unsuccessful. Transmission experiments with viruliferous individuals of *Euscelis striatulus* on *Vaccinium corymbosum* failed. *Euscelis striatulus* is parasitized by a species of dryinid and a species of pipunculid, neither of which is an important factor in control. Control measures suggested consist in reduction of insect vector by flooding the bogs and also by application of pyrethrum-soap sprays.—*A. Hartzell.*

3456. **DUFRENOY, J. Maladies à virus du tabac.** *Phytopath. Zeitschr.* 2(4): 321-339. 12 fig. 1930.—Normal tobacco cells, when observed under the ultramicroscope in the living condition, show the nucleus as a whitish body, and the surfaces between the cytoplasmic strands and the vacuoles as bright lines. The cytoplasm itself and the vacuolar solutions show no bright micellae; they are optically empty, and may be considered to be in the gel state. Mitochondria may be discerned in the cytoplasmic strands, their content also being in the gel state. So also are the plastids, the contour of which only becomes bright on the dark field, except when they contain oil droplets, which appear very brilliant. Bright oil droplets also show in the cytoplasm itself. In virus affected cells, some areas in the cytoplasm appear whitish under the dark field, indicating coagulation of the cytoplasmic material. Striated bodies consisting of protein crystals may develop in these areas of coagulated cytoplasm, which appear very bright on the dark field. "X-bodies" or "vacuolated bodies" are coagulated areas of cytoplasm where the lipo-protein constituents of the cytoplasm split into fat droplets and amino acids; some of the latter go into solution in the vacuolar contents, whereas some may crystallise into striated bodies.—*J. Dufrenoy.*

3457. **ELZE, D. L. The relation between insect and virus as shown in potato leaf roll, and a classification of viroses based on this relation.** *Phytopath.* 21(6): 675-686. 1931.—Experiments on the spread of leaf roll from the varieties Bevelander, Green Mountain, Rural, New Yorker, and Irish Cobbler to the varieties President, Duke of York, and Red Star by the aphids, *Aphis rhamni, A. fabae,* and *Myzus persicae,* and the flea beetle, *Psylloides affinis,* show that *M. persicae* infected all 22 plants, *A. rhamni* 13, *A. fabae* 6, and *P. affinis* 8 plants. The low transmitting power of *P. affinis* is ascribed to the fact that insects with cutting mouth parts can cause infection only through the virus residue that may accidentally adhere to the mouth parts. With the aphids and other Hemiptera, on the contrary, the differences are explained by the assumption that the virus taken with the food is more or less destroyed by the organs of the insect, according to the degree of adaptability of the virus to the insect. This assumption is corroborated by the facts that *M. persicae* and *M. solanifolii* do not lose their transmitting power when molting and that the percentage of virus-bearing individuals that are able to transmit the disease is nearly the same before and after the molt. Under similar conditions the transmitting power of *M. persicae* was much greater than that of *M. solanifolii.* Based on the relation of virus diseases to insects, a classification (p. 684) is given whose major divisions are (1) viroses not spread by insects, (2) those spread by different insects and not especially adapted to any one, and (3) those that are adapted to particular insects.—*Author's summary.*

3458. **HEUBERGER, J. W., and A. J. MOYER. Influence of mosaic infection on tomato yields.** *Phytopath.* 21(7): 745-749. 1931.—Experiments showed that early infections cause the greatest reduction in yield and that a direct relationship exists between the time of infection and the amount of reduction in yield. The earliest infections caused a reduction of over 50% in yield, while the latest infection caused a reduction in yield of 1.9% in 1927 and 11.2% in 1930.—*From authors' summary.*

3459. **HOLMES, FRANCIS O. Local lesions of mosaic**

in Nicotiana tabacum L. *Contr. Boyce Thompson Inst.* 3(2): 163-172. 3 fig. 1931.—Inconspicuous yellowish local lesions, comparable to distinct necrotic local lesions previously described in other hosts (*B. A.* 3 (9/11): Entry 17669) are described as occurring at the site of inoculation with extracts of tobacco mosaic plants on leaves of *N. tabacum* var. Turkish. The affected tissues contained more or less starch than the surrounding normal tissues. Staining with iodine served to make the lesions easily conspicuous. Inoculated plants were removed from sunlight and held in darkness 16 hr. at 10° C. and about 8 hr. at 22° C.; they lost starch from normal tissues sooner than from lesions; the lesions were rendered conspicuous by staining with iodine in KI solution. The affected tissues were found to contain much virus, whereas nearby normal green portions of the same leaves contained no demonstrable quantities of virus. The lesions served to indicate the numbers and locations of points of infection in this host.—*F. O. Holmes.*

3460. **KUNKEL, L. O. Studies on aster yellows in some new host plants.** *Contr. Boyce Thompson Inst.* 3(1): 85-124. 50 fig. 1931.—The experimental transmission of aster yellows to 120 new host species in 30 families is reported. The most striking symptoms on each host plant are described. 15 of these are families to which the disease had not previously been transmitted. The following families are represented by the hosts here reported: *Caryophyllaceae, Moraceae, Chenopodiaceae, Nyctaginaceae, Aizoaceae, Ranunculaceae, Papaveraceae, Cruciferae, Rosaceae, Limnanthaceae, Datiscaceae, Cistaceae, Loasaceae, Onagraceae, Umbelliferae, Plumbaginaceae, Primulaceae, Apocynaceae, Polemoniaceae, Hydrophyllaceae, Boraginaceae, Labiatae, Solanaceae, Scrophulariaceae, Gesneriaceae, Acanthaceae, Plantaginaceae, Valerianaceae, Campanulaceae,* and *Compositae.* Aster yellows was not transmitted mechanically by means of juice from diseased tissues to any plant. The disease was carried to all host plants except the tomato by means of *Cicadula sexnotata.* It was transferred to the tomato by budding. Some other plants to which aster yellows was not transmitted after repeated exposure to virus-bearing colonies of *C. sexnotata* are potato, tobacco, peach, celery and *Zinnia elegans.*—*L. O. Kunkel.*

3461. **LINFORD, MAURICE B. Yellow-spot disease of pineapples transmitted by Thrips tabaci Lind.** *Science* 73(1888): 263. 1931.—Experimental evidence was obtained that *T. tabaci* is a major vector operating in the field occurrence of a destructive disease of pineapple plants in Hawaii and that this insect carries the virus to pineapple from certain weeds, of which *Emilia flammea* now appears most important. Preliminary evidence indicates that certain plants other than *Emilia* may be sources of the yellow-spot virus. The feeding of this insect upon pineapple plants appears to be incidental, and it is probable that any natural transfer of the virus from pineapple to pineapple is uncommon.

3462. **LOJKIN, MARY, and CARL G. VINSON. Effect of enzymes upon the infectivity of the virus of tobacco mosaic.** *Contr. Boyce Thompson Inst.* 3(2): 147-162. 1931.—Several purified preparations of the virus and also the untreated juice expressed from diseased tobacco plants were incubated with various enzyme preparations. Under the conditions of the experiments emulsin, pepsin, and yeast extract did not reduce the infectivity. The trypsin preparation showed marked inactivating effect on all purified preparations. Papain was especially effective in inactivating the virus in neutral phosphate solution. The erepsin preparation was effective only after an incubation period of several days. None of the enzyme preparations used was effective in inactivating the virus in untreated juice, from either frozen or fresh plants. Inactivation of the virus was not due to adsorption or to the production of inactivating substances. —*C. G. Vinson.*

3463. **MERKENSCHLAGER, F., (with the collaboration of M. KLINKOWSKI). Zur Biologie der Kartoffel. II. Zur Pathologie der Blattrollkrankheit. [Biology of the potato. II. Pathology of the leaf-roll disease.]** *Arb. Biol. Reichsanst. Land- u. Forstw.* 17 (4): 345-376. 2 pl., 9 fig. 1929.—The degeneration of the potato is held to be an ecological reaction. Leaf roll, which is only one of the manifestations of degeneration, is a pathological increase of an ordinary function. It is characterized by an abnormal state of water balance. The number of functional stomata is greatly reduced. A comparison of the transpiration curve in normal and rolled leaves shows that at first the normal leaf loses water more rapidly. Later this relation is reversed, a fact attributable to the loss of stomatal regulatory power in the diseased leaf. A comparison is made between the leaf rolling which is due to cold, maturity, acid soil, nutritional deficiency, etc., and that characteristic of the leaf-roll disease, and the conclusion is reached that all are fundamentally an expression of water deficiency. In the leaf-roll disease, in the narrow sense, the leaf-rolling tendency has become irreversible. The critical period for the leaf-rolling tendency to become fixed is at the appearance of flowers and the inception of tuber formation. Soil moisture, atmospheric humidity, and temperature are the determining factors in the regulation of the water balance. The infiltration test as a method of demonstrating the condition of the stomata shows whether a potato variety is in its optimum environment. The diverse contributions to the knowledge of leaf roll growing out of 30 years' investigation of the subject are reviewed. It is stated that the matter of transmissibility of a virus as the causal agent of leaf roll is disputed by most investigators. Inheritance of leaf roll through tubers is attributed to the effect of the disease on the colloids of the mother tuber.—*F. Weiss.*

3464. **QUANJER, H. M. The methods of classification of plant viruses, and an attempt to classify and name potato viroses.** *Phytopath.* 21(6): 577-613. 8 fig. 1931.—A standard named collection of potato-virus material from the leading workers of the Old and the New World being available, a new basis was sought for the classification and nomenclature of the viroses of the potato. The principle has been followed that a potato virus should be identified, named and classified after the morbid effect it has on a potato variety that shows clearly definable internal symptoms. For international agreement on nomenclature, a stock of the same differential varieties should be grown in a virus-free state at all research stations where potato virus studies are in progress. One of the best differential hosts is the variety Paul Krüger, called President, in England. The following is proposed as an international nomenclature for the potato diseases of the virus type: (1) anecrotic mosaics (the result of later work may be that some of the members of this section must be classed under one or more of the groups of necrosis); (2) phloem necrosis (containing one disease—leaf roll, or as inoculation-symptom in tubers of Green Mountain, net necrosis); (3) acronecrosis (or top necrosis, a disease produced by "healthy-potato virus" occurring in most of the American standard varieties and in a Scotch and a French variety); (4) acropetal necrosis (containing rugose mosaic and a part of all diseases hitherto called crinkle and streak); (5) phloem-parenchyma necrosis of the tuber-pseudo-net-necrosis (no foliage symptoms of this disease which is perpetuated by the seed tubers); (6) and concentric necrosis of the tuber (no foliar symptoms of the disease, which is not perpetuated by the seed tubers, infection taking place through the soil via the lenticels). Short descriptions of the histological features characteristic for each of the 6 groups are given.—*From author's summary.*

3465. **RANKIN, W. HOWARD. Virus diseases of black raspberries.** *New York State [Geneva] Agric. Exp. Sta. Tech. Bull.* 175. 1-24. 1931.—A synonymy of the raspberry virus disease names is given, the following being recommended: leaf-curl alpha type, leaf-curl beta type, severe streak, mild streak, red (raspberry) mosaic, and yellow mosaic. The name mild mosaic may be retained for a small dot-like type of mottling, but its virus nature, if it is separable from red (raspberry) mosaic, is

doubted. The symptoms of these diseases are given as they appear in black varieties of raspberries. Results of inoculations, using the 2 known aphid vectors, are given. The rate of spread of yellow mosaic, mild streak, and red mosaic (including "mild mosaic") is given for an experimental planting containing the varieties Plum Farmer, Cumberland, and Ohio. Red mosaic is shown to be very rapid in its spread. Yellow mosaic spreads slowly, apparently due to the early dwarfing and death of the plants reducing the number of sources of spread. Mild streak spreads rapidly in the variety Ohio. Correlation in the variety Plum Farmer between "mild mosaic" and red mosaic in the same plants indicates that they are phases of the same disease as shown by a susceptible variety. The Cumberland is an exception to most black varieties in that the necrotic symptoms are often suppressed to a point where they are scarcely detectable. The suppression of the necrotic symptoms in Cumberland is believed to explain the original description of "mild mosaic" on that variety as a distinct disease.—*W. H. Rankin.*

3466. **RAWLINS, T. E., and W. T. HORNE. "Buckskin," a destructive graft-infectious disease of the cherry.** *Phytopath.* 21(3): 331-335. 2 fig. 1931.—"Buckskin," a disease of sweet cherries in northern California, is characterized by more or less conical fruits that fail to mature and which develop a dull buckskin appearance on the surface of the blossom end. During autumn the leaves on infected portions of the tree show a peculiar orange to maroon coloration along the base of the midrib and extending out along the lateral veins. Diseased trees show considerable variation in vigor. In grafting experiments (examination previously revealing no visible organism), the disease was transmitted to the healthy trunk and to healthy scions in a large proportion of the trees in which diseased Napoleon scions had been grafted. Of 27 trees treated, 12 showed distinct symptoms of the disease in the fruit on either the healthy scion or the trunk, 6 showed slight symptoms, and 7 appeared to be healthy. All diseased Napoleon scions that bore produced diseased fruit. However, 3 diseased Tartarian scions which bore fruit produced healthy fruit and in only one case was there any evidence of transmission by a diseased Tartarian scion. On the other hand, no difficulty was experienced in transmitting the disease from diseased Napoleon scions to healthy Tartarian trunks and healthy Tartarian scions. The variety known locally as "Long Stem Bing" has not been observed to take the disease.—*W. A. Whitney.*

3467. **SALAMAN, REDCLIFFE N. Virus disease of the potato: Streak.** *Nature* [*London*] 126(3172): 241. 1930.—2 strains of virus causing streak disease of potatoes, designated as streak A and streak B, are differentiated by their reactions in standard healthy varieties.

3468. **SMITH, KENNETH M. Thrips tabaci Lind. as a vector of plant virus disease.** *Nature* [*London*] 127 (3214): 852-853. 3 fig. 1931.—Experiments have shown that *T. tabaci* can transmit the virus of ringspot disease of *Solanum capsicastrum, Datura,* and tobacco, the spotted wilt of tomato, and a virus disease of *Dahlia.* Inoculations from dahlias to tobacco and *Datura* suggest that these diseases are the same.

3469. **SREENIVASAYA, M. Masking of spike-disease symptoms in Santalum album (Linn.).** *Nature* [*London*] 126(3190): 957. 1930.—Infected plants may show no external symptoms until injury, loss of leaves, or light pruning brings out typical symptoms.

3470. **STOREY, H. H. The inheritance by a leafhopper of the ability to transmit a plant virus.** *Nature* [*London*] 127(3216): 928. 1931.—Certain *Cicadulina* (*Balclutha*) *mbila* individuals are capable of transmitting streak disease of maize, while others of the same species are not. These characteristics may be fixed by selective breeding. The character of "activity" is dominant to that of "inactivity."

3471. **ZUNDEL, GEORGE L. New or unusual symptoms of virus diseases of raspberries.** *Phytopath.* 21(7): 755-757. 3 fig. 1931.—"Fern leaf"—a symptom not unlike that on tomatoes (cucurbit mosaic)—and a witches'-broom type of growth are reported from Pennsylvania. The latter may be an unusual manifestation of the streak virus.—*W. A. Whitney.*

NON-PARASITIC DISEASES AND TERATOLOGY (INCLUDING DISEASES OF UNKNOWN CAUSE)

3472. **CHESTER, KENNETH S. Graft-blight of lilac.** *Jour. Arnold Arboretum* 11(4): 232-233. 1930.—See following abstract.

3473. **CHESTER, KENNETH S. Graft-blight: a disease of lilac related to the employment of certain understocks in propagation.** *Jour. Arnold Arboretum* 12: 79-146. 4 pl. 1931.—A disease observed throughout the U. S. A. and other countries where varieties of *Syringa vulgaris* are grown and propagated. The diseased plants show symptoms of chronic nutritional deficiency and are short-lived. That the practice of grafting the lilac on understock of *Ligustrum,* chiefly *L. ovalifolium* (California Privet), is the cause of this disease had been suspected by lilac growers, but not hitherto proved experimentally. The author now shows by experiments that the disease is abiotic and non-contagious, and is due to incompatibility between the privet understock and the lilac scion. The immunological differences between stock and scion were studied; precipitin tests between normal plants of genera and species of Oleaceae showed no, or occasionally a slight, reaction, while tests of grafted and blighted lilac scions against the various stocks showed distinct precipitin reactions. The control of graft blight is discussed and the own-root method of propagation strongly recommended.—*A. Rehder.*

3474. **COIT, J. ELIOT. Sun-blotch of the avocado, a serious physiological disease.** *Yearbk. California Avocado Assoc.* 1928: 27-29. 3 fig. 1928.—The presence of pendulous branches together with a rough and scaly condition of the bark; yellowish depressed streaks on the twigs and young branches or irregular, white, yellow, reddish yellow, or red sunken areas on the fruit, usually accompanied by dwarfing or marked distortion of shape, characterize the malady produced as the direct result of sunburn as affecting weak or spindling trees or those suffering from neglect. Trees in a thrifty condition do not contract the disease, nor do healthy trees older than 6-8 yr. The direct incidence of sunlight on the bark in which sap is not moving rapidly, is thought to cause this chimeric condition.—*W. A. Whitney.*

3475. **GRÄSER. Zur Frage des Tannensterbens. [The problem of the fir disease.]** *Forstwiss. Centralbl.* 53(3): 91-106; (4): 117-136. 8 fig. 1931.—The reasons for the extensive dying of *Abies pectinata* in central Europe are discussed, as well as possible remedial measures. The disease is not prevalent where site conditions and composition of the stand are particularly well suited to fir, as in Switzerland, the Carpathians, and certain German forests. In Saxony, where the disease is most widespread, conditions are particularly unfavorable, due in part to the practice of growing spruce in practically pure, even-aged stands. The woolly aphids (*Dreyfusia piceae* and *D. nüsslini*) can not be the primary cause, because fir thrives on good sites even with the aphids present, but dies on poor sites or where grown in dense, even-aged stands even though aphids are absent. Firs with abnormally shallow roots and small crowns suffer the most, especially in drought years. In uneven-aged, mixed stands both roots and crowns are more likely to be normal.—*W. N. Sparhawk.*

3476. **MacMILLAN, H. G. Turgescence and rupture of potato tuber.** *Phytopath.* 21(6): 701-703. 1931.—Newly made cracks of various shapes and sizes on potato tubers grown under irrigation, supplemented by unusually high moisture conditions due to additional rainfall, are caused by the rupture of the super-turgid tuber. As the affected tubers in this condition dried down, the tendency to "explode" decreased until at the end of 8 days no rupturing occurred. Tubers showing this phenomenon averaged 218.03 gm. in weight when taken from the field and in 8 days lost 13.4 gm.—*W. A. Whitney.*

3477. **MARILL, S. Notes sur la "tache jaune" du liège.**

Bull. Stat. Rech. Forest. Nord de l'Afrique 1(8): 331-335. 1 col. pl. 1926.—The "yellow spot" disease attacks and degrades the cork bark of *Quercus suber* in Algeria after the trees are 10 yr. old. If the cork is harvested completely at 9-10 yr., the disease will disappear.—*J. Kittredge, Jr.*

3478. **MARTIN-SANS, E. Fascies chez le Fraxinus excelsior L. Quelques remarques sur la fasciation.** *Bul. Soc. Bot. France* 76(7/8): 740-757. 2 fig. 1929.—2 cases of fasciation are described and discussed as modifications of the normal symmetry of the plant. The theoretical causes of fasciation such as disturbed nutritional conditions, and the disturbance of the dominance of the terminal bud due to various physical and chemical factors, are discussed.—*H. H. Clum.*

3479. **RICHARDS, B. L., and C. M. TOMPKINS. The late blight of the sugar beet.** *Phytopath.* 21(3): 289-314. 4 fig. 1931.—This non-parasitic disease is characterized primarily by an abrupt collapse of the leaf tissue and may not be accompanied by the dry rot (*Phoma betae*), which attacks the root only after its resistance is seriously impaired. Under conditions of continued drought it may not follow leaf blight as an important feature. Late blight in Utah is correlated in its occurrence with abnormally low precipitation during June, July, and August. Experience has shown that late blight can be induced locally in any season by cultural practices, which result in poor tilth and low soil fertility. Excessive alkalinity, high calcium, and high organic content of the soil, especially combined with moisture deficiency, appear as intensifying factors. The exact nature and cause of late blight remain obscure. Control is a complex problem and methods vary for each type of soil and locality.—*Authors' summary.*

3480. **TUCKER, LOWELL R., and GLADYS BOEHM TUCKER. The effects of russet and sunburn on quality and culinary properties of the Italian prune.** *Proc. Amer. Soc. Hort. Sci.* 27: 233-236. 1930(1931).—Russeting caused the storage of a high percentage of sugar and acid in the tissue of the affected area. At the same time the amount of pigment formation in the skin was very low. The flavor was of high quality but the scars injured the appearance for canning and drying. Since these scars do not show in other forms of utilization affected fruit is well suited to other uses. Results indicate that prunes injured 10% or more with russet or sunburn and not seriously deformed in shape should be placed in the U. S. No. 2 grade.

3481. **WILSON, J. D., and H. A. RUNNELS. Bordeaux mixture as a factor increasing drouth injury.** *Phytopath.* 21(7): 729-738. 2 fig. 1931.—The moisture content of the soil in the wood lots became low in June and at certain times then and in July approached the wilting-point value. This factor, combined with dryness of the air, frequently resulted in a severe desiccation of the leaves. Incipient wilting occurred, but plants which had not been sprayed were able to recover before permanent wilting was followed by death. The presence of the Bordeaux film caused increased water loss.—*From the article.*

3482. **ZIMMERMAN, P. W., and WILLIAM CROCKER. Sulphur dioxide injury to plants.** *Proc. Amer. Soc. Hort. Sci.* 27: 51-52. 1 pl. 1930(1931).—Injury resulted from 3-4 parts per million of SO_2 for 1-4 hrs. in tomato, *Coleus*, rose, *Abutilon, Galensoga, Potentilla, Oxalis*, chickweed, nasturtium, geranium, sweet geranium, *Salvia*. Injury resulted from 4-8 parts per million for 3-5 hr. in castor bean, *Sorbus aucuparia*, snapdragon, peach, *Ilex opaca*. Injury resulted from 8-10 parts per million for 4 hr. in carnation, gardenia and rhododendron. The following were resistant to 60 parts per million (except *Cymbidium*, in which the leaves were spotted): *Cymbidium, Oncidium, Cattleya, Odontoglossum, Lilium rubrum.*—*Authors' summary.*

DISEASE RESISTANCE AND PARASITISM

3483. **AJON, GUIDO. Aspetti chimici del malsecco. [Chemical aspects of citrus-blast.]** *Riv. Ital. Essenze e Profumi* 12(10/11): 226-236, 253-262. 1930.—Citrus-blast (*Deuterophoma tracheiphila*) on the lemons of western Sicily follows disturbance of the physiological equilibrium as the result of changes in the mineral nutrition of the trees. Analyses of the leaves, twigs, wood, and bark of diseased and healthy trees have shown a notable deficiency of Ca and Mg in the diseased trees, with an unusually large content of Fe, Cl, SiO_2, P_2O_5 and SO_3. If the ash constituents are calculated as their equivalents of acid and alkali, the balance is strongly basic in the diseased plants. This "balance of equivalence" may prove a useful diagnostic aid in determining susceptibility to disease.—*G. Ajon (transl. by H. S. Wolfe).*

3484. **APPEL, O., und A. SCHEIBE. Beobachtungen über die Verbreitung der einzelnen Getreiderostarten in Deutschland, insbesondere im Jahre 1930. [Grain rusts in Germany, 1930.]** *Mitteil. Deutsch. Landw. Ges.* 46(4): 61-63. 1931.—A survey of the occurrence and prevalence of cereal rusts was made in various provinces in Germany in 1930, seed inspectors collecting samples of diseased leaves, culms, and heads for microscopical and cultural identification. In the 577 rust samples examined, the percentage of each kind of rust was: dwarf rust (*Puccinia simplex*) on barley, 10.34; orange rust (*P. glumarum tritici*) on wheat, 7.16; orange rust (*P. glumarum hordei*) on barley, 3.98; brown rust (*P. dispersa*) on rye, 19.16; leaf rust (*P. triticina*) on wheat, 37.67; stem rust (*P. graminis secalis*) on rye, 5.67; stem rust (*P. graminis tritici*) on wheat, 11.67; black rust (*P. graminis avenae*) on oats, 0.77; stem rust on barley (*P. graminis tritici*), 0.27; and crown rust (*P. coronifera*) on oats, 3.24. As a result of the early onset of summer temp., the 1930 season was chiefly a leaf rust season. Dwarf rust on barley occurred throughout Germany; orange rust on wheat occurred nowhere in large quantities; orange rust on barley attained only a small prevalence; and leaf rust on rye and wheat attained wide prevalence in all Germany. Stem rust attacked late varieties of winter and spring wheat, but heavily only in designated districts. Crown rust of oats was also found chiefly on late varieties.—*L. R. Tehon.*

3485. **ARNAUD, G., et M. GAUDINEAU. Le traitement de la carie du blé. [Continuation.]** *Ann. Sci. Agron.* 47(1): 4-56. 5 fig. 1930.—The majority of dust treatments were generally more effective in the spring, while liquid treatments were best in the fall. Certain varieties were more susceptible to treatment injury in the spring. Copper oxychloride was the best dust treatment used. The presence of inert material lessened the value of the copper dusts. The salts of mercury were the most efficient wet treatments, but their use is prohibited by the French legislature because these salts are poisonous. Copper salts were best for highly contaminated seed. The recommended method consists of steeping for 1 hr. in a 0.5% solution of $CUSO_4$, followed after draining by powdered dry lime. The use of copper solutions for "sprinkling," steeping in copper solution followed by treatment with unslaked lime, and steeps for short durations were unsatisfactory. Copper fluosilicate in a low concentration (0.5%) has shown promise and merits further trial. Bordeaux mixture with casein gave variable results. Copper solutions in oil were unsatisfactory. Formaldehyde and hot water were not studied. The varieties "Red Hussar" and "Martin" proved to be entirely immune. Polish wheat is quite resistant. "Ardito précoce" and "Carlotta Strampelli," though somewhat resistant, are not sufficiently so to warrant dispensing with treatments. The wheats "Prolifique nain" and "Bon Fermier" are quite susceptible to the disease.—*From authors' summary (transl. by E. N. Bressman).*

3486. **BARKER, J. The prevention of wastage in New Zealand apples.** *Gr. Brit. Dept. Sci. & Indust. Res. Food Invest. Spec. Rept. No.* 39. 1-26. [1930].—The wastage in commercial shipments of New Zealand apples in 1928 and 1929 was due chiefly to fungal rotting, and to a lesser extent to bitter pit, internal breakdown, soft scald, and freezing. Split-consignment experiments showed that each of these forms of wastage was markedly affected by temp. during shipment. Wastage from fungal rotting

and from bitter pit (in Cox's Orange Pippins) was greater the higher the temp. in transit, while internal breakdown and soft scald occurred at temp. which, though slightly above the freezing point of the fruit, was still too low for the varieties concerned. For the best results, rapid reduction of the temp. after loading, and the maintenance of a uniform temp. close to the optimum low value thereafter, are essential. The survey of the temp. in the various holds used in the experiments showed that these conditions are seldom attained. The reduction of temp. in the early part of the voyage is generally slow, and the differences in temp. between different parts of the hold in the later part of the voyage are large. The efficiency of certain 'tween-deck holds fitted with improved systems of refrigeration is noted and discussed. It is pointed out that the temp. range for storage and oversea transport accepted as most suitable for particular varieties of apples is not always correct. The effects on the different forms of wastage of certain pre-shipment and post-shipment factors, such as time of picking, delay before shipment, pre-cooling, and delay in marketing, are considered in the light of the split-consignment experiments. Special emphasis is laid on preventing the shipment of over-mature fruit and on providing increased facilities for cold storage at the ports, both for pre-cooling and to minimize the effects of delay pending shipment. A note is included on over-ripeness in pears.—*From author's summary.*

3487. **CURZI, MARIO, e MARIA BARBAINI. Intumescenze e Cladosporium pisi sui legumi di Pisum sativum. [Intumescences and Cladosporium pisi on Pisum sativum.]** *Atti Ist. Bot. R. Univ. Pavia. Ser.* 3. 3: 91-105. 1 pl. 1926.—This disease, heretofore attributed to *Cladosporium pisi,* exhibits pathological manifestations caused by the disturbance of the plant functions. The hypertrophies attributed to *C. pisi* are neither caused nor influenced by any parasitic agent. Various hyphomycetous saprophytes develop on the dead cells of the intumescences, among which the most common is *Cladosporium* sp., which, although preceded by other very common molds, develops vigorously on a layer of dead cells without damaging the living cells of the overgrowth. *C. pisi* is identical with and synonymous to *C. herbarum.* The swellings begin on the stomata and develop especially in the parts where a greater deposit of nutritive substance (ventral suture) or an afflux of water is present. Their development also takes place in naturally or artificially curved cavities of the seed pods, where there is a compression of tissues and a decreased surface for respiration, perhaps an entire closure of the stomata. The formation of the intumescence may be influenced by the variety or vigor of the plant, its age, or the development of the seed pods. Atmospheric moisture is one of the external conditions which influence the development of the intumescence. Temp. and, to a limited extent, light have an influence upon the development of the swellings under identical conditions of moisture. Hypertrophy of this kind may also develop under complete absence of light.—*C. Zeimet.*

3488. **EDDINS, A. H. Pathogenicity and cultural behavior of Ustilago zeae (Beckm.) Ung. from different localities.** *Phytopathology* 19(10): 885-916. 7 fig. 1929.—All multisporidial cultures of *U. zeae,* including the 12 cultures derived from smut galls from different localities in Iowa, and the 5 cultures isolated from 1 smut gall, differed in their pathogenicity on inbred lines of maize. *U. zeae* is regularly heterothallic and 1 monosporidial culture behaved as if homothallism also occurs in the organism. When 5 monosporidial cultures were mated, they were found to represent 4 sex strains of *U. zeae.* Paired multisporidial cultures were generally more virulent than the individual cultures comprising them. Conidia of *U. zeae* retained their ability to produce smut when exposed to winter temp. and cultures of the organism lost their ability to produce smut galls when repeatedly transferred. Hypodermic injection of the inoculum into young tissues of corn plants resulted in a higher percentage of smut infection than did dropping the inoculum on the apical buds. When the latter method was used in the greenhouse, more smut was produced on plants with open apical buds than on those with closed buds. Both methods of inoculation gave a higher percentage of smut infection in the greenhouse than in the field. Colonies of *U. zeae* from the same and different cultures differed from each other in their cultural characteristics.—*Author's summary.*

3489. **GOLDSWORTHY, M. C., and RALPH E. SMITH. Studies on a rust of clingstone peaches in California.** *Phytopath.* 21(2): 133-168. 10 fig. 1931.—A severe epiphytotic of a rust-fungus disease of peaches occurred in the principal canning-peach districts of central California in 1926 and 1927. Serious economic loss was caused by disfiguration of the fruit, which ruined it for canning purposes, as well as by defoliation of the trees. The uredinial stage of the organism was the only one observed. Overwintering of the fungus depends mainly on twig infections which originate in the fall, remain latent and invisible through the winter, and then develop as uredinial sori in early spring. The fungus was also carried over to a certain extent by overwintering of older sori on twigs of the previous season, and by renewed production of urediniospores in spring from such sori. Subsequent infection of leaves and fruit depends upon the presence of sufficient inoculum and the occurrence of periods of several days of rainfall and high humidity. For the germination of urediniospores a period of at least 3 hr. in a saturated atmosphere is necessary. The viability of urediniospores attached to living leaves is limited to a period of about 6 weeks but on dried leaves the spores are somewhat shorter lived. Urediniospores of the peach-rust fungus germinated over a range of temp. between 8° and 38°C. The optimum is between 13° and 26°C. Best growth of the germ tubes was observed at about 22°C. Sulphur and sulphur compounds were found to be more toxic than copper to the germinating urediniospores. Mineral oil seemed to stimulate germination. The identity of the fungus with relation to the prune-rust fungus, *Tranzschelia punctata,* is discussed. In the present instance no spore form other than the uredinial was found on the peach, and the fungus did not attack trees of other *Prunus* spp. (prune, cherry, almond, apricot), even when growing immediately adjacent to badly infected peach trees. In the Santa Clara Valley, California, the telial stage of the prune rust usually develops very abundantly on the leaves of prune trees, in the late fall, but the same fungus was not found on adjacent peach trees.—*Authors' summary.*

3490. **HAMMARLUND, C. Mahonia-rosten, Puccinia (Uropyxis) mirabilissima Peck.** [With English summary.] *Lustgården* 11: 59-80. Map. 3 fig. 1930.—See next entry.

3491. **HAMMARLUND, C. Rostsvampar på Mahonia (Puccinia mirabilissima Peck och P. graminis Pers.). [Rust fungi on Mahonia.]** *Bot. Notiser* 1930(5): 380-407. 4 fig. 1930.—*Puccinia (Uropyxis) mirabilissima,* found on an American species of *Mahonia* in Scotland in 1922, has since been found in Sweden (about 1924), Denmark (1925), Germany, and Holland. It was detected in Limhamn in Scania (1926), but up to the end of 1928 was only known in 4 localities. Since 1928, the fungus has spread rapidly until now there are more than 100 stations throughout southern and middle Sweden. Spread by transplanting infected plants is known in only a single case. In all others old plants, sometimes 10-20 yrs. old, were infected. In 33 localities infection occurred in 1929-30. In the south there were severe snow storms that winter; these, supposedly, favored dispersal. The fungus is winter-hardy. Uredospores, kept at −10 to −20° C. for a month, maintained their germinative power. Minimum temp. for development of the fungus is only a few degrees above 0°C. (optimum about 8-12°C., maximum about 20°C.). Even at a comparatively low temp. the fungus is able to infect leaves of *Mahonia.* In the spring of 1930 aecidia occurred in all investigated localities besides uredo-teleutospores. The author carried out 2 series of infection experiments in which aecidi-

ospores were transferred to leaves of *M. aquifolium*. In the 1st, all 10 inoculated branches and the same number of control branches were covered for 3 weeks by pergamine paper. The inoculated leaves developed numerous red spots but for a time no uredosori, but these sori appeared later. Control branches remained healthy. In the 2nd series many uredosori of *P. mirabilissima* were observed. All controls remained healthy. The author considers the abundant occurrence of aecidia in the spring of 1930 to be associated with the exceptional prevalence of teleutospores as compared with the preceding year. Aecidia of *P. graminis* from leaves of *Berberis vulgaris* and from *Mahonia* leaves showed marked morphological differences, indicating that the 2 rusts are distinct. The aecidium on *M. aquifolium* is referred to *P.* (*Uropyxis*) *mirabilissima*.—*H. K. Svenson.*

3492. **HEY, G. L., and J. E. CARTER.** The effect of ultra-violet light radiation on the vegetative growth of wheat seedlings and their infection by Erysiphe graminis. *Phytopath.* 21(6): 695-699. 1931.—With American Club and Little Joss, 1 min. of irradiation a day for 15 days gave increased growth but only slightly reduced the percentage of infection; while irradiation for 3 min. a day for 15 days reduced growth and greatly reduced the percentage of plants infected by mildew. When irradiation ceased the plants again became infected. In the case of Persian Black, the effect on growth was not so marked, and its immunity from mildew was not affected. It is possible to render the plants free from mildew without causing any visible harmful effects on the seedlings themselves. The effect of irradiation twice a day seems greater than irradiation for the same total time once a day.—*From authors' summary.*

3493. **HOLTON, C. S.** The relation of physiologic specialization in Tilletia to recent epiphytotics of bunt in durum and marquis wheats. *Phytopath.* 21(6): 687-694. 1 fig. 1931.—The virulence of 4 collections of *T. tritici* and 2 collections of *T. levis* was compared on 10 varieties of *Triticum*. The results with *T. tritici* confirmed those already published. The recent epiphytotics of bunt in durum wheats are caused by a physiologic form which has not been prevalent until recent years. Vernal, previously resistant, is now susceptible to bunt, because of the appearance of a form of *T. tritici* previously unknown. 2 physiologic forms of *T. levis* were identified on the basis of their reaction on Kota, Ceres, Marquis, and Marquillo. The St. Paul, Minnesota, collection represents one form which is distinguishable by its high degree of virulence on Kota and Ceres and low virulence on Marquis and Marquillo. The collection from Ivanhoe, Minnesota, represents another form which attacks Marquis and Marquillo, as well as Kota and Ceres, with a high degree of virulence. Field observations have confirmed the experimental evidence. Under field conditions *T. levis* is the predominant species on Marquis and *T. tritici* on Mindum and Vernal. The experimental results show that Marquis is susceptible to *T. levis* and highly resistant to *T. tritici*, while the reverse is true with Mindum and Vernal.—*From author's summary.*

3494. **IMMER, F. R., and J. J. CHRISTENSEN.** Further studies on reaction of corn to smut and effect of smut on yield. *Phytopath.* 21(6): 661-674. 1931.—The larger the galls on the stalks, the greater was the reduction in yield of shelled corn. Large or medium-sized smut galls on the stalk above the ears did greater damage than galls of similar size below the ears. Susceptible lines of corn tend to have a greater number of smut galls to the plant and larger galls than resistant lines. The reduction in yield in shelled corn resulting from large, medium, and small galls on stalks was 50, 25, and 10%, resp. Selfed lines that differ greatly in resistance to smut can be obtained in all varieties of corn used in breeding work at University Farm, Minnesota. 15 lines of corn inbred for at least 8 yr. reacted in a very similar manner for each of the 6 different years when grown in an epiphytotic of smut. In 1928 and 1929 the extent of infection of numerous lines grown in the field, in which smut collections from University Farm only were used, was correlated with the smut infection obtained in a different field where smut collections were from a wider source. The correlation coefficients were 0.47, 0.03, 0.75, and 0.02, resp. The smut infection of 34 F_1 crosses was compared with that of the parents. Crosses between 2 resistant lines were fairly resistant, although they were more severely infected than the parents. A composite cross was made of 7 low-smut lines and of 1 medium-smut line. From a study of 299 F_3 lines selected at random 87% were no more susceptible than the most susceptible parent. The results indicate that composite crosses will undoubtedly yield smut-resistant lines in a large percentage of cases.—*Authors' summary.*

3495. **JANKOWSKA, KRYSTYNA.** Spostrzezenia nad grzybem szklarniowym (Moniliopsis aderholdi Ruhl.). [Observations on M. aderholdi.] [With English summary.] *Pam. Państw. Inst. Nauk. Gospod. Wiejskiego Puławach* (*Mém. Inst. Nation. Polonais Écon. Rur. Puławy*) 11(1): 60-69. 1 pl., 1 fig. 1930.—In *M. aderholdi*, which caused heavy damage to seedlings of begonia, petunia and lobelia in greenhouses, but little specialization was found as to substratum either under natural conditions or in pure culture. Variations in mycelial development were not large over a pH range of 5.4-6.8; 25°C. was optimum and 6-7° minimum for development in culture. It probably lives as a harmless saprophyte and becomes noxious only at high temp. and humidity, such as occur in greenhouses. Pseudosclerotia enable the fungus to survive periods of dryness or cold. They may germinate even when 1 yr. old, though less readily than when fresh.

3496. **JOHNSON, C. O., and E. B. MAINS.** Relative susceptibility of varieties of sorghum to rust, Puccinia purpurea. *Phytopath.* 21(5): 525-543. 7 fig. 1931.—Rust was found on sorghums as far north as La Fayette, Indiana, and Manhattan, Kansas, in 1927. The disease was also seen on sorghums in Oklahoma in the same year. Kafirs and sorgos seem to be moderately susceptible, while the feteritas are very susceptible and the milos very resistant. Both resistant and susceptible varieties were found in kaoliang and broomcorn. In the field shallu proved to be highly resistant in all years, while white durra was susceptible. Several unnamed grass sorghums, Johnson grass, Tunis grass, and Sudan grass proved to be susceptible, while several other unnamed sorghums were resistant. Pronounced purpling accompanied uredinia on most varieties, but none was observed in shallu CI 85, white durra CI 81, and Leoti Red FCI 6610, and "Japanese Honey Drip" KB 2896 sorgos. These varieties apparently lack factors governing the development of red pigment in foliar tissues. No definite evidence of the occurrence of physiologic forms was obtained. *P. purpurea* failed to cause infection in varieties of dent and sweet corn, and no infection resulted from the inoculation of varieties of sorghum with *P. sorghi* p. f. 1. Notes on the characters of the fungus and the pathological histology are given.—*Authors' summary.*

3497. **McINDOE, K. G.** The inheritance of the reaction of maize to Gibberella saubinetii. *Phytopath.* 21(6): 615-639. 6 fig. 1931.—The most suitable soil temp. for experimental infection studies was found to be about 15°C., at which the correlation between replicates was sufficiently high (considering the small numbers used) to warrant conclusions. Crosses of susceptible and resistant parents gave conflicting results in the F_1 generation. Occasionally resistant hybrids appeared from parents possessing an intermediate degree of resistance, but in no case did very resistant progeny appear from parents of extreme susceptibility, although such crosses sometimes proved to be of intermediate resistance. Resistance is probably quantitative in nature and conditioned by multiple factors, as evidenced by an examination of the F_3 progeny of 5 selected crosses. A definite segregation of F_3 lines occurred in conformity with a Mendelian explanation of such inheritance. Where the parental lines differed widely in reaction, highly resistant and

susceptible strains appeared in the F_3, in sufficient proportion to suggest tentatively that relatively few factors for intrinsic resistance are involved. In F_3 lines obtained from parents differing widely in resistance, a significant correlation was found between seedling vigor and resistance, but the relation is not sufficiently constant to warrant selection for resistance on the basis of seedling vigor. No significant correlation was found between seedling reaction in the greenhouse and yield in the field, as affected by infection of mature plants.—*Author's summary.*

3498. **MASSEY, R. E. Studies on blackarm disease of cotton—II.** *Empire Cotton Growing Rev.* 8(3): 187-213. 4 pl. 1931.—Blackarm is due to a combination of factors, of which soil moisture and soil temp. are predominant. Infection of the seed is mainly carried externally but internal infection also occurs. The necessity for the use of clean seed is emphasized. The effect of rainfall in chilling and in increasing the water content of the soil during the critical period of germination has been studied, the amount of infection being directly proportional to the rate of splitting of the seed coats and the penetration of the tissues by the parasite, subject to limitation by a time factor imposed by the lethal properties of the soil. Danger from infected debris may be minimized by watering, whereby the parasite is destroyed. The life of *Bacterium malvacearum* in wet soil is probably limited to 72 hr. The presence of a bacteriophage in the soil of the Gezira has also been demonstrated.—*Author's summary.*

3499. **NIEVES, RAIMUNDO. Resistencia comparativa a la Tilletia levis Kühn, Del Trigo, en la Argentina. [Comparative resistance to T. levis in Argentina.]** [With English summary.] *Phytopath.* 21(7): 705-727. 1931.—The most favorable conditions for infection of fall-sown winter varieties occurred in April and May. The widest spread of infection was noticed where wheat germinated in progressively drying soil. With the exception of varieties belonging to the hard red-winter group, wheats with 14 pairs of chromosomes show greater resistance to bunt than do those with 21 pairs. *Triticum vulgare* presents great variability in the reaction of varieties to infection by *Tilletia,* ranging from total susceptibility to almost complete immunity. Most of the resistant new strains belong to a subgroup of winter wheats, with bearded, lax, white heads, and hard red kernels, that are especially adapted to cold, dry regions (*T. vulgare* var. *erythrospermum*). Strains varying from susceptible to highly resistant have been found in a local variety known as Kansas, which is probably the same as Crimean C. I. 1435 of the U. S. Dept. of Agriculture. Yield tests for 3 yr. with these new strains indicate the possibility of their becoming valuable commercial varieties. Certain strains of winter wheats from Hungary, and the variety Florence from Australia, were shown to be highly resistant.—*From author's English summary.*

3500. **RODENHISER, H. A. Physiologic specialization in some cereal smuts.** *Phytopath.* 18(12): 955-1003. 18 fig. 1928.—In the group of species *Ustilago tritici, U. nuda, U. hordei, U. levis,* and *U. avenae* from 5-18 physiologic forms were obtained for study. Morphological studies were based on color, topography, surface, consistency and type of margin in artificial cultures. Studies with *U. tritici* and *U. nuda* showed that various forms respond differently to temp. Pathogenicity tests were made using forms of *Tilletia levis* and *T. tritici.* Wide variations were found in the amount of smut developed on Pentad, Marquis, and Kota wheat and on Einkorn. Experiments with barley regarding resistance to *U. hordei* gave similar results. New physiologic forms of the smut fungi are developed, probably constantly, by hybridization or mutation.—*J. A. Small.*

3501. **SCHEIBE, A. Die Bedeutung der Spezialisierungsfrage bei den Getreiderostpilzen für Pflanzenbau und Pflanzenzüchtung.** *Züchter* 1(6): 165-171. 3 fig. 1929.—The rusts of Germany and central Europe are discussed, especially the occurrence of specialized forms. A general discussion is given on the present state of knowledge regarding *Puccinia graminis, P. triticina, P. dispersa* and *P. coronifera.*—*F. V. Owen.*

3502. **SCHEIBE, ARNOLD. Studien zum Weizenbraunrost, Puccinia triticina Erikss. I. Methoden und Ergebnisse bei der Bestimmung seiner physiologischen Formen (Biotypen).** *Arb. Biol. Reichsanst. Land- u. Forstw.* 16(4): 575-608. 2 col. pl., 6 fig. 1929.—Collections of physiologic forms (biotypes) in *Puccinia triticina* from various points in Germany and neighboring European countries were grown on differential hosts and the biotypes present determined. Physiologic forms XI, XIII, XIV, and XV were grown in the greenhouse on a series of spring and winter wheat varieties and the type of infection noted. The presence in Europe of the same biotypes as previously had been found in America was demonstrated, and a discussion of the significance of this result to breeding of rust-resistant wheat and the possibilities of the isolation of further biotypes is included.—*J. C. Gilman.*

3503. **SCHEIBE, ARNOLD. Studien zum Weizenbraunrost, Puccinia triticina Erikss. III. Über die geographische Verbreitung der einzelnen physiologischen Formen und Formenkreise in Deutschland und in seinen angrenzenden Gebieten.** *Arb. Biol. Reichsanst. Land- u. Forstw.* 18(1): 55-82. 5 fig. 1930.—Of 12 physiological forms of *P. triticina* found in Germany, 5 were distinctly west European and 7 were east European. The most virulent forms belonged to the east European group. Only 4 forms were typical of Germany proper, and the wheat varieties Malakoff and Norka were resistant to 2 of these 4 forms.—*A. E. Hitchcock.*

3504. **UPPAL, B. N., and M. K. DESAI. Physiologic specialization in Sclerospora graminicola.** *Phytopath.* 21(3): 337-338. 1931.—Oospores of *S. graminicola* from *Setaria viridis, S. magna,* and *S. italica* produced infection in *S. italica, S. magna* and *Euchlaena mexicana* but not in *Pennisetum typhoideum,* while oospores of the same organism from the last-named grass infected only this species. Neither form of the organism was capable of causing infection in *Panicum miliaceum.*—*W. A. Whitney.*

3505. **WELLMAN, F. L. Clubroot of crucifers.** *U. S. Dept. Agric. Tech. Bull.* 181. 32p. 3 fig. 1930.—A detailed report upon studies of the life history of *Plasmodiophora brassicae* and control methods. Spore germination occurred from about 6-27° C., with the peak at 25°. Disease development occurred at 12-27°, with optimum at 18-25°. The temp. range of disease development is a direct result of the action of temp. on the parasite. Infection of the host plant occurred quite readily after 18 hr. of exposure to infested soil of adequate moisture content, indicating that no drainage system could be expected to inhibit infection following heavy rains. A pH range of 5-7.8 was found for 116 disease-infested soils. In a soil of pH 7.2, the addition of K_2CO_3 produced a pH of 8.1 without inhibiting the disease, whereas $CA(OH)_2$ sufficient to change the pH to 7.3 completely prevented infection. Apparently H-ion concentration in itself was not a limiting factor in control. Limes consisting of $CaCO_3$ and $CaSO_4 \cdot 2H_2O$ were not satisfactory for control while those of CaO or $Ca(OH)_2$ composition gave satisfactory control with plants grown in infested soils. For satisfactory control in thoroughly infested seed beds, the author suggests applying at least 1,500 lb. of hydrated lime per acre, while in the field at least 2 tons per acre were required to obtain commercially satisfactory control. Raw ground limestone was not effective, and air-slaked limes were of questionable value.—*Courtesy Exp. Sta. Rec.*

DISEASE CONTROL (SEED TREATMENT, SOIL DISINFECTION, FUNGICIDES AND SPRAYING)

3506. **ANDERSON, H. W., and M. A. SMITH. Experiments on apple disease control in 1930.** *Trans. Illinois State Hort. Soc.* 64: 242-261. 1930(1931).—Flotation sulphurs used throughout the season gave as good control of apple scab and blotch as did the standard spray of lime sulphur alone. There was no significant

difference between any of the treatments where flotation sulphur, lime sulphur, or lime sulphur followed by flotation sulphur was used. All gave a high percentage of scab- and blotch-free fruit. There was no significant difference between the treatments of Thylox and Ferrox, the 2 types of flotation sulphur used. Both gave over 95% scab-free fruit in the varieties Gano and Stayman. Calcium monosulphide failed to give satisfactory control of apple scab in both varieties, Ferrox and Thylox flotation sulphurs both gave as good control of apple blotch as did the standard spray of lime sulphur alone. No serious russeting of the fruit or foliage injury occurred in any of the plots receiving flotation sulphurs, lime sulphur, or calcium monosulphide.—*M. A. Smith.*

3507. **BENTON, R. J. Prevention of decay in oranges.** *Agric. Gaz. N. S. Wales* 42(5): 411-413. 1931.—In untreated fruit decay was 3.35 and 2.06 times as great as in fruit treated with borax and bicarbonate of soda, resp. The appearance of the treated fruit was also better. The mountain-grown oranges had little more than half the amount of decay found in the lowland-grown fruit, the losses being 7.17% and 11.82%, resp.

3508. **CURTIN, LEO PATRICK, and WILLIAM THORDARSON. Experiments in wood preservation. VI. Recent laboratory work.** *Indust. & Eng. Chem.* 20(1): 28-30. 1928.—Toxicity data are tabulated to show the "killing points" of various hitherto untested inorganic preservatives for *Fomes annosus*. 12 additional fungi have been studied, all of which evolved sufficient acid to convert sodium alizarin sulfonate to the free sulfonic acid (pH 5), and 7 gave an acid reaction with methyl orange (pH 3). The toxicity of zinc meta-arsenite in powder form toward 14 wood-rotting fungi has also been studied. —(*Courtesy Indust. & Eng. Chem.*)

3509. **CZIÁKY, JÁNOS. Az új csávázószerek és a rézgálic. [New treating materials and copper sulphate.]** [German abstract.] *Kisérletüzyi Közlemények [Budapest]* 33(1): 43-62. 4 fig. 1930.—Wet seed-treating materials tested were Tillantin, Higosan, Germisan, Resinol, and Triamid, and dry treatments used were Tillantin, Porzol, Tutan, Resopor, Triamid, and a product containing copper sulphate. In the prescribed concentrations these showed neither a stimulating nor injurious action on the germination of the seed. An overtreatment with wet-treating materials injured germination. Their concentration must therefore be controlled. With dusts there was no injury due to overtreatment. Copper sulphate used in 0.5-1.0% solutions afforded as good control as the newer preparations, and the development of young plants was equally vigorous. A 2% solution of copper sulphate caused injury similar to that due to overtreatment with the other liquid disinfectants, which is ascribed to entry of the chemical through cracks in the seed coat caused in threshing. This possibility of injury was the only disadvantage of copper sulphate but is of no practical importance as an excess of seed is always used. The new materials are much more poisonous than copper sulphate, the dry treatments particularly requiring caution since continued inhalation of the dust is dangerous. The new treating materials are also much more expensive than copper sulphate, the cost of treating a specified quantity of grain with them being 2-5 times as great.—*E. L. Griffin.*

3510. **GODFREY, G. H., and H. R. HAGAN. Some experiments on nematode control by clean fallow. Preliminary report.** *Pineapple Quart. [Hawaii]* 1(1): 10-18. 1931.—Report of an experiment showing reduction of effectiveness of the inter-cycle period in nematode eradication in pineapple fields attributed to weeds and volunteer pineapples.

3511. **HAMILTON, J. M. Studies on the fungicidal action of certain dusts and sprays in the control of apple scab.** *Phytopath.* 21(5): 445-523. 7 fig. 1931.—All fungicides applied before inoculation gave excellent control if the trees were not subjected to washing. Leaves treated with sulphur dust or lime-sulphur spray were effectively protected until they became resistant. Bordeaux mixture was somewhat less effective. The fungicidal effectiveness of sulphur dusts and lime-sulphur was not appreciably reduced when applied to foliage which was then held for a period in a moist chamber before inoculation. Temp. within the range 6-23° C. during the infection period appeared to affect the development of host and parasite more than the toxicity of sulphur. When applied after inoculation sprays containing lime-sulphur were more effective than the sulphur dusts (whether finely ground, sublimed, "activated," or containing arsenate of lead), wettable sulphur sprays, calcium monosulphide, Bordeaux mixture, emulsified oils with or without a sulphur fungicide, and certain proprietary mercury compounds. Sulphur-arsenate dust 90-100 afforded but little control when applied later than 12 hr. after inoculation, unless the application was followed by a moist treatment, while sprays containing lime-sulphur, especially 1-40 plus arsenate of lead 1-50, gave good control when the application was made after infection periods of 30-72 hr. Under these experimental conditions no significant difference in scab control between the various wettable sulphurs or finely ground sulphur preparations and the coarser sulphur products tested is evident which is attributable to their physical states. Bordeaux mixture was more effective than certain sulphur dusts or sprays. Some of the emulsified oils and proprietary mercury compounds were effective. The quantity of ascosporic inoculum was a factor in the effectiveness of sulphur fungicides applied after inoculation and temp. above 26° C. was an appreciable factor in the inhibition of the fungus. Higher temp. was most effective against the pathogen before penetration had taken place. Moisture was also an important factor in the maximum effectiveness of lime-sulphur containing sprays when applied after an infection period. Histological evidence shows that the pathogen may be inhibited after infection has taken place. Rapid drying of lime-sulphur appeared to increase its effectiveness in applications made after inoculation. Lime did not diminish the reaction of lime-sulphur plus arsenate to an appreciable extent when applied after infection periods. The increased effectiveness of lime-sulphur from the addition of lead arsenate is due, at least in part, to soluble arsenic (As_2O_5), which may be fungicidal alone. Injury did not result when this soluble arsenic was applied alone at a concentration of 0.04% or with lime sulphur 1-40 at the concentration of 0.03%. Kayso (casein lime) slightly increased the fungicidal property of lime-sulphur plus lead arsenate when applied after infection. The effectiveness of certain sulphur fungicides was increased when applied in a soft-soap solution. Oil emulsion applied before or after inoculation exhibited fungicidal properties, and the addition of oil emulsion increased the effectiveness of certain fungicides. Development of conidia of *V. inaequalis* on leaf lesions was checked according to the fungicidal efficiency and adhesiveness of the materials used. Certain sulphur fungicides and Bordeaux mixture were effective over a larger area than the actual surface covered. No significant increase in fungicidal efficiency of sulphur resulted from the addition of potassium permanganate. Lime-sulphur sprays and Bordeaux mixture were decidedly more adhesive than certain sulphur dusts, finely divided sulphur sprays, and emulsified oils. The addition of soft soap, emulsified oil, Kayso, or ferric oxide increased the adhesiveness of certain fungicides, emulsified oil giving generally the most satisfactory results.—*From author's summary.*

3512. **HEALD, F. D. Blue mold in relation to fruit cleaning methods.** *Washington State Hort. Assoc., Proc.* 23: 143-148. 1927.—From experimental data the author stresses 3 methods of reducing the amount of blue mold (*Penicillium expansum* et al.) in packed apples: Reduction of the blue mold content of both acid and rinse baths to the lowest possible point; more care in handling the fruit from the orchard to cold storage to prevent mechanical injuries, by increased care in sorting out fruit showing any injuries; and reducing calyx injury to the minimum.—*From author's conclusions.*

3513. **HORSFALL, J. G. Combating damping-off of tomatoes by seed treatment.** *New York State [Geneva] Agric. Exp. Sta. Bull.* 586. 22p. 2 fig. 1930.—Damping-off (*Pythium ?debaryanum*) is the most serious disease affecting tomato seedlings in New York. Although control by steam sterilization has been demonstrated repeatedly, the expense and care restrict the use of this method. Seed soaked in a copper sulphate solution, 1 lb. in 8 gal. of water, for 10 minutes to 24 hr., gave remarkable increases in stand and freedom from disease of the emerged seedlings in a number of greenhouse trials. Tomato seed shows great resistance to copper poisoning, and may be soaked in a 7.2% copper sulphate solution for 22 hr. without injury, whereas, seedling plants may be injured by a 0.5% solution applied to the soil at the rate of 1 quart per square foot. Dusting seed with an excess of copper carbonate also gave increased stands and freedom from disease, but this treatment was less efficient than soaking in copper sulphate. Increased stands have also been obtained on a small scale by dusting seed with various other copper salts. Cuprous cyanide caused great injury to germination. Under certain conditions not yet well defined tomato seed is injured by treatment with calomel, mercuric sulphide, mercuric oxide, mercuric iodide, Semesan, Ceresan, and Dipdust (Semesan Bel).—*J. G. Horsfall.*

3514. **MacLEOD, D. J., and R. R. HURST. Potato scabs. Powdery scab Spongospora subterranea (Wallr.) Johns. Common scab Actinomyces scabies (Thaxter) Güssow.** *Dept. Agric. Canada Pamph.* 134. 3-26. 14 fig. 1931.—This bulletin incorporates the results and recommendations for control derived from laboratory studies made in several Dominion Laboratories.

3515. **MARSH, R. W. Spraying trials against apple and pear scab at Long Ashton.** *Jour. Bath & West & Southern Counties Soc.* 5: 143-153. 1930/1931[1931].—Scab control experiments for the 3rd yr. in succession afford striking evidence of the cumulative effect of spraying. Addition of aluminium sulphate to a lime-sulphur spray did not prevent sulphur injury in the variety Lane's Prince Albert. Bordeaux mixture injury to the fruit of Worcester Pearmain is recorded. The use of spray guns with a powder outfit saves time and caused no increase in spray damage. Excellent control of scab on pears was obtained by 2 sprayings with Bordeaux—one before and one after flowering.—*Author's summary.*

3516. **MORWOOD, R. B. Flag smut in wheat experiments, 1930.** *Queensland Agric. Jour.* 35(6): 363-367. 1931.—Bluestone effectively controlled seed-borne infection of flag smut, but treatment of seed with lime after bluestone is liable to impair its effectiveness. Hot water seriously reduced germination, and is impracticable as a method of control. Copper carbonate completely controlled infection in the lightly infested rows, but not entirely in rows planted with seed that was moderately to heavily contaminated.—*From author's conclusion.*

3517. **NILSSON, GEORG. Några resultat från betningsförsök. [Some results from seed treatments to control plant diseases.]** *Sveriges Utsädesför. Tidskr.* 41 (2): 99-116. 1931.—*Fusarium* may be combated with Uspulun dust, bunt with Uspulun, Tutan, Abavit B dusts, or Uspulun Universal; oat smut with Oats-Tillantin or U. T. 687 dusts.—*G. Nilsson-Leissner.*

Missouri* 29(5/7): 1-80. 107 fig. 1931.—A handbook which gives descriptions of diseases, insect pests, and other injuries, with formulae for certain materials used in control.

3519. **TILFORD, PAUL E. The effect of different pressures and of different types of lime in potato spraying.** *Amer. Potato Jour.* 8(6): 145-150. 1931.—Bordeaux mixture applied at 400 lb. pressure was more effective than when applied at either 200 or 600 lb.; 300-400 lb. is considered the most effective pressure for potato spraying. In Ohio good grades of hydrated lime have proved as good for making Bordeaux mixture as stone lime. 2 yr. tests with a high magnesium lime indicate that it may prove as satisfactory for the preparation of Bordeaux as a high calcium lime.

3520. **TORRES, I. L. Bud rot of coconuts in Porto Rico.** *U. S. Dept. Agric. Bur. Plant Indust. Plant Dis. Reptr.* 15(3): 23-24. 1931. [Mimeographed.]—Brief note on the occurrence of *Phytophthora faberi* on coconut and hat (*Sabal causiarum*) palms and progress of eradication of diseased specimens.—*W. A. Whitney.*

3521. **TUCKER, JOHN. The effects of seed treatment on black-leg.** *Amer. Potato Jour.* 8(6): 158-159. 1931.—Data compiled from 9,019 good reports show that potato seed treatments, as at present applied on farms, reduce but do not altogether control black leg. Formalin treatment is but slightly effective; mercury bichloride is more so. The results as compiled from field records during 3 yr. (1928-1930) are fairly uniform.—*Author's summary.*

3522. **[VLADIMIRSKAĬA, N. N.] ВЛАДИМИРСКАЯ, Н. Н. К вопросу дезинфекции почвы. [Soil disinfection.]** [With English summary.] Болезни Растений [*Bolezni Rastenii*] 19(1/2): 22-54. 1930.—Chemical disinfection of the soil with formalin, paradichlorbenzene, chloride of lime, sulfur dioxide and copper carbonate cannot be recommended either agriculturally, economically or phytopathologically. Fungicides introduced into the soil always affect to a certain degree the regular course of the nitrifying process. Treatment of the soil with strong chemicals causes various detrimental effects in plant growth. Fungicides such as paradichlorbenzene and chloride of lime persist in the soil for a long time. Only mercuric chloride as applied against club root has given entirely satisfactory results. In other cases the maximum decrease of infection obtained was only 50%. Disinfection of the soil by heat offers many advantages, as it quickly and completely destroys soil infesting fungi at moderately low temp. (for *Plasmodiophora brassicae* 60° C. for 30 min.; for *Colletotrichum lini*, 50° for 30 min.), whereas chemical disinfection frequently does not kill the spores. Heating of the soil to high. temp. increases its fertility. Heating at 50-60° C. does not interfere with the chemical and physical properties of the soil; plants growing in such a soil show no adverse effects.—*From author's summary.*

3523. **VOELKEL, H. Methoden zur Prüfung von Pflanzenschutzmitteln. II. Die Bestimmung der Haftfähigkeit von Stäubemitteln. [Methods for testing the protective covering of plants. II. The determination of the adhesive properties of dust materials.]** *Arb. Biol. Reichsanst. Land- u. Forstw.* 17(3): 253-272. 6 fig. 1929.—A method is described for comparing the capacity of different dust materials to adhere to leaves and to a slanted slate surface after being agitated by a mechanical shaker. Talc was used on one half of the slate, and the dust to be tested on the other half. Dusted ivy leaves placed at the end of a long rod were shaken in a manner similar to the slate. By this method it is believed that dusts may be evaluated for their adhesive capacity on different leaves under external conditions of wind and rain.—*A. E. Hitchcock.*

3524. **WIANT, J. S. Potato seed treatment with formaldehyde dust for the control of scab.** *Amer. Potato Jour.* 8(4): 101-104. 1931.—Formaldehyde dust effectively controlled scab and reduced the loss from blackleg.

3525. **ANONYMOUS. The testing of wood preservatives.** *Nature [London]* 126(3189): 921-922. 1930.—Wood blocks are preferred as a substrate; several fungi should be tried, by spore as well as mycelial inoculation. Other factors besides toxicity (liability to leaching, stability in wood) need to be considered in evaluating a preservative.

BIOCHEMISTRY, METABOLISM (GENERAL)

3537. BEWS, J. W., and J. E. VANDERPLANK. Storage and other carbohydrates in a Natal succulent and a Natal geophyte and their behavior before, during, and after the winter resting season. *Ann. Botany* 44 175): 689-719. 1930.—For the succulent type *Portulacaria afra,* Jacq., and for the geophytic type *Hypoxis cooperi,* Moore, were used. Analyses were made of the leaves and twigs of the former and of the corms and leaves of the latter. Monosaccharides and disaccharides were extracted with aqueous alcohol and their respective reducing powers estimated before and after inversion under Herzfeld conditions. Polysaccharides were estimated after hydrolysis with 1.1% HCl for 4¼ hrs. on boiling water-bath. The reducing powers of sugars were estimated by means of excess Fehling's solution, and the excess was determined iodimetrically or by a new, quick modification of the titanous chloride method. Pentosans were estimated by the Kröber method, the pentoses produced by the hydrolysis of the pentosans being separated from unhydrolysed pentosans by means of aqueous alcohol. The analyses were made from autumn to spring (March or May to October), the *Portulacaria* leaves and twigs being analyzed once each month in May, June, July, August, and October, the *Hypoxis* corms in March, May, June, August, and October, and the leaves in March, May and October. The slight seasonal variations or changes in the content of the various carbohydrates are discussed. The stored starch did not seem to be used to any appreciable extent during periods of renewed growth. The sugars did not seem to be directly affected by the water content. Contrary to Spoehr's findings the data on the succulent plant showed an increase of pentosans with aridity and low temp. Aridity is therefore supposed to be the chief factor affecting pentosan content. The pentosans, however, did not always increase with decreasing water content. The authors believe that for shallow-rooted succulents the distribu-

tion of rain throughout the year is more important than the annual total amount. Differences were noted in the carbohydrate content of *Portulacaria* leaves gathered from the north (sunny) and south sides of the tree. The total carbohydrate content was higher in the leaves on the north side as was also that of the pentosans and hexosans, while the content of monosaccharides and disaccharides was somewhat lower. The hexosans in the *Portulacaria* leaf before photosynthesis commences were found to be largely or totally colloidal by the iodine test for starch and a study of the diurnal changes in carbohydrate content. They, the chief products of photosynthesis, increased largely during the day and decreased at night, so that the content on 2 consecutive mornings was fairly similar.—*M. C. Merrill.*

3538. **CHANNON, HAROLD JOHN, and ALBERT CHARLES CHIBNALL.** The ether-soluble substances of cabbage leaf cytoplasm. V. The isolation of n-nonacosane and di-n-tetradecyl ketone. *Biochem. Jour.* 23 (2): 168-175. 1929.—**CHIBNALL, ALBERT CHARLES, and HAROLD JOHN CHANNON.** The ether soluble substances of cabbage leaf cytoplasm. VI. Summary and general conclusions. *Biochem. Jour.* 23(2): 168-184. 1929. —These 2 papers are parts of a series presenting some of the relations between P and the fatty substances in plant cells. "Although the higher paraffins have been isolated from a large number of plant sources, no evidence has been forthcoming as to their origin in the plant, and the lack of a reasonable hypothesis for their metabolism made it appear vital that the exact position of the carbonyl group should be established with certainty." The total amount of ether-soluble material in the cytoplasm is about 3.5% of the total leaf solids. Since fat-soluble substances containing Ca and Fe had not been demonstrated previously, the proportion of Ca, P, and Fe of the cabbage-leaf present in the form of Ca phosphatidate and the Fe compound was calculated roughly. Water-soluble Fe was too small to be determined gravimetrically. The I value of the glyceride fatty acids is about 200 compared with 137 for the fatty acids present in the phosphatide.—*G. J. Peirce.*

3539. **EHRLICH, FELIX, und FRIEDRICH SCHUBERT.** Über tetra-Araban und seine Beziehung zur tetra-Galakturonsäure, dem Hauptkomplex der Pektinstoffe. *Biochem. Zeitschr.* 203(1/6): 343-350. 1928.—Plant pectins consist of 2 substances, present in approximately the same amounts. One is araban (a pentosan) and the other is a Ca-Mg salt of pectinic acid. Dried sugar beet contains 20-30% of a hydrated pectin, which is obtained by boiling with water and evaporating on a water bath. Yellowish brown leaflets are obtained. These are treated with 70% alcohol, which dissolves the araban only. On evaporation a yellow brown hygroscopic mass is obtained, still impure with saponin, acetic acid salts, and colored matter. This crude araban is hydrolysed by dilute H_2SO_4 and about 90% crystalline l-arabinose is formed. Araban is a mixture of different anhydrides of arabinose. Some arabans apparently consist of 2-3 mols. arabinose from which 1-2 mols. water are extracted. A high molecular araban, probably already partly hydrolysed in the plant by enzymes, but mainly by the prolonged action of the boiling water (which contains acetic acid, developed from the pectinic acid), was isolated from crude araban. This was treated with alcohol and ether and the isolated product was called tetra-araban ($4C_5H_{10}O_5 - 4H_2O = C_{20}H_{32}O_{16}$). It is a nearly colorless, amorphous neutral powder; contains a little ash; is soluble in water and alcohol; reduces Fehling's solution very little; and gives the color reactions of the pentoses. On hydrolysis with acids it reduces Fehling's solution strongly and the solution contains l-arabinose. Tetra araban is also decomposed by takadiastase, l-arabinose being formed. The main compound of pectins is tetra-galacturonic acid, containing 4 mols. d-galacturonic acid and 4 mols. water ($4C_6H_{10}O_7 \cdot 4H_2O = C_{24}H_{32}O_{24}$). Stereochemically d-galacturonic acid is nearly related to l-arabinose. Therefore it seems possible that in the plant araban is formed from tetra-galacturonic acid by enzyme action, CO_2 being released from the 4 free carboxyl groups. The relation of these facts to products such as the plant mucilages (acacia gum, tragacanth, and others), also to the pectins of flax and the xylans of wood and straw is discussed.—*M. G. Breyer-Brandwijk.*

3540. **SCHMORL, KARL.** Getreidechemie. *Naturwiss.* 18(19): 413-417. 1930.—The chemistry of cereals seeks analytical methods for judging cereals and flour; is finding sound chemical devices for the refining, bleaching, and sterilization of flour; and, finally, by the aid of colloidal chemistry, is trying to give a scientific exposition of this special field. In the analytical chemistry of cereals it is of primary importance to determine water, ash, and protein content, diastatic power, acidity, pH, etc. As for the refining of the flour, it is impossible for the miller to produce a good-baking flour from German wheat alone. It was once the practice to mix the gluten-poor wheats of central Europe with foreign types rich in gluten. In recent yrs. less Manitoba wheat has been used, partly because of a falling off in quality and partly because substitutes have been added to the domestic flour. "Bleaching" differs from "refining" of flour in that the former involves only the change in color produced by oxidizing the yellow carotin pigments to colorless oxides. If the baking quality of the flour is improved in this process it is due to accelerated maturation and this does not take place in all cases. The refining or improvement of flour depends on increasing the gluten content.—*K. Schmorl (transl. by C. J. Lyon).*

3547. **POPOFF, METHODI. Ueber die Methodik der Zellstimulation.** In: **EMIL ABDERHALDEN. Handbuch der biol. Arbeitsmethoden; Lief. 289. Abt. V. Methoden zum Studium der einzelnen Organe des tierischen Organismus.** Teil 2. Heft 12. 1324-1334. Urban & Schwarzenberg: Berlin, 1929.—Stimulating agents are those which hasten the oxidative processes in living cells. Their action is conditioned by their concentration and duration. It falls in 3 phases: acceleration, optimum, and overstimulation, with resulting lowering of vital phenomena. Physical agents such as temp., mechanical action, and radiant energy exhibit comparable stages. *Euglena* reared in 1% peptone plus 1% citric acid encysts when washed and transferred to alkaline water. Glycerophosphoric acid in 0.5% solution induces 80-90% excystment in 10 min. and 100% in 20. A solution of 0.25% induces 100% excystment in 40 min. Stimulation constants have been determined for a wide range of reagents. Sister paramecia, following binary fission, were used for experiment and control, respectively, in determining stimulants to fission. Ten min. exposure to 5% $Mn(NO_3)_2$ followed by washing and transfer to culture fluid resulted in 2490 paramecia, while only 883 were produced in the control. Regeneration in *Hydra* and in *Planaria* is stimulated by specific concentrations of various reagents acting for 1-5 min. Healing of wounds in the horse and in man is accelerated by 30% MgBr, 5% KBr, 15% $MgCl_2$, glycerin, 5% KI, and 1% tannin. Ripe unfertilized ova of *Strongylocentrotus lividus* are in a state of physiological depression. Parthenogenetic development is incited by a very wide range of chemical substances. An optimum concentration and duration can be determined for each. In the case of $MgBr_2$ this is 100% for 40 min., which results in about 90% of the ova attaining the blastula or pluteus stage. Aqueous extract of 1 gm. of fresh pollen of *Quercus* or *Calla* in 4 cu. cm. sea water for 15 min. induces development to the blastula stage. Moribund avitaminose doves lose their symptoms upon subcutaneous injection of 0.0035 to 0.0150 gm. of $MgBr_2$ in 0.5-1 cu. cm. of water. Vitamin extracts of yeast and of rice hulls will induce parthenogenetic development of as high as 80% of the eggs of the sea urchin. Seed soaked for 10 min. to 72 hrs. in solutions of stimulants such as 1% KI, 5% KBr, or various combinations of stimulating chemical solutions give 25-30% increase in yield.—*C. A. Kofoid.*

3550. **ANSON, M. L., and A. E. MIRSKY. Protein coagulation and its reversal. The preparation of insoluble globin, soluble globin and heme.** *Jour. Gen. Physiol.* 13(4): 469-476. 1930.—By a procedure involving the use of acid acetone, hemoglobin may be rapidly separated into a precipitate of denatured globin and an acetone solution of heme. By neutralization procedures the denatured globin may be largely converted into a soluble, apparently native form which can combine with heme to form hemoglobin. The heme may be obtained in acetone-free, slightly alkaline solution without the use of strong alkali, which may modify it.—*Authors' summary.*

3551. **ASTBURY, W. T., and A. STREET. X-ray studies of the structure of hair, wool, and related fibres. I. General.** *Phil. Trans. Roy. Soc. London A* 230(683): 75-101. 2 pl., 6 fig. 1931.—X-ray photographs were made of 3 varieties of wool, human hair, llama hair, hedgehog spine, and porcupine quill. The materials studied all contain a crystalline or pseudo-crystalline constituent, which gives substantially the same x-ray photograph. Different photographs were obtained from stretched and unstretched fibers. The interference figures obtained do not suggest a substance of high molecular wt.; like those of cellulose, they suggest "that a comparatively simple unit may be repeated, 'via' primary valency bonds, an indefinite number of times. The photograph (α) of unstretched hair is a typical 'fibre photograph' and may be referred provisionally to a rectangular cell of dimensions, $a=27$ Å., $b=10.3$ Å., and $c=9.8$ Å. On stretching hair, the α-photograph gradually disappears and is replaced by another 'fibre photograph' (β) which first becomes prominent at about 30% extension. The β-photograph may be referred provisionally to a rectangular cell of dimensions, $a=9.3$ Å., $b=6.64$ Å., and $c=9.8$ Å. The α-β transformation is reversible and appears to be based on the elongation of an intramolecular group of length 5.15 Å. to another group of length 6.64 Å., an increase of 29%. The reversible α-β transformation gives a qualitative and quantitative explanation of a number of characteristic tensile properties of hair." Since cystine is the amino acid most abundant in wool protein, a preliminary x-ray examination was made of its structure. "The lattice is hexagonal, with 3 molecules per cell, and $a=9.40$ Å., $c=9.42$ Å. X-ray micro-analytical experiments have shown that stretched hair (β-form) is more vulnerable than unstretched (α-form); and among other things, that in the case of β-hair the main destructive action of Na_2S is preceded by a rapid non-solvent reaction. The structure of cystine and the action of Na_2S on the β-form suggest that the latter is based on molecular chains linked side-to-side by nuclei of cystine or cysteine. The chief molecular grouping of the α-form repeats along the fibre axis with a period equal to the most prominent period of cellulose (5.15 Å.). The whole series of experiments conveys the impression of long filament-like molecules, which in some way involve the continuous repetition of hexagonal ring systems connected by bridge atoms. The x-ray measurements suggest that the primary molecular grouping of hair keratin is based on equimolecular proportions of the 4 chief constituent amino-acids, leucine, glutamic acid, cysteine, and arginine."—*From authors' summary.*

3552. **BRINLEY, FLOYD J. Effects of cyanide on the protoplasm of ameba.** *Jour. Gen. Physiol.* 12(2): 201-206. 6 fig. 1928.—Concentrated solutions ($N/10$-$N/300$) of HCN or KCN produced an initial increase in protoplasmic viscosity of immersed amebae which was followed by liquefaction and cell disintegration. Dilute solutions of HCN or KCN decreased protoplasmic viscosity. Injections of HCN or KCN into amebae produced a reversible decrease in viscosity. These experi-

ments seem to indicate that the toxicity of HCN and KCN for amebae is due to their effect on the cell membrane and not on the internal protoplasm.—*Author's summary.*

3553. **FISCHER, F. P. Über die Teilchengrösse intravenös injizierter Farbstoffe im Serum und Kammerwasser.** *Arch. Augenheilk.* 103(3/4): 554-579. 1930.—The passage of dyes from the blood into the aqueous humor and cerebrospinal fluid is referred to their colloidal properties, especially particle size and electric charge. Hence the author measured the diffusion coefficient of different dyes in watery solution, in blood serum, in primary and secondary aqueous humors, and in serum filtrates of different protein concentrations. In watery solutions only a small portion of dye diffused according to theory, but deviations or anomalous diffusion occurred. Dyes which diffused more rapidly than eosin, which appears in the aqueous and cerebrospinal fluid, were inferred to be in a state of finer dispersion than eosin, and their retention in the blood was referred to their charge, which is the opposite of eosin. All dyes diffused more slowly in serum than in water, apparently because of absorption by the protein, but even in serum a number of dyes showed anomalous diffusion. Fluorescein was the only dye studied in relation to aqueous humors. It diffused more rapidly in primary aqueous than in serum, but more slowly than in water. Its diffusion in secondary aqueous was about equal to that in serum.—*F. H. Adler.*

3554. **HAYASHI, S. Über die parenterale Resorption von Kolloiden. II.** *Biochem. Zeitschr.* 208(4/6): 361-367. 2 fig. 1929.—Urease preparations made from the jackbean were injected intravenously, intraperitoneally, and subcutaneously into dogs. The urease in the blood was determined at intervals by estimating the amount of NH_3 formed from urea by the action of the urease. The largest amounts of urease were found in the blood, naturally, soon after the intravenous injections and most of this had disappeared in 30 hrs. Following intraperitoneal injections the amount in the blood rose gradually for several hrs. and then declined, its relative concentration being always less than that following intravenous injection. The rate of absorption depended on the concentration of the injected solution, the kind of ions in the buffer or salt solution used, and on the pH. Following subcutaneous injections of the urease, the concentration in the blood was at all times still lower.—*J. M. Ort.*

3555. **HÖBER, RUDOLPH. The present conception of the structure of the plasma membrane.** *Biol. Bull. Marine Biol. Lab.* 58(1): 1-17. 1930.—This general review discusses the pore theory and the solution theory of cell permeability and emphasizes the variability of the plasma membrane, in that the same membrane may vary from time to time and corresponding membranes of the same kind of cell may vary from sp. to sp.—*P. H. Mitchell.*

3556. **IRWIN, MARIAN. Spectrophotometric studies of penetration of dyes. VII. Dyes absorbed by a non-medullated nerve.** *Jour. Gen. Physiol.* 13(4): 391-394. 1930.—Living non-medullated nerves of the lobster claw, exposed, were bathed in a solution of methylene blue, azure B, and acid fuchsin, in sea water; rinsed in sea water; and the absorbed dye was extracted from the nerve, with sea water. Spectrophotometric measurements of the extracted dye show that its absorption curve is the same as that of the dye used for the staining. Three successive extractions from the stained nerve within 8 hrs. after staining gave the same results. The experiments show that the dyes were actually absorbed, unchanged by the nerve, but not necessarily that they penetrated into its interior.

3557. **LEBERMANN, FERDINAND. Über die Caseinfällung im isoelektrischen Punkte.** *Biochem. Zeitschr.* 206(1/3): 56-59. 1929.—The buffer capacity of cow's milk requires consideration in the precipitation of casein. Casein precipitated by acetate buffers sets free alkali or withdraws H^+ ions from the milk solution through adsorption or phase buffer action. The optimum precipitation of casein from skim milk was by an acid acetate buffer—8: 1—of pH 3.74. The final pH of the milk plus this buffer was 4.89, thus being different from the isoelectric point of the pure casein, which was precipitated best at pH 4.7.—*D. R. Briggs.*

3558. **MATHYS, HERMANN. Untersuchungen über die Permeabilität der Zelle. 15. Die Permeabilität der Farbstoffe durch die Speicheldrüsen.** *Biochem. Zeitschr.* 234(5/6): 419-440. 1931.—Indigo carmin, Na-fluorescein, or erythrosin was injected into rabbits and excretion of dye through the saliva and urine was studied. Pilocarpine caused all 3 dyes to appear in the urine but not in the saliva, although it stimulated salivary secretion. Thyroxin caused accelerated and increased salivary secretion, but caused only small amounts of fluorescein to appear in the saliva. The results are held to show the difference in permeability between salivary gland cells and kidney cells, and to confirm the permeability promoting effect of the internal secretion of the thyroid.—*D. I. Hitchcock.*

3559. **PRAKASH, SATYA. Influence of temperature on the coagulation of sols and the problem of acclimatisation of animals.** *Allahabad Univ. Studies (Sci. Sect.)* 6(2): 79-92. 1930.—Because an increased temp. accentuates ageing of certain sols, both inorganic and organic, an explanation has been advanced for greater longevity of cold-blooded animals over warm-blooded animals of the same size. Since animal metabolism seems minimum when the outside temp. is 20°, people living in a country having an average outside temp. of 20° should have the maximum longevity.—*P. B. Powers.*

3560. **RUSSO, GIUSEPPE. Influenza degli aneletroliti sulla velocità dell'azione smorzatrice degli organi animali e vegetali. [Influence of non-electrolytes on velocity of buffer action of animal and plant tissues.]** *Boll. Soc. Ital. Biol. Sperim.* 5(6): 963-965. 1930.—Glucose and urea increased the velocity of the buffer action of animal and plant organs for pH values lower than neutrality, whereas they decreased it for pH values higher than neutrality.—*M. Comel.*

3561. **SPIEGEL-ADOLF, M., und K. F. POLLACZEK. Physikalisch-chemische Untersuchungen an bestrahlten Proteinen. VIII. Über Beziehungen der Lichtkoagulationsgeschwindigkeit von Eiweisslösungen zu deren Sterilität.** *Biochem. Zeitschr.* 214(1/3): 175-186. 1929.—Various protein solutions, some sterile, some inoculated with various bacteria, and some accidentally contaminated with common microörganisms, were irradiated with ultraviolet light from quartz Hg vapor lights. The time necessary for turbidity to develop at a given distance from the light source was determined. Sterile solutions soon coagulated. The infected ones coagulated after a much longer time, due to the accumulation of certain electrolytes which are products of bacterial metabolism; after electrodialysis these solutions had the short coagulation time of the sterile ones. The electrodialysis did not kill the organisms, for in 1-2 days the electrolytes elaborated in the purified solutions again delayed coagulation by ultraviolet light, and tests showed the presence of living bacteria.—*J. M. Ort.*

3562. **TIRELLI, M. Mutamento irreversibile nella viscosità delle uova di "Bombyx mori L." [Irreversible changes in viscosity of silkworm eggs.]** *Atti R. Accad. Naz. Lincei Rend. Cl. Sci. Fis. Mat. e Nat.* 11(1): 80-86. 1930.—Heating silk-worm eggs for 40 min. at 50°C. increased the viscosity of juice expressed from them, and altered their stratification. These changes were irreversible. After 2 mo. the viscosity of the juice from warmed eggs was still greater than that of the control. After hibernation and incubation, the warmed eggs all hatched, their silk-worms being normal. Thus an irreversible variation of a chemical-physical property of the egg may not impede embryonic development. In some cases it is held that such an irreversible change of a chemical-physical property in the egg may cause a somatic mutation by influencing the chromosomes.—*M. Tirelli.*

3563. ABDERHALDEN, EMIL, und FRITZ REICH. Fortgesetzte Studien über das Problem der spezifischen Einstellung der Polypeptide spaltenden Fermentkomplexe. *Fermentforsch.* 10(3): 319-329. 1929.—Glycyl-dl-leucyl-β-alanin, β-alanyl-glycyl-dl-leucin and β-alanyl-dl-leucyl-glycyl-dl-leucin were hydrolyzed with *N* NaOH; β-alanyl-dl-leucin was not. Erepsin had no action, trypsin-kinase hydrolyzed β-alanyl-dl-leucyl-glycyl-dl-leucin. β-iodpropionyl-glycyl-dl-leucin was not split by trypsin-kinase. Chloracetyl-dl-leucyl-β-alanin, $C_{11}H_{19}O_4N_2Cl$, was soluble in alcohol, insoluble in ether and petroleum ether, uncrystallizable from water, m. p. 124-126°C. Glycyl-dl-leucyl-β-alanin, $C_{11}H_{21}O_4N_3$, was slightly soluble in water, almost insoluble in alcohol, ethyl acetate, ether and chloroform, m. p. 160°C. β-alanyl-dl-leucin, $C_9H_{18}O_3N_2$, was moderately soluble in water and methyl alcohol and barely soluble in ethyl alcohol, m. p. 245-246°C. β-alanyl-glycyl-dl-leucin, $C_{11}H_{21}O_4N_3$, was soluble in water and alcohol and insoluble in ethyl acetate, ether and chloroform, and decomposed at 125°C. β-alanyl-dl-leucyl-glycyl-dl-leucin, $C_{17}H_{32}O_5N_4$, was amorphous and hygroscopic, soluble in water and alcohol, almost wholly insoluble in ethyl acetate, ether and chloroform, and decomposed at 130°C.—*F. Reich (transl. by G. G. De Bord).*

3564. ABDERHALDEN, EMIL, und EUGEN RIESZ. Vergleichende Untersuchungen über die Spaltbarkeit der CO-NH-Bindung in Polypeptiden und verwandten Verbindungen, deren NH_2- bzw. COOH-Gruppe mit verschiedenen Substituenten besetzt ist, durch verdünntes Alkali, Erepsin, und Trypsin-Kinase. *Fermentforsch.* 12 (2): 180-222. 1930.—Benzoylglycyl-aspartic acid, a substituted compound containing 2 acid groups, was readily hydrolyzed by normal alkali. Erepsin hydrolyzed *dl*-leucyl-*p*-aminobenzoic acid and *dl*-leucyl-taurine, which proved that the foreign grouping coupled with a protein constituent did not annul the action as far as the amino group of the latter was concerned. Polypeptide derivatives whose free COOH-group was combined with aromatic radicals containing COOH groups were not attacked by trypsin or trypsin-kinase as shown by the lack of reaction upon *dl*-leucyl-*p*-aminobenzoic acid, chloracetyl-*dl*-leucyl-*p*-aminobenzoic acid and *N*-*dl*-*α*-bromisocapronyl-glycyl-sulfamido-*m*-benzoic acid, 4-chlor-2-nitro-phenyl-sulfo-*dl*-leucyl-glycine, phenyl-*dl*-leucyl-glycine, dinitro-phenyl-*dl*-leucyl-glycine, and *dl*-leucyl-taurine. Alkali attacked several of these compounds. These data represent no new findings for the action of erepsin and trypsin but do indicate several important points concerning the action of alkali. The latter depends not only on the nature of the atom which effects the union of the substituent with the polypeptide but also its valence (difference between SO_2-NH and CO-NH linkage), the place of entrance of the substitute group in the polypeptide (amino or carboxyl group), the acidity or basicity of the substituting group (difference between phenyl-, dinitro-phenyl-leucyl-glycine, and nitrobenzoyl-leucyl-glycine), and polysubstitution (e.g., *n*-cresoltrisulfo derivative).—*E. McCoy.*

3565. ABDERHALDEN, EMIL, und ELLA von EHRENWALL. Beitrag zur Frage der Einheitlichkeit des Erepsins. *Fermentforsch.* 12(2): 223-230. 1930.—Erepsin-kinase attacked only those polypeptides which contained a free amino group; it may thus be called the amino-polypeptidase. It split chloracetyl-*dl*-leucine and chloracetyl-*d*-alanine but not chloracetyl-*l*-tyrosine. Trypsin preparations free of erepsin split chloracetyl-*l*-tyrosine but not chloracetyl-*d*-alanine. Chloracetyl-*dl*-leucine was hydrolyzed as well by erepsin as by tyrosine. Only when the trypsin solution used contained both trypsin and erepsin were all 3 halogenacyl compounds attacked.—*E. McCoy.*

3566. ABDERHALDEN, EMIL, und FRIEDRICH SCHWEITZER. Studien über die Abspaltung von Halogen durch verdünntes Alkali aus raumisomeren Halogenacylaminosäuren und deren Verhalten gegenüber Erepsin und Trypsin-Kinase. *Fermentforsch.* 12(2): 231-243. 1930.—By test of the racemic forms A and B of α-brom-propionyl-norvaline, α-brom-propionyl-leucine, and α-brom-isocapronyl-valine, and especially by the test of the behavior of optically active forms of the above mentioned racemic bodies, i.e., *d*-α-brom-propionyl-*d*-norvaline, *l*-α-brom-propionyl-*l*-norvaline, *d*-α-brom-propionyl-*l*-norvaline, and *l*-α-brom-propionyl-*d*-norvaline, evidence was obtained that the splitting off of a halogen under the influence of alkali was dependent upon the substituting group in the halogen acyl amino acid.—*E. McCoy.*

3567. ALWALL, NILS, und JORGEN LEHMANN. Berichtigung zur Frage der Herstellung einer fumarase-freien Succinodehydrogenase. *Skand. Arch. Physiol.* 61: 159. 1931.—Lehmann demonstrated that in Alwall's method the fumarase was not heat labile at 50° but that the enzyme left the muscle and passed into the wash water. A phosphate extract of such muscle was fumarase-free. Using the polarimetric determination of *l*-malic, which is synthesized by fumarase, the authors were not sure that the muscle was free of fumarase.—*R. C. Herrin.*

3569. CAILLET, O. R. Stability of esterase and ereptase in ground liver and kidney preserved in glycerol. *Proc. Soc. Exp. Biol. & Med.* 28(4): 357-358. 1931.—After 13 yrs. the esterase activity of the dog's liver extract was unimpaired, and the peptone-splitting activity reduced by ¼; ground dog's kidney had lost about ½ its original esterase and more than ½ its original protease activity.

3570. CLEMENTI, A., e D. TORRISI. Sull'assenza di asparagina tra i prodotti abiuretici della idrolisi enzimatica delle proteine. [Absence of asparagine among the abiuretic products of the enzymatic hydrolysis of proteins.] *Boll. Soc. Ital. Biol. Sperim.* 5(6): 956-958. 1930.—During digestion of the protein molecule aspartic acid was set free as such, not as asparagine. The latter is therefore not an intermediate product of the enzymatic degradation of proteins.—*M. Comel.*

3571. DELHOUGNE, FRANZ. Untersuchungen über den Fermentgehalt des Blutes. I. Methodisches. Die Fermentzahlen des Blutes beim gesunden Menschen. *Deutsches Arch. Klin. Med.* 165(3/4): 213-222. 1929.—The blood ferments in 20 normal human subjects were estimated. By the Jolles, permanganate and Bach and Zubkowa methods, the catalase values were reckoned in terms of the gm. H_2O_2 reduced by 1 cc. blood; they ranged from 10 to 16, showing from day to day certain variations, which under like conditions were not greater than 10%, but became extreme under pathologic conditions. The variations in the protease findings under physiologic conditions, on the other hand, were very great. The peroxidase value (reckoned in terms of the amount of guaiacol, expressed in 0.001 mgm., oxidized by 0.001 cc. blood in the presence of H_2O_2) in normal subjects ranged from 50 to 100; values many times these were found in sick persons. The esterase values (reckoned in terms of the amount of guaiacol, expressed in 0.001 mgm. split off from guaiacol ester by 0.001 cc. blood) in normal persons ranged from 50 to 120, but under pathologic conditions were many times greater. The ferment values in the blood showed marked increase under the influence of physical work.

3573. **GUALDI, ANTONIO.** Die Wirkungsweise tierischer Phosphatase in stereochemischer Beziehung. *Biochem. Zeitschr.* 205(4/6): 320-324. 1929.—The effect of phosphatases from livers and kidneys of rabbits upon the salts of *dl* borneol phosphoric acid, using cell-free extracts, was studied. Rabbit liver phosphatases split the salts asymmetrically, exactly as did the plant phosphatases. Also, the optical properties of the liberated borneol were the same as those obtained with fungus phosphatases; at first *l* borneol and later *d* borneol precipitated out. The behavior of kidney phosphatase was identical with that of liver phosphatase in its tendency to select certain optically active components. Here also the *l* borneol was first formed, then the *d* form.—*B. Kramer.*

3574. **KISCH, BRUNO.** Die Autokatalyse der Adrenalinoxydation. *Biochem. Zeitschr.* 220(1/3): 84-91. 1930.—The oxidation of adrenalin, as indicated by red coloration and promoted by light, rise in temp., and rise in pH of the solution, is autocatalytically hastened by a certain not yet exactly defined oxidation product (designated as omega) which acts in dilutions of 1: 10 billion, and in the dark and in weakly acid solutions (conditions under which normally oxidation of adrenalin is very slow) but not noticeably in the absence of O. Solutions of omega long exposed to O, light or heat lose activity. It is adsorbed on animal charcoal and eluted by alcohol. Omega did not increase blood pressure nor produce hyperglycemia in animals. Freshly prepared p-quinone solution in concentrations of 1: 1 billion oxidized adrenalin solutions.—*N. M. Payne.*

3575. **KISCH, BRUNO.** Die Omegakatalyse der Dioxyphenylalaninoxydation. *Biochem. Zeitschr.* 220(1/3): 92-96. 1 fig. 1930.—Spontaneous oxidation of dihydroxyphenylalanin was increased by rise in temp., increase of pH of the solution, and by light. Addition of omega catalyzed the dihydroxyphenylalanin oxidation even in the dark and in weakly acid solutions. Adrenalin, pyrocatechol, dopa (a proprietary derivative of dihydroxyphenylalanin), and oxidized pyrocatechol solution did not have the effect of omega. Under anaerobic conditions the dopa color reaction did not take place. Omega catalysis and light catalysis acted in synergy on the dopa color reaction. Omega solutions that were filtered through animal charcoal not only lost their positive catalytic reaction, but actually checked dopa oxidation. Addition of KCN (M/1000) did not inhibit the omega catalysis of dopa oxidation in an acid medium, and *p*-quinone in freshly prepared solutions of 1: 100 million accelerated it. Heating decreased the catalytic action of omega.—*N. M. Payne.*

3576. **MILLER, LAWRENCE P.** The effect of thiocyanates upon amylase activity. II. Salivary amylase. *Contr. Boyce Thompson Inst.* 3(2): 287-296. 6 fig. 1931.—The action of KSCN in affecting the hydrolysis of starch by dialyzed salivary amylase, as measured by viscosity changes, color with I, or by the reducing sugars formed, was to cause a shift toward the alkaline side of the optimum pH for the action of the enzyme; with high concentrations this shift might be as much as a whole pH unit. Potassium thiocyanate, therefore, might depress, or stimulate, or have no effect depending upon the pH at which the reaction takes place and upon the concentration of KSCN. At low pH values all concentrations depressed, at high pH values all concentrations stimulated, and at certain intermediate pH values KSCN might depress, stimulate, or have no effect, depending upon the concentration. At the pH of saliva and in the absence of NaCl small amounts of KSCN increased the activity of dialyzed saliva. In the presence of NaCl similar amounts of KSCN had no effect.—*L. P. Miller.*

3577. **OYA, TAKEO.** Über die Spaltung des Lecithins durch die Lecithase und Phosphatase des Präparates "Takadiastase." [XV in LUDWIG PINCUSSEN: Fermente und Licht.] *Biochem. Zeitschr* 215(4/6): 366-371. 1929.—The production of lecithase from lecithin by the action of takadiastase in 10 days darkness was found to be 72.4% of the theoretically possible lecithase content. In a 2nd experiment the action of the lecithase (measured by determination of cholin) and of the phosphatase (measured by determination of total P) of takadiastase at pH 6.6 were found to be parallel. At pH 6.6 phosphatase was much more seriously injured by ultraviolet light than lecithase. About $\frac{2}{3}$ of the lecithase present was inactivated by u.v. irradiation in 30 min.; about $\frac{2}{3}$ of the remainder was inactivated in the next 30 min. The action of the rays was therefore uniform during the observation period, following the law for a reaction of the first order.

3582. **BORGGRAEF, L. de.** Ions et excitabilité du coeur de grenouille. *Arch. Internat. Physiol.* 33(3): 300-324. 1931.—Ions normally present and influential in the perfusion liquid were replaced by others chemically related in Mendeleef's tables—Ca by Be, Mg, Sr and Ba; K by Li, Rb, or Cs; and Cl by F, Br and I. By measuring the excitability of hearts perfused with different liquids it was possible to recognize a certain analogy between the chemical properties of these different bodies and their influence on the properties of the cardiac

muscle: rhythm, amplitude of contractions and above all excitability. There also seems to be a relation, differing for anions and cations, between this last property and the atomic weight of the elements; excitability increases with increase of the atomic weight of the cations and diminishes as the atomic weight of the anions rises. These phenomena may be related to the electrolytic potential of the respective elements.—*Author's summary (transl.)*.

3583. **DRUCKER, CARL.** Messungen elektromotorischer Kräfte galvanischer Ketten mit wässerigen Elektrolyten. 234p. Verlag Chemie, G. m. b. H.: Berlin, 1929. Pr. 24 M.—This, the 2nd supplement to an earlier book by the same title, is a reference book of E.M.F. values for all the elements whose electrode potentials have been measured. Part I is an exhaustive bibliography of the period between 1914 and the end of 1917, giving for each citation the particular chain measured. Part II gives the results appearing within this period which have been selected as the most trustworthy. Part III lists the accepted values for the normal potentials of the various electrode processes, indicating those values which have been determined for the first time or which have been changed as the result of better work.—*J. M. Ort.*

Influenza del volume e del grado di smorzamento di una soluzione sul potere smorzatore di un'altra.** [Action of the amount and intensity of buffer power of a solution on the buffer power of other solutions.] *Boll. Soc. Ital. Biol. Sperim.* 5(5): 759-762. 1930.—The buffer power of a solution of phosphates increased when amount and buffer activity of a solution mixed with it were greater.—*M. Comel.*

3587. **WHITEHEAD, R. W. Responses of excised intestines to alterations of electrolyte concentrations (Na, Ca, K).** *Amer. Jour. Physiol.* 89(2): 253-265. 1929.—Segments about 2 cm. long were taken from the ileum or jejunum of freshly killed rabbits and suspended, as in the ordinary Magnus method, from a light muscle lever, in aerated, physiological solution kept at 38° C. ±0.5°. Fractional deprivation and addition of the 3 important cations in Locke solution, carried out singly and simultaneously, show that: Na increases the amplitude, but has little effect on the tone or rate of contractions; Ca increases the tone and rate of contractions and decreases the amplitude; K in concentrations below normal has effects like Na, and antagonistic to Ca; above the normal concentration it increases the tone and decreases amplitude, synergistic with Ca, while tending to induce periodicity. K deprivation inhibits with a subsequent tendency to spasticity when this ion is added. The effects following simultaneous alteration of cation concentration, in which only the amount of the ions was changed, seem not to have been extensively investigated for mammalian intestinal smooth muscle. The results show that the concentration as well as the ratio of ions must be considered important in maintaining normal functional activity. The changes which appear in the form of periodic contractions, especially with deprivation of Ca, K or both, may be confusing if these are not recognized as qualitative. The author doubts whether these qualitative alterations have so far been sufficiently emphasized. Complete deprivation of Ca has the most pronounced effect in inducing periodicity, K deprivation as well as complete removal of Ca and K results in the appearance of these irregularities less promptly, while removal of Na causes no such response.

3589. **BLACHER, L. J., und W. N. SAMARAJEW. Die Organisationszentren der Hydra fusca L. als Quelle mitogenetischer Ausstrahlungen.** *Biol. Zentralbl.* 50(10): 624-633. 1930.—Cultures of the yeast, *Nadsonia fulvescens*, were used as detector, increased budding being taken as evidence of mitogenetic rays. Emulsions of whole hydras, and the hypostomeal region and of the budding zone, emitted rays, but those of the foot, and of the body region intermediate between the hypostome and the budding zone, did not. Emulsions of regenerating anterior and posterior halves showed no increase of radiation over normal, probably because regeneration takes place without cell division in hydroids. A living hydra in a narrow glass tube emitted rays from its hypostomeal end but not from its foot end. The addition of dilute KCN to an emulsion destroyed radiation, which suggests that the rays originate in an oxidation. Radiation is a property of those regions of hydra which, when transplanted, are known to act as centers of organization. It is presumably a result of the higher rate of oxidation of these centers.—*F. Gilchrist.*

3590. **BLOOMFIELD, J. J., JAMES E. IVES, and ROLLO H. BRITTEN. Effect of radiant energy on the skin temperatures of a group of steel workers.** [*U. S.*] *Public Health Repts.* 45(18): 997-1009. 2 fig. 1930.—This is a part of a study of the influence of environmental conditions on the incidence of respiratory diseases among steel workers, with especial reference to pneumonia. It deals largely with the results obtained by the use of 2 thermoelectric instruments, one type used for the measurement of skin temp. of workers exposed to radiant heat, and the other used for the measurement of radiant heat. Intense sources of radiant energy had a pronounced effect on the skin temp. of workers exposed to them; the forehead and cheeks showed the greatest increase. Great differences in the skin temp. of different parts of the body, for a single individual, were found in workers exposed to radiant energy. Even under relatively cold atmospheric conditions, not far above the freezing point, high skin temp. were encountered in workers exposed to radiant energy. For workers not exposed to radiant energy there was a definite relation be-

tween atmospheric conditions and skin temp., both for arduous and for moderate work; the skin temp. increasing with increase of effective temp.—*J. J. Bloomfield.*

Species that can withstand desiccation can withstand the greatest range of temp.

3592. **CASTALDI, LUIGI. Ulteriori studi sulle radiazioni "mitogenetiche." Nota I. Bibliografia sulle radiazioni "mitogenetiche."** Pubbl. Staz. Biol. San Bartolomeo (Cagliari). nr. 25. p. 1-12. 1931.

3593. **CREMONESE, GUIDO (preface by GIOVANNI GIORGI). Iraggi della vita fotografati. [Rays of life photographed.]** 79p. 9 pl. Paolo Cremonese: Roma, 1930. Pr. L. 12.50.—This work deals with radiations of varying frequency and wavelength emitted by living organisms. Photographic evidence is given in appended plates. Besides the radiations already discovered by Gurwitsch, plant organisms emit radiations which penetrate the black paper wrapper of photographic plates and produce an impression but do not penetrate metal nor cellophane. They do traverse glass, which gives evidence that they are not identical with the Gurwitsch rays but have a greater penetration and shorter wavelength. The radiations emitted by saliva, blood and the human body, however, penetrate glass and black paper, producing a faint impression on the photographic plate. If, however, a small metallic disc 0.1 mm. thick be placed on the sensitive side of the plate there is produced a very dark black area under the metal as contrasted with the gray color beyond the metal produced by the rays passing through the black paper alone. This leads to the hypothesis that this intense blackening under the metal results from secondary radiations of very short wavelength set up by the rays from the saliva and blood.—*G. Cremonese (transl. by A. Canzanelli).*

3594. **GLASER, OTTO. Temperature and heart-rate in Fundulus embryos.** *British Jour. Exp. Biol.* 6(4): 325-339. 5 fig. 1929.—On the 4th day after fertilization, cardiac rhythm in *Fundulus* embryos is, in all probability, myogenic. Between 5° and 25° C., one of 2 temperature characteristics prevails and fluctuates either about $\mu = 16{,}300$ or 14,300. On the 12th day, embryos, presumably neurogenic, disclose prevailing increments of 20,900 or occasionally of 18,200. A definite critical region is localised about 20° where the prevailing increments break to the orders 16,000, 14,000 or 12,000. Over the corresponding range embryos about to escape from the egg-case exhibit, in the only 2 instances recorded, μ 23,000, 20,900 and 16,300. On presumable restoration of myogenic conditions in embryos of the 12th day, μ may be 14,300 over the entire range. The frequency of μ 14,300 is greater than in normal larvae of the same age, whereas μ 20,900 is restricted to the lower temp. In their bearing on the differences between myogenic and neurogenic rhythms, these results become explicable if we imagine an underlying mechanism identical for both cases. The same increments either occur or suggest themselves at all stages of development, or, if at times some appear to be distinctive of neurogenic *Fundulus*, these can be promptly duplicated from the list of increments shown by myogenic *Limulus*, e.g., 20,900. Clearly, however, the most frequent characteristics found belong to categories exposed by a great variety of biological acts, and their association in cardiac rhythms is common. These facts harmonise well with the recent work on the metabolism of muscle and nerve.—*Author's summary.*

3598. **HUTCHINSON, A. H., and M. R. ASHTON. Specific effect of monochromatic light upon plasmolysis in Paramecium.** *Canadian Jour. Res.* 4(6): 614-623. 1931.—*Paramecium caudatum* was irradiated in a quartz cell at room temp. with a Cooper-Hewitt "Lab-arc" for 6 and 24 hrs. and the rate of plasmolysis in NaCl and sucrose solutions then determined. The organisms passed through the same series of reactions in both solutions but plasmolysis occurred much more rapidly in NaCl than in sucrose solutions, even when the latter were of greater concentration. Apparently the effect of light is to increase the rate of plasmolysis under all circumstances. In general there is a marked similarity between the curves showing the increase in rate of plasmolysis and those showing the effect of irradiation on the growth rate of paramecium. In most cases visible and near ultra-violet light caused an increase in the rate of plasmolysis of less magnitude than that caused by the far ultra-violet. All visible and near u.-v. lines used, except 4960 Å, 4078 Å and 3022 Å, caused stimulation of division rate and these lines had the least effect on the rate of plasmolysis. The single green spectral line ($\lambda = 4960$ Å) retarded growth and also caused a decided increase in plasymolysis. The lines 4078 Å and 3022 Å both caused slight decrease in division rate and slight increase in rate of plasmolysis. Apparently, with few exceptions, the effect of monochromatic lines of the spectrum in increasing the rate of plasmolysis is greater the shorter the wavelength. In many cases injury produced rapid increase and stimulation of growth. It would seem that when light energy is absorbed, the physiological condition of the plasma membrane changes. Apparently the conditions accompanying moderate increase in rate of plasmolysis also accompany increase in the rate of cell division in paramecium, and the conditions accompanying excessive increase in rate of plasmolysis result in decrease of growth.—*Authors' abstract.*

3599. **KLUGH, A. BROOKER. The effect of the ultra-violet component of sunlight on certain aquatic organisms. III.** *Canadian Jour. Res.* 4(5): 483-486. 1931.—The animals were placed in 3 quartz tubes in a 3-compartment box, each compartment receiving only the light which passed through the filter in the front of the compartment. The animals in the 1st compartment received only visible radiation, those in the 2nd compartment received both visible and ultra-violet radiation, and those in the 3rd compartment received only u.-v. radiation and a little of the extreme violet. Young starfishes, *Asterias vulgaris*, were found not to be affected by u.-v. radiation. The nudibranch, *Eolis gymnota*, which occurs at depths from 7 to 10 metres, proved sensitive to ultra-violet. The little thin-shelled mollusc, *Yoldia sapotilla*, was affected injuriously by u.-v., while the amphipod *Hyperia galba*, which lives in the cavity of the jellyfish, *Aurelia aurita flavidula*, proved to be resistant to u.-v. radiation.—*Author's abstract.*

(See also in this issue Entries 3272, 3593, 3630, 3657, 3942, 4025, 4103, 4192, 4193, 5324)

3607. **BUCKY, GUSTAV** (with contrib. by **OTTO GLASSER and OLGA BECKER-MANHEIMER.** Transl. by **WALTER JAMES HIGHMAN**). Grenz ray therapy. xii+170p. Macmillan Co.: New York, 1929. Pr. 15 s. net.—The author describes his experiences with the therapeutic use of oversoft x-rays of an average wavelength between 1 and 3 Å. Since clinical and biological effects of these rays have been observed which resemble those of x-rays as well as those of ultraviolet radiation, Bucky called this range of wave-lengths "Grenz" rays or boundary rays. After a short historical note on the therapeutic use of soft x-rays and a presentation of the guiding principles, there follows an extensive chapter on the physical foundations of Grenz ray therapy in which Glasser presents a discussion of the production of Grenz rays, their spectral distribution, and the practical methods of determining their quality and quantity for practical use. Bucky then continues with a chapter on anatomical and biological considerations in Grenz ray therapy in which he discusses the actual amount of radiation absorbed in the skin and its effect on diseased tissue. A special chapter is devoted to the technique of Grenz ray therapy in which apparatus, technique of application, etc., are gone into thoroughly. A detailed discussion of superficial and internal diseases which are favorably influenced by Grenz rays is given. There is a chapter on the leucocyte drop after application of Grenz rays and a discussion of the dangers of Grenz rays. A bibliography is given.—*O. Glasser.*

3608. **GATENBY, J. BRONTË, R. N. MUKERJI, and SYLVIA B. WIGODER.** The effect of x-radiation on the spermatogenesis of Abraxas grossulariata. *Proc. Roy. Soc. [London] B* 105(739): 446-469. 5 pl. 1929.—Larvae of *Callimorpha jacoboe* were killed at their last instar, 3 days after x-radiation, with a dose corresponding to about 12 times the human erythema dose (85 KV, 4 MA, no filter, 23 cm. focal skin distance). A dose 4½ times the erythema dose hastened pupation of the larvae of *Callimorpha*. The same effect was also observed on *A. grossulariata* after the application of a similar dose. Pupation and emergence were normal after the application of 2½ erythema doses. In parasitised *Pieris brassicae* caterpillars, x-radiation caused the larvae of *Apanteles glomeratus* to come out of the caterpillars, often while the radiation was in progress. After a detailed discussion of the normal spermatogenesis of *Abraxas* the authors present a study of the cytological effects which take place after x-radiation. Five hrs. after radiation most of the spermatocytes in the growth stage in the testis of *Abraxas* were killed. Spermatogonia and spermatids were not so sensitive. It was not possible to show that the mitotic prophase is exceptionally radiosensitive. In many spermatocytes the Golgi bodies form abortive acroblasts which are ultimately absorbed. No clogged chromosomes or abnormal amphiastral figures were discovered.—*O. Glasser.*

3609. **GLOCKER, R., E. HAYER, und O. JÜNGLING.** Über die biologische Wirkung verschiedener Röntgenstrahlenqualitäten bei Dosierung in R-Einheiten. *Strahlentherapie* 32(1): 1-38. 20 fig. 1929.—The biological effectiveness of measured doses of 2 qualities of x-rays (80 KV. fiber filter, and 180 KV. 0.7 mm. Cu filter) differ slightly. The softer rays are about 15% more energetic in producing an erythema and in retarding the growth of bean seedlings, when the dose is small. After larger doses the effects are alike for both qualities. The course of the erythema in the same patient is the same for both hard and soft rays.—*C. Packard.*

3610. **KOIDSUMI, KIYOAKI.** Quantitative studies on the lethal action of x-rays upon certain insects. *Jour. Soc. Trop. Agric.* 2(3): 243-263. 1930.—*Dacus cucurbitae* Coq. and *D. dorsalis* Hendel which damage various kinds of fruits and vegetables in Formosa can be killed by certain doses of x-rays in any stages of their life cycle. The resistance of the animals to x-rays increases as development proceeds from egg to full grown larva; falls rapidly after the beginning of pupation resistance; and increases until the emergence of the adult. The law of Bunsen-Roscoe dealing with photochemical change is applicable within the limits investigated for the lethal action of rays on these insects. When it is constant, the rate of death is the same for every lot investigated. The percentage of animals dying, in relation to the x-ray dosage, is expressed by the formula

$N=N_0e^{kx}$ where N represents the number of animals killed by x-rays, N_0 the number of control animals dying, X the x-ray dose, and e the base of Napierian logarithms. Data presented by Hussey, Thompson and Calhoun showing the prolongation of prepupal period of *Drosophila* caused by x-rays is represented by the analogous formula $D=D_0e^{kx}$ in which D means the length of the prepupal period of the animal after being x-rayed, and D_0 the duration of the period of normal insect. These formulae are analogous forms with the radiochemically inactivation formula of several biological enzymes $Q=Q_0e^{-kw}$ from which it is assumed that change in the activity of protoplasmic enzymes is a physiological process underlying radiobiological phenomena. Radiobiological phenomena as well as radiobiochemical phenomena are subject to the general photochemical reaction, and they are represented by the Weber-Fechner's psychophysical law or by its extension.—*Author's summary.*

3611. **MUNK, FRITZ, und MAX FLOCKENHAUS.** Über die Ruheströme der menschlichen Haut. *Zeitschr. Ges. Exp. Med.* 61(3/4): 363-389. 8 fig. 1928.—By placing unpolarizable electrodes at different places on the human body, according to the method of Tarchanoff, the authors have measured the distribution of potential difference between the different positions of the electrodes. Two galvanometers were used, a mirror galvanometer and a recording string galvanometer. The potential difference between the forehead and different parts of the body was measured for about 50 normal persons and the general distribution determined, the highest values being obtained for measurements between the forehead and either the palm of the hand or the sole of the foot. Measurements were taken on 10 subjects with various nervous diseases which show neither an appreciable deviation from the normal potential distribution or from the usual zero potential between symmetrical points on the body. The potential distribution is shown to persist several hours after death. Excessive cooling of some local part of the body sufficient to cause sneezing and shivering produces considerable variation in the potential distribution. The authors conclude that the body processes involved in the acquiring of a cold are closely connected with those which determine the potential distribution.—*Allan Hemmingway.*

3612. **NORRIS, ROBERT J.** The increased bactericidal effect of inorganic compounds in the presence of X-rays. *Bull. Basic Sci. Res. [Univ. Cincinnati] Ser. 4* 3(1): 21-36. 10 fig. 1931.—When bacteria are irradiated in solutions containing NaBr, NaCl, NaI, $BaCl_2$, $HgCl_2$, uranium nitrate, caesium iodide, or thorium nitrate, the resulting lethal action is very much greater than that obtained by exposing the bacteria successively to x-rays and to the salts previously irradiated with x-rays, and is a true synergistic action. This action has previously been ascribed to ultra-violet fluorescence, or to emission of photoelectrons. These experiments indicate that the synergistic action in the case of the above salts is not due primarily to these factors, and that the synergistic action is independent of permanent chemical decomposition. In the case of thorium salts, the resulting action is greatest at the critical voltage for the ejection of the K electrons while theoretically the speed of the emitted K electrons is at a minimum at this voltage; at a higher voltage, at which the K electrons are emitted at much greater speed, the action is much less. A tentative explanation is based upon the theory that the toxicity of the ion is related to its ionic potential or state of ionization.—*Author's summary.*

3613. **PACKARD, CHARLES, and C. C. LAURITSEN.** The biological effect of high voltage X-rays. *Science* 73(1890): 321-322. 1931.—In studies to determine whether equal doses of x-rays of different wave length have the same biological effect, doses equal in r units (measured by air ionization) were delivered to eggs of *Drosophila* (this being a remarkably uniform material). Beams of hard (0.20Å), medium (0.50 Å), and soft (0.70 Å) rays, delivered at constant potential (50-180 KV.), gave asymmetrical sigmoid mortality curves. Quality of the beam had no effect; intensity was the deciding factor, and it was possible to determine how many r units were required to kill any % of eggs in a sample. Using a tube which operates at 550 KV., the rays filtered through 6 mm. of steel (effective wave length 0.04 Å), doses of 120, 180, and 240 r units were given; these yielded killing percentages agreeing well with the theoretical, computed from the ordinary (0.2-0.7 Å) x-rays. The identity of effect per r unit, of rays of 0.04-0.7 Å, was further demonstrated on mouse tumor.

3614. **RUSS, SIDNEY.** The effect of x-rays on hair. *Nature [London]* 127(3215): 894. 1 fig. 1931.—A photograph is given of a black rat of which the hair fell out at the points exposed to x-rays in the region of about 150 kilovolts and was replaced by thinner, slightly curly white hair.

3615. **[SCHECHTMANN, J. L.]** ШЕХТМАН, Я. Л. Об абсолютных измерениях международной единицы интенсивности рентгеновых лучей "r." [The absolute value of r, the international unit of x-ray intensity.] Известия Академии Наук СССР. Отделение Физико-Математических Наук (*Bull. Acad. Sci. URSS. Cl. Sci. Phys.-Math.*) 1930(2): 125-135. 13 fig. 1930.

3616. **TSEBRIKOW.** Sur la modification de la perméabilité des tissus vivants sous l'action des rayons de Roentgen. *Arch. Internat. Méd. Exp.* 3(1): 185-199. 1927.—The conductivity of living tissues can be expressed by the following equations:

$$Z=\left(R^2+\frac{2Rr+r^2}{1+4\pi^2r^2\cdot C_1^2v^2(1-\alpha)}\right)^{\frac{1}{2}}$$

$$Z=\left(R^2+\frac{2Rr+r^2}{1+(r/\rho)^2v^2(1-\alpha)}\right)^{\frac{1}{2}}$$

and the resistance to polarization of a membrane is expressed by the equation:

$$R_p=-(j)\ \frac{\rho}{v^{(1-\alpha)}}$$

where Z is the resistance in ohms of a cc. cube of tissue measured at a frequency v, expressed in periods a sec., R_p is the specific polarization resistance expressed in ohms per cc. at a frequency v, R is a constant (specific resistance in ohms of 1 cc. of tissue), r is a constant (resistance in ohms of membranes and intracellular spaces of a tissue), C is a constant (electrical capacity in farads of 1 cc. tissue at a frequency of 1 period per sec.), ρ is a constant (polarization resistance of 1 cc. of tissue at a frequency of 1 period per sec.), α is the numerical coefficient expressing decrease in electrical capacity as a function of frequency,

$$\rho=\frac{1}{2\pi C_1}\quad\text{and}\quad C_v=C_1v^{-\alpha}.$$

The constant R characterizes the physico-chemical state of the protoplasm. The constants r, c, or ρ and α characterize the physiological state of the membrane. R, r and ρ of both normal irradiated mice, normal non-irradiated mice, irradiated mouse cancer and non-irradiated cancer were determined. X-ray dosage varied from irradiation 100 to 200 KV and filter of 0.1 mm. Cu—1 mm. Al to filter of 2 mm. Cu—1 mm. Al. Irradiation decreased the electrical resistance of all tissues, but decreased the resistance of cancer to a greater extent than it did healthy tissue. Constants of resistance of cancer are smaller than of normal tissue. Difference between effects of hard and soft rays was greater than between effects where length of dosage of the same wave length ray varied.

3617. **CANNAN, ROBERT KEITH. Echinochrome.** *Biochem. Jour.* 21(1): 184-189. 1927.—Echinochrome can be isolated from eggs and perivisceral fluid of *Arbacia punctulata*. It does not form a dissociable compound with O, but is the oxidant of an oxidation-reduction system. Electrode potentials have been measured over a range of pH 2.2-9.76. Normal electrode potential is +0.1995. If echinochrome has any respiratory function, it is an activator rather than a carrier of O. From the electrode equation $E_h = E_o' - 0.03006 \log [S_r]/[S_o]$ at reduction intensities of less than r_H 7, it would appear that enough reduced pigment is present to be important in cell oxidations, even though the quantity is analytically insignificant.—*N. M. Payne.*

3618. **CHAMBERS, R., B. COHEN, and C. POLLACK. Intracellular oxidation-reduction studies. III. Permeability of echinoderm ova to indicators.** *Jour. Exp. Biol.* 8(1): 1-8. 1931.—Living echinoderm larvae were immersed in sea-water solutions of indicators and the penetration of a number of dyes into the interior of the cell investigated. Under aerobic conditions all the penetrating dyes, including methylene blue, can be completely reduced within the ova. Ultimately, through progressive intracellular accumulation of the oxidant, the dyes all impart a visible coloration to the cytoplasm. Eggs immersed in the penetrating indicators eventually die without undergoing segmentation. The eggs immersed in solutions of all but one of the non-penetrating indicators developed into swimming larvae. Upon cytolysis the increased permeability of the disintegrated remains of the egg permits the washing out of the contained indicator. The agent or agents responsible for the reducing activity of protoplasm apparently escapes from the cytolysed cell debris into the surrounding medium in which it may still exert its reducing action.—*J. M. Robson.*

3619. **CONANT, JAMES B., and CARL O. TONGBERG. The α-oxidation of acetaldehyde and the mechanism of the oxidation of lactic acid.** *Jour. Biol. Chem.* 88(3): 701-708. 1930.—The oxidation of lactic acid by ceric sulphate yields acetaldehyde which is further oxidized to formic acid through an intermediate which may be glycolic aldehyde. Equations are given showing how glycolic aldehyde may be formed in the biological oxidation of lactic acid.—*F. Bernheim.*

3620. **DIXON, MALCOLM, and KENNETH ALLAN CALDWELL ELLIOTT. The effect of cyanide on the respiration of animal tissues.** *Biochem. Jour.* 23(4): 812-830. 1929.—A study has been made of the effect of various concentrations of cyanide on the rates of respiration of a number of animal tissues. In most cases a cyanide concentration of $M/1000$ is sufficient to produce maximum inhibition. No greater inhibition is produced by increasing the cyanide concentration 100 times. Maximum inhibition varies in different tissues between 40% and 90%, the average value being about 60%. It is concluded that the respiration of animal tissues is of 2 sorts. One, accounting for about $\frac{2}{3}$ of the total, is due to systems poisoned by cyanide; the other $\frac{1}{3}$ is due to systems which resist cyanide. Warburg's "respiratory enzyme" (Keilin's cytochrome-indophenol-oxidase system) can therefore only account at most for about $\frac{2}{3}$ of the total respiration of animal tissues. The respiration of spleen, unlike that of all the other tissues tested, is not affected by small amounts ($M/1000$) of cyanide. It appears to contain some substance with a greater affinity for cyanide than the "respiratory enzyme." Negelein's statement that the respiration of yeast is almost completely inhibited by cyanide is confirmed. Some samples of yeast, however, show an incomplete (85%) inhibition. The effect of pyrophosphate on the respiration rates of liver, muscle and yeast has also been studied. With liver, small concentrations produce a slight acceleration, but larger amounts produce inhibitions which vary between 30% and 70% but are always considerably less than the corresponding cyanide inhibitions. With muscle pyrophosphate produces a greater inhibition than cyanide Pyrophosphate produces no effect on yeast. Possibly the cell-membranes are not permeable to it. Since the "respiratory enzyme" is not inhibited by pyrophosphate, the inhibition of respiration must be due to its action on some other system. It is shown that pyrophosphate inhibits the reduction of methylene blue by the succinoxidase system, though this reaction is unaffected by cyanide. The actions of both cyanide and pyrophosphate on respiration are reversible.—*Authors' summary.*

3622. **PREISLER, PAUL W. Kinetics of the reduction of cystine and related dithio (R-S-S-R) acids by reversible oxidation-reduction systems.** *Jour. Biol. Chem.* 87(3): 767-784. 1930.—Dithio (R-S-S-R) acids were reduced by reversible oxidation-reduction systems of high reducing intensity and reaction rates were obtained which resembled approximately those of 2nd order reactions. These results serve as a criterion for the exclusion of certain reduction reactions as the predominating mechanisms. The reduction rates differed for the various acids studied and seemed to depend on the position and nature of the groups attached to the -S-S- linkage, the rates being higher in those cases in which the -COOH or a $-NH_2$ group was adjacent to the -S-S- linkage. The reduction rates decreased as the acidity was increased. Temperature coefficients calculated for certain of the reactions were rather unusual and certain unexpected results were obtained for the effect on the reaction rates of the potential of the reversible reagent employed for the reduction; the rate of reduction was not affected by an alteration of the potential of the reagent employed when the oxidant-reductant ratio was changed, but the use of another system of different E_o value did alter the rate of the reduction. The results led to certain conclusions regarding the possible nature of the apparent reversibility of the change R-S-S-R to R-S-H and a comparison of this system to other oxidation and reduction systems has been presented to assist in classifying this reaction.—*Author's summary.*

3623. **REY-PAILHADE, J. de. Le philothéion, diastase d'hydrogénation.** *Compt. Rend. Soc. Biol.* 99(35): 1700-1702. 1928.—Phylotheion is a proteinic compound containing a chain of S H which enables it to play the rôle of hydrogenating enzyme. 2 R-SH (phylotheion) + O = H_2O + R-S-S-R (phylotheion). The author takes hen's egg albumin, diluted twice with water as a source of phylotheion. When mixed with sulphur and warmed to 40°C., H_2S is given off: 2 R-S-H + S = H_2S + R-S-S-R. This reaction is inhibited when the egg albumin has been previously heated to 80°C. Phylotheion is fixed in the cell and there it is oxidized and reduced reversibly. The author suggests that the sugar molecule may be responsible for the regeneration of phylotheion.—*E. S. G. Barron.*

3637. **CUNY, LOUIS.** Le dosage des sels biliaires dans la bile et le liquide duodénal. 199p. Masson et Cie: Paris, 1927. Pr. 30 fr.—The book is for the most part a review of the literature on the methods of determining bile salts. Part I considers (1) Chemistry of bile acids, (2) Composition of bile and duodenal liquid, (3) Methods of isolation of bile constituents. Part II classifies the methods of bile, etc., analysis under heads of (1) Gravimetric, (2) Surface tension, (3) Alkaline hydrolysis, (4) Colorimetric methods, (5) Determination of sulfur, (6) Acidometric and polarimetric methods. Considerable emphasis has been put upon alkaline hydrolysis, wherein the N is checked by 3 methods. The colorimetric method was carefully studied to provide a simple, rapid method for hospital work. Each series of methods is preceded by general information of the reactions employed. Appendix contains a complete bibliography, calculating tables for gasometric work, and a table of the author's results of analysis of bile.—*J. E. Andes.*

3638. **ELVEHJEM, C. A.** A note on the determination of iron in milk and other biological materials. *Jour. Biol. Chem.* 86(2): 463-467. 1930.—A further revision of Elvehjem and Hart's modification of the thiocyanate method is described, applicable to milk and to other material rich in P. This method eliminates the difficulties encountered due to the formation of pyrophosphate during the ignition of milk samples.

3640. **FLORKIN, MARCEL.** Studies in the physical chemistry of the proteins. 7. The solubility of fibrinogen in concentrated salt solution. *Jour. Biol. Chem.* 87(3): 629-649. 1930.—Fibrinogen is readily transformed, even at room temp. and at neutral reactions, to substances which are no longer precipitated by half saturation with NaCl. Conditions of acidity and of temp. have been determined, however, under which fibrinogen may be sufficiently purified of other proteins and of its own de-

naturation products to yield a chemical individual of constant and reproducible solubility. The solubility of fibrinogen in concentrated salt solutions is defined by the equation $\log S = \beta - Ks\mu$. The values of β and of the salting out constant, Ks, have been determined at 25° for NaCl at pH 5.8, $(NH_4)_2SO_4$ at pH 6.0 and 6.6, and for potassium phosphate at pH 6.6. The results that have been obtained with $(NH_4)_2SO_4$ at pH 6.0 and 6.6 are consistent with the postulate that Ks is a constant for a given protein and salt, independent, over wide ranges, of temp. and pH. The amphoteric properties of the protein are reflected by the values of β. The variation of β from 2.81 at pH 6.6 to 2.51 at pH 6.0 suggests that fibrinogen has an acid isoelectric point. A comparative study of the solubility of the different blood proteins in concentrated solutions of the same salt, $(NH_4)_2SO_4$, shows that, of all of them, fibrinogen has the highest value of Ks. This study is thus a further contribution towards the description of the "salting out" of the blood proteins by neutral salts, in terms of physicochemical constants.—*Author's summary.*

3641. **GERLACH, WALTHER, und WERNER GERLACH. Bleinachweis im organischen Gewebe.** *Naturwissenschaften* 19(5): 111. 1931.—Note. The micro method described by Gerlach and Schweitzer (Zeitschr. Anorg. u. Allgemein. Chem. 195: 1931.) is applicable to organic material and has been used to detect Pb poisoning.

3642. **GETTLER, ALEXANDER O., and HYMAN BLUME. Chloroform in the brain, lungs and liver. Quantitative recovery and determination.** *Arch. Path.* 11(4): 554-550. 2 fig. 1931.—When chloroform-containing distillate is treated with pyridine and NaOH and heated in the water bath for 1 min., a pink color develops, which is read against similarly treated standard chloroform solutions. The use of permanent colored glass standards for the colorimetric work is described. Experiments showed that after death the chloroform content of the tissues decreases daily. After 42 days, only 18% of the original amount present is recoverable. The chloroform content of the brain, lungs and liver in 7 cases of death due to excessive administration of chloroform, was: brain, 372-480 mgm.; lungs, 355-485 mgm.; liver, 190-275 mgm., in 1,000 gm. The chloroform content of the brain, lungs and liver of 9 patients after chloroform anesthesia, given in preparation for surgical operation, was: brain, 120-182 mgm.; lungs, 92-145 mgm.; liver, 65-88 mgm. in 1,000 gm.—*Authors' summary.*

3643. **GILMAN, ALFRED, and GEORGE R. COWGILL. The determination of peptic activity: an examination and application of the Gates method of proteolytic enzyme titration.** *Jour. Biol. Chem.* 88(3): 743-752. 1930.—The Gates method involves the digestion of the gelatin layer on a photographic film. Proteolytic activity is estimated by the difference in light intensity through the film before and after digestion. Films are exposed to x-rays at 25,000 volts, and 10 milliamperes for 2 min. at a 2 ft. distance. They are developed and fixed in plain sodium thiosulphate, and digested at 25° C. at pH 2, as regulated by Sørensen's glycine-NaCl-HCl buffer. The light penetrating is measured by a Klett or Duboscq colorimeter. Armour's pepsin, 1:10,000 is used as a standard at varying dilutions of a similar pH as the film solution. Normal gastric juice gives optimal results in 10 minutes and 0.5 cc. per sample is adequate.—*H. L. Keil.*

3644. **GOIFFON, R. Défécation au permanganate pour le dosage du calcium dans les selles.** *Compt. Rend. Soc. Biol.* 106(9): 723-724. 1931.—The new method described for determining fecal Ca insures quick filtration and produces no disagreeable odor. The results compare well with those obtained by ashing. It is possible to test the clear filtrate obtained for other mineral elements.—*E. Weiner.*

3645. **GREENWALD, ISIDOR, and IRVING LEVY. The preparation of lipoid-free serum. Apparatus for extraction at low temperatures.** *Jour. Biol. Chem.* 87 (2): 281-287. 2 pl. 1930.—Description of apparatus for the continuous extraction at low temp. of solids or of liquids with solvents both heavier and lighter than the material to be extracted. The essential feature is a provision by which the condensed solvent is cooled, in ice, in solid CO_2, or in other cooling material, before coming in contact with the material to be extracted. Denaturation of the protein can thus be greatly reduced or prevented entirely. Using ethyl or methyl alcohol followed by ether in one type of apparatus or N-amyl alcohol, isoamyl alcohol or diethylcarbinol in the other, it was found possible to reduce the lipoid P content of 2 samples of serum from 5.0 mgm. per 100 cc. to 0.5 mgm. per 100 cc., the cholesterol from an initial value of 83 mgm. to 2-7 mgm., and the fatty acids from 73 to 4-40 mgm. (one sample) and from 178 mgm. to 2.4 mgm. (another sample). The preparations with alcohol and ether were completely soluble in water. The amyl alcohols produced considerable coagulation but not enough to affect appreciably the pneumococcus antibody content of the serum.—*I. Greenwald.*

Soc.* 53(3): 1037-1039. 1931.—The Ter Meulen and the Heslinga methods have proven highly valuable; both methods employ much less material than the customary macro methods, without requiring the special equipment or unusual technique of the micro methods in general use.

3647. **GUILLAUMIN, CH. O., R. WAHL, et Mlle. M. L. LAURENCIN. Sur le dosage des albumines seriques. Comparaison de quelques resultats obtenus par pesee, par azotometrie et par refractometrie.** *Bull. Soc. Chim. Biol.* 11: 387-399. 1929.—The conditions of separation of various serum albumin fractions were determined by a micro-method after Howe. Compared with the gravimetric method, the determinations have a rapid, uniform technic, yielding about the same result (a little better). With Reiss' tables for reference, refractometry produces considerable error. Other methods of serum albumin measurement are necessary, particularly for large and small molecular groups.—*R. H. M'Gonigle.*

3648. **HAENDEL, MARCELO. La dosificación del ácido glucorônico en la orina y en la sangre. Un nuevo procedimiento. [Determination of glucuronic acid in blood and urine.]** *Rev. Assoc. Méd. Argentina* 42(281/282): 215-220. 1929.—Glucuronic acid is precipitated in 10 cc. urine by means of lead acetate and NH_3. The precipitate is converted into furfural with HCl, distilled, and determined by adding bisulphite. Blood is diluted in 10 vol. strong acetic acid solution and heated to boiling. Pulverized KCl is added till no more precipitate is formed. After 24 hrs. the precipitate is filtered and washed. The filtrate is neutralized to litmus with NaOH and precipitated with lead acetate and NH_3; then treated as with urine. Values found were 5-8 mgm. % in urine, 0.6-1.8 mgm. % in blood.—*E. A. Molinelli.*

3650. **HEILBRON, I. M., and F. S. SPRING. The colour reactions and absorption spectra of sterols in relation to structure.** *Biochem. Jour.* 24(1): 133-135. 1930.—The Tortelli-Jaffe reaction was modified to render it both instantaneous and more sensitive. The reagent seemed to be specific for sterol derivatives containing an "inert" ethenoid linkage, possibly in position $\Delta^{10:19}$. The sterol derivatives showed selective absorption when they contained 2 double bonds and gave positive color reactions with trichloracetic acid or antimony chloride. —*E. B. Carmichael.*

3651. **HEILMEYER, LUDWIG. Die spektrophotometrische Bestimmung des Urobilins und Urobilinogens mit besonderer Berücksichtigung der Terwenschen Methode, zugleich eine Kritik der quantitativen Urobilinbestimmung überhaupt.** *Zeitschr. Ges. Exp. Med.* 76 (1/2): 220-235. 1931.—Spectrophotometric studies showed that urobilin was not a uniform substance; quantitative determination had to be made by way of urobilinogen, which showed absolute uniformity. The spectrum of the

benzaldehyde compound of mesobilirubinogen agreed with that from corresponding preparations from feces and urine. Ratios of absorption averaged 0.0000923. Beer's law for the acetic acid urobilinogen aldehyde solution was confirmed. On these facts a spectrophotometric method for determining urobilinogen was based, and, using Terwen's method of reduction, urobilin plus urobilinogen. Terwen's method was thereby tested and his standardization of the phenolphthalein standard found approximately correct. It seemed probable that the endogenous urobilin was reduced to urobilinogen but that that arising secondarily in the light only slightly so. Material should be reduced as soon as possible to prevent loss. The proportion of urobilinogen to urobilin in fresh urine showed 100% urobilinogen; in urobilinuria much more urobilinogen than urobilin; in feces frequently 100% urobilinogen, though the urobilin content was often higher.

3663. **LAMMERT, OLIVE M., J. LIVINGSTON R. MORGAN, and MARGARET A. CAMPBELL. The quinhydrone electrode. II.** *Jour. Amer. Chem. Soc.* 53(2): 597-604. 1931.—An investigation of the effect of N upon the reproducibility of the quinhydrone electrode in 0.1 *N* HCl leads to the following conclusions. The quinhydrone half-cell, when prepared with electrodes dried in N and with solutions stirred with N, or when prepared with electrodes dried with air and with solutions stirred with N, is far more readily reproducible than when prepared with air-dried electrodes and solutions stirred either mechanically in the presence of air or with compressed air or O. In the preparation of the quinhydrone half-cell it is not sufficient to dry the electrodes with N; N must be passed through the solution. If, however, N is passed through the solution the electrodes need not be dried with N. The 0.1 *N* HCl quinhydrone half-cell, prepared as described in this and in the first paper of this series [see Entry 3674], is the most easily and readily reproducible electrode which the authors have used. Electrodes prepared with N acquire a definite equilibrium potential much more quickly than those prepared with air. Short circuiting the electrodes in pairs during pre-treatment does not affect the p. d. obtained in N.—*From authors' summary.*

3664. **LAUG, EDWIN P. The application of the quinhydrone electrode to the determination of the pH of serum and plasma.** *Jour. Biol. Chem.* 88(2): 551-573. 1930.—A comparative study of the pH of normal dog serum and plasma at 38° by the H_2 and quinhydrone electrodes has shown that on the average the latter electrode reads 0.03 pH more acid than the former. Under experimental conditions this difference has remained sufficiently constant to inspire confidence in the reliability of the method. Determinations of pH with the quinhydrone electrode can be rapidly made and require only small amounts of fluid. The occurrence of the 1st change of shed blood, discovered by Havard and Kerridge, has been substantiated with both types of electrodes.—*E. P. Laug.*

3665. **LEACH, W. On a simple electric immersion heater for constant temperature baths.** *Ann. Botany* 45 (178): 373-376. 2 fig. 1931.

3666. **LEULIER, A., et L. REVOL. Sur le cholestérol des surrénales: détection histochimique et dosages chimiques.** *Bull. Histol. Appl. Phys. et Path.* 7(8): 241-250. 1 fig. 1930.—Formalin fixed tissue is treated in various ways: (1) Fresh sections are stained with Sudan and mounted in glycerin jelly; (2) Immerse in digitonine or other saponins in alcohol up to 10 days, wash in alcohol, pass to water, cut, and mount as above. Examine in polarized light. Cholesterol crystals appear only in the cortex though an almost equal amount can be extracted from the medulla or can be shown by colorimetric test.—*J. G. Sinclair.*

3667. **LeVESCONTE, AMY, J. H. BUCHANAN, and MAX LEVINE. The biological estimation of glucose. I. A study of factors influencing changes in H-ion concentration of media.** *Iowa State Coll. Jour. Sci.* 4(3): 331-342. 1930.—Glucose was estimated by means of pH measurements at varying concentrations both in pure solutions and with sucrose. The synthetic medium consisted of a dilute glucose solution with $(NH_4)_2HPO_4$ and KCl. *Aerobacter levans* was used to produce acid from glucose. The medium was brought to pH 7 by adding KOH, using brom thymol blue. The sterilized and inoculated tubes were incubated at 30° C. under anaerobic and aerobic conditions. Incubation time was 2-24 hrs. for aerobic and 4-6 days for anaerobic. Under aerobic the pH first falls as organic acids form, then rises showing their destruction. This secondary change is a function of the glucose concentration. Under anaerobic there is no increase in pH so the total change is a function of the glucose concentration. There is indicated a possibility of quantitative sugar determination by biological means.—*H. L. Keil.*

3668. **LEYS, DUNCAN. Estimation of urea in urine.** *Lancet* 220(5606): 296. 1931.—It is impossible to estimate urea excretion by the hypobromite method when there is a combination of bacilluria and "acidosis." Bacilluria alone does not appreciably affect the result. Excess ammonia in the urine in "acidosis" should be allowed for by estimating by the formalin method, and subtracting 2.6 c.cm. N for every 0.1% ammonia found, whenever urea excretion is estimated in patients whose urine gives a positive nitroprusside reaction.—*Author's summary.*

3670. **LOGAN, MILAN A. An apparatus for the evaporation of liquids in a test-tube.** *Jour. Biol. Chem.* 86 (2): 761-764. 2 fig. 1930.

3671. **LUSTIG, B., und A. PERUTZ. Über ein einfaches Verfahren zur Bestimmung der Wasserstoffionenkonzentration der normalen menschlichen Hautoberfläche.** *Arch. Dermatol. u. Syph.* 162(1): 129-134. 1930.—The author gives a simple indicator method which determines the minimum acid reaction of the skin. This varied in different parts of the body, and also after washing with soap and water or with benzine, the range being pH 4.0-6.8.

3672. **MAGARA, MASANAO. A new hydrogen electrode vessel for the pH determination of the blood.** *Japanese Jour. Exp. Med.* 7(3): 413-416. 1929.—The vessel has a capacity of 1 cc.; it is attached to a cannula by means of a 2-way stopcock, and it has a 2-way valve in its other end, the arrangement being such that the first blood drawn may be rejected, and that the blood from the cannula does not come in contact with air, determination being possible in an atmosphere of H or any other gas. Another apparatus is described, which furnishes H with the same CO_2 tension as blood. The pH of the blood of rabbit, measured with this vessel under pure H gas, is 7.49 at 25°C. and 7.35 at 38°C.; under H gas with CO_2 tension equal to that of blood the pH is 7.27 at 38°C. The difference between the pH of the arterial and venous blood is almost negligible.

3673. **MINOSIMA, TAKASI. Zur Gefrierpunktbestimmung von Lösungen in kleinen Mengen mit Thermoelement. Versuche an Krötenblut.** *Pflüger's Arch. Ges. Physiol.* 226(6): 794-798. 2 fig. 1931.—In place of the usual Beckmann thermometer a 2-junction iron-constantan element was used whose sensitivity was 53.10^{-6} volt per 1°C. It was sealed into a glass tube and protected with shellac. A D'Arsonval coil galvanometer with a sensitivity of 1.2×10^{-8} amp. per mm. at 1.63 meters was the measuring instrument. The freezing point vessel is of the Beckmann type but so small that 0.5 to 1 cc. of material suffices for a determination. The procedure is likewise similar to the Beckmann method. The control element is placed in a water-ice mixture in a vacuum flask. The method of calibration, sources of error and a circuit diagram are given. The sensitivity is 1 mm. of galvanometer deflection $= 0.00997 \pm 0.00018°$ C. The freezing point depression of toad blood was found to be $0.520 \pm .009°$C. In addition freezing points of glucose are reported. An accuracy of 1.2% is claimed.—*W. C. Stadie.*

3674. **MORGAN, J. LIVINGSTON R., OLIVE M. LAMMERT, and MARGARET A. CAMPBELL. The quinhydrone electrode. I.** *Jour. Amer. Chem. Soc.* 53(2): 454-469. 1931.—A study of the reproducibility of the quinhydrone electrode in 0.1 *N* HCl under varying conditions and with a large number of electrodes of different sizes, ages and compositions, leads to the following conclusions. The quinhydrone electrode can be reproduced with ease and with great precision, 2 electrodes made from the same piece of foil consistently giving potential differences agreeing with one another to less than 0.000010 volt. The greatest source of error in the quinhydrone half-cell lies in the preparation of the metal electrode, differences of almost 0.1 volt having been observed when the glass of one of the electrodes was cracked. For this reason a method of making, testing and cleansing the electrodes, which reduces the breakage to a minimum, is suggested. The results obtained when the electrodes are heated in an alcohol flame before use do not justify the method in view of the large number of electrodes which crack. Electrodes made of longer pieces of wire which can be connected directly to the potentiometer wires without the use of Hg as a connecting medium do not give any better results than electrodes made of short wires. The size of the metal exposed to the solution determines the precision with which electrodes properly prepared may be reproduced. Very small, short wires give erratic results; larger, short wires give consistent results but larger deviations than foils or longer lengths of wire; but 2 foils with dimensions greater than 1 sq. cm. give differences of potential, when measured against one another, of less than 0.000010 volt. The composition and age of the metal comprising the electrode is of little importance if the electrode is large enough. However, in 0.1 *N* HCl when the electrodes were much smaller than 1 sq. cm., old roughened platinum seemed to give better results than either new platinum, platinum alloyed with iridium or gold, but the platinum and platinum alloys gave better results than the gold. Two pieces of metal, cleaned and dried by the method

suggested give very nearly the same potential differences whenever they are measured against one another, which fact enables an investigator to select, from a group of electrodes, a few electrodes whose potential differences will invariably be reproduced with great precision.—*Authors' summary.*

3675. **MORGAN, J. LIVINGSTON R., and OLIVE M. LAMMERT. The quinhydrone electrode. III.** *Jour. Amer. Chem. Soc.* 53(6): 2154-2168. 1931.—A study of the comparative potential differences obtained for the quinhydrone electrode in 0.1000 *N* HCl when prepared with metals and graphite of different sizes, ages, sources and compositions leads to the following conclusions. Au electrodes, from whatever source, are likely to give erratic results unless the electrode is a foil or wire as large or larger than 1 sq. cm. Au electrodes give cells of lower current capacities than do Pt electrodes of the same size under the same conditions. Very satisfactory quinhydrone electrodes may be prepared from the graphite core of a lead pencil but not from lamp carbons, etc., since the latter seem to absorb the electrolyte, affecting not only their own potentials but the potentials of any metal electrodes immersed in the same solution. The reproducibility of gold-plated electrodes is not so satisfactory as either Au, Pt or graphite. The reproducibility of quinhydrone electrodes prepared with Au or with graphite is not in general improved in *N*, whereas that of electrodes prepared with C. P. platinum, platinum-iridium, platinum-rhodium alloys, or with gold-plated platinum is very decidedly improved. 24 K gold and C. P. platinum develop, within the limits of the reproducibilities possible with different samples of the same substance, the same potential differences, no matter what the size, age or source of the substance. Lead pencil graphite also seems to develop the same potential difference, although that from only 1 source has been thoroughly tested. Platinum-10% iridium, platinum-10% rhodium alloys and gold-plated electrodes do not develop the same potentials, the C. P. platinum or 24 K gold being negative to the alloys and plate. This difference, however, disappears almost entirely if the solution is stirred with *N*.—*Authors' summary.*

3679. **ROMAN, WADIM. Gemeinsame Bestimmung der Halogene in organischen Substanzen.** *Biochem. Zeitschr.* 207(4/6): 416-425. 2 fig. 1929.—The organic substance is fused with KOH and the I titrated with thiosulphate after extraction with alcohol and oxidation with $KMnO_4$. Bromides and chlorides are extracted from the alcohol-insoluble residue with water. The Br is extracted from this aqueous solution with chloroform after oxidation with H_2O_2. After removal of the remaining oxidizing substances KI crystals are added liberating a quantity of I equivalent to the Br. This is titrated with thiosulphate. Cl is determined by titration of the aqueous extract for halogens and then subtracting the determined quantity of Br. The method is rapid and virtually one procedure. It answers the requirements of accuracy and the determination of such small quantities of the halogens as occur in blood and body organs.—*E. K. Borman.*

Gebiet Auslandsk.* 26: 507-511. 1927.—Chloranil (tetrachlorobenzoquinone) proved to be specific for plasmochin, up to 1 part in 200,000 aqueous urine-free solution (plasmochin is extracted from urine with ether), producing an intense blue color. A less sensitive reagent (1: 100,000) is mercuric potassium iodide.

3682. **STEENKEN, WILLIAM Jr. Application of the quinhydrone method for the determination of the pH of solid media.** *Jour. Lab. and Clin. Med.* 16(3): 316-317. 1930.

3683. **TAKETOMI, N., and K. MIURA. On the glucosazone reaction.** Original: *Jour. Soc. Chem. Ind., Japan* 32. 776-779. 1929. Abridgement: *Mem. Fac. Sci. & Engineer., Waseda Univ., Tokyo* 7. 132-133. 1930.—The usual methods of carrying out the phenylhydrazine reaction give osazone yields amounting to only about 50% of the theoretical. Experiments are briefly reported in which the concentrations of reagents, and the time of boiling, were varied. These showed that the optimum proportion of phenylhydrazine hydrochloride to Na acetate is 1: 2.7-2.8; that the osazone yield increases with increasing concentration of reagents up to 3.2 gm. phenylhydrazine hydrochloride in 20 cc. water; optimum time of heating is 3 hrs.—*From abridgement.*

3684. **TAMMANN, G., und H. THIELE. Versuche zur Bestimmung der Konzentration von Oxydationsmitteln mit Hilfe des Reststroms.** *Pflüger's Arch. Ges. Physiol.* 226(6): 694-696. 2 fig. 1931.—A bright platinum electrode as anode and a platinized electrode as cathode in a solution containing H_2 and an oxidizing agent when at a potential below the decomposition potential will give a constant current (Reststrom) after a short time which according to Nernst is $i = \frac{D.\ o.\ n.\ F}{S} . c$, where i = the residual current; D = diffusion coefficient of the depolarizer; n = valence of the oxidizing agent; F = electrochemical equivalent; o = area of the electrode; c = concentration of the oxidizing agent; S = the thickness of the diffusion layer. For H_2O_2 in *N* HCl the residual current was $1.151 \pm 0.015 \times \%\ H_2O_2 \times 10^{-3}$ amp. For $FeCl_3$, $KMnO_4$ and $K_3Fe(CN)_6$ it was found impossible to determine the value of the residual current. In the case of *N* HCl saturated with O and with air the ratio of the residual currents was 1: 3.7 instead of 1: 4.8, the ratio of O concentration. In arterial blood the residual current was 2 m. Amp.; in venous blood it was 0.1 m. Amp.—*W. C. Stadie.*

Physiol.* 226(6): 746-748. 1 fig. 1931.—High sensitivity galvanometers, particularly string galvanometers, are disturbed by mechanical shaking; irregular stray currents, static charges on the floor and walls and the A. C. of the lighting circuits. The use of D. C. for lamps, motors, etc., does not eliminate this latter difficulty. It is possible, however, by the use of the D. C. from a 120 volt accumulator to eliminate the disturbing effects of the A. C. in the lighting circuit. A diagram of the required circuit is given.—*W. C. Stadie.*

3686. **WADA, ISABURO. An improvement on the potentiometric titration apparatus made in the institute, by introducing a shunt in the galvanometer.** [Japanese] *Rikwagaku-Kenkyū-Jo Ihō* (*Bull. Inst. Phys. & Chem. Res.*) 10(2): 137-145. 1931. [English abstract] *Abstr. from Rikwagaku-Kenkyū-Jo Ihō* (*Bull. Inst. Phys. & Chem. Res.*) p. 8-9. [appendix to *Sci. Papers Inst. Phys. & Chem. Res.* 15(286/287): 1931].—By introducing a shunt into the galvanometer of high sensitivity in the apparatus, the sensitivity may be varied within a wide range, giving ample scope to the titration experiments. Various kinds of titration, which cannot be made satisfactorily by using a galvanometer of a certain definite

sensitivity, may be performed precisely with a high sensitivity, or less precisely but very simply in manipulation with a lower sensitivity. All these facts have been illustrated with the results of the experiments made in the writer's laboratory. Mention has also been made of the abnormal movements of the pointer of galvanometer which come from various causes. Some of these movements can be avoided by cleaning the platinum electrode with a very fine sandpaper, or by other means.—*Author's summary.*

3687. **WEBER, C. J. The determination of arginine in dog blood.** *Jour. Biol. Chem.* 88(1): 353-359. 1930.—The substance responsible in the Folin-Wu filtrate of dog blood for most of the color given with the modified Sakaguchi reaction is believed to be arginine, because it is destroyed by arginase (liver extract) and gives a crystalline precipitate with flavianic acid. A method is given by which arginine may be determined directly on the Folin-Wu filtrates of blood.—*Author's summary.*

Augenheilk* 103(3/4): 657-664. 3 fig. 1930.—The author calls attention to the disadvantages of the Hess pupilloscope, in particular the influence on the patient of movement of the lever necessary to change the illumination. The instrument of Sander is also objectionable in that the apparatus has to be placed too close to the patient's eye. To overcome these difficulties he has devised an instrument by which a rapid change in the illumination may be made without any change noticeable to the patient which might distract his attention. The instrument consists of a series of resistances through which current is passed to an electric lamp. The eye is illuminated at a constant intensity and a change in this intensity may be made by pressing a lever. This results in an exposure of the eye to 2 different light intensities one of which is constant. The other may be altered by changing the resistance.

The motor and visual discriminative acuity can thus be determined.—*F. H. Adler.*

Eine Fehlerquelle bei der Bestimmung der perspiratio insensibilis mit der Sauterwaage.** [A source of error in determination of insensible perspiration with the Sauter balance.] *Zeitschr. Ges. Exp. Med.* 73(3/4): 481-487. 1930.—The hygroscopic materials used in the bed change its weight in accordance with increase or decrease in the moisture of the atmosphere.

3706. **HEMINGWAY, A. Surface heating with two types of diathermy electrodes.** *Jour. Lab. and Clin. Med.* 16(3): 271-274. 1930.—To avoid surface heating with saline electrodes, the pads must be soaked in salt solutions having a conductivity greater than that of 10% KCl. Evaporation which produces cooling at the saline pad lowers the surface temp. below that of the metallic electrode. Hence a larger current can be used with a saline pad electrode than with a metallic electrode.—*Author's conclusions.*

3707. **HOFFMAN, WILLIAM J. New technic and instrument for obtaining biopsy specimens.** *Amer. Jour. Cancer* 15(1): 212-220. 11 fig. 1931.—A piece of the tumor is punched out and removed through an outer insulated sheath. The outer sheath of the instrument may be used in conjunction with a syringe for aspiration of the tumor. By connection to a source of high-frequency current the needle track is coagulated and any adherent tumor tissue devitalized, thus preventing implantation of tumor tissue along the course as the needle is withdrawn. The action of the instrument is safe, simple, and positive, obtaining tissue on the first attempt in all cases to date, including many dense, fibrous tumors.—*From author's summary.*

3708. **JACOBJ, C. Weitere Beiträge zur Methode der Durchblutung isolierter überlebender Organe. I. Ein neuer Durchblutungsapparat (Pneumohaematisator). Teil II. Technik der Durchblutung.** *Arch. Exp. Pathol. u. Pharmakol.* 136(3/4): 203-238. 6 fig. 1928.—The author describes the apparatus developed by him during 40 yrs., a "pneumohaematisator" for perfusing isolated organs with blood. The blood is arterialized in a lung artificially ventilated. The gas from the trachea may be analyzed as in living animals. The surviving organs are supplied with an ample blood flow. On the kymograph are registered the blood pressure curve with pulse rate and amplitude, and the respiratory rate. The volume change of the blood stream is transferred, through an electrically driven twin-pump, corresponding to the right and left heart, and filled with glycerine, to 2 rubber balloons, likewise glycerine-filled. These maintain the cross circulation of the blood in 2 cylinders provided with stream-directing valves. The constancy and the regulation of the blood pressure is attained by means of 2 safety-manometer pressure-valves. These control the blood before the insertion of the organs, allowing it to enter against the vestibule of the right heart whence it flows into the lungs. In this way, edema and congestion of the circulation is avoided, and therefore also subsequent overextension and rupture of the capillaries. For the same reason, 2 so-called venous valves are introduced into the venous circulation, preventing too strong suction. The pulse amplitude, depending in the body on the tone of the vascular walls, is here regulated by a rubber balloon, variable in its tension, in the arterial stream. 120 ccm. of blood is required to fill the apparatus; it may be recovered quantitatively for analysis. The venous blood of organs may pass through the apparatus without the influence of the arterial blood, a corresponding amount of normal blood going from the reservoir into the system; therefore, by injection of a solution of poison into the arterial stream of the organs, temporary poisoning with subsequent recovery may be effected. The lungs, organs, all the blood-vascular system, except the heart-pump and blood reservoir, are immersed in the water bath, which is maintained at constant blood temp. by an electrical heater. Taking apart, cleaning, and again setting up the apparatus, which should be done after every experiment, requires only 1½-2 hrs. Part III describes experiments on perfusion of the kidneys, illustrating some of the results obtainable with this apparatus and technique (see entry 3875, in this issue.)—*C. Jacobj (transl. by L. S. Godfrey).*

3709. **JENKINS, C. E. A flicker haemoglobinometer.** *British Jour. Exp. Path.* 11: 261-266. 1930.—The instrument is fully described; it consists essentially of 2 fixed lights and a Simmance-Abady photometer head in a fixed position between them. The brightness is varied by the depth of a glass plunger in a cup containing a coloured solution through which the light from one lamp passes. A glass cell is placed between the head and the other light and contains the sample to be examined. The instrument offers a means of ascertaining the strength of a solution of haemoglobin which is accurate to within 1% as a rule and 2% as a limit, and which is rapid, suitable for routine clinical work, is not easily deranged and is uninfluenced by color.—*J. Bland.*

3710. **JUDSON, LYMAN S., and P. E. GRIFFITH. Electrodynamic recorder.** *Science* 72(1853): 15-16. 1 fig. 1930.—Brief description whereby records can be made on a kymograph at any convenient distance from the stimulated muscle.

3711. **KASAKOW, M. M. Methoden der Blutstillung bei Milzverwundungen.** *Arch. Klin. Chir.* 163(1): 72-85. 7 fig. 1930.—In an unstated number of dogs deep incisions, involving the large veins, were made in the spleen, various hemostatics (mechanical, chemical, physical and biological) applied, and their effect examined in the course of a few days. Vivocoll, a proprietary blood product, was found to obviate the necessity of suture; the scar was smooth and small; the adhesions to surrounding tissues minimal; and it was greatly superior to the other routine methods.

3712. **LAMPERT, HEINRICH. Die Bestimmung der Blutgerinnungszeit.** [The determination of blood coagulation time.] *Münchener Med. Wochenschr.* 77(14): 586-588. 1930.—The wettability of various materials was studied. Substances to which moisture adheres hastened coagulation, moisture-repelling substances delayed it. Glass as a moisture-attracting substance proved unsuitable for blood investigation. Lampert has prepared an alkali-free, transparent, moisture-repelling substance, "athrombit," a condensation product of phenol and formaldehyde, for use in the place of glass in the determination of blood coagulation time.

3713. **LEYSHON, W. A. Note on a frequency recorder for use with a neon lamp excitation circuit.**

Jour. Physiol. 71(2): i-iii. 1 fig. 1931.—A high resistance telephone receiver designed to respond to currents of the order of magnitude of those in the neon lamp circuit, and so modified as to carry a writing point instead of the light aluminium diaphragm, to record the frequency of stimulation of nerve-muscle preparations.

3728. **TSCHERMAK, A.** Beschreibung einer Vorrichtung zur Fixation und Neigung von Fischen und Reptilien. *Pflüger's Arch. Ges. Physiol.* 222(4): 439-444. 3 fig. 1929.—The contrivance, planned by Tschermak, set up in the Prague Institute, and described in detail in the above journal, permits a comfortable and dependable holding of fish and certain reptiles of very variable size. The body of the fish remains accessible from all sides and aquatic animals can remain long periods of time in the apparatus with the help of aerated water flowing over the gills. The animal is held by means of a variable number of movable spring clamps, covered with rubber tubing, on a horizontal four-cornered bar; smaller animals are of necessity laid upon a wood strip of varying thickness. The apparatus permits the accomplishment of a precise perpendicular and horizontal movement and a measurable adjustment of the body of the animal as well as measurable rotation or inclination of 360° around an axis, which either passes through the medium plane of the body, or through an eye, or outside of the body. Such a practicability is especially important for the investigation of the postural reflex in the fins and eyes of fishes due to the gravity receptors, whereby the downward turned organs are appropriately observed from above in a mirror tilted at 45° under the head of the fish. Especially, by this means, can the vertical divergence of the eyes be investigated. Tschermak studied this postural reflex already investigated by others, in which he found vertical divergence with even eye-movement combined with ventral movement of the eyes. In *Bargibius marmitos* and *Junius* frontally directed rolling of the eyes is combined with vertical divergence. The gravity-receptor postural-reflexes remain persistently with suitable holding of the animal in the forced position. Upon return to the 0° original position they disappear quickly and distinctly.—*A. Tschermak (transl. by J. E. Lynch).*

3733. **BACH, E. Über die Bestimmung des Katalasegehaltes des Blutes.** *Biochem. Zeitschr.* 227(1/3): 221-229. 1 fig. 1930.—Unless blood defibrinated according to Krueger is used, catalase determinations should be made immediately after taking the sample. The destructive action of H_2O_2 solutions on catalase can be avoided by the use of highly dilute solutions. The variation in pH of the H_2O_2 solutions is equalized with the use of buffers. As a measure of the relative amounts of catalase the author uses the equation of a mono-molecular reaction since it bears a direct relationship to the amount of catalase. The initially described apparatus is used for catalase determinations as its use renders the procedure more simple and it is more serviceable for making a series of determinations.—*Author's summary (transl. by J. M. Johlin).*

Kinderheilk.* 49(6): 693-708. 1930.—Studies of 145 children, including 6 healthy children and 139 with 36 forms of disease, indicated that the capacity for binding CO_2 is lower in children than in adults, and labile. Low values in infancy are especially significant in nutritional disturbances. In later childhood the alkali reserve tends to remain normal even in severe diseases.

3736. **CLEMENTI, A., e F. CONDORELLI. Nuove proprietà biologiche dei pigmenti biliari. I. Potere emolitico e potere agglutinante della bilirubina. II. Variazioni del potere emolitico e del potere agglutinante della bilirubina per aggiunta di siero di sangue o di sali biliari. [Biological properties of bile pigments. I. Hemolytic and agglutinant power of bilirubin. II. Variations of the hemolytic and agglutinant activity of bilirubin when serum or bile salts are added.]** *Boll. Soc. Ital. Biol. Sperim.* 5 (4): 482-485, 486, 488. 1930.—Bilirubin exercises a remarkable agglutinant and hemolytic action. The latter is less intense than the former, agglutination very promptly following the addition of bilirubin, whereas hemolysis occurs only after many hours, and not constantly. Agglutination is still present at a dilution 1: 20,000. Oxidation to biliverdin is followed by a marked decrease of agglutinant and hemolytic activity. Erythrocyte agglutination is delayed when to bilirubin bile salts or blood serum is added. Hemolysis is delayed by addition of blood serum, but is quickened by addition of bile salts, a summation of their hemolytic action presumably taking place.—*M. Comel.*

3737. **CONANT, JAMES B., and RALPH V. McGREW. An inquiry into the existence of intermediate compounds in the oxygenation of hemoglobin.** *Jour. Biol. Chem.* 85 (2): 421-434. 1930.—As the result of experiments on crystalline oxyhemoglobin prepared from horse hemoglobin no evidence was found for the presence of intermediates in the oxygenation of hemoglobin. Such intermediates will not therefore explain the anomalies in the O dissociation curve. A decrease in the O concentration of buffered solutions of Hb_4O_8 and a persistence of solid Hb_4O_8 in spite of considerable deoxygenation of the solution was found possibly due to "salting out effect" of one protein or the other.—*J. Vaughan.*

3738. **CZONICZER, GABRIEL, und STEPHAN MOLNÁR. Ikterus und Erythrocytenzahl.** *Zeitschr. Ges. Exp. Med.* 72(3/4): 539-544. 3 fig. 1930.—In 8 out of 15 jaundice cases the erythrocyte and bilirubin curves ran parallel; 3 other cases could not be followed out, and in the remaining 4 no regular variations could be discerned. Apparently (1) either erythropoiesis may be stimulated, or (2) erythroclasis checked by the bilirubin in the blood. It is suggested that bilirubin may, concomitantly with other factors, aid in maintaining the erythrocyte count level in health, increased destruction of erythrocytes leading to increased bile-formation which, by increasing resistance, automatically checks further decrease in erythrocytes.

3739. **DAHL, ROLV HOYER. Om differentialtelling av leukocytter i utstrykspreparat. [Differential counts of leucocytes in blood smears.]** *Norsk Mag. Laegevidensk.* 91(9): 972-980. 1930.—The relative dominance of monocytes, eosinophiles and neutrophiles found in the ragged end of a blood smear is sometimes very great. Grave errors may be avoided by counting selected even smears only or by counting the leucocytes in corresponding groups chosen from all parts after a preliminary survey with low magnification. The young forms of neutrophiles (Arneth-Schilling) were relatively constant in distribution. Daily variations in differential counts were inconstant. In fasting normal persons, both the total white count and relative lymphocytosis were variable.—*C. M. Goss.*

3740. **DESEÖ, D. von. Über die Volumenabnahme der Blutkörperchen in hypertonischen Kochsalzlösungen bei Kühen und Föten.** *Biochem. Zeitschr.* 199(1/3): 41-47. 1 fig. 1928.—The method of estimating the shrinkage of erythrocytes of cows and fetal calves is given. The author concludes that erythrocytes of the fetus shrink more, contain more water, have greater volume, and contain more colloids, than those of cows.—*E. A. Baumgartner.*

3741. **DORRANCE, G. M. Demonstration of an instrument for determining the coagulation time of the blood.** *Med. Times* 58(5): 138-139. 4 fig. 1930.—A film of the blood sample is placed on the tapering tip of each of 7 small glass rods, which are placed in water at 1-min. intervals, and the difference in precipitation and clotting noted.

3742. **EFTIMESCU, J. Untersuchungen über die Alkalireserve des Pferdeblutes.** *Zeitschr. Zücht. Reihe B. Tierzücht. u. Züchtungsbiol.* 19(2): 233-267. 5 fig. 1930. —In the case of healthy horses following a period of rest, the limit of the CO_2 binding capacity of horse blood plasma drops below the limit at which acidosis results in humans (53 vol%) which condition for horses was

assumed by Bartsch to occur at 35.7 vol%. Sex was found to influence the alkali reserve, which was higher in stallions than in geldings and mares. A racial difference was not distinctly observed. That of geldings and mares was 0.44 to 0.53 for draft horses and 0.50 to 0.61 for coach horses; that of stallions 0.50 to 0.56 for draft horses and 0.66 to 0.82 for coach horses. There is no relationship between color and alkali reserve of a given sex or race, nor does age appear to affect it. Different food rations, basically hay and oats, influence it but little, and need only be considered when the ration differs fundamentally from the usual basic ration. Temperament of horses has no effect. The CO_2 binding capacity of mares is lowered during lactation. There is a difference of 0.033 ± 0.005 in the alkali reserve as between rest and work. The daily average for the remounts is less than for troop horses of the same race and sex. Data obtained are not sufficient to establish the effect of training. Determinations by the Van Slyke method are practical and certain, but Hg poisoning must be guarded against in case of long continued use of this method.—*Author's conclusions (transl. by J. M. Johlin).*

3743. ERNST, MAX. Das Verhalten der roten und der weissen Blutkörperchen nach intravenöser Einverleibung anisotonischer Flüssigkeiten. *Deutsche Zeitschr. Chir.* 228(6): 331-339. 1930.—In 3 cats, after intravenous injection of distilled water, findings were negative for stromata and for hemoglobinemia; as was spectroscopic study of the blood of 2 animals for coloring matter from the erythrocytes. Likewise, in 8 cats intravenously injected with distilled water subsequent investigation of the vascular system was negative for thrombosis, and microscopic study of the internal organs revealed no hemorrhagic infarcts or embolic foci. Similar negative findings followed "numerous" intravenous injections of cats with hypertonic NaCl and sugar solutions. Thrombosis, however, was twice observed in 22 cases of injection of 50-100 cc. of 50% glucose solution, both cases in patients with retarded circulation and both without untoward results. Ernst believes that the theory of increased erythrolysis or serious change in the white blood-picture through the use of anisotonic intravenous injections is without foundation.

3744. EUGSTER, A. Zur Frage des Chlorgehaltes im Blute und dessen Verteilung auf die Konstituenten unter hämopathologischen, insbesondere anämischen Zuständen des Organismus. *Zeitschr. Klin. Med.* 107(3/4): 224-255. 1928.—An investigation concerning the relationship between the hemoglobin and Cl contents of whole blood showed that the Cl increased as the hemoglobin decreased. This is especially to be observed in cases of severe anemia. In cases of severe nephritis an increasingly anemic condition was found to run parallel to an increase in residual N as indicated by a decreasing hemoglobin content of the blood. Parallel to this was a disturbance in the Cl picture, in the most severe cases of nephritis—there was mainly a decrease in the NaCl content of serum from the normal of 600 mgm. per 100 cc. to 400 mgm., while the NaCl of the cells increased from the normal of 320 mgm. per 100 cc. to 400 mgm. Similar studies were made in cases of infectious diseases, especially pneumonia, and in diabetes mellitus and similar phenomena were noted. Anemia in cases of diabetes indicates that the decreasing hemoglobin content bears a relationship to the accumulation of ketone bodies in the blood. There is an apparent parallelism between the various cases which were studied.—*J. M. Johlin.*

3745. FALKENHAUSEN, M. von, H. J. FUCHS, und M. SCHUBERT. Über proteolytische Fermente im Serum. IX. Über das verschiedene Verhalten der Sera in den einzelnen Metamorphosestadien der Anuren. *Biochem. Zeitschr.* 193(4/6): 269-275. 1928.—The sera of cold blooded animals (*Rana esculenta, Pelobates*) at different stages of metamorphosis show such a behavior toward the fibrins of the same species at more advanced stages of development as they would show toward fibrins of an entirely different species; i.e., they cause an increase of the residual N; on the other hand their behavior toward fibrins of earlier stages of development is like that of an immune serum toward the normal fibrin of the same species; i.e., they produce a decrease in the residual N. The serum of the fully developed older frog behaves toward the fibrins of the stages of metamorphosis as toward the fibrin of a different species; the sero chemical immunological properties do not remain in the fully developed frog. Immune sera produce a decrease in the residual N as they do in the case of normal fibrins of the same species as well as in the case of the normal fibrin of a different species.—*Authors' summary (transl. by J. M. Johlin).*

Hämin, Bilirubin und Porphyrine. *Naturwiss.* 18(47/49): 1026-1037. 1 fig. 1930.—A brief historical review and an exposition of the biological and chemical relationship of hemin, bilirubin and the porphyrines, giving the natural occurrence and fate of these substances, their constitutional formulae with special reference to side chains, and the results of the structural synthesis of identical compounds.—*J. M. Johlin.*

3747. FOULGER, J. H., and C. A. MILLS. The influence of urea upon blood clotting. II. Tissue fibrinogen clotting and tissue fibrinogen. *Amer. Jour. Physiol.* 96 (3): 509-517. 1931.—Saturation of a 1.5% suspension of tissue fibrinogen in 0.9% NaCl with solid urea at room temp. (about 23° C.) liberates free cephalin and destroys the clotting activity of the tissue fibrinogen. Under the same conditions, 53 gm. urea added to 100 cc. of the tissue fibrinogen suspensions up to a concentration of 31 gm. per 100 cc. has less effect: 31% urea destroys only about ½ the original tissue fibrinogen clotting power. If heat-coagulated tissue fibrinogen is dissolved in saturated urea, then, after removal of urea, free cephalin is found present in high concentration. On standing, the cephalin disappears and a fraction of the original tissue fibrinogen is reproduced. Saturation with urea will again liberate a large quantity of free cephalin. These results indicate that urea, at least partially, reverses the change which heat has produced.—*Authors' summary.*

3748. GELFAN, S., and J. P. QUIGLEY. Conductivity of blood during coagulation. *Amer. Jour. Physiol.* 94 (3): 531-534. 2 fig. 1930.—The authors employed the Kohlrausch method to measure the conductivity of blood during the process of coagulation. They conclude that the conductivity of whole blood or blood plasma is not influenced by the process of coagulation and is consequently independent of the viscosity changes occurring at this time. The increase in the resistance of the whole blood after it has already coagulated is apparently due to the presence of the corpuscles, for the conductivity of plasma is practically unchanged after coagulation. Since conductivity studies indicate that the fibrin gel is similar to such reversible gels as gelatin, soap, agar, and silicic acid, additional evidence is offered in support of the micellar structure of coagulated blood.

3749. GIORDANENGO, GUGLIELMO. Ricerche sperimentali sull'azione del liquido amniotico introdotto nel peritoneo sulla formazione delle aderenze peritoneali post-operatorie. [The influence of amniotic fluid introduced into the peritoneum on the formation of peritoneal postoperative adhesions.] *Ann. Ital. Chir.* 9(6): 543-555. 1930.—In 15 experimental guinea pigs and 5 controls Giordanengo produced the conditions of Hebert's experiments, but the results failed to sustain the latter's finding that amniotic fluid prevents the formation of postoperative peritoneal adhesions. In vitro, amniotic fluid did not increase the proteolytic power of leukocytic ferments; it diminished the intensity of the reaction, though the diminution was less than that produced by blood serum. Hence it appears that the amniotic fluid contains little or no antiferment, which indicates that the liquor amnii is not a simple transudate from the maternal serum. Amniotic fluid is not capable of neutralizing the antiferment in blood serum.

3750. GORDY, SAMUEL T., and STEPHEN M.

SMITH. The permeability of the hemato-encephalic barrier as determined by the bromide method. *Arch. Neurol. & Psych.* 24(4): 727-734. 1930.—A series of 183 cases of mental disorder studied for the determination of meningeal permeability by the Walter bromide method is presented. In dementia paralytica the majority of cases showed a marked tendency toward increased meningeal permeability. In dementia praecox the majority of patients presented normal permeability (about 69%), about 24% increased permeability and the remainder diminished permeability. In the cases of chronic alcoholic psychosis there appears to be a tendency toward increased permeability. A similar tendency is shown to some degree in psychosis with cerebral arteriosclerosis. About ½ the cases of manic-depressive psychosis showed normal and the other ½ increased permeability. In the postencephalitic cases and in senile psychoses no particular tendencies were shown. The Walter bromide method does not appear to afford distinct aid in the differential diagnosis of mental disease, especially as between dementia praecox and manic-depressive psychosis. The wide range of permeability quotients, such as the ones displayed in the catatonic cases of dementia praecox, may be evidence that one is dealing with schizophrenias as a plural concept in contrast with schizophrenia as a unity. It may be that the marked deviation of the permeability quotient from the normal range occurring in other psychoses may have a discoverable organic basis such as occurs in dementia paralytica.—*Authors' summary.*

3751. GOUNELLE, HUGUES, et JULIEN WARTER. De l'influence d'un effort musculaire intense (course) sur l'image blanche du sang périphérique. (La leucocytose de mouvement et le rôle de la rate.) *Arch. Malad. Coeur, Vaisseaux et Sang* 23(12): 757-767. 1930.—After the subjects (15 ♂ and 1 ♀), the latter splenectomized, had run for ¾ min., the leukocytes (chiefly mononuclears) in the peripheral blood increased, invariably but temporarily. In 20-30 min. after the run, the leukocyte figure had reached or dropped below the original figure. The greatest rise was observed in subjects unused to physical exertion. The authors seek to explain this transient leukocytosis as due to contraction of the spleen; but as the rise took place also in the splenectomized subject, they admit that other factors also must be involved. They remark that this leukocytosis of movement explains the difficulty of studying modifications of the blood count in laboratory animals: the animal, unless anesthetized, is sure to struggle frequently, thus complicating the experimental conditions.

3752. GUERRINI, GUIDO. Dell'influenza della luce attraverso schermi colorati sull'azione emolitica della clorofilla. [The influence of light filtered through colored screens on the hemolytic action of chlorophyl.] *Boll. Soc. Ital. Biol. Sperim.* 5(4): 567-569. 1930.—The influence which colored filters exert upon the hemolytic action of chlorophyl depends upon the color of the screen; the light filtered through red and yellow screens increases the hemolytic activity, whereas the latter is inhibited by light filtered through green and blue screens. —*M. Comel.*

3753. HAVARD, ROBERT EMLYN, and PHYLLIS TOOKEY KERRIDGE. An immediate acid change in shed blood. *Biochem. Jour.* 23(4): 600-607. 1929.—The authors report an increase in the hydrogen ion concentration of shed blood, of the mean value of 0.05. The change occurs within 6 min. at 38 degrees, and 11 min. at 28 degrees. At room temperature it does not occur until after 1.5 to 2 hrs. The change is not associated with coagulation; and it is not affected by substances which inhibit oxidation, enzyme action or glycolysis. It takes place in laked blood, and in the absence of leucocytes, but not in plasma.—*H. E. Jordan.*

3754. HAYASHI, HARNO. Étude de la réaction de Van den Bergh sur la bilirubine du sang. *Presse Méd.* 37(44): 720-721. 1929.—In a study of the nature of the icterus experimentally produced in dogs (1) by the intravenous injection of a suspension of red blood corpuscles (a hemolytic icterus) and (2) by ligating the bile duct (obstructive jaundice), Hayashi found that (1) the source of the blood serum rather than that of the blood bilirubin determines whether the Van den Bergh reaction will be immediate or delayed; (2) the intravenous injection of red cell stroma causes a delayed reaction. He concludes that the rapidity of the Van den Bergh reaction is determined by the reciprocal quantities of bilirubin and stroma in the serum. If there is more bilirubin than stroma, the reaction is accelerated; if stroma predominates, the reaction is diphasic. He also finds that stroma slowly oxidizes bilirubin with the result that a delayed Van den Bergh reaction is produced. —*M. M. Wintrobe.*

3755. HERMS, J. Über den Zuckergehalt von Pleura- und Peritonealexsudaten. Klinisch-chemische Studien mit besonderer Berücksichtigung der Pneumothoraxexsudate. *Beitr. Klin. Tuberk.* 75(5/6): 748-771. 1930.—The morphological, bacteriological and chemical properties of an exudate may be of use in diagnosis. The cell content and the number of polynuclear leucocytes are increased in inflammation and in resorption. Lymphocytosis is characteristic in mild exudative pleuritis. Eosinophilia may occur in resorptive processes but is not of use in prognosis. Clinical evaluation of the protein curve is difficult as its rise may indicate either inflammatory or resorptive processes. An increased fibrin content often indicates the beginning of resorption. Glucose is the chief reducing substance. Exudate sugar concentration may be 10 mgm. % lower than blood sugar hence the hypothesis of a transudate is improbable. Lower values of exudate sugar may be due to (1) fermentative anaerobic glycolysis, associated with increased lactic acid concentration, (2) adsorption on proteins and (3) change in proportion of solvent. A striking decrease in sugar is found in (1) mixed infection, (2) in chronic protracted pneumothoracic exudates, (3) in rapid suppurative exudates and (4) in empyema.—*D. B. Dill.*

3756. HIRSCHFELD, H. Lehrbuch der Blutkrankheiten. [Textbook of diseases of the blood.] 2nd ed. 263p. 5 pl. 43 fig. Johann Ambrosius Barth: Leipzig, 1928. Pr. 22 M.

3757. HOFFSTAEDT, ERNST. Beobachtungen über Verlangsamung der Blutkörperchen-Senkungsgeschwindigkeit. *Deutsche Med. Wochenschr.* 54(46): 1925-1927. 1928.—Knowledge of retarded rates is as important as that of accelerated velocities. Deceleration occurs constitutionally especially in the vegetative stigmatized, neurotics, hysterics, allergics, etc., besides in organic brain diseases, particularly of the vegetative centers, and in some other disease conditions, as certain liver and cardiac obstruction states. In cases of constitutional retardation, moderately strong and low-grade accelerations readily are masked and hence overlooked.—*Author's summary (transl. by W. A. Peabody).*

3758. HORNEFFER, LUTZ. Das Blut des Menschen, mit neueren Methoden untersucht. II. Mitteilung. Absolute Hämoglobinbestimmungen, Erythrocytenzählungen und Erythrocytenmessungen bei 20 Studenten und 20 Soldaten zur Ermittlung des Hämoglobingehalts eines Erythrocyten und des Hämoglobins pro μ^2 Oberfläche des Erythrocyten. *Pflüger's Arch. Ges. Physiol.* 220(1/6): 703-715. 1 fig. 1928.—The range in Hb content was from 14.39 to 18.03 gm. per 100 gm. of blood and in cell count, from 4.37 to 5.58 million per mm^3. These results give a mean value of 32.4×10^{-12} gm. Hb per cell, which is significantly higher than that previously reported for mammals. Cell diameters varied from 7.75 to 8.46μ and averaged 8.15μ. The average surface area of the dry erythrocyte was 104.2μ^2 and the Hb content was 31×10^{-14} gm. per μ^2 of surface. This agrees closely with the average value of $31.7\text{-}10^{-14}$ for mammals, thus proving that the hemoglobin distribution law is valid for young men.—*L. Horneffer (transl. by D. B. Dill).*

11(4): 571-578. 2 pl. 1929.—The author found microscopic evidence of increased activity of the blood forming organs of the rabbit (liver, spleen and bone marrow) after the use of blood destroying poisons such as phenylhydrazine, hydroxylamine and pyrogallol. The same effect was produced by bleeding and by chronic benzol poisoning. Young red cells were also circulating in the blood. Similar changes were found shortly after immunizing doses of typhus bacteria, but were not seen 2 mos. later. Rabbits immunized shortly before the bleeding or poisoning showed a much higher agglutinin content of the blood serum, and this was also true of those animals immunized immediately after bleeding or poisoning. The author concludes that the blood forming organs have a marked effect in the production of agglutinins.—*J. C. Watt.*

3760. **JOHANSEN, A. HECHT. Lipemia in hemorrhagic anemia in rabbits.** *Jour. Biol. Chem.* 88(3): 669-673. 1930.—After bleeding rabbits there is found, coinciding with the low hemoglobin percentage, a decrease in serum proteins and in colloid osmotic pressure and an increase in ether-soluble fats in serum. The similarity between these artificially produced conditions in serum and the findings in nephrosis is discussed.—*A. H. Johansen.*

3761. **JORDAN, H. E., and C. C. SPEIDEL. The hemocytopoietic effect of splenectomy in the salamander, Triturus viridescens.** *Amer. Jour. Anat.* 46(1): 55-90. 2 pl. 1930.—In this salamander, the spleen is the chief organ for erythrocytopoiesis and thrombocytopoiesis; the liver capsule, for granulocytopoiesis. After total splenectomy, new erythrocytes are differentiated chiefly in the general circulation, to some extent in the heart and sinuses of the liver. Proliferation by mitosis of young red cells and of their hemoblast progenitors occurs in the general circulation. Of special interest is the failure of the granulocytopoietic capsule of the liver to act as a compensatory locus of erythrocytopoiesis. There is probably an increased rate of production of lymphoid hemoblasts from the reticular cells and lymphoid cells of this region, with their subsequent migration into the sinuses of the liver and the general circulation. Thrombocytes in all stages of development were observed in the blood of some of the splenectomized salamanders kept for one year after the operation. The youngest thromboblasts were of large size and clearly revealed their origin from the lymphoid hemoblast (hemocytoblast). A small number of thromboblasts were seen in mitosis. Extravascular thrombocytopoiesis was not observed. This study emphasizes the importance of the general circulation in the salamander as a potential locus for both erythrocytopoiesis and thrombocytopoiesis. In no case was there formation of a new spleen, although 60 of the animals were kept for from 4 mos. to a year after total extirpation of the spleen.—*Author (courtesy Wistar Bibl. Serv.).*

3762. **KAWAMOTO, NOBUYUKI. Physiological studies on the eel. III. Microscopical observations of the blood.** *Jour. Imperial Fish. Inst.* 26(1): 1-4. 1 col. pl. 1930.—Material, methods and observations are given concerning the blood of the eel *Anguilla japonica.* For morphological studies eels of almost equal size, weighing about 80 gm., were used, but for counting blood corpuscles, much larger and much smaller individuals were used. The number of red blood corpuscles varied from 2,546,000 to 2,855,000 as the individuals varied in weight from 170.00 to 0.78 grams, the number in the small eels being comparatively greater than in the larger ones. The number of the red to white corpuscles was in the ratio of 8: 1.—*Evermann and Clark.*

3763. **KESSLER, ROBERT. Untersuchungen physikalisch-chemischer Eigenschaften des Bluteiweisses in der Gestationsperiode.** *Arch. Gynäkol.* 138(3): 634-709. 1929.—The non-volatile residue, refractometric index, viscosity, blood elasticity, various stability reactions, and the labile-globulin quotient were determined during the period of gestation and compared with those of the blood of normal patients. Determinations of non-volatile residues of the blood show a greater variation during pregnancy, indicating a slower aqueous exchange between blood and tissues than in normal cases. Refractive index determinations show that during 9 mos. of pregnancy the protein content of serum is less than normal and increases again during the 10th month. The viscosity increases slightly at the beginning of pregnancy but soon after decreases and during confinement increases again to exceed the initial value. It was concluded that there is no specific reason for considering blood elasticity differently from indications shown in viscosity determinations. Structural variations in blood proteins, so far as variations in the dimensions of the disperse phase shown by viscosity measurements are concerned, are small. During the first 5 mos. of pregnancy the rate of cell sedimentation increases but slightly, after which until the 7th week after confinement it increases rapidly reaching its highest point at this time. Precipitation methods according to Starling show a variation in the different blood proteins during pregnancy and especially an increase in the fibrinogen-globulin fraction. A similar lability is shown by the flocculation reaction of Gerloczy. The reaction of Matefy showed a decreased stability during pregnancy reaching a maximum during confinement, in 50% of the cases investigated. The most labile phase is that of the labile-globulin, of the euglobulin fraction, which like fibrinogen is a delicate indicator of lability disturbances in pregnant blood. It increases in the early months of pregnancy, decreases again during the middle months and reaches a maximum in the ninth month. Great variations in this fraction are to be observed. Comparisons are made with conditions of inflammation.—*J. M. Johlin.*

3764. **LINTZEL, W. Notiz über die Funktion der Milz als Blutkörperchenreservoir bei der weissen Ratte.** *Pflüger's Arch. Ges. Physiol.* 226(2): 305-306. 1930.—To test the functional importance of the spleen of the white rat in storing erythrocytes and releasing them into the circulation under conditions of O want, the author removed the spleen, ground and extracted it and estimated its hemoglobin colorimetrically. By the same method he estimated the hemoglobin content of the remainder of the body. He thus obtained the splenic hemoglobin as a percentage of the total hemoglobin. The results were as follows: after an hour's narcosis from chloral hydrate, 6.50 and 4.00%; following instant death from a blow on the neck during repose, 4.80, 4.25 and 2.96; following suffocation during narcosis, 2.30 and 1.90; after poisoning with CO, 1.70 and 1.47%. He concludes that the reservoir function of the spleen in the white rat is a very limited one.—*J. H. Austin.*

3765. **MARCHESELLI, I. Contributo allo studio delle funzioni spleniche. [Splenic functions.]** *Ateneo Parmense* 2(5): 488-506. 1930.—The spleen was "externalized" in 6 dogs, which were then made to work and the changes in splenic erythrocyte count and splenic volume observed. The erythrocytes were invariably diminished, and in 26 out of 32 experiments the spleen volume (contrary to Barcroft's findings) was increased after exercise; in 4 there was no difference, and in 2 there was a decrease. To study the theory that modifications in circulating blood are determined by splenic contractions, a drug producing contracture of the spleen (ephedrine) was injected into 5 normal dogs and into 6 splenectomized dogs at various intervals (2 days-12 mos.) after operation. In the normal dogs ephedrine increased the red count; but in 5 of the splenectomized dogs (contrary to Binet's findings) the rise in erythrocytes was more rapid and higher than in the normals; in the 6th splenectomized dog the erythrocytes fell after ephedrine. These results, Marcheselli believes, do not exclude the share of the spleen in producing polycythemia in the normal dog, but they do indicate that some as yet unknown factor may act as a substitute for a missing spleen.

3766. **MINZ, BRUNO. Über das Verhalten kolloidaler Stoffe im Blut. (Ein Beitrag zur Methodik der Blutmengenbestimmung.)** *Zeitschr. Klin. Med.* 114(4/5): 623-

641. 2 fig. 1930.—Author gives critical review of previously used methods for blood volume determinations and describes a new colorimetric method for determining small amounts of coloring matter in plasma. Tests by the usual methods show that values obtained with congo red are more variable and higher than has theretofore been believed, that volume determinations made with congo red and trypan red on plasma of the same animal give different values, and that the concentration of trypan red in plasma diminishes with time, thus giving increasing values for the plasma volume of the normal rabbit at each point of determination. Experiments for determining blood volume by means of colloidal Ag gave the following facts: a) colloidal Ag may be found in the blood 24 hrs. after administration, giving evidence of its relatively slow removal. b) The concentration of the Ag remains the same for periods of 4 to 10 min. c) Tests with Ag-albumin give similar results. d) After the addition of a solution of a salt of Ag to blood (in vitro) Ag is to be detected in the plasma but not in the blood cells. e) Following the injection of colloidal Ag into the blood stream there is a difference in its distribution between plasma and whole blood. f) When, following the injection of larger amounts of collargol into rabbits, blood samples were taken at definite intervals and analyzed for Ag salts, Ag-albumin and metallic Ag, it was found (1) that a large amount of colloidal Ag is changed into Ag salts within 3 minutes, (2) that the Ag salts diminished at a greater rate than the continually diminishing Ag-albumin, whence it might be concluded that the Ag salt is converted into Ag-albumin in the blood and taken up as such by the organs, (3) that a fractionated Ag determination of plasma showed, after 60 min., a decrease of the Ag salt and an increase of Ag albumin.—*Author's summary (transl. by J. M. Johlin).*

3767. NICE, L. B., MARY E. MORRIS, and W. P. ELHARDT. Polycythemia in white rats. *Physiol. Zool.* 3(4): 494-502. 1930.—The number of erythrocytes in the blood of white rats was studied in the normal state; when given daily injections of adrenalin; when adrenalized and administered adrenalin daily, also when subjected to excitement (anger and pain) in the normal, adrenalectomized, and splenectomized states. The average number of erythrocytes per cubic millimeter of blood in 11 normal rats was 10,840,000 in comparison to 12,080,000 after they had been subjected to adrenalin. This is an increase of 11.4%. The average number of erythrocytes in 11 adrenalectomized rats was 9,480,000 in comparison to 10,490,000 in those injected with adrenalin —an increase of 10.9%. In normal rats subjected to faradic stimulation, the average count before excitement was 10,960,000 in comparison to 12,640,000 in the same animals 3 min. after excitement. This is an average increase of 15.3% above the basal counts. The average count for the group of adrenalectomized rats before excitement was 11,240,000, while 3 min. after excitement it averaged 11,160,000, or an average decrease of −0.7%. The number of erythrocytes in the splenectomized group before excitement averaged 10,150,000 per cubic millimeter of blood, while after excitement it was 9,790,000— a decrease of −3.5%. The splenectomized group which was given adrenalin daily had an average of 10,343,000 erythrocytes before excitement and 10,312,000 afterward —a decrease of −0.3%.—*Authors (courtesy Wistar Bibl. Serv.).*

3768. PACKARD, RAWSON J., L. F. PIERCE, and ROBERT L. WORTHINGTON. I. On hemoglobinometry. *Jour. Lab. & Clin. Med.* 15(8): 746-751. 1930.—As a result of experimental comparison, Packard concludes: That normal hemoglobin means normal for age and sex, and should be determined by Williamson's or other standards, and so recorded. The Dare hemoglobinometer should be discarded. For clinical work hemoglobin may be estimated by the following methods: (a) Rough bedside estimations may be made by the Tallqvist or the Sahli. If the blood is below normal, a more accurate method should be used. (b) The Newcomer disk, or the Newcomer hemoglobinometer as furnished by Bausch and Lomb is sufficiently accurate for clinical work. Blood dilutions made with their pipette can be carried to be read at leisure. When the color index is diagnostic, duplicate tests should be made, and an average of 10 readings be taken from each dilution. If there is any doubt as to the accuracy of a disk, it should be checked by the van Slyke O capacity method or an accurate ferrometric analysis through a wide range. In the case of adults there is so long a period during which the normal hemoglobin scarcely varies that the percentage of variation may be added as a simple and vivid comparison, along with the grams per 100 c.c. blood. For infants and children the percentage of an arbitrary ♂ standard, as used in the past, is only misleading. The hemoglobin observed should be recorded in grams, together with the normal for age and sex, which can be interpolated from Williamson's curve.—*Authors' conclusions.*

3769. PONDER, ERIC, and JAMES FRANKLIN YEAGER. The use of nth order equations to describe the action of simple haemolysins. *Proc. Roy. Soc. [London] B* 106(747): 506-531. 1 fig. 1930.—When the kinetics of simple hemolytic systems containing saponin, sodium taurocholate, or other simple lysins, together with washed mammalian red cells are investigated by the improved methods described in this paper, the results are best described by an expression of the nth order instead of by one of the first order ("monomolecular"), taking place in a population of cells whose resistances are distributed according to one or another type of frequency curve. The first order reaction which has been postulated describes the result quite well over the limited range which has been investigated, but is based on assumptions which are seen to be wrong when the experimental range is sufficiently extended. The value of n determining the order of the reaction which is now supposed to be proceeding varies between about 1.0 and about 3.0, the most usual values, at ordinary temperatures, being between 1.5 and 2.0. The value of n varies, however, with the nature of the lysin, with the temperature, and probably with the type of cell, and is also affected by the addition to the hemolytic system of some accelerators and inhibitors. It is tentatively suggested that the value of this constant is determined by the lysin existing in aggregates of varying size, and by the lysin reacting with some cell component, the molecules of which present varying affinities for the lysin molecules; even if this suggestion proves to be incorrect the equations developed from it are useful in that they provide a very complete description of the phenomena. The type of frequency curve which describes the distribution of red cell resistance to the lysin is probably always negatively skew, the degree of skewness, however, varying considerably. In previous papers the distribution has been supposed, in many cases at least, to be of a symmetrical type, but it is probable that this symmetry is spurious, and the result of treating the reaction between cells and lysin as monomolecular, when it is really of a higher order. While the treatment of the reaction between cells and lysin as one of a higher order than the first constitutes quite a fundamental change in the theory of the kinetics of simple hemolysins, it is shown that the conclusions of most previous investigations require no essential modification. On the other hand, quite a number of observations, inexplicable on the previously adopted theory, become readily explicable on the newer hypothesis.—*E. Ponder.*

3770. SCHRÖDER, INGEBORG. Über die Veränderung der Plasmakolloidstabilität nach intravenösen Traubenzuckerinjektionen bei Operierten. *Zeitschr. Geburtsh. u. Gynäkol.* 98(2): 323-337. 1930.—After operation the stability of plasma colloids was increased whether or not glucose was given. When 500 cc. of a 10% glucose solution was given to 5 non-operated patients there was no change in one case and in the other cases a definite increase in lability. It was concluded that the increase in stability found after operation is due to narcosis.—*D. B. Dill.*

3771. WIENER, H. J., and R. E. WIENER. Plasma

proteins. *Arch. Internal Med.* 46(2): 236-265. 1930.—The 2 main groups of the serum proteins, the albumin and globulin fractions, were determined together with the plasma fibrinogen, cholesterol, Ca and some of the other blood constituents significant to the clinical condition studied. A total of 133 cases was examined, including 20 of healthy adults. In 15 cases of diabetes mellitus and 6 cases of benign glycosuria the plasma proteins were within the physiologic limits. In 40 cases of infections the albumin decreased, slightly in mild cases and decidedly in the more severe infections. The fibrinogen increased, even in slight infections which did not call forth an increased globulin concentration. In the more severe infections the globulin increased, and the increase paralleled the severity of the condition. In 12 cases of hepatic cirrhosis of the liver the albumin decreased and the globulin increased. The changes in the serum protein concentrations, however, were not so marked as in the infectious conditions. The fibrinogen was a low normal or decreased. In jaundice without elevation of temp., the serum proteins were normal or increased, the albumin was generally within the normal limits and the globulin was increased. The fibrinogen remained within the normal limits. In 4 cases of cholecystitis and 3 of jaundice due to arsphenamine the picture was similar to that found in infections. In chronic, glomerular nephritis, in the absence of an infection, the serum proteins were slightly reduced, especially the albumin fraction. The fibrinogen was often slightly increased. In acute nephritis the changes found were the same as in infections. In nephrosis the albumin was materially decreased, the globulin was normal and the fibrinogen was much increased.

FOOD AND NUTRITION

3772. **ABDERHALDEN, EMIL. Über den Einfluss der Ernährung und von Umweltsfaktoren auf die Entwicklung von Kaulquappen.** *Pflüger's Arch. Ges. Physiol.* 216: 749-752. 8 fig. 1927.—The growth of tadpoles can be accelerated by the use of a series of food materials (bread, brain, milk, yeast, etc.). The metamorphosis is influenced to a lesser degree but also in a positive sense. If the supplement of these food materials (with algae serving as the basal diet) is carried on for several weeks, in some cases disturbances in development appear. It is of interest from a general point of view that the development of amphibians in the tadpole stage can be influenced so easily and so effectively.—*Author's summary (transl. by G. T. Lewis).*

3773. **ABDERHALDEN, EMIL. [Editor.] Biochemisches Handlexikon. Rev. by HERBERT MAHN, ERNST ROSSNER, and HANS SICKELT. XII. Band (5. Ergänzungsband).** v+1103p. Julius Springer: Berlin, 1930.

3774. **BECKER, J. ERNESTINE, and E. V. McCOLLUM. The nature of dietary deficiencies of milk.** *Amer. Jour. Hyg.* 12(2): 503-510. 1930.—The data presented show that where rats [number not stated] are confined to rations consisting chiefly of milk and dextrinized starch, progress is not normal. Growth curves show a tendency to flatten after about 3 mos. and normal reproduction is seldom observed. Of 38 diets in which milk powder was used at a 60-85% level in combination with other substances, only 24 sufficed for production of young. In only 4 cases were there 5th generation animals. The supplements in these diets were cooked dried beef liver, 4 and 5%; yeast, 5%; and a combination of ferric citrate and $CuSO_4$.

3775. **BÍLEK, F. Versuchsergebnisse der Aufzucht der tierischen Säuglinge verschiedener Haustierarten mit Kuh- und Ziegenmilch, mit besonderer Rücksicht auf die alimentären Anämien.** *Jahrb. Kinderheilk.* 129(1/2): 98-117. 1930.—Young guinea pigs, rabbits, pigs, kids, calves and colts were tested with goat's milk and cow's milk. In the cases of guinea pigs, rabbits, and pigs a control group of 5 were normally fed by the mother animals, for observation of the normal development, bodily condition and blood picture; while a 2nd group of 10 were taken from the mother soon after birth and fed cow's and goat's milk as substitutes, and a 3rd group of 10 were fed goat's milk. Of the kids, 3 were nursed by the mother as controls, and 3 had substituted cow's milk. Of the calves, 10 suckling calves served as controls, while 10 others had goat's milk. From these experiments and the literature it may be said: For calves, goat's milk is not suited to replace the mother's milk in any case. For orphaned pigs, goat's milk is not by itself a suitable substitute food, especially for the first weeks after birth; but on the other hand, undiluted cow's milk is suitable, provided, of course, that the pigs are kept clean and in a dry, warm place. Pigs 6-8 weeks old can take goat's milk if a concentrate and a green feed containing vitamins be given also. Goat's milk, on the other hand, can be used without hesitation as substitute for cow's milk diluted half and fed warm, for orphaned colts of a tender age, and for this it is best to let the colts suckle the goat directly.—*M. H. Keith.*

3776. **BISCHOFF, GEORG. Fäulnisprozess und Sterinreduktion mit besonderer Berücksichtigung der Verhältnisse im Säuglingsdarm.** *Biochem. Zeitschr.* 227 (1/3): 230-236. 1930.—Even on a sole diet of milk reduced sterols are found in the feces in amounts paralleling the clinically observed putrefaction. Small quantities always occur in breast milk stools and other nonputrefying stools though it appears that dihydrocholesterol rather than koprosterin is involved. The old conception of the putrefaction-inhibiting action of milk applies only to the growing young and then only with certain limitations. In stools from sucklings and small children or even stools from a milk diet no such high koprosterin values are found as occur in stools from a mixed, or more especially a meat, diet. Koprosterin is apparently not reabsorbed by man.—*Author's summary (transl. by C. S. Robinson).*

3777. **BOWER, WARD T. Salmon—an economical and valuable food.** [U. S.] Bur. Fisheries Econ. Circ. 69. 19p. 12 fig. 1929.

3778. **BROOKS, R. O. Critical studies in the legal chemistry of foods.** 280p. Chemical Catalog Co. Inc.: New York, 1927. Pr. $6.—The title is somewhat misleading, since the legal aspects of the book constitute but a minor portion of the discussions and only a comparatively small class of foods is involved. The foods discussed are fruits—fresh, dried, preserved, canned, and fruit juices; vinegar, including one chapter on the interpretation of analyses; condimental sauces such as catsup, salad dressing, prepared mustard; a chapter on

edible oils; cacao products; spices; and maple products. There are 8 appendices from publications largely in trade journals, and these cover fruits, fruit products, fruit beverages, pectin, jelly, and mayonnaise. The so-called "Federal Food Standards," as applied to the above-mentioned products, are quoted and discussed. Their shortcomings, irregularities, and liberalities are explained, and a few instances are given of variances between certain natural substances and these standards, past standards, and certain statutory standards. Many quoted and some original analyses of the foods in question are given and discussed. The author declines to discuss fermented fruit juices and deplores the commercial availability of certain highly toxic distilled beverages and the non-availability of the harmless fermented beverages; which condition he believes to have been brought about by legislation. The book will be of value to persons engaged in industries concerned with the foods discussed. It will also be of interest to food-inspection chemists who desire to obtain information regarding certain trade practices not usually found in the standard textbooks on food, and information relative to abnormal analyses which are liable to result from the examination of apparently normal food products.—*H. C. Lythgoe.*

3782. **EIMER, KARL, und WERNER VOIGT. Rohkoststudien. II. Mitteilung: Die Rohkostbehandlung des dekompensierten Kreislaufs.** *Zeitschr. Klin. Med.* 112 (5/6): 477-527. 14 fig. 1930.—Illustrative cases are reported. Raw food (vegetables, eggs and milk products prepared without the use of heat or addition of NaCl) in the organism with disturbed circulation produces a dehydration and desalination which does not cease on the 2nd or 3rd day, as in the healthy organism, but continues until the body-stores of H_2O and NaCl have been greatly depleted, not only washing away peripheral and organ edema, but producing regularly a remarkable reversal of the refractive value of the blood serum. The favorable effect of the raw diet is based first on its low H_2O and NaCl content, and next on its high mineral content, especially K and Ca salts and basic balance.—*From authors' summary (transl.).*

3783. **EIMER, KARL, und WERNER VOIGT. Rohkoststudien. III. Mitteilung: Die Bedeutung der Rohkost für die diätetische Behandlung des Nierenkranken.** *Zeitschr. Klin. Med.* 113(2): 224-242. 1 fig. 1930.—The limited amounts of water, protein and NaCl in raw food make it suitable for diet in renal cases, of which 4 are described, 2 of acute glomerulonephritis, 1 of chronic nephritis and 1 of secondary renal cirrhosis. In the 2 latter raw food diet produced a remarkable dehydration.

3784. **FINE, M. S. Cereals and mineral metabolism.** *Cereal Chem.* 7(5): 456-465. 1930.—Rats were fed for long periods on diets containing 60% whole wheat, and 60% oats with suitable variations in the Ca: P ratios in the 2 series. By means of x-ray examinations progressive bone changes were observed. It is concluded that occurrence or non-occurrence of rickets on both these grain diets can be controlled by proper adjustment of the Ca: P ratio within wide limits of consumption levels of these elements. Evidence of spontaneous cures on rachitogenic wheat diets is presented. With a comparable oat diet there is less tendency towards such spontaneous cure. Growth and food consumption were better on the wheat than on the corresponding oat diets. These differences are in harmony with data reported by Mellanby, by Steenbock, Black and Thomas, and by Burton.—*Author's summary.*

3785. **GIL, S. A. Über die Bedeutung der Brustmilch als eines auf die Entwicklung des Kindes wirkenden Faktors.** *Jahrb. Kinderheilk.* 128(1/2): 86-94. 1930.—The question studied was whether stimulation of the vagus or of the sympathetic of the mother may so alter the biochemical nature of the milk as to affect the suckling infant. For this purpose an unspecified number of mothers, aged 17-38 yrs., frequenting the Ukrainian institute for care of mothers and children in Kharkow were induced, after expression of the normal milk, to submit to subcutaneous injection of epinephrine or pilocarpine. About 3 hrs. later the milk was again expressed and fed to 22 healthy infants aged 1-12 mos.; ½ hr. after the meal the milk was siphoned from the infant's stomach and analyzed. It was assumed that, since epinephrine and pilocarpine are quickly broken up in the organism, the milk secreted after injection of either contains, not the respective drug, but the physicochemical properties called forth by its injection into the lactating mother. The chlorides, pH and rennin were compared with those after meals of normal milk. After epinephrine milk the chlorides of the entire gastric contents showed no change in 23.5% of cases, increase in 53% and decrease in 23.5%; chlorides of the gastric juice alone, no change in 25%, increase in 62.5%, and decrease in 12.5%; pH, no change, 29.41%, increase, 47.07%, decrease, 23.52%; rennin ferment, no change, 43.75%, increase, 43.75%, decrease, 12.5%. Thus, while in most cases the chlorides were increased or unchanged, the acidity was decreased or unchanged. After pilocarpine milk the chlorides of the entire gastric contents were unchanged in 58.82% of cases, increased in 23.53, decreased in 17.65; chlorides of gastric juice only, unchanged in 50%, increased in 18.75%, decreased in 31.25%; pH, unchanged in 25%, increased in 12.5% and decreased in 62.5%; rennin, unchanged in 41.18%, increased in 35.29%, decreased in 23.53. Thus in the meal of pilocarpine milk the acidity is increased, indicating that the Cl of the gastric contents must occur chiefly as HCl.

A comparison of this method with the usual method based on tables of the individual dietary ingredients showed an agreement within 10% of the latter of the short cut method.—*E. M. MacKay.*

3790. **JONES, J. BREESE, and FRANK A. CSONKA. The prolamins of dwarf yellow milo and feterita, two horticultural varieties of Holcus sorghum.** *Jour. Biol. Chem.* 88(1): 305-309. 1930.—Prolamin is the predominant type of protein in the seeds of kafir, milo, and feterita. The prolamins of these seeds differ only slightly in their elementary composition and in N distribution as determined by the Van Slyke method. The milo prolamin, however, is characterized by lack of trypto-

phane; feterita prolamin contains 1.29%. A globulin fraction precipitable from 10% NaCl extracts of the meals at 47-50% of saturation with $(NH_4)_2SO_4$ was found in small quantities in each of the 3 varieties. The presence of glutelin could not be demonstrated.—*Authors' summary.*

3791. **KOJUCHAROFF, P., und M. JORDANOFF.** Диференциране на млѣката посрѣдствомъ преципитацията и единъ новъ серологически методъ за сжщата цѣль. [Differentiation of different milk species by precipitation and a new serological method.] [In Bulgarian.] Годишникъ на Софийския университетъ, Ветеринарно-медицински факултетъ (*Jahresber. Univ. Sofia Vet. Med. Fakultät.*) 5: 175-260. 4 fig. 1929.—Adulteration of a milk with foreign milk on pecuniary and other grounds very often occurs in Bulgaria. The forensic differentiation of milk adulterated in this way is not possible with the chemical methods we have today. The serological method discovered by the authors rests upon flocculation of the casein by strongly specific lactosera, so-called "lactotest." (Specific only for a definite milk species:—cow's, buffalo's, sheep's, or goat's.) The method is simple, cheap, and suited to large-scale investigation. It is so sensitive that mixtures of 5% of foreign species can be detected with certainty. Relation reactions are entirely removed. By this method one can even investigate pasteurized, boiled, sterilized, or condensed milks, etc.—*A. Kalojanoff (transl. by E. V. Lynn).*

3793. **KÖNIG, J. Neues Verfahren zur chemischen Untersuchung der Futter- und Nahrungsmittel.** 65p. illus. Paul Parey: Berlin, 1930. Pr. 3.50 M.—Discusses (a) defects of the usual procedure in food analysis, (b) new investigations of the so-called N-free extract and the plant cell membrane, (c) composition and characteristics of the constituents of the cell membrane, (d) solubility products of the constituents of the cell membrane, (e) synthesis and cleavage of the constituents of the plant cell membrane, (f) divergent views on the functioning of the plant cell membrane, and (g) a new course of procedure for the chemical investigation of feeds and foodstuffs, in collaboration with Fr. Bartschat and B. Stempel. The new procedure distinguishes: I water; II mineral substances (a) soluble in water, (b) soluble in 2% HCl, (c) insoluble in 2% HCl; III ether extract; IV protein, (a) crude, (b) true protein, (c) amids, (d) water-soluble true protein, (e) true protein soluble in 2% HCl, and (f) true protein insoluble in 2% HCl; V pentosans (total), and VI carbohydrates, etc., classified as (a) water soluble, including glucose, sugar after inversion, dextrin, acids, and unknown substances, (b) soluble in 2% HCl including starch, and proto- and hemi- pentosans, hexosans, lignins, etc., (c) soluble in 72% H_2SO_4 or 41% HCl, including orthopentosans, hexosans, lignin, etc., and (d) insoluble compounds, including lignin, and kutin+suberin.—*E. B. Forbes.*

3794. **KRAUSS, W. E. Studies on the nutritive value of milk. IV. The supplementary value of yeast in nutritional anemia of albino rats.** *Jour. Dairy Sci.* 13 (3): 246-256. 1930.—Ten samples of yeast from various sources were assayed for antianemic potency. Albino rats were used, and both curative and prophylactic procedures were carried out. As measured by hemoglobin determinations, 7 samples showed definite hemoglobin regenerating power of varying degrees; 3 showed very little or none. Some correlation appeared to exist between the Cu content of the yeasts and their antianemic potency. No such correlation was evident with respect to Fe. Some supplementary effect on growth was shown by the addition of yeast to milk. This was attributed to vitamin B.—*W. E. Krauss.*

3798. **PATTEE, ALIDA FRANCES. Practical dietetics. With reference to diet in health and disease.** 17th ed. 856p. A. F. Pattee: Mt. Vernon, N. Y., 1929. Pr. $2.75.—This handbook for nurses and dietitians, combines the subjects of dietetics and dietotherapy, greater emphasis being given to the latter subject. Part I is devoted to an elementary discussion of the principles of nutrition and food preparation. Part II deals with the practical phases of the preparation and serving of foods. The energy value, weight of protein, fat and carbohydrates are presented for each recipe. Part III comprising the major portion of the book gives detailed procedures for the dietary treatment of the various diseases. The several chapters of this portion of the book have been written with the supervision of prominent physicians. The subjects of infant and child feeding and of the proper diet during pregnancy and lactation are fully discussed. A very extensive table combines the energy value, carbohydrate, fat, protein and mineral content of 100 gm. portions of food, together with the weight and the approximate amounts contained in average servings, and data on the vitamin content, % of fiber, acid-base reaction and purine content of these foods.—*A. Spohn.*

3799. **PITMAN, GILBERT. Further comparison of California and imported almonds.** *Indust. & Eng. Chem.* 22(10): 1129-1131. 1930.—The shearing stresses of almonds were found to substantiate the "tooth-test" in determining texture. Differences in hemicellulose content did not explain differences in texture. The average composition of the nuts from the two leading almond districts was practically identical, with the single exception that the Drakes were slightly higher in oil. The Drake from Sacramento gave the highest average oil content.—*G. Pitman.*

3802. **SEEL, H. Experimentelle Untersuchungen über das Sauermilchpräparat "Saya."** *Zeitschr. Fleisch. u. Milchhyg.* 40(14): 294-297. 1930.—"Saya" is said to be prepared by 6 wks. fermentation of pure, uncooked milk at low temperature with complete exclusion of O, under the influence of *Streptococcus lactis, S. paracitrovorus,* and *S. citrovorus.* In all, 40 rats were used. Of these 4 received bread and milk, 6 bread and "Saya" milk; 4 received oats and water, 6 oats and "Saya" milk. The 4 bread-and-milk rats increased 350% in 60 days; the 6 bread-and-"Saya" rats, 373%; the 4 oats-and-water rats increased 133%, 6 oats-and-"Saya" rats, 306%. The remaining 20 rats received a deficient, rickets-producing diet; "Saya" milk was added on the 8th experimental day to the food of 10 rats, and from the end of the 3rd wk. to the food of the other 10. The 1st 10 made a rapid recovery from the rachitis, and by the 60th day their O consumption was practically normal. The other 10 rats made a slower though clinically complete recovery from rickets, with some retardation of growth compared with normal rats. The preparation, then, appears to promote the growth of normal animals and to cure those affected with rickets.

3803. SNYDER, HARRY. Bread. A collection of popular papers on wheat, flour and bread. (With biographical sketch [of HARRY SNYDER, 1867-1927] by ANDREW L. WINTON.) 293p. 10 portraits, 8 pl. Macmillan Co.: New York, 1930.—An appreciation of Snyder's work, as soils investigator and teacher, by FREDERICK J. ALWAY constitutes the 3rd article in the present book. The main section of the book, entitled "Bread" consists of the following of Snyder's papers, reprinted: "Food habits and flour consumption," "White flour, a wholesome food," "The digestibility of breads," "The relative value of white flour and whole wheat flour," "Mineral components of wheat and flour and their rôle in human nutrition," "Camouflage bread," "The bread-fed man and the well-fed man," "Improved methods of flour milling," "The old-fashioned flour mill," "The grading and merchandising of wheat flour," "The flour moisture standard," "The mill chemist," "Some of the flour miller's problems," "The milling value of wheat," "A working knowledge of flours," "The granulation of flour," "Modern milling of hard wheats," "Some of the baker's problems," "The individuality of wheat," "What science does for farm crops," "Soil wealth and its conservation," "Wheat in times of war and peace," and "Washington as a wheat farmer."

3804. SULLIVAN, BETTY, and MARJORIE HOWE. Minerals of wheat. Part I. Sulfur and chlorine. *Cereal Chem.* 6(5): 396-399. 1930.—Determinations of S and Cl were made on a wheat and products milled from it and also on bread baked from the patent flour. The higher the protein content of the samples analyzed the higher the S content. S is combined organically as a component of cystine. S and Cl were almost completely lost upon ignition of samples at 590-600° C.—*Authors' summary.*

3805. THOENES, F. Über den Einfluss saurer Milchmischungen auf die chemische Zusammensetzung des wachsenden Hundeorganismus. *Jahrb. Kinderheilk.* 128 (3/4): 155-160. 1930.—The feeding experiments were carried out in 4 series on 13 puppies for periods ranging from 28 to 117 days. In Series I, 1 dog received unchanged whole milk and the other Marriot's lactic-acid milk; in Series II, 1 dog received whole milk, Scheer's HCl milk, and 1 dog lactic acid milk; in Series III and IV, 2 dogs in each series received whole milk, 1 HCl milk and 1 lactic acid milk. The dogs were weighed at the beginning and again at the end of the feeding period, and at the end the dogs were killed, the flesh and bones separated, and in Series I and II the water, fat, total ash, N, Ca and P found for the bones of the extremities, and the water, total ash, N, chlorides, K, Na and P for the musculature of the extremities were determined; in Series III and IV only the skeleton was analyzed. While in 1 series the skeletons of the dogs on acid milk diet were strongly mineralized as compared with the control, the findings in the 4 series taken together were far from uniform. In Series I and II the musculature showed insignificant variations as between the full milk and acid milk.

Sci.* 41(1): 85-102. 22 pl. 1930.—The composition was determined of 6 varieties of Philippine bananas, 1 from Guam, 18 Philippine fruits, 3 tubers, 3 kinds of seeds, 6 vegetables and 12 forages. Description and photographs are also published.—*H. C. Koser.*

3807. WIEDEMANN, JOHANN FRIEDRICH. Die Zelluloseverdauung bei Lamellicornierlarven. *Zeitschr. Wiss. Biol. Abt. A. Morph. u. Ökol. Tiere* 19(1): 228-258. 9 fig. 1930.—The food of Lamellicornia larvae lacks ordinary nourishing substances to such a degree that cellulose must be made use of as food material. The middle part of the intestine produces an alkaline secretion, which is mixed with the food material to produce a thin paste. The protease contained in this secretion acts only in acid solution, and therefore micro-organisms pass the middle part of the intestine unharmed and find excellent living conditions in the large rectum, where they multiply very rapidly. The combined action of the bacteria is to break down cellulose (certain acids appearing as by-products), and to assimilate inorganically bound N. The end-products which occur are not utilized by the larvae; but in certain parts of the rectum the acids produced by the bacterial action neutralize the alkalinity of the intestinal juices, thus allowing the protease to act. It in turn dissolves a large part of the bacteria and flagellates present producing food material which is absorbed by certain regions of the rectum.—*J. F. Wiedemann.*

GROWTH

3808. DARBY, HUGH H. Studies on growth acceleration in protozoa and yeast. *Jour. Exp. Biol.* 7: 308-316. 1930.—*Paramecium caudatum, P. aurelia,* and *Stylonichia pustulata,* carefully washed, were transferred to and cultivated in satisfactory media. No allelocatalytic phenomena were observed when the volume of the medium was decreased. The observations of Wildiers on the multiplication of yeast can be explained by the buffering action of the organisms on a hyperalkaline medium. The original pH of Wildiers' medium was about 7.2 while the optimum for yeast multiplication was found by controlled tests to be 4.4.—*J. M. Robson.*

3809. HAMMETT, FREDERICK S. The natural chemical regulation of growth by increase in cell number. *Proc. Amer. Philosoph. Soc.* 69(4): 217-223. 1930.—A continuation of work showing, "that the -SH or sulfhydril group is the essential chemical stimulus to growth by increase in cell number" in concentrations of one part in ten million of culture solution, for both plants and animals. Reimann has since applied this principle successfully in healing old ulcers, bed-sores, etc. But sooner or later "cell proliferation as a participant in body size increment stops." To account for this the "Law of Mass Action" is invoked, whereby "the progress of a reaction is gradually slowed and brought to a state of equilibrium by the products resulting from the reaction itself." This possibility was tested also on root tips of corn, by comparing "the action of a series of organic compounds containing partially oxidized sulfur groups" with controls of sub- or fully oxidized sulfur, finding retardation of increase in cell numbers, and of length-growth of the roots. Tests on paramecium give like results, as also on "transplantable growth" material in mice.—*W. Browning.*

3810. HAX, DORA. Tierexperimentelle Wachstumsstudien. III. Mitteilung. Die chemischen Veränderungen des Gesamtorganismus und der Organe im Verlauf der postuterinen Entwicklung. *Pflüger's Arch. Ges. Physiol.* 216: 627-639. 5 fig. 1927.—37 puppies from healthy, well-nourished mothers were studied to determine the changes in the chemical composition of the whole body and of the principal organs with age during postnatal development. The relation between water and dry matter and the glycogen and fat content of the body was determined. The total N, residual N, and sugar content of the blood were determined. The results are given in 6 graphs to facilitate comparisons. Together with the live-weights and the weights of the organs obtained with comparable animals over the same period of time (reported in an earlier paper), the data may be of much value in determining the influence of nutrition on the development of the organs, and also, to some extent, the functions of the organs at various stages of development. —*Author's summary (transl. by W. Hendricks).*

3811. HENTSCHEL, HANS-GEORG. Die Bildung des Haarpigments nach Untersuchungen an Mäusen. *Jenaische Zeitschr. Naturwiss.* 64(3): 551-596. 3 pl., 17 fig. 1930.—The development of hair pigment was studied on mice employing a cross between the albino and the Japanese dancing mouse; also on the Japanese dancing mouse and on the wild grey house mouse (*Mus musculus* L.). Since hair pigment is already formed at birth only embryonic material was used. This permitted very clear observation of the ontogenesis of the hair pigment. In order to obtain a general concept of controlling factors,

pieces of skin were taken from different parts of the body of young animals and embryos, cleared in clove oil or xylol and cut in 10μ sections. The observations showed that the hair pigment develops independently in the epidermis and is not related to the pigment in the cutis. Migration of cutaneous pigment, which is formed earlier, into the layers in which hairs are formed, could not be detected. This fact was especially emphasized and controlled. It was confirmed by the voluminous material, which through the crossing produced a large variety of patterns and colors. While the cutaneous pigment is completely absent in the dancing mouse, it appears well developed in the grey house mouse and in the hybrids. Furthermore, the cutaneous pigment was lacking in all animals on the portions of skin which remained white. The pigment-producing cell is to be regarded as the source of pigment formation. It appears in the earliest stages of hair anlage, in the basal layer of the Stratum germinativum and is easy to differentiate from other cells by the brown color. Often these cells are found in the early hair anlage, where they are present in all regions. It is entirely indifferent for the pigmentation process as to where it begins. The formation of the pigment cone is always present in pigmented hairs. It begins at about half the height of the cutaneous papillae and surrounds it, cover-like, toward the upper part. Yet in embryos shortly before birth pigment is found as fine granules about the nucleus, from which the pigment is further developed and increased. The early stages can be clearly observed in the sections. Pigment is never found in the papilla. The formed pigment cone is in the matrix layer, equally distributed, and spreads into the cortical layer of the hair, which appears diffusely pigmented. Later, the pigment is arranged in the matrix over the nuclei and migrates from the hair cortex into the hair medulla. On the 6th to 7th day after birth the pigmentation of the hair is completed.—*H.-G. Hentschel* (*transl. by H. J. Ropshaw*).

3812. [LEVITT, M. M.] ЛЕВІТТ, М. М. Деякі дані про постембріональний ріст прядки соснової (Dendrolimus pini L.) [Some data on the postembryonic growth of D. pini.] [English summary.] Всеукраїнська Академія Наук, Труди Фізично-Математичного Відділу (Збірник Праць Біологічного Інституту 4) (*Acad. Sci. Ukraine, Mém. Cl. Sci. Phys. et Math.*) (*Trav. Inst. Biol.*) 12(4): 269-277. 1929.—Schmalhausen established that for vertebrates the rate of growth falls inversely in proportion to time. In order to study this law on organisms that have a metamorphosis, larvae of *Dendrolimus pini*, in 8 series, were weighed during the ages I-IV of their metamorphosis. The rate of growth (C) was calculated by the formula: $C_v = \log v_1 - \log v/0.4343 (t_1 - t)$ and the growth constant by $K = Cvt$, where t is the time and v the weight. K was determined for every age in every series, for every series as a whole, for every age in all the series and for the growth of all the population. Passing from age I to II, K increases; from II to III it increases slightly; if there is an age (IV) in which the caterpillars pass the winter, then it decreases from III to IV. If the caterpillars pass the winter in age III, K decreases in this age. In every age K decreases from high values at the beginning to negative values at the end, after some fluctuations in the middle. Average value of K in the population = 3.0240. The law of growth mentioned above is operative in this case. The moults, the stiffening of the chitin, the differentiation, etc., are sharply reflected in the rate of growth.—*B. J. Luyet.*

3813. **MERRELL, MARGARET. The relationship of individual growth to average growth.** *Human Biol.* 3 (1): 37-70. 1931.—An analysis of the characteristics of the mean curve which results from averaging a group of individual curves of any given type. It is shown that the mean curve may be expressed as a series, consisting of a term which is the same function as that describing the individuals, and a series of correction terms. The effect of these correction terms is studied in applications of this analysis to two empirical growth equations, the generalized parabola and the logistic. In the case of the parabola, the correction terms vanish and the mean curve has the same form as for the individuals. In the case of the logistic the correction terms remain and may produce major fluctuations and a skewness in the mean curve, not present for the individuals. As applied to human growth material, these results indicate that the description of growth given by getting the average size of different groups of children at successive ages is an adequate description of the growth of an individual child, as to the number of major cycles of growth, but may differ in its degree of skewness, from that which would be found in the individual children if they were followed through their period of growth.—*M. Merrell.*

3814. **MEYER, PAUL FRIEDRICH. Untersuchungen über die Aufnahme pflanzlicher Farbstoffe in den Körper von Lepidopterenlarven.** *Zeitschr. Wiss. Biol. Abt. C. Zeitschr. Vergleich. Physiol.* 11(2): 173-209. 8 fig. 1930.—Lepidopterous larvae from the following families were used in these experiments: Papilionidae, Pieridae, Nymphalidae, Sphingidae, Notodontidae, Lymantriidae, Lasiocampidae, Noctuidae and Geometridae. Chemical analyses were made of the intestinal contents after feeding plants containing various pigments. Neither chlorophyll nor its split products were found in the intestines of the larvae studied. The green coloring matter that was in the hemolymph was not chlorophyll, but an oxidation product of proteins, produced by oxidases in the hemolymph. Carotin in the food was recovered as carotin in the hemolymph and intestinal fluids. Carotin was found, however, in larvae fed carotin-free food; xanthophyll was never found in the body of the larvae. The larvae could not grow, transform nor form their usual body colors on a chlorophyll- or carotin-free diet. In *Pieris brassicae* larvae there was a sex difference in the pigments of the hemolymph. The hemolymph of ♀ larvae in strong HCl was a deep blue violet when heated, that of ♂ larvae a pale red. The red color of larvae about to pupate and of freshly emerged adults of *Vanessa io* and *V. urticae* was found to be excretory in nature. Excretion of the red pigment was also observed to take place from the malpighian tubules into the intestine.

3815. **NEEDHAM, DOROTHY MOYLE. The chemical changes during the metamorphosis of insects.** *Biol. Rev. & Biol. Proc. Cambridge Phil. Soc.* 4(4): 307-326. 9 fig. 1929.—This is a review of the metabolic changes accompanying morphological changes in insects. Changes in O consumption and CO_2 output; in carbohydrate and fat content of the organism during metamorphosis; N metabolism including the fractions; protein N, uric acid N, basic N, water-soluble N, and chitin N; the formation of silk, and the differences in metabolism between insects forming large and those forming insignificant cocoons are discussed. The silk worm (*Bombyx mori*), the hawk moth (*Deilephila euphorbiae*), the blow-fly (*Calliphora vomitoria*), the corpse fly (*Ophyra cadaverina*) and the honey bee (*Apis mellifica*) are considered. The physico-chemical causes of insect histolysis and of regeneration, and the origin of the low respiratory exchange during the middle period of pupation are discussed.—*T. A. Brindley.*

3816. **OGUSHI, K., und K. YOSHIDA. Die Grundformeln bezüglich der wachsenden Körperstatur des Menschen. (Vorläufige Mitteilung.)** *Folia Anat. Japonica* 8(6): 433-437. 1930.—The authors constructed many empirical formulae from different data of the growth in stature of Japanese and of European children, from birth to puberty. The following general expressions were derived from those formulae: (1) $y = at^b + c$, to be applied for height; (2) $y = ae^{bt}$, for the circumference of chest and for weight; (3) $y = ae^{bt+ct^2}$ for indices of the circumference of the chest or the body weight in relation to height (the letters a, b, and c are used to denote the constants which must be computed; t, the variable "age"; and e, the base of the natural logarithms). Starting from 2 hypothetical equalities $u/l = u'/l'$, $w/l = w'/l'$, in which l, u, and w are the original data of height, circumference of chest, and body weight, respectively,

and l', u', and w' are computed values of l, u, and w, which can be obtained from the empirical formulae above mentioned, the authors obtained the following formulae:

$$(1)\ \frac{l'u}{lw'} \gtrless 1; \quad (2)\ \frac{l'\sqrt[3]{w}}{l\sqrt[3]{w'}} \gtrless 1; \quad (3)\ \frac{l'w}{lw'} \gtrless 1.$$

These expressions define the relative quantity of the periodical fluctuations of u and w, taken in comparison with the height, for the annual increments of u and w proceed exponentially, while the height increases neither in the same manner nor linearly, but parabolically.—*Authors (courtesy Wistar Bibl. Serv.).*

3817. ORR, J. B., and M. L. CLARK. A report on seasonal variation in the growth of school children. *Lancet* 219(5581): 365-367. 1930.—Children to the number of 657, aged from 7 to 11 years, from 4 Scottish towns were measured and weighed in quarterly periods. They showed a very much greater increase in height in the 3 mos. from the end of March to the end of June than in any other period, and the smallest increase in height in the months of October to December. The weight increase was greatest in the quarter July to September.—*Authors' summary.*

3819. SCHAMBERG, JAY F., and ELI SALEEBY. The growth of hair in newly born albino rats. *Arch. Dermatol. and Syphilol.* 22(1): 34-39. 6 fig. 1930.—During 1 yr. the microscopic changes in the hair of an unspecified number of albino rats (born hairless) were studied from birth to the 16th day of life. Removal of the testicles and 1 adrenal gland was followed by a stunting of the growth of hair.

3820. [SCHMALHAUSEN, I. I.] ШМАЛЬГАВЗЕН, I. I. До теорії росту. **[The theory of growth.]** [English summary.] Всеукраінська Академія Наук, Труди Фізично-Математичного Відділу (Збірник Праць Біологічного Інституту) (*Acad. Sci. Ukraine. Mém. Cl. Sci. Phys. et Math.*) (*Trav. Inst. Biol.*) 12(4): 243-268. 1929.—The usual theory of growth supposes that exponential growth is restricted by an increasing obstacle analogous to growth of a population in a limited space; the theory of parabolic growth supposes that the restriction is due to the progressive diminution of the mass of undifferentiated cells or undifferentiated protoplasm in differentiated cells. The fact that the rate of growth falls inversely with elapsed time is explained on the assumption that the mass of undifferentiated cells falls in inverse proportion to age. The same fact in differentiated cells is explained by a decrease of the mass of indifferent protoplasm inversely proportional to age. The growth of undifferentiated cells may be exponential if there is a proportionate increase of the outer surface: it becomes parabolic if there is a decrease of the surface. The growth constant in organs is usually restricted by the form and distribution of the zones of undifferentiated cells to low values. The growth curve of a whole organism is, in general, parabolic as a summation of parabolic curves of separate organs and tissues. The division of the growth process in separate natural periods is so sharp that it makes impossible a single mathematical formulation.—*B. J. Luyet.*

3821. SCHMALHAUSEN, I. Über Wachstumsformeln und Wachstumstheorien. *Biol. Zentralbl.* 50(5): 292-307. 1930.—A brief description of methods suggested by the author for comparative growth studies. The author replies to several objections to his work raised by W. Ludwig (Biol. Zentralbl 49. 1929).—*I. Schmalhausen (transl. by W. Hendricks).*

3822. SLIFER, ELEANOR H. Insect development. I. Fatty acids in the grasshopper egg. *Physiol. Zool.* 3(4): 503-518. 1930.—The fatty-acid content of the egg of the grasshopper, *Melanoplus differentialis* [and *Chortophaga viridifasciata*], was determined by means of the saponification method of Kumagawa and Suto for, (1) eggs kept at 25° C. from the day they were laid and, (2) for eggs first exposed to low outdoor temp. and then placed at 25°C. until hatched. The newly laid egg contains, on an average, 0.352 mgm. of the higher fatty acids. This comprises from 9 to 12% of the wet weight or from 17 to 22% of the dry weight. Hibernation begins, in eggs kept at 25° C., at the end of the 3rd week. By the 21st day each egg contains approximately 0.040 mgm. less fatty acid than when first laid. During the early stages of hibernation little change occurs in the fat content. The later stages of development were studied in eggs first exposed to low temperatures, then placed at 25°C. until hatched. As development proceeds, the amount of fatty acid falls rapidly; and at hatching, less than half—on an average 45.7%—of that found in freshly laid eggs remains. Changes in the viscosity of the egg contents and of the resistance of the shell to destruction by strong alkali were also noted.—*Author (courtesy Wistar. Bibl. Serv.).*

3823. ALLODI, ANGELO, e GIOVANNI DE-MATTIA. Le variazioni della motilità gastrica dopo stimoli fisici differenti (meccanici, termici, diatermici, elettrici) applicati sulla regione gastrica, studiate parallelamente nello stesso soggetto. [Modifications of gastric motility following mechanical, thermic, diathermic and electric stimuli.] *Arch. Sci. Med.* 54(10): 657-676. 3 fig. 1930.—Physical stimuli applied on the skin of the abdomen caused modifications of gastric motility. Heat, massage, faradisation and diathermy hastened the evacuation of the stomach. More effective than all was diathermy. Cold stimulation causes habitually a delay of evacuation. The authors suspect a reflex vagal action following physical stimulation.—*M. Comel.*

3824. BAUR, M. Studien über die Dünndarmperistaltik. *Arch. Exp. Pathol. u. Pharmakol.* 131(3/4): 233-254. 1928.—These are studies of the action of physostigmine and of electrical stimulation on the isolated small intestine of the guinea pig. Through the action of physostigmine the coordinated movements of the longitudinal and circular muscle, as seen in normal contraction of the gut, are shifted due to a more sluggish but higher contraction of the longitudinal muscle. There is a plateau type of contraction of the circular muscle. With poisons which attack the muscle, e.g., Ba, or with mechanical distension, there is an increased contraction of the longitudinal muscle but coordinated action is maintained by a change in the rate of contraction, i.e., by summation. The action of physostigmine is analogous in its effect to a stimulation of the longitudinal muscle at the beginning of its contraction with a resulting superposition and consequent incoordination. With weak galvanic stimuli there results a "relative refractory period" (never an absolute refractory period) in the rhythmically active gut, no effect if the resting gut is stimulated. The point of attack of physostigmine is not the muscle but is apparently Auerbach's plexus.—*A. C. Ivy.*

3825. BAUR, MAX. Die Peristaltik des isolierten Meerschweinchendünndarms im Filmversuch. *Arch. Exp. Pathol. u. Pharmakol.* 133(1/2): 69-83. 3 fig. 1928.—A study of 30 typical peristaltic waves on the isolated small intestine of the guinea pig based on the photo-

graphic method was made. Thirty-five to 45 photographs of a single contraction were taken. Of these 10-12 films showing characteristic changes were enlarged to 9 x 12 or 13 x 18 and from these the time relationships between contraction of longitudinal and circular muscle determined. Surface measurements were made with a planimeter and from these the volume of the gut in different phases of contraction was calculated. From the calculated volume curves hypothetical curves were calculated which would show the volume change due to the contraction of the circular muscle alone, as compared with that produced by contraction of the longitudinal muscle. The hypothetical curves were interpolated with the normal curves with a maximum error of 10%. Contractions of the longitudinal and circular muscle are not synchronous, the longitudinal muscle contraction preceding somewhat that of the circular muscle. Increase in volume is due chiefly to relaxation of the circular muscle, the greatest amount due to contraction of longitudinal muscle being 25% of the total. These results are not applicable to the rabbit intestine.—*A. C. Ivy.*

3826. BAXTER, STEWART G. Continuous pancreatic secretion in the rabbit. *Amer. Jour. Physiol.* 96(2): 343-348. 1931.—Continuous pancreatic secretion (adhering to the general rule of parallel secretion of enzymes) was traced in urethanized rabbits for as long as 10-12 hrs., and in decerebrate or decapitate rabbits for 5-6 hrs. or until death. It persisted unabated and without marked change in enzyme content for 10-12 hrs. after ligation of the pylorus and the common bile duct, and in decapitate and urethanized rabbits, practically unchanged for 4-5 hrs. after evisceration (stomach and intestines). It is assumed that this continuous secretion is essentially a true "spontaneous" pancreatic secretion due to the particular properties of the pancreatic gland in the rabbit.

3827. BAXTER, STEWART G. Nervous control of the pancreatic secretion in the rabbit. *Amer. Jour. Physiol.* 96(2): 349-355. 1931.—From numerous experiments in vagus stimulation Baxter concludes that the vagus nerve, contrary to previous belief, is a true secretory nerve to the pancreatic gland in the rabbit, and possesses secretory "trophic" and motor fibres to the ducts. The pancreatic secretion in the rabbit was stimulated by the parasympathetico-mimetic drugs, pilocarpine and acetyl-choline. Section of the parasympathetic nerves to the pancreatic gland had no marked effect on the rate of secretion or the enzyme content. Stimulation of the splanchnic nerves in the rabbit produced, after a preliminary inhibition, an increase in the rate of secretion and a definite rise in the tryptic power of the pancreatic juice. Repeated injection of small amounts of adrenaline produced the same results in the pancreatic secretion of the rabbit as stimulation of the splanchnic nerves. Section of the sympathetic nerves in the rabbit produced an immediate and profound fall in the enzyme content of the pancreatic secretion, which had a lasting effect.

3828. BILLI, A. Alterazioni istologiche nell'intestino di animali con fistola duodenale. [Histological alterations in intestine of animals with duodenal fistula.] *Boll. Soc. Ital. Biol. Sperim.* 5(4): 594-595. 1930.—In the intestine below the fistula, especially in the colon, alterations of epithelium of the mucosa, hemorrhage and abnormal mucin production were observed.—*M. Comel.*

3829. DELRUE, GEORGES. Étude de la sécrétion acide de l'estomac. I. Sécrétion acide de la muqueuse isolée de l'estomac de grenouille.—Technique.—Action de l'histamine et de la pilocarpine. *Arch. Internat. Physiol.* 33(2): 196-216. 1930.—The surviving isolated gastric mucosa was stretched across lateral communicating apertures between 2 test tubes, placed upright side by side; both tubes were filled with fluid, one representing the organism (O) with Ringer's fluid, the other representing the gastric cavity (I) with distilled water; 23 experiments are reported. The mucosa remained alive in some cases as long as 24-29 hrs., tending to maintain in vitro on the side corresponding to the gastric cavity a constant pH identical with the pH of the contents of the living stomach. Pilocarpine alone in the Ringer's fluid (O tube) had no stimulating effect on the isolated mucosa, but gastric extract with pilocarpine produced an acid secretion and a toxic action by which the mucosa was soon killed. Histamine alone stimulated the mucosa to acid secretion; histamine plus gastric extract was more active and possibly, not certainly, toxic.

3831. ERBEN, ALOIS. Über die ernährungsphysiologische Bedeutung der Mikroorganismen im Darmtrakt der Pflanzenfresser. III. Über die Speicherung von ungelöstem pepsinverdaulichen Eiweiss (Infusorieneiweiss) im Blinddarm des Pferdes. *Pflüger's Arch. Ges. Physiol.* 213(5/6): 571-576. 1926.—In the cecum of the horse occurs a storage of insoluble, pepsin-digestible protein, in all probability in the form of infusorial protein. An increase in bacteria does not occur in the cecum; this appears first in the colon. The formation of the pepsin-digestible (infusorial) protein in the cecum results from the nitrogenous compounds from the ileum, which accumulate in the cecum in a non-absorbable non-assimilable form. The absorption of N-containing digestion products is negligible from the terminal part of the ileum to the beginning of the colon in the horse.—*Author's summary (transl. by B. F. Lutman).*

3832. FORSGREN, ERIK. Über die Beziehungen zwischen Schlaf und Leberfunktion. *Skand. Arch. Physiol.* 60(5/6): 299-310. 1 fig. 1930.—From theoretical considerations, discussed at length, and experiments briefly summarized, Forsgren concludes: The human liver, like that of the rabbit, probably has a rhythmic function with an alternating assimilatory and secretory phase of activity. The secretion of bile in the human reaches its maximum in the day-time and its minimum at night. It can therefore be concluded that the assimilatory (anabolic) phase of activity of the liver reaches its maximum at night, at the time of minimum bile secretion. According to observations to date there seems to be a different relation between liver function and sleep in rabbits as compared with the human. The rabbit goes into a state of sleep or inactivity in the day-time during which the liver is usually in its secretory phase of activity. The afternoon inertia due to digestive activity in the human is perhaps a condition related to the day-time sleep of the rabbit. It is, at any rate, possible that certain substances, originating during the secretory phase of activity of the liver, have an hypnotic effect. This assumption is supported by experiments which show that water extracts of the livers of sleeping animals injected subcutaneously into active and alert animals produce a condition of inactivity.—*Author's summary (transl. by B. Blechman).*

3833. GUDJONSSON, SKULI V. (unter Beihilfe von GIRLY OPPENHEIM). Über den Darmdurchgang bei normalen jungen Ratten. *Zeitschr. Ges. Exp. Med.* 71 (1/2): 220-228. 4 fig. 1930.—The periods of time required for transit of food through the various portions of the digestive canal were studied in 120 normal young rats; also the period required to empty the stomach and upper intestine when the rats had consumed a measured portion of food. After 16 hrs. fasting the intestines were half empty. A minute after the rats had begun to eat the ventricle was about full, and after 3 min. the food had begun to pass the pylorus; in 5 min. the duodenum was half full. After 15-20 min. the most of the small intestine was full, and in 1 hr. it was completely full, but the jejunum remained continually only half full, in some segments contents being abundant, in others almost none. The contents remained in the ileum until 80-90 min. after eating had begun; about 80 min. thereafter the cecum was filled; about 160 min. were required to fill the colon. In all 340 min. were required to fill the intestine with the recently eaten food.

3834. HAESLER, KURT. Der Einfluss verschiedener Ernährung auf die Grössenverhältnisse des Magen-Darmkanals bei Säugetieren. *Zeitschr. Züchtung B.*

Tierzücht. u. Züchtungsbiol. 17(3): 339-412. 1930.—In view of the assumption frequently made that bulky foods tend to produce large digestive tracts in swine and thus make possible a greater utilization of the food, extensive investigations were undertaken with growing pigs to determine the influence of foods of animal and plant origin upon the digestive tract. A litter of 9 pigs was divided into 3 groups at the age of 4 weeks. One group received a concentrated diet composed entirely of animal products. The 2nd received a bulky diet of purely plant origin. The 3rd received a normal diet consisting of a mixed feed prepared according to the Ruhlsdorf formula. The animals were slaughtered as soon as they reached a weight of 90 kgm. This weight was attained by the normal group at an age of 21-22 weeks, the vegetable-fed group at 26-27 weeks, and the animal-fed group at 33-35 weeks. The length, volume, inner surface area, and weight of the digestive tract were measured. The length, obtained for only the small and large intestines, was measured after suspending the material in a glass vessel filled with 0.9% NaCl solution and applying a tension of 130 gm. The volume was measured by filling the material with 0.9% NaCl solution at a pressure of 25 cm. The length measurements did not confirm the assumption that a plant diet produces a long intestine and an animal diet a short one. The animal-diet group had the longer small intestines and the shorter large intestines; the plant-diet group, the shorter small intestines and the longer large intestines. For the normal group the length of the small intestine was similar to that for the animal-diet group, and the length of the large intestine was similar to that for the plant-diet group. The length of the whole intestine was 23.20 and 23.90 m. for the normal group and on the average 22.85 m. for the animal-fed group and 21.96 m. for the plant-fed group. The volume of the stomach was greater for the plant-fed group but not significantly smaller for the animal-fed group. The small intestine showed a decrease in volume for the plant-fed group. The cecum was distinctly enlarged by the bulky plant diet, whereas its volume was least for the animal-fed group. The differences in volume were greatest for the large intestine. The data clearly showed a considerable increase in the volume of the large intestine with the bulky vegetarian diet, and a decrease in volume with the non-bulky animal diet. The measurements of the inner surface areas were fairly parallel to the volume determinations. The weight of the stomach corresponds to its volume. The weight of the small intestine was greatest for the normal group and least for the animal-fed group. The weights of the cecum and large intestine correspond to their volumes. The plant-fed group had the heaviest large intestines and the animal-fed group, the lightest. The normal group corresponds more nearly with the plant-fed group in this respect.—*Lenkeit (transl. by W. Hendricks).*

3835. HINRICHSEN, JOSEPHINE, and A. C. IVY. Studies on the ileo-cecal sphincter of the dog. *Amer. Jour. Physiol.* 96(2): 494-507. 1 fig. 1931.—Three methods were used in a study of the innervation and control of the sphincter in the dog: (a) In 40 acute experiments with barbital anesthesia nerves were electrically stimulated to determine the extrinsic innervation of the sphincter. In other experiments various portions of the intestine were distended as a means of studying the reflex innervation. Epinephrine and pilocarpine were injected intravenously. (b) Action of the sphincter on animals with a fistula of the cecum about 1 in. distal to the sphincter was observed directly. (c) In dogs with a fistula of the ileum response to feeding was fluoroscopically observed. Results indicate that the ileo-cecal sphincter in the dog is a true physiological sphincter, for which the vagus nerve contains both motor and inhibitory fibers. The authors believe that the normal vagal control of the ileo-cecal sphincter, the pyloric and cardiac sphincter results in relaxation followed by contraction. The splanchnic nerves contain only motor fibers for and play a rôle in maintaining the tone of the ileo-cecal sphincter, which confirms Elliott's work on the cat and Toennis' on the dog and may explain in part certain clinical observations. Reflex contraction of the sphincter may be caused by either the extrinsic or the intrinsic nervous mechanism. Stimulation of almost any nerve in the abdomen or distension of the stomach, duodenum, ileum, and colon may cause contraction of the sphincter. Motor disturbances of the ileo-cecal sphincter may thus be produced by local pathological changes in the ileum and colon, by abnormal states of the nervous system and by irritation of any portion of the gastro-intestinal tract. Stimulation of the sciatic nerve failed to cause a motor change of the ileo-cecal sphincter, confirming Elliott. Adrenalin and pilocarpine cause the sphincter to contract. A "feeding reflex" is a definite physiological phenomenon, excitation of the duodenum being the most potent factor concerned in the elicitation of this reflex. The emptying of the distal ileum is described and observations of the ileo-cecal sphincter under direct vision in dogs with a cecal fistula are recorded.—*From authors' summary.*

3836. KRAINZ, W. Über die Hauptschluckstelle beim Menschen. *Arch. Ohren-, Nasen- u. Kehlkopfheilk.* 126 (3/4): 259-262. 1930.—It is considered that the locus of initiation of the deglutition reflex in man, at any rate for solids, lies at the side of the posterior wall of the hypopharynx at its commencement. This region is innervated by the glossopharyngeal nerve, which would therefore be the chief nerve of deglutition in man. The sensitive margin of the epiglottis evidently serves as the first accessory reflex locus, apparently coming into activity when fluids are swallowed; it is innervated by the superior laryngeal branch of the vagus, which is thus the first accessory nerve of deglutition.—*R. J. Brocklehurst.*

3837. LESSER, E. J. Untersuchungen über Diastasesekretion. I. Die Freilegung der Diastase in den Zellen der Speicheldrüse. *Biochem. Zeitschr.* 184(1/3): 125-146. 3 fig. 1927.—The diastase content of the parotid glands of the mouse was measured, and data are given as to the normal variations and the correlations between opposite glands in the same mouse. The rates of O-consumption and diastase liberation during periods of immersion in Ringer's solution in a Warburg apparatus showed that no synthesis of diastase went on in the isolated gland, that the diastase in the cells probably existed in 2 forms, and that the rate of its liberation into the bath was proportional to the concentration of the diffusible form remaining in the cell. Experiments with atropine were negative, but epinephrine and pilocarpine hastened the liberation of diastase. Epinephrine did not increase the O-consumption of the tissue, but pilocarpine doubled it. Isocapillary solutions of propyl, butyl, and amyl alcohols which did not affect the O consumption nevertheless had about the same effect as pilocarpine in increasing the rate of liberation of diastase. The process of liberation of diastase is apparently not directly connected with the energy producing processes in the cell; in fact, it appears to demand no contribution of energy. The fact that the various alcohols act in isocapillary and not in isomolar concentration points toward an effect on surfaces, i.e., the so-called cell membrane. The course of events is explicable only on the assumption that diastase exists in 2 forms, (1) diffusible, dissolved in the cell liquids, (2) bound. The "bound" diastase (held by adsorption on the surface of the cell structure) is freed from its attachment by the action on the surfaces of homologous alcohol of isocapillary concentration. The author regards it of the highest importance that the substances which liberate diastase in the parotid of the white mouse promote sugar formation in the liver; this, he believes, explains the significant point in the secretion of digestive ferments. There is a difference between the liver and the salivary glands, since liberated diastase does not leave the liver cell; this is attributed to the fact that in the winter liver of the frog the liberated diastase encounters great masses of glycogen which retain it in the cell.—*F. T. Jung.*

3838. MAIRANO, M., e G. VECCHI. Sull'equilibrio acido-base del sangue nell'occlusione intestinale sperimentale. [Acid-base equilibrium of blood during experimental intestinal occlusion.] *Arch. Sci. Med.* 54(10): 677-684. 1930.—Intestinal occlusion was made in dogs at various levels of the intestinal canal (duodenum, ileum, colon). The blood alkaline reserve steadily increased after occlusion and reached very high values before death. The pH values on the contrary continued normal, and only in the terminal stage an increase of pH was noted.—*M. Comel.*

3839. MOLINARI-TOSATTI, P. Secrezione gastrica da istamina e secrezione da pasto. [Gastric secretion following histamine and after meals.] *Arch. di Sci. Biol.* 13(1/2): 97-108. 1929.—A comparative study on Pavlov pouch dogs. The diagram of the histamine secretion, as regards quantity, free HCl, proteolytic power, closely resembles, though a little shortened, that of the meal secretion. Therefore it is permissible to use histamine to test gastric secretion in man, it being better than the old method of the standard test meal, which gives a mixture of gastric juice and semi-digested food.—*A. Jappelli.*

3840. MONTGOMERY, MARY F. The rôle of the salivary glands in the thirst mechanism. *Amer. Jour. Physiol.* 96(1): 221-227. 1931.—After total extirpation of the salivary glands in 6 dogs the average daily water intake was not increased (making it improbable that the salivary glands play a major rôle in the thirst mechanism) and the buccal mucosa remained healthy and moist.

3841. NAKAYAMA, S., and T. TACHIBANA. The effect of ovarian extract on the gastric fluid. *Japanese Jour. Obstetr. and Gynecol.* 13(1): 66-68. 1930.—The problem of the genesis of peptic ulcer in pregnancy was studied by injection of 3 kinds of ovarian extract, oophormin, ovoglandol and luteoglandol, into dogs with Pavlov fistulae. The site of injection and sex and number of dogs are not specified. A tendency to slight decrease in quantity of gastric secretion, and a decrease in HCl and pepsin, with no particular change in total acidity, were noted.

3842. PRIKLADOWIZKY, S., und A. APOLLONOW. Muskelarbeit und Magensekretion. *Arbeitsphysiologie* 3 (4): 309-314. 6 fig. 1930.—The experiments were carried out on dogs with a Pavlov pouch or esophagotomy and gastric fistulas. The work was running on a treadmill a distance of 6.4 kilometers in 30 min. When the dogs were first made to run and then fed 200 gm. of meat or bread, the gastric secretion was nearly the same in amount and lasted nearly as long as at rest. When the feeding was done first and the dogs were then run, the appearance of the secretion was delayed and it was very much smaller in quantity. The authors interpreted this as due to a hindrance to the reflex phase of secretion. This was substantiated by experiments with false feeding and running, in which the secretion was practically absent, whereas false feeding at rest gave normal amounts and duration. Experiments in which the running was performed 1 hr. after the feeding and after secretion was going on actively resulted in a temporary suppression of secretion and a very small amount after the running was ended.—*T. M. Carpenter.*

3843. TEMPLETON, R. D., and HAMPDEN LAWSON. Studies in the motor activity of the large intestine. I. Normal motility in the dog, recorded by the tandem balloon method. *Amer. Jour. Physiol.* 96(3): 667-676. 1931.—Triple tandem balloons, as devised by Templeton and Bollens, inserted through a cecostomy into the proximal colon, or through the anus into the distal colon, were used in unanesthetized dogs (number not stated). Tracings of the contractions (classified under 3 general types) show relationships suggesting that larger contractions are the result of some sort of summation of the smaller. The fundamental activity of the dog's colon is described as rhythmic pulsations. The mechanism of conversion of these pulsations into moving waves is considered. Differences in activity are noted in the proximal and distal colon: The proximal colon shows high tone changes, coinciding with periods of activity, with progressive delay of contractions analward during the first ½ of the period, and rhythmic pulsations during the middle of the period which may be replaced by contractions delayed oralward in a small area near the cecum toward the end of the period. The distal colon shows only slight tone changes, with little tendency toward interruption of simultaneity in the rhythmic pulsations. A reciprocal relationship is observed between certain types of activity in the proximal and the distal colon.

3844. USUELLI, FILIPPO. Das Verhalten der Panseninfusorien gegenüber Cellulose und grünen Pflanzenteilen. *Wissensch. Arch. Landwirtsch. Abt. B. Tiernähr. u. Tierzucht* 3(2): 368-382. 1930.—The infusoria in the rumen of sheep fed hay and barley were allowed to act on the green and other parts of plants and on starch grains; and on maize cellulose colored with fuchsin and then added, ground, to the contents of the rumen and placed in a thermostat. The green parts of the plants, which contained very little cellulose, were taken up by the infusoria in considerable quantity. The cellulose of the unpigmented parts and especially of the seed coat of the grain (barley in the 1st and 2nd and maize in the 3rd series) was taken up by the infusoria only in minimum quantity. The infusoria evidently have an almost negligible intracellular digestive action on cellulose. Over 80% of the starch contained in the feed of ruminants is taken up by infusoria, and this is in part transformed into glycogen.—*Author's summary (transl. by W. E. Joseph).*

3845. VINEBERG, ARTHUR M. The activation of different elements of the gastric secretion by variation of vagal stimulation. *Amer. Jour. Physiol.* 96(2): 363-371. 1931.—A satisfactory method has been evolved for obtaining a gastric secretion in a dog under anesthesia through the application of rhythmical stimuli to the vagi in the neck. Experiments (number not stated) indicate that a weak induction current applied to the vagi in the neck stimulates a flow of mucus having a high digestive power. The chief source of the mucus appears to be the mucous membrane of the body of the stomach, since it was obtained following the exclusion of the mucoid secretions from the esophagus and from the pylorus. Strong induced currents provoke a flow of gastric juice with a very high digestive power, high acidity, normal content of Cl and a small amount of mucus. It is suggested that the vagus nerve contains different fibres innervating different cytological elements of the gastric mucosa and that these may be activated by currents of different strengths.—*Author's summary.*

ANIMAL PHYSIOLOGY

RESPIRATION

3846. ANTHONY, und HEINE. Spirographische Untersuchungen bei Lungenkollaps. (II. und III.) *Beitr. Klin. Tuberk.* 73(1): 51-58. 11 fig. 1929.—II. Complementary air, reserve air and volume of respiration in unilateral pneumothorax. Reserve air and complementary air are so affected by unilateral pneumothorax that in each individual case the respiratory position of rest corresponds to the new balance of the forces of respira-

tion. The results from different patients are not uniform. In pneumothorax patients the alterations of the neutral position from various changes of posture are not so marked as in healthy subjects; sometimes they are altogether lacking.—III. Normal capacity in unilateral pneumothorax. After unilateral pneumothorax the volume of the thorax and of the sound lung is increased, but the increase fails to offset the decrease in volume of the collapsed lung. The entire study shows with what reserve conclusions should be drawn from spirographic curves after pulmonary collapse, since so many individual factors enter into each case that really parallel cases are hard to find.

3847. BOCK, A. V., D. B. DILL, H. T. EDWARDS, L. J. HENDERSON, and J. H. TALBOTT. On the partial pressures of oxygen and carbon dioxide in arterial blood and alveolar air. *Jour. Physiol.* 68(3): 277-291. 4 fig. 1929.—Alveolar air was collected by a special method and arterial blood by direct puncture, normal men being subjects. Errors due to variations in body temperature, acid production in shed blood, and deviations from a standard dissociation curve were obviated by suitable refinements of technique. O content of inspired air ranged from normal to 9.58%. Pressures of CO_2 in alveolar air and arterial blood showed close correspondence (mean difference 0.2 mm.) when normal air was breathed; with mixtures low in O the difference was somewhat greater (mean 1 mm. higher in blood than in alveolar air). This close correspondence indicates that the number of alveoli in which equilibrium is not established between air and blood must be very small. O pressure of alveolar air exceeded that of arterial blood by 4 mm. or less as long as mixtures low in O were inhaled and blood was less than 85% saturated with O. With higher alveolar O the alveolar O pressure exceeded the arterial by 20 mm. or more. Forced breathing of outside air did not alter this result, so that the difference cannot be due to inadequate ventilation of some alveoli during quiet breathing. It is suggested that when a large proportion of the hemoglobin molecules are unsaturated with O equilibrium with alveolar O is attained more rapidly than when saturation is more nearly complete, because in the latter case the unsaturated molecules would lie deep in the interior of the cells and O would not reach them during the stay in the lungs.—*C. F. Schmidt.*

3848. DAVIES, H. WHITRIDGE. Therapeutic uses of carbonic acid. *Edinburgh Med. Jour.* 36(7): 385-418. 4 fig. 1929.—Respiratory response to CO_2 is increased in conditions of impaired general circulation (mitral stenosis) and of non-gaseous acidosis. It is decreased in conditions of increased CO_2 combining power of the blood, whether due to non-gaseous alkalosis (ingestion of sodium bicarbonate) or to compensated gaseous acidosis (chronic pulmonary emphysema). It has been found that CO_2 is of value in the treatment of many types of respiratory failure, especially those where the respiration tends to be rapid and shallow, gasping or periodic. Also to stimulate the respiratory centre in narcotic poisoning and to promote the elimination of such volatile poisons as methyl alcohol, H_2S and CS_2. By the addition of CO_2 to inspired air, the anesthetist is enabled to control the amount of pulmonary ventilation; by means of the increased ventilation, not only the absorption but the elimination of ether is accelerated. The anesthetist is thus enabled rapidly to deepen or lighten the anesthesia as the stages of the operation may require; therefore to maintain a much lighter anesthesia and use a much smaller amount of ether. This, together with the rapid de-etherisation after the anesthesia, causes a very considerable lessening in post-anesthetic vomiting, collapse and pulmonary complications. The aim of CO_2 use in carbon monoxide poisoning is threefold: (1) To promote the rapid elimination of the poison; (2) to abolish the secondary O_2 lack due to alkalosis; (3) to overcome the functional disability in the conveyance of O_2 by haemoglobin by increasing as far as possible the amount of O_2 in simple solution in the plasma. CO_2 may also be used at high altitudes, improving respiration by the addition of a small amount to the inspired air. The author also advocates the use of CO_2 in cases of shock and collapse, or following the hyperpnea of heat stroke.

3849. EIZAGUIRRE, EMILIANO. Influencia del diafragma en la respiración. *Rev. Soc. Med. Interna y Soc. Fisiol.* 4(2): 211-226. 8 fig. 1928.—A case is described in which phrenectomy and pneumothorax for alleviation of a tubercular lesion were complicated by a subsequent pregnancy, accentuating the effect of the phrenectomy. X-ray examination after resorption of the pneumothorax showed the liver entirely within the thorax and the lung half collapsed by the ascent of the paralyzed diaphragm. Therefore, since so much resistance is offered by the diaphragm in normal pregnancy, this muscle has a more important rôle in respiration than is usually accorded to it.—*B. R. Lutz.*

3850. HERMANN, H., et L. MERKLEN. Des effets physiologiques de la reduction du champ de l'hematose chez les Cheloniens par ligature d'une bronche. *Bull. Soc. Nancy* 2(6): 685-690. 1926.—Earlier work by these authors showed that ligating one bronchus first caused frequency of breathing to diminish while amplitude progressively increased to a maximum. Then frequency increased while amplitude decreased, thus restoring normal respiratory rhythm. At this stage the volume circulating through one lung equaled or surpassed that originally circulating through two. Absorbed O compensation lagged, beginning only after circulating volume was reestablished. However, final O figures were normal. The present paper adds that the absorbed O reaches and maintains a figure considerably above normal in quiet, non-hibernating animals. Body weight falls upon ligation, increases after respiration has been compensated, but never attains its original figure. Compensation is not adequate, for while most animals survive throughout the period of activity, all die at hibernation.—*A. L. Hintze.*

3851. JACOBAEUS, H. C., G. SELANDER, and N. WESTERMARK. Attempt at a clinical functional test of the emptying capacity of the bronchi. *Acta Med. Scandinavica* 71(3/4): 379-437. 45 fig. 1929.—Lipiodol, colored with 1% Red Sudan, was injected into the bronchi and roentgenographic studies were made, following the technic of Sicard and Forestier. Simultaneously sputum was measured and examined: the red color of the oil made possible a study of the duration of expectoration, as well as the appearance and distribution of the material in sputum. The expectoration of lipiodol in all cases (with or without pulmonary disease) was found to occur in two phases: first, the oil appears in large quantity (4-8 hrs. in normals); then frequently a transition stage (8-12 hrs. in normals) during which lumps of oil are still expectorated; then a second phase, often lasting several days, during which the oil appears in streaks or spots. The first phase is believed to be an expression of the emptying capacity of the bronchi, the second that of the finest bronchioles and alveoli. The present study deals mainly with the 1st phase. Of 4 patients with chronic bronchitis, but without bronchiectasis, expectoration time was found prolonged in 2, indicating that the motility, or emptying capacity, even of radiologically and clinically normal bronchi, may be disturbed. In 14 cases of bronchiectasis, expectoration time was prolonged in all, but not as much as expected (days instead of weeks or months). Of 10 cases of pulmonary tuberculosis, 2 showed no bronchial involvement: expectoration time was normal. In the remaining 8 bronchiectasis and cavities were present: expectoration time was prolonged in all, more than in the cases of simple bronchiectasis as a rule. Six additional cases of other types of pulmonary disease (asthma, collapse, empyema, etc.) showed normal expectoration time. Serial roentgenograms showed that the bronchi undergo occasional generalized contraction, less frequently localized contraction or dilatation. Such contractions are not marked enough to be called peristaltic. Expulsion of lipiodol is apparently due to coughing, a mechanism like

that of an air-gun, a general contraction of the bronchi being also conceivably involved. In the finest bronchioles lipiodol is either propelled toward the trachea by some other unknown means, or else it is aspirated into the alveoli, where it remains for months until finally absorbed. An influence of expectorants (senega, iodine) on the elimination of lipiodol from the bronchi could not be demonstrated. Adrenalin, in a few cases, led to increased expectoration of the oil in fine granules, which were apparently casts of alveoli or finest bronchioles. The figures are roentgenograms of the chest and graphs of the expectoration time of lipiodol.—*C. F. Schmidt.*

3852. KÜSTER. Über Gasstoffwechsel in ventilierten Räumen. *Zeitschr. Ges. Physikal. Therap.* 39(6): 340-347. 1930.—The temp. was about 20° with relative moisture of 65%. The size of the room was 120 cu. m. The subject and observer were continually in the room, so that during the course of the 3 hr. experiment changes in the air could be held within narrow limits. At the beginning of the experiment temp. and moisture in various parts of the room were made as near alike as possible by a 15 min. stirring; the ventilator furnished 1200 cu. m. per hr. Throughout the 3 hr. period the subject remained as quiet as possible on a bed and breathing into a Simonson Apparatus. After an hour's rest of the subject, during which the observer carried out an analysis of the air of the room, the first of the tests of the respired air were made; 3 parallel tests (basal exchange) were made at intervals of 10 min. After this the room air was thoroughly mixed 10 times during the course of an hour; then the 2nd basal determinations with 3 parallel tests were carried out. Then followed a period of 1 hr. without ventilation, during which 2 analyses of the room air were made. At the end of the hour the 3 basal determinations were again carried out. We have experimented on 20 days with 8 subjects and have been able in general to confirm the experimental results of Hermann. We found in the great majority of cases after 1 hr.'s ventilation a distinct fall of the basal exchange, expressed in calories per day, a fall which greatly exceeds the fall without ventilation and also exceeds the limits of error of the method. In confirmation of Hermann's findings we were able to show that even with optimal room ventilation there frequently occurred a diminution of the basal exchange. After discontinuation of the ventilation there occurred in the subjects a tendency to return to the previous height of basal exchange. Changes of temp. and moisture, very limited in our experiments, have, according to Bachmann, an influence when carried beyond the limits of comfort and then in a reverse sense: they raise the basal exchange. The fall of the basal exchange brought about by ventilation is, therefore, all the more striking. We have not been able to explain our observations.—*Author's summary (transl. by I. I. Lemann).*

3853. LAUX, L. Über den Anteil der Kapazitäts- und der Widerstandsänderungen der Lungenbahn an den respiratorischen Schwankungen der Stromstärke. *Pflüger's Arch. Ges. Physiol.* 224(1): 110-120. 1930.—Intrapleural and intratracheal pressure during natural and artificial respiration, blood pressure and velocity of flow in the pulmonary artery and outflow from the pulmonary veins were recorded. With uniform increase of pulmonary arterial pressure, velocity flow increases more rapidly than the pressure principally as a result of decreased resistance and to a lesser degree as a result of increased capacity of the pulmonary vascular bed. With natural expansion of the lungs, the resistance of blood flow falls considerably and according to the degree of expansion. With artificial expansion, the resistance decreases only slightly and with low degrees of expansion; with greater expansion, the resistance rises. With natural respiration, the blood velocity rises, therefore, with increase of pulmonary arterial pressure as well as because of expansion of the lungs; during artificial respiration, only with increased blood pressure. Periodic changes of extrapulmonic negative pressure (natural respiration) cause increase of pulmonary inflow and decrease of outflow during inspiration and, conversely, during expiration. The inspiratory increase of inflow rests chiefly on the fall of resistance in the arterial vascular bed; the 3-6 times greater variations of outflow depend on capacity changes in the veins. During periodic changes in intratracheal pressure (artificial respiration) inflow and outflow behave alike, both falling during increase of pressure and both rising during decrease of pressure. The decreased inspiratory inflow is due to increased resistance of the vascular bed and the very much greater decrease of outflow to the artificially expanded lung.—*L. Laux (transl. by D. A. McGinty).*

3854. LINTZEL, W., und T. RADEFF. Über die Wirkung der Luftverdünnung auf Tiere. I. Hämoglobingehalt, Erythrocytenzahl, Herzgewicht. *Pflüger's Arch. Ges. Physiol.* 222(5/6): 674-689. 1929.—White rats and mice were exposed to abruptly or progressively established air pressure of 280 mm. Hg., some of them brought back toward a normal atmosphere while others remained under the low pressure conditions. At the end all were sacrificed. Those exposed to acute anoxemia, which died during the experiment, showed increase in the erythrocytes and Hb per cmm., but their total Hb was scarcely augmented. Increase of Hb and of the total blood-volume was more notable in progressively acclimatised animals. These changes had disappeared 4 weeks after they were brought back to normal air. The heart weight of young animals increased in the low pressure from 3.5 to 4.9 gm. per kgm. of living body-weight. The work-performing capability of the heart is considered as the deciding factor of acclimatisation to low air-pressure. —*W. Lintzel (transl. by J. J. Izquierdo).*

3855. MANQUAT, M. L'eau milieu respiratoire. *Rev. Questions Sci.* 15(3): 431-445. 1929.—The author discusses the principle of the constancy of the respiratory medium (Colosi) and supports it with several arguments. His own observations on the Lumbricidae and Helicidae exposed to drying in a desiccator are given. The observations of Colosi on frogs subjected to a purely aquatic respiration, those of Cecchini on respiration of the Limacidae, those of Domini on respiratory function of wet mammalian skin and those of Caroli on atmotropism of toads are presented. The author reviews the experiments and their results.—*G. Colosi (transl. by A. Canzanelli).*

3856. MARGARIA, R. Die Arbeitsfähigkeit des Menschen bei vermindertem Luftdruck. *Arbeitsphysiologie* 2(3): 261-272. 5 fig. 1929.—The amount of work which could be done in 10-15 min. at various air pressures at or below atmospheric pressure was determined by means of a bicycle ergometer in a pneumatic chamber. With diminishing air pressure, the amount of work performed fell at first slowly, and then at a pressure of 400-500 mm. Hg. fell off very rapidly and at 300 mm. fell to 0. It was concluded that the first stage of the fall in performance was due to a diminution of the oxidation processes in the muscles and that the second and final falling off was due to an asphyxiation of the nerve centers which made them incapable of sending impulses to the muscles.—*T. M. Carpenter.*

3857. MARGARIA, R. Sulla resistenza alla depressione barometrica in miscele di aria ed anidride carbonica. [Resistance to low pressures of animals breathing air of various CO_2 percentages.] *Arch. di Sci. Biol.* 13(1/2): 19-30. 1929.—CO_2 added to the inspired air up to 20% does not modify the resistance of guinea pigs to pressure diminution.—*A. Jappelli.*

3858. NARINS, SIDNEY A. A quantitative study of the effect of chloroform on oxygen consumption of the tadpole (Rana clamitans). *Physiol. Zool.* 3(4): 519-538. 1930.—The average hourly variation in O consumption of 21 tadpoles was 21.4%. Thirty-six tadpoles were subjected to chloroform solutions having the concentrations of 0.01, 0.02, 0.03, 0.04, 0.05, 0.0625, and 0.125%. The average % depression in O consumption was, respectively, 30.9, 41.3, 48.7, 53.2, 55.5, 56.5, and 67.5. Recovery from anesthesia is rapid, normal O consumption being attained within 1 hr. after respiratory movements are resumed.

During deep anesthesia, the O consumption is depressed to a low level, at which point it remains fairly constant as long as the anesthesia is complete. The effect on O consumption of various solutions of chloroform whose concentrations were less than the lowest showing a reversible depressing effect was tested as above on 21 tadpoles. The concentrations used were 0.005, 0.00625, 0.0075, and 0.00825. The average % variation in O consumption was, respectively, 6, 5.5, 15.9, and 15. Since all of these variations were within the average greatest % variation for the normal series, it was concluded that none of the concentrations tested showed any measurable effect. No concentration was found which stimulated O consumption. The threshold point, it was concluded, lies somewhere between 0.00825 and 0.01% chloroform.—*Author (courtesy Wistar Bibl. Serv.).*

3859. PAWLOWSKY, E. N., und N. M. LOPATINA. Einfluss der Nasen- und Trachealatmung auf die Lungenventilation. *Monatsschr. Ohrenheilk. u. Laryngo-Rhinol.* 64(7): 815-823. 1930.—Using the expired air as a measure of ventilation, 42 experiments and more than 300 determinations were made on anesthetized, tracheotomized dogs, nasal and tracheal respiration alternating in 5-min. intervals. The variations in pressure in the pleural excursions were measured by a water manometer. Ventilation was reduced 25-30% during tracheal respiration, mainly through a decrease in the depth of respiration. Extirpation of the nerve supply of the upper and lower respiratory tract, occlusion of the sinuses, division of the olfactory nerves and introduction of warmed, moist air into the trachea did not increase tracheal ventilation. In a few instances in 20 experiments extirpation of the trigeminal nerves resulted in equalization of respiration.

3860. ROMANOFF, ALEXIS L. Effect of composition of air on the growth and mortality of the chick embryo. *Jour. Morph. & Physiol.* 50(2): 517-525. 1 fig. 1930.—Fertilized hen's eggs of known origin were incubated under predetermined, standardized, and uniform conditions of all physical factors except air, the composition of which in respect to the CO_2 and O varied in each experiment. The growth and mortality of the embryo were studied daily, with, on an average, 4 observations. The experimental data show that the continuous exposure to about 0.4% CO_2 in the air of the incubator stimulated growth during the first part of embryonic life. A high content of CO_2 and at the same time a slightly reduced content of O resulted in diminishing of the size and increasing of mortality of the embryo. The maximum combined proportions of these gases possible for growth of the embryo were about 22.0 and 16.3%, respectively. A temporary exposure (24 or 48 hrs.) to a large amount of CO_2 resulted in diminishing the size of the embryo without apparent deformities or increase of mortality.—*Author (courtesy Wistar Bibl. Serv.).*

3861. SCHWIEGK, HERBERT. Der Einfluss der Kohlensäureatmung und Hyperventilation auf die Blutgeschwindigkeit des Menschen. *Zeitschr. Ges. Exp. Med.* 74(1/2): 274-292. 1930.—Voluntary hyperventilation increased O consumption in 6 subjects much more than during an equally increased respiration brought about by rebreathing CO_2. In the period following hyperventilation, O consumption fell below the rest value. After 5 min. breathing an 8% CO_2 mixture, min. volume (Grollman) increased by 50-130%, persisting for about 10 min. in the post-experimental period. During voluntary hyperventilation, the circulation does not accelerate in proportion to the increased O consumption and falls as much as 45% below the rest value in the post-experimental period. The CO_2 dissociation curve of blood does not alter after breathing 8% CO_2 for 5 min. pH calculations in arterial blood after CO_2 show changes toward the acid side of .12 to .18, amounts which according to other investigators bring about physiological changes in the vascular bed.—*Author's summary (transl. by D. A. McGinty).*

3868. LANDSBERG, MARTIN. Interferometrie und

innere Sekretion. *Deutsche Zeitschr. Chir.* 213(3/4): 198-201. 1929.—The relations of glands of internal secretion shown on a normal curve established by Zimmer are compared with the findings obtained from more than 200 individual experiments. In accord with Zimmer, it is found that normally the hypophysis, thymus, and adrenals showed no decomposition over 20 drum divisions and that the relation between hypophysis and thyroid is on an average 1:2.3. Yet there occur also normal instances in the proportion of 1:4. The correlations between thyroid and gonads deviate with a difference of 9 drum divisions, which is pathological. The highest decomposition is not shown with the thymus, as given by Zimmer, but with the adrenals. Deviations are explained from the different effects of the opzimes established by Hirsch which Zimmer and Landsberg utilized. Opzimes of differently established numbers show a difference of 5 drum divisions. Formulation of a generally valid, normal curve is not yet possible.—*M. Landsberg (transl. by G. Bachmann).*

3869. LIPSCHÜTZ, A. Zur Terminologie der weiblichen Sexualhormone. [Terminology of the female sexual hormone.] *Biochem. Zeitschr.* 220(4/6): 453-455. 1930.—In the endocrine activities of the ovary there are 2 phases: the follicular phase (in which folliculin, the estrus-exciting hormone, is formed), and the corpus luteum phase (in which a luteohormone is formed, which is concerned with the implantation of the ovum). It remains to be seen whether there is need to distinguish an α-luteohormone, which governs the growth of the pregnant uterus, and a β-luteohormone, which inhibits estrus. The discovery by Aschheim and Zondek of rut-exciting substances in urine of which it is not yet known whether they are of ovarian or placental origin makes necessary a name by which to identify them without assuming their identity with folliculin. The same applies to the feminizing substances discovered by Loewe et al. in plants, for which Loewe proposed the name "thelykinine." It is desirable to distinguish the estrus-exciting substance of vegetable origin as such. The most suitable term for the purpose is "estrin," proposed by Parkes and Bellerby for the hormone of the follicular fluid but unsuitable for that purpose because based on function, not on localization. "Estrin" is well adapted to indicate substances of non-ovarian origin which produce follicular action; thus, plants produce so many units of estrin; urine contains estrin. Whether there is an estrin identical with the ovarian folliculin is a question for investigation. Laquear and Dingemanse have already shown a difference between the folliculin from follicular fluid and the estrin from urine.

3870. M'GOWAN, J. P. On the nature and structure of the suprarenal cortex. *Edinburgh Med. Jour.* 37(9): 545-553. 1 pl. 1930.—Certain appearances of the suprarenals of fowls suffering from leucosis have led to deductions regarding the structure and function of its tissues. The occurrence of a myelocytic proliferation in the sinusoids would seem to be an instance of the general rule that myeloid tissue is formed in endothelial or subendothelial situations in veins. The cortical nodules are considered to be periarterial structures and to be formed in the mature gland by the development of the reticulo-endothelial elements in the sheaths of arterioles. The cells of the cortex, therefore, are mesoblastic in origin. As regards their function ordinarily in the sex complex, it has been suggested elsewhere by M'Gowan that, while the interstitial cells of the ♂ and ♀ gonad regulate the sex characters, the cells of the suprarenal cortex have a wider function in that they compel the soma of the individual to conform to the type represented by the indifferent germ epithelium. They act, thus, as the architects for the construction of the neutral soma. As they have no contact with the germ cells subsequent to the original one, it is presumed that the essence, incorporated then, is passed on hereditarily from cell to cell in division. As the indifferent germ epithelium of the germinal ridge disappears, it would seem that the interests of the species must be entrusted to some persisting organ. The view advanced here is that this is the suprarenal cortex.

3871. NAKAYAMA, S. Effect of placental extract and a few endocrine preparations on gastric juice. *Japanese Jour. Obstetr. and Gynecol.* 13(2): 176-178. 1930.—This paper merely states conclusions drawn from an experiment in which placental extract in various concentrations was injected into a dog with Pavlov fistula, and the changes in gastric juice throughout a subsequently induced pregnancy were then observed. The placental extract 500 times diluted acts upon the sympathetic nerves as a stimulant, causes decrease in the secretion of gastric juice, and acts inhibitively upon the secretion of acid, especially free HCl. At the same time, among the parasympathetic nerves the extract stimulates the nerves that control the secretion of pepsin. Thus both the controls are balanced, and consequently the normal value is perhaps maintained. In the case of placental extract 20 times diluted, the action is stronger, and the nerves that control the secretion of gastric juice are also stimulated, these belonging to the parasympathetic nerves; thus it is supposed that an increase is caused in the quantity of juice secreted.

3872. VAN DYKE, H. B., PERCIVAL BAILEY, and PAUL C. BUCY. The oxytocic substance of cerebrospinal fluid. *Jour. Pharmacol. and Exp. Therap.* 36(4): 595-610. 5 fig. 1929.—In 12 out of 17 experiments on isolated guinea-pig uteri the effect of cerebrospinal fluids (15 canine and 2 human) on uterine contractions was greater than that of artificial fluids when the Ca content of the cerebrospinal fluid was greater, but the same when the Ca content of the 2 was equal, posterior-lobe oxytocic substance remaining the same. In 4 experiments no effect was produced by either cerebrospinal or artificial fluid. The melanophore-expanding effect of cerebrospinal fluid and serum may be due to differences between their Ca concentrations and those of artificial fluids used in the limb-perfusion method of assay.

136(5/6): 300-330. 4 fig. 1928.—The perfusion apparatus and technique described by Jacobj (see Entry 3708, in this issue) was employed. The flow of blood to even such sensitive organs as the kidneys may be interrupted for 30 min. or even longer, and the organs brought back to normal function. With a blood pressure maintained at normal height the blood flow through the organs rises after a short initial decrease, so that within 1-1½ hrs. there is gradual recovery, even to the point of urine secretion. In the apparatus, in the absence of vascular tone of the kidneys, normal urine secretion should reach an amount of 200% of the kidney weight (70-80 ccm. for 35-40 gm. kidney tissue), while in the normal living animal with a normal amount of blood flow through the kidneys, 50-100% of the weight of kidney tissue is to be regarded as normal urine secretion. Addition of caffein to the blood accelerates the increase of the blood flow until the height necessary for secretion has been reached, the blood pressure during the restitution period remaining the same. The secretion increases, and may reach a strong diuresis (4.8 liters per day). When such urine secretion occurs, the cells of the tubules show the characteristic microscopic changes described by Heidenhain for strong diuresis in living animals—a proof of their normal life and function. During the recovery of the kidneys, the pulse-rate and amplitude influence urine secretion; a small quick pulse increases diuresis, while a slow pulse with greater amplitude diminishes it. This influence of the pulse in urine secretion confirms, as does the above mentioned microscopic finding, the conception of Jacobj (Münch. med. Wochenschr. 1911. Nr. 36) that for urine synthesis and secretion the "recoil-elevation" (as in the physical mechanics of the hydraulic ram), through the rise of the blood pressure effect in the glomeruli, plays a significant rôle. —*C. Jacobj (trqnsl. by L. S. Godfrey).*

3876. LIVSCHITZ, A. E. Der Einfluss von Schlammprozeduren auf die Bildung des Harnstoffes und auf dessen Ausscheidung im Harn. *Zeitschr. Ges. Physikal. Therap. Abt. A.* 37(4): 161-164. 1929.—The daily total of urine urea increases immediately after institution of the mud bath treatment. Since earlier study by the author showed that this treatment does not alter the blood urea, he concludes that it results in an increased formation as well as an increased excretion of urea.—*Author's conclusions (transl. by M. E. Collett).*

3877. LURZ, L., und H. RÖHRICH. Einfluss der paravertebralen Anästhesie auf die Nierensekretion. *Bruns' Beitr. Klin. Chir.* 147(4): 639-641. 1929.—In a 3-yr. old boy the urinary bladder had been removed. Tests were made of the amounts of urine secreted and of the amounts of NaCl in solution from the right and left ureters with both sides normal, with right paravertebral anesthesia and left side normal, and with left anesthesia. In opposition to Wiedhopf, who maintained that by paravertebral elimination of segments D 11, D 12, and L 1 a regular increase of urinary secretion was produced, with a small proportionate and large absolute increase in NaCl elimination, the present authors found the amounts of urine alike on the normal and anesthetized sides, and no regular change in NaCl excretion.

3878. MADON, V. F. Sulla prova della diluizione e della concentrazione dell'urina dopo la fatica. [The test of dilution and concentration of urine after physical exertion.] *Minerva Med.* 1(18): 737-739. 1930.—To determine the variations in the functional capacity of the kidney to eliminate either water or dissolved substances after intense and prolonged muscular exertion, and the effect of the various toxins formed during exertion and the abundant elimination of water by perspiration on renal functional capacity, 4 persons with normal kidneys were tested by dilution and concentration. For the 1st test, made in repose or after exercise, the subject was made to drink 800 cc. of water 4 hrs. after breakfast; the urine was collected every hour for 4 hrs. For the concentration test, the experiment was begun 4 hrs. after breakfast; in the interval the subject either rested (control) or walked for about 3 hrs., being weighed before and afterward, and then received a luncheon of weighed and specified solid foods; and another 4 hrs. later; the urine was collected every 2 hrs. for 8 hrs. from the first luncheon. In the dilution test the average 4-hr. quantity of urine eliminated was 927 cc. after repose, 240 cc. after exercise; the average quantity of dissolved substances eliminated was slightly augmented after exercise. The weight of the body in the dilution test diminished by 200-500 gm. after repose and by 800-1,000 gm. after exercise. In the concentration test the average 8-hr. quantity of water eliminated was 365 cc. after repose and 305 cc. after exercise; the average 8-hr. quantity of dissolved substances eliminated was increased after exercise by about 11%; the body weight in the test of repose had returned, 8 hrs. after the ingestion of the first and principal luncheon, to the initial value; in the test with exercise the weight increased during the same period by 200-500 gm. This fact indicates the limitation of perspiration, to compensate for the loss of water during exercise. The average quantity of dissolved substances eliminated per cc. of urine was (taking that in the dilution test after repose as 1) 4 after exercise in the same test; in the concentration test, 5 after repose, 7 after exercise. After exercise, then, the quantity of water eliminated by the kidney becomes lessened, but the capacity of the kidney to eliminate dissolved substances does not suffer thereby; a quantity of solute equal or superior to that eliminated after repose is eliminated after exercise in a smaller quantity of water.

3879. WÜLLENWEBER, GERHARD. Untersuchungen über die Druckverhältnisse in Blase, Ureter und Nierenbecken (besonders während der Schwangerschaft). Zugleich Mitteilung einer neuen Apparatur. *Deutsches Arch. Klin. Med.* 165(5/6): 296-310. 2 fig. 1929.—The author studied the pressures in the urinary bladder and kidney pelves simultaneously, after passing No. 5 catheters up to each renal pelvis and keeping the cystoscope in place, using 3 water manometers. Any increase in the bladder pressure will raise the intrapelvic pressure proportionately. In pregnancy he found the pressure in one or both kidney pelves always above normal; in some instances the pressures were high enough to inhibit renal activity.—*M. Muschat.*

3880. ADLER, MARGARETE. Der Calciumspiegel des Blutserums während der Gestationsperiode. *Arch. Gynäkol.* 143(2): 236-247. 1930.—The Ca content in 14 non-pregnant women was 9.24-10.47 (av. 9.64). In 26 women between the 2nd and 8th month of pregnancy Ca averaged (per month) normal, 9.32, 9.26, 8.60, 8.37, 8.67, 8.39. During partus (5 patients) it was: at the beginning of the 1st stage 8.24-8.96; at end of 2nd stage 9.12-9.40; 24 hrs. after partus 8.08-8.80. During the puerperium Ca rose to the lower limits of normal toward the end of the 2nd wk. The change in Ca appears at the same time as the appearance or disappearance of other blood reactions in gestation, and is attributed to the same causes.

3881. ALLEN, WILLARD M., and GEORGE W. CORNER. Physiology of corpus luteum VII. Maintenance

of pregnancy in rabbit after very early castration, by corpus luteum extracts. *Proc. Soc. Exp. Biol. & Med.* 27(5): 403-405. 1930.—Does, spayed 18 hrs. after mating, were given subcutaneous injections of corpus luteum extract, daily, beginning the day after the operation. Four such does were brought to term, delivering normally at 29, 32, 28, and 32 days; 2, under Caesarian section on the 34th and 36th days, respectively, were found to carry fully developed dead fetuses. In 6 animals, implantation failed to occur; in 2, the embryos were resorbed soon after implantation, but the extract used in 7 of these 8 cases was found to have lost potency.

3882. **BAUMGARTNER, W. J. What moving forces are found in the follicles of the Orthopteran testes?** *Trans. Kansas Acad. Sci.* 33: 107-110. 1930.—A summary of possibilities is followed by the query, is it not both a vibratory movement of the tail of the sperm together with a contraction of striated muscles of the follicle?—for which the author has some evidence.—*F. C. Gates.*

3883. **BENTON, ANNE G. Variations in the milk from different quarters of the same udder: their significance in studies of coagulability.** *Jour. Dairy Sci.* 12 (6): 481-483. 1929.—Volume, fat, serum solids, pH, alcohol test, coagulation at 120° C. and bacterial count were determined for the quarters separately on different days. The samples from separately-milked quarters were frequently no more alike than if obtained from different cows. The quarters of the udder are, thus, physiologically as well as anatomically separate units.

3884. **BOLDRINI, MARCELLO. Sulla proporzione dei sessi nei concepimenti e nelle nascite. [Sex-proportion in conceptions and births.]** *Contr. Lab. Ist. Univ. Cattolica Milano* Ser. I. p. 211-281. 1928.—According to an opinion generally accepted by demographers and obstetricians, the males are conceived in much larger proportion than females, but they are more severely eliminated by ante-natal mortality, which reduces their proportion in living births to the well-known figure of 105 males per 100 females. The author finds this opinion wrong. The external genitalia of the human embryo, during the first months, are such that the females are easily taken for males and erroneously registered in clinical certificates and in vital statistics. These incorrect statistics represent the basis of the current opinion on the subject. Taking statistics obtained from embryos anatomically classified by sex and age, the author states that the proportion of sexes, at the moment of conception, cannot be very far from 1:1, as theoretically suggested by the chromosome hypothesis of sex determination.—*M. Boldrini.*

3885. **BRITTON, S. W. Maternal and fetal blood sugar changes under various experimental conditions.** *Amer. Jour. Physiol.* 95(1): 178-185. 1930.—In 12 cats, 2 rats and a dog and their offspring, comparison of maternal and fetal blood sugar changes showed that under insulin the blood sugar in the mother falls readily to the convulsive level; concurrently in the fetus the glucose percentage is notably higher, however, and may be within normal limits. Even when convulsions are allowed to extend for 2 hrs., the sugar values are slightly in favor of the fetus. The conditions do not hold in very young fetuses, or when the mother is anesthetized before making the (Caesarean) delivery. Normally in the later stage of pregnancy the fetal blood sugar is lower than that of the mother. At birth the values in the kitten were somewhat higher than those of the mother. In 1 case in which an animal gave birth to 4 kittens during severe insulin hypoglycemia, the blood sugars in the latter were within the normal limits, but considerable increments were observed an hour after birth. The mother showed none of the usual hypoglycemic symptoms during parturition, although convulsions followed the same insulin dosage a few weeks later. Marked hyperglycemic reactions which were produced in the mother by emotional excitement, or by adrenalin or glucose administration, did not affect notably the fetal glycemia. It is indicated that during the later stages of gestation, important adjustments are able to be carried out by the fetus in response to various emergency conditions that may be imposed on the mother.—*Author's summary.*

3886. **CANNON, W. B., and E. M. BRIGHT. A belated effect of sympathectomy on lactation.** *Amer. Jour. Physiol.* 97(2): 319-321. 1931.—Observations on 2 sympathectomized dogs and 2 sympathectomized cats show that sympathectomy does not interfere with the processes of reproduction in the ♀, but that it may disturb lactation, and that in the cat and dog the disturbances are more profound the longer the time after the sympathetic system is extirpated.

3887. **CORFIELD, C. RUSSELL. The foetal heart beat.** *Lancet* 218(5563): 803. 1930.—In experiments to determine the relationship of the fetal heart rate to sex of the child, and also to age of mother and sex of future children, 3 separate groups of 100 cases were studied. The fetal heart rate was 112-180 per min. and 6 definite groups were found each with an average age-incidence and sex value. There was only 1 group where ♂♂ predominated and it contained the majority of births, showing a sex value of 51.1 of ♂♂, a fetal heart rate of 131-140, and an age-incidence of 24.74. The chances of a woman having male issue become less with age, and "the experiment suggests that the best age of expectation for male issue is between 24 and 25 years of age."

3888. **CREW, F. A. E., and L. MIRSKAIA. On the effect of removal of the litter upon the reproductive rate of the female mouse.** *Quart. Jour. Exp. Physiol.* 20(3): 263-266. 1930.—The reproductive phase of the sex cycle consists of 2 periods separated by an oestrous phase: the 1st of these is occupied by pregnancy, the 2nd takes the form either of lactation or else of another pregnancy. Pregnancy and lactation are of equal duration and are alternative events, and so the reproductive phase represents a double pregnancy period. In any description of the reproductive phase the lactation period must be distinguished from the period of pregnancy. The non-suckling female can give birth to twice as many offspring in a given period of time as can the suckling.—*F. A. E. Crew.*

3889. **DOMM, L. V. Artificial insemination with motile sperm from ovariotomized fowl.** *Proc. Soc. Exp. Biol. & Med.* 28(3): 316-318. 1930.—Preliminary paper. Spermatozoa operatively removed (post mortem) from the gonads of a poulard which had been ovariotomized when 8 days old and which was over 3 yrs. old when killed, were suspended in Locke's solution and introduced with a medicine dropper into the cloaca and distal end of the oviduct of 3 virgin hens. The eggs produced were infertile. The technique of insemination was tested with the spermatozoa of sexually active cocks and yielded fertile eggs when used on virgin hens. This may indicate that the spermatozoa of fowls undergo a ripening process somewhere in the reproductive tract, as happens in mammals.

3890. **FRIEDMAN, MAURICE HAROLD. The mechanism of ovulation in the rabbit. I. The demonstration of a humoral mechanism.** *Amer. Jour. Physiol.* 89(2): 438-442. 6 fig. 1929.—In 4 ♀ rabbits in which both Fallopian tubes and both uteri were removed, coitus was followed by ovulation. In 9 out of 13 oöphorectomized ♀♀ in which ovarian tissue had been grafted into the rectus muscle, signs of ovulation appeared in the grafts after coitus. Up to about 10 hrs. after ovulation, the changes observed in the discharged follicles of the transplants simulated those seen in the discharged follicles of the normal ovary. These results indicate that following coitus there occurs in the humors of the ♀ rabbit some change, or changes, capable of provoking ovulation.

3891. **GOETTSCH, MARIANNE. Relationship between vitamin C and some phases of reproduction in the guinea pig.** *Amer. Jour. Physiol.* 95(1): 64-70. 1930.—The oestrous rhythm is ordinarily a sensitive indicator of the nutritional state of an animal. When [3] guinea pigs with normal cycles were gradually deprived of vitamin C, the oestrous rhythm was maintained regu-

larly until the animals began to lose weight. The cycles continued although the animals were receiving far from enough orange juice to protect them from chronic scurvy. The onset of oestrus was accompanied by a sudden and temporary loss in weight, amounting sometimes to 8% of the weight of the animal. When 7 ♂♂ were gradually deprived of vitamin C, they lost their ability to sire litters. Smears from the epididymis of ♂♂ dying of chronic scurvy contained motile sperm. That such sperm had not lost their fertilizing function was proved by artificial insemination. In a curative experiment, a ♂ recovered the ability to sire litters.—*Author's summary.*

3892. GRAY, J. The senescence of spermatozoa, II. *Jour. Exp. Biol.* 8: 202-210. 1931.—The available data concerning the spontaneous decay in the activity of a sperm suspension are best described without reference to the precise mechanism which brings to an end the active life of individual cells. The facts can be adequately described on the assumption that there exist intracellular units which form a statically heterogeneous system wherein the period of viability of any given unit in any specific environment is fixed and that this period is not the same for all the units of the population. Static variability is, on this hypothesis, a fundamental property of living matter and is not restricted to populations of cells or of complete organisms.—*J. M. Robson.*

3893. HARTMAN, CARL G., WARFIELD M. FIROR, and E. M. K. GEILING. The anterior lobe and menstruation. *Amer. Jour. Physiol.* 95(3): 662-669. 1930.—Injections of Allen-Doisy hormone (e.g., in the form of Amniotin Squibb) have been known to cause bleeding in ♀ monkeys, whether normal or castrated. It is here shown that this also occurs consistently in baby monkeys 1300 to 1700 gm. in weight, about a year old and 2½ to 3 yrs. before the menarche—that is, corresponding to a human child 3 or 4 yrs. of age. That this effect is not a direct one is shown by the fact that hypophysectomy abolishes it. But bleeding occurs in hypophysectomized as well as normal animals upon injection of anterior lobe extracts or by implants of the fresh gland. This is interpreted as a direct effect. A physiological basis of uterine bleeding is, therefore, for the 1st time demonstrated. It seems reasonable to postulate a separate anterior lobe hormone as the direct cause of bleeding, since it is here demonstrated that the bleeding is independent of the follicle stimulating effect of Smith and Engle and the luteinizing phenomenon of Evans and Simpson and other influences attributed to the gland. With the treatments here outlined bleeding may result from a uterus that shows not the slightest macroscopic change. Hence the threshold for bleeding is far below that causing "oestrous" changes (growth, edema, congestion) in uterus or ovaries. This has adaptive significance, for the prime and original function of the bleeding is that of supplying blood cells (perhaps for Fe) directly to the embryo in early pregnancy; "oestrous" changes would be disastrous to the continuance of pregnancy. Since uterine bleeding may be caused so much more readily than hyperplasia of dormant reproductive tract and ovaries, the gynecologist must determine what benefit the patient receives from a mere bleeding without the usual concomitant "oestrous," not to mention pregravid changes.—*Authors' summary.*

3894. HILL, MARGARET, and A. S. PARKES. Attempts to promote the re-formation of germ cells. *Jour. Anat.* 65(2): 212-214. 1931.—Various extracts containing the anterior pituitary principle were administered to 11 oophorectomized mice without increasing the percentage of ovarian regeneration, and to 20 mice sterilized by irradiation without causing the reformation of oöcytes.

3895. HILL, MARGARET, and A. S. PARKES. Studies on ovulation. IV. Induction of ovulation in the hypophysectomized rabbit by administration of anterior lobe extracts. V. The action of the ovulation-producing substance of urine of pregnancy on the hypophysectomized rabbit. *Jour. Physiol.* 71(1): 36-39, 40-46. 1931.—IV. Experiments on 10 hypophysectomized rabbits surviving for 12 or more hrs. after injection show that acid-alcohol extracts of the anterior lobe of ox pituitaries will cause ovulation in estrous, pseudo-pregnant or immature rabbits hypophysectomized by decerebration. The time taken for induced ovulation to occur in estrous animals is greater than the normal reaction time after copulation: in pseudo-pregnant and immature animals the smallness of the follicles results in a much longer latent period.—V. Great difficulty was experienced in inducing ovulation in hypophysectomized rabbits by the administration of urine extracts. In 4 estrous animals out of 19, however, 1 or more follicles ovulated. Extracts of normal rabbits' placentae were found not to induce ovulation. Highly active extracts were, however, prepared from the placentae of intact or hypophysectomized rabbits previously injected with urine extracts.

3896. HOLDAWAY, F. G. Nutritional status and sex determination. *Nature [London]* 126(3169): 131. 1930.—Preliminary notice is given of results on the determination of sex in the flour beetle, *Tribolium confusum* Duval, by starvation of the newly hatched larvae for varying periods of time under controlled conditions of temperature, humidity, light, nutrition of parents and subsequent nutrition of the larvae. The resulting sex ratios indicate an oscillating change in sex ratio with the period of starvation. A proportion of the population is stable as regards its expression of sexuality, while a proportion is more easily converted to the opposite sex one way or the other; or else forms of either sex may be changed to the opposite sex but there are gradations of sexual stability upset only after varying periods of time. In either case it is indicated that there are gradations in constitution which show a relation between nutritional status, dependent on time of starvation, and the ultimate sex expression.—*F. G. Holdaway.*

3897. KELLOGG, HOWARD B. Studies on the fetal circulation of mammals. *Amer. Jour. Physiol.* 91(2): 637-648. 1930.—The O content of the blood within the 2 ventricles of 16 dog fetuses as determined by the Van Slyke method was found practically the same, averaging about 2 volumes %, which proves that the 2 canal streams mix in the right atrium. Kellogg concludes that the early rapid development of the liver, head and upper extremities as compared to the growth of the rest of the body does not depend upon a superior O supply. In gas analyses of umbilical blood from 12 dog fetuses, the O content varied greatly with the size of the fetus, increasing progressively with growth and not approximating that of the uterine vein until the fetuses were near term. In the fetus at term the area of the placental surface and the rate of blood flow through the placenta are so balanced as to give a maximum efficiency at which the blood in the fetal umbilical vein is approximately the same in O tension as the venous blood of the mother's uterus. Apparently the higher O content of the umbilical vein blood in fetuses near term may be largely explained on the basis of an increase in placental area. Although the CO_2 content of fetal blood is relatively high at all ages, there is little difference between very young fetuses and those at term.

3898. KUNDE, M. M., F. E. D'AMOUR, A. J. CARLSON, and R. G. GUSTAVSON. Studies on metabolism. VIII. The effect of estrin injections on the basal metabolism, uterine endometrium, lactation, mating and maternal instincts in the adult dog. *Amer. Jour. Physiol.* 95(3): 630-640. 2 fig. 1930.—The basal metabolic rate in [2] normal dogs was neither lowered nor elevated as a result of subcutaneous injections of ♀ sex hormone (estrin). Many tests near the lower limit of normal variation occurred, so that the average over a period of daily injections may be slightly (2%) below the average for a control period. Congestion and enlargement of the external genitalia, hemorrhagic discharge from the vagina, hypertrophy of the uterine endometrium with histological evidence of secretory activity, and evocation of the mating instinct followed the administration of ♀ sex hormone in [2] normal and

[2] castrate bitches. Hyperplasia of the nipples and slight palpable enlargement of the mammary glands occurred in all dogs, and copious lactation and evocation of the maternal instinct in 1 dog followed the subcutaneous injection of estrin.—*Authors' summary.*

3899. **MIRSKAIA, L., and F. A. E. CREW. On the genetic nature of the time of attainment of puberty in the female mouse.** *Quart. Jour. Exp. Physiol.* 20: 299-304. 1930.—Comparison of the 105 albino and 65 colored ♀ mice showed that in the first group the average age at onset of sexual maturity was 39 days, and in the second 51.6 days. This fact supports the earlier conclusion that age of puberty is a genetic character. The percentage of pregnancies, on the other hand, is affected by environmental conditions, such as food and husbandry.—*F. A. E. Crew.*

3900. **MIRSKAIA, L., and F. A. E. CREW. On the pregnancy rate in the lactating mouse and the effect of suckling on the duration of pregnancy.** *Proc. Roy. Soc. Edinburgh* 51(1): 1-7. 1930/31.—The pregnancy rate of primiparae, suckling their young, was 24.1%; that of multiparae suckling their young, 50%. This difference is not due to differences in the incidence of ovulation associated with postpartum oestrus. The suggested explanation of this difference between puberal and adult groups is that a certain level of somatic maturity is a prerequisite for full reproductive activity. In all cases the duration of pregnancy was prolonged. The degree of prolongation was variable and could not be related to the number of young in the uterus or suckling. The results provide no support for the suggestion that this prolongation, due to delayed implantation of the fertilised ova, is to be referred to an inhibitory action on the part of the mammary gland. The suggestion is made that the delayed implantation and prolonged pregnancy are due to inability on the part of the corpus luteum to cater adequately for implantation and lactation synchronously.—*Authors' summary.*

3901. **NELSON, W. O., J. J. PFIFFNER, and H. O. HATERIUS. The prolongation of pregnancy by extracts of corpus luteum.** *Amer. Jour. Physiol.* 91(2): 690-695. 1930.—Extracts of corpora lutea of pregnancy (sow) were successful, when administered subcutaneously, in prolonging the period of pregnancy in [9] rats for 30-150 hrs. The young born 40 hrs. or more overtime were larger than normal. If the period of prolongation did not exceed 70 hrs. the young were viable when born. In excess of this time stillbirths occurred.—*Authors' summary.*

3902. **NIBLER, C. W., and CHAS. W. TURNER. The ovarian hormone content of pregnant cow's urine.** *Jour. Dairy Sci.* 12(6): 491-506. 1 pl. 1929.—A simple efficient method of extracting the ovarian hormone from the urine of pregnant cows by the use of oil is described. As a result of the study of the diurnal variation in the volume of urine and its ovarian hormone content on a 12 hr. basis, it was found that the excretion of urine from 8 p. m. to 8 a. m. exceeded the collection during the day by 1117 cc. or 13%; however, the difference in the excretion of the ovarian hormone was insignificant. For successive 24 hr. collections, little variation either in volume of urine or number of rat units was observed. The yield of ovarian hormone is generally independent of the volume of urine excreted during a 24 hr. period. Beginning with non-pregnant cows which excrete the ovarian hormone only at oestrum it was shown that following conception there was a slight excretion of the ovarian hormone during the first 100 days. From 100 days until parturition there was a considerable increase in the rate of excretion of the ovarian hormone, amounting to 3.5 to 4 rat units per day. Following the alcoholic extraction of oils containing the ovarian hormone, there was an apparent increase in the number of rat units present in a definite volume of oil. These results are taken to indicate that there is present in the urine, and absorbed by the oil, some agent which has an inhibitory effect on the ovarian hormone. A tentative theory is advanced that this hormone or factor is responsible for maintaining the anoestrous type of cells in the vagina of pregnant animals.—*Authors' summary.*

3903. **PUJIULA, JAIME. Nota embriológica. Por qué se atrasan y deshacen algunos embriones? [Why are some embryos backward and regressive?]** *Butl. Inst. Catalana Hist. Nat.* 8(8/9): 144-146. 1 fig. 1928.—In the rabbit, some atrophic and some dead fetuses were found. The author supposes that implantation of ova is so governed, by hormones, that the implanted ova are properly spaced, each avoiding the field of action of the others. Failure of this mechanism leads to crowding and competition, perhaps for "primary ontogenetic elements." Hormonal insufficiency may be a factor in the atrophy and death of the less fortunate embryos.

3904. **ROWAN, WM. A unique type of follicular atresia in the avian ovary.** *Trans. Roy. Soc. Canada, Sect. 5, Biol. Sci.* 24(1): 157-164. 4 pl. 1930.—Birds of various species, principally *Junco hyemalis connectens* Coues, were stimulated to recrudescence during winter months at low temp. Although histologically they were normal, certain cases of follicular atresia (5 or 7 in a single ovary; 3 stages described), resembling in initial stages the atresia described by Hill and Gatenby (1926) for *Ornithorhynchus,* were found.

3905. **ROWE, ALLAN WINTER, DOROTHY GALLIVAN, and HELEN MATTHEWS. The metabolism in pregnancy. IV. The nitrogen metabolism.** *Amer. Jour. Physiol.* 95(3): 592-600. 1930.—Three groups of normal women, one drawn from an out-patient service, the other two from institutions, have been studied throughout their pregnancy and for a number of weeks after delivery. With liberal protein intake the N elimination both ante- and post-partum while adequate is somewhat low. This is traced to protein storage during the pregnancy and to protein loss in the milk after delivery. The N partition was studied and only the uric acid showed any marked change with delivery, the earlier values being somewhat high. The nitrogenous constituents of the blood are all somewhat low. Contrary to a frequent report, urea N was found to be nearly 50% of the total non-protein nitrogen throughout the entire period.—*A. W. Rowe.*

3906. **RUNNSTRÖM, JOHN. Struktur und Atmung bei der Entwicklungserregung des Seeigeleis.** *Acta Zoologica [Stockholm]* 9(3): 445-492. 6 fig. 1928.—The effect of mixtures of CO and O on the O intake of *Paracentrotus* and *Arbacia* eggs was studied by the Warburg manometer. Mixtures with 20% O are ineffective; percentages of CO greater than 80% lower the O intake with a maximum effect at 97.5 to 95% CO. The depression is much greater with fertilized than unfertilized eggs; average maximum with the former 64%, with the latter 5%. The spontaneous rise in O intake occurring in unfert. eggs standing in sea-water, the rise in fert. eggs with development, and the accelerating effect of hypertonic sea-water on O intake, are all eliminated by CO. Unfert. eggs after exposure to CO for several hours yield on return to normal sea-water and insemination 100% of membranes; while control eggs kept an equal length of time in normal sea-water produce no membranes but will develop. The CO eggs develop better, however; changes undergone by eggs standing in sea-water are thus eliminated in CO. Fert. eggs after exposure to CO do not develop on return to normal sea-water and show when viewed in the dark field a turbidity indicative of colloidal aggregation. Warburg's theory that CO inhibits oxidation by combining with the respiratory ferment is accepted and on the basis of the equation $n/1-n\cdot CO/O=k$, where n is the amount of uninhibited respiration, k is determined from the data and a curve constructed of the theoretical depression to be expected in fertilized eggs from various CO/O mixtures. The curve agrees well with the data obtained. The lesser effect of CO on unfertilized eggs is considered due to incomplete saturation of the ferment by CO. A symbol for the degree of saturation is introduced into the equation which then yields the result that the degree

of saturation equals the quotient of O intake of unfert. eggs over O intake fert. eggs. KCN inhibits the O intake of fert. and unfert. eggs; the effect is much greater on the former. It also inhibits the spontaneous rise in O intake of unfert. eggs. Urethane can depress fert. and unfert. eggs equally, but usually there is an increase in O intake in unfert. eggs in urethane. The O intake of fert. and unfert. eggs is equally depressed by raising the acidity of CO_2-free sea-water to about pH 6. Hypertonic $MgCl_2$ accelerates the O intake of unfert. eggs; NaCl and $CaCl_2$ had less effect. The increase in O intake is related to the induction of parthenogenesis by these hypertonic solutions.—*L. H. Hyman.*

3907. SIMEONE, F. A., and W. C. YOUNG. A study of the function of the epididymis. IV. The fate of non-ejaculated spermatozoa in the genital tract of the male guinea-pig. *Jour. Exp. Biol.* 8: 163-175. 1931.—Spermatozoa which have attained full functional maturity and are not discharged in copulation, undergo regressive changes which end in death and subsequent liquefaction within the epididymis and particularly within the vas deferens. The number of dead and degenerating spermatozoa appears to be greatest among those removed from the distal end of the vas deferens. It is concluded that spermatozoa are carried out of the testis into the ductus epididymis while they are functionally immature; much of the time consumed in passing through the duct is necessary for a completion of their development. Once full spermatozoon development is attained in a male which is not copulating frequently, there is no influence which preserves them in an optimal functional condition.—*J. M. Robson.*

3908. SLONAKER, JAMES ROLLIN. Pseudopregnancy in the albino rat. *Amer. Jour. Physiol.* 89(2): 406-416. 1929.—During the 1st 8 or 10 days of pseudopregnancy there was a great reduction in spontaneous activity, an absence of oestrual rhythm, an increase in body wt. and in daily food intake, and a development of the mammary glands similar to that found during the same days of true pregnancy. In 475 cases of pseudopregnancy the av. duration from coitus to the 1st succeeding oestrus was 14.53 days (shortest, was 7 days; longest, 19 days). Pseudopregnancies resulted from positive matings of normal ♂♂ with hysterectomized ♀♀ and of vasectomized and castrated ♂♂ with normal ♀♀. Pseudopregnancy can be induced by artificial stimulation of the cervix uteri. Autopsies made at the 1st oestrus following pseudopregnancy showed typical oestrual conditions of the uteri and ovaries. There was no trace of embryos or of resorption. Pseudopregnancy is not caused by any secretion of the ♂ or by young. All the unfertile matings in which erythrocytes were found in the smear following coitus resulted in pseudopregnancy. Many cases, however, in which erythrocytes were not found were observed. Pseudopregnancies were more prevalent in young animals and in those matings made late in oestrus. Evidence indicates that the persistence of the corpora lutea is not caused by a direct nerve impulse to the ovaries. There is a suggestion of a hormone secreted by the mucosa of the vagina, of the uteri, or both, which acts on the corpora lutea either directly or through some intermediary agent, possibly the anterior pituitary gland.—*Author's summary.*

3909. STOTT, T. The spawning of Echinus esculentus and some changes in gonad composition. *Jour. Exp. Biol.* 8: 133-149. 1931.—The spring inshore migration of *Echinus* at Port Erin in 1930 was investigated. Mature gonads were found at the end of February and throughout March and early April. At the end of June all gonads examined were spent. It is probable that May was the chief month in which natural spawning took place. Observations on the cycle of changes in the composition of the gonad from November 1929 to July 1930 showed: (1) An increase in percentage dry weight of the male maturing gonad, the opposite taking place in the female. (2) A decrease in percentage glycogen in both male and female gonads prior to spawning followed by a great post-spawning increase. There is an indication that an increase in the percentage of carbohydrates other than glycogen occurs with the maturation of the gonad and it is suggested that glycogen is transformed into carbohydrate food reserved for the ripe eggs and sperm.—*J. M. Robson.*

3910. VANDEL, A. (préface de M. Caullery). La Parthénogenèse. (Encyclopédie Scientifique.) 412p. 42 fig. Gaston Doin et Cie: Paris, 1931. Pr. 32 fr.—This book gives a history of the discovery of parthenogenesis, a classification of types of parthenogenesis (arrhenotokous, thelytokous, deuterotokous, cyclical, geographic, etc.), and a brief statement of the pertinent facts for each of the taxonomic groups. It contains short discussions of the origin of alternation of generations (as in Cynipidae), of the cycles of rotifers, aphids and cladocera, and of parthenogenesis in general. There are chapters on paedogenesis, accidental (occasional) parthenogenesis, the nematode type of parthenogenesis, and experimental (artificial) parthenogenesis. Under geographic parthenogenesis are described the species in which two races exist, one parthenogenetic and one bisexual, which commonly occupy different areas. Chromosome behavior in natural and artificial parthenogenesis is described. Parthenogenesis in plants is briefly discussed. One chapter is devoted to the relation of parthenogenesis to sex determination. The work of the various authors is critically weighed, not merely restated. Among the general conclusions are discussions of polyploidy, hybridization, variability, and origin of species, all in relation to parthenogenesis. A long but selected bibliography is classified in accordance with the chapter headings and subdivisions, but placed at the end of the book. A full index of authors and another of subjects is included.—*A. F. Shull.*

3911. YOUNG, W. C. A study of the function of the epididymis. III. Functional changes undergone by spermatozoa during their passage through the epididymis and vas deferens in the guinea-pig. *Jour. Exp. Biol.* 8: 151-175. 1931.—Female guinea pigs were artificially inseminated with spermatozoa removed from different levels of the ductus epididymis and with spermatozoa confined in the seminiferous tubules. It was shown that the time consumed by spermatozoa in passing through the epididymis is necessary for a completion of their development and that the changes undergone during this period represent a continuation of changes which start while the spermatozoa are still attached to the germinal epithelium, and are not conditioned by some specific action of the epididymal secretion. Regressive or degenerative changes follow the attainment of an optimal functional capacity in spermatozoa which are not discharged or lost in some other manner. Evidence has been obtained for the existence of a constant distally directed current of spermatozoa through the epididymis even in the absence of copulation. Abortions and intrauterine resorptions occurred with greater frequency among females inseminated with older spermatozoa.—*J. M. Robson.*

3912. HETZER, HILDEGARD, HENRY BEAUMONT, und EMIL WIEHEMEYER. Das Schauen und Greifen des Kindes. Untersuchungen über spontanen Funktionswandel und Reizauslese in der Entwicklung. I. Spontane Zuwendung zu Licht und Farbe im ersten Lebensjahr. *Zeitschr. Psychol. u. Physiol. Sinnesorg. Abt. I. Zeitschr. Psychol.* 113(4/6): 239-267. 8 fig. 1929.—Using a pocket flash light, and red, green, blue and yellow wool as stimuli for children 1-7 mos. of age, Hetzer and Beaumont found that during the 1st and 2nd mos. the child responds with negative effect reactions to both light and color. At the age of 3 mos., positive effect reactions set in. At this age also begins an active turning toward the stimulus instead of the passive reception which previously characterized the behavior. This increasingly positive reaction to optical stimuli appears related to a corresponding decrease in positive reactions in the acoustical field.—*J. L. Jervis.*

3913. HETZER, HILDEGARD, HENRY BEAUMONT, und EMIL WIEHEMEYER. Das Schauen und Greifen des Kindes. Untersuchungen über spontanen Funktionswandel und Reizauslese in der Entwicklung. II. Optische Rezeption und Bilderfassen im zweiten Lebensjahr. *Zeitschr. Psychol. u. Physiol. Sinnesorg. Abt. I. Zeitschr. Psychol.* 113(4/6): 268-286. 7 fig. 1929.—Pieces of cardboard on which were pasted plain colored paper, meaningless figures and pictures of familiar objects were used as optical stimuli in this experiment with 1½ to 2 year old subjects. The results seem to indicate that during the first 4 mos. of the 2nd year there is a transition from mere handling to attentive observation of the meaningful material. Not until 2 years of age is actual comprehension of the pictures evident; in other words, the understanding of graphic representation appears to be acquired simultaneously with the function of speech and the ability to name the objects represented.—*J. L. Jervis.*

3916. ADLER, FRANCIS HEED. Reciprocal innervation of the extra-ocular muscles. *Arch. Ophthalmol.* 3(3): 318-324. 1930.—In 2 cases, inward movement of 1 eye occurred in the presence of a complete paralysis of the 3rd nerve when the fellow eye was abducted. This, Adler believes, can be explained only by an inhibition of the contractile activity of 1 external rectus associated with the increase in contractile activity of the opposite antagonistic external rectus and demonstrates that reciprocal innervation of the ocular muscles does exist in man.—*Author's conclusion.*

3917. BEHR, CARL. Der Anteil der beiden Antagonisten an der Pupillenbewegung bei den verschiedenen Reaktionen. *Graefe's Arch. Ophthalmol.* 125(1): 147-155. 1 fig. 1930.—A contusion separated the stroma and pigment layers of the iris for about 1/10 of the average pupillary circumference. In light reflex there was an active increase in tonus in the sphincter and a simultaneous decrease in the sympathetic. In myosis due to near accommodation there was a relaxation of the dilator, though less than in light, and an increase in the tonus of the sphincter. In the psychoreaction there was an active increase in tonus in the dilator at the beginning of movement, which attained a considerable degree. Control experiments in a subject with the stellate ganglion resected showed that there were simultaneous inhibitory processes in the sphincter, which were slight at the beginning of movement. Cocaine led to an active increase in tonus in the dilator without a decrease in sphincter tonus being seen. Eserine produced a pronounced contraction of the sphincter but no corresponding relaxation of the dilator; 2% pilocarpine produced a slight contraction of both membranes. Scopolamine and atropine led to uniformly pronounced dilatation of the pupil. The author concludes that there is no double innervation of the sphincter in man in the sense of a parasympathetic promoting, and a sympathetic inhibiting.

3918. BUDDENBROCK, W. von. Einige Bemerkungen zum augenblicklichen Stand der Frage nach dem Farbensinn der Tiere. *Zool. Anzeiger* 84(7/8): 189-201. 1929.—Hess has shown that many lower animals behave like color-blind persons, choosing different colors because of their relative brightness rather than because of the color. Such animals find the maximum brightness toward the green in a continuous spectrum, red having a very low intensity value. Von Frisch found that there was a positive color sense in bees, *Daphnia,* and minnows. Schlieper demonstrated that *Hippolyte* reacted to brightness alone, and not to color. In the case of bees it was not proven whether there were two sets of receptors, one for color and one for intensity. Hanstroem believes that there is one set of nerves for perception in bright light and another for perception in dim light. There is proof of the existence of visual purple in the eyes of some of the lower animals, but in others we must look for the presence of some other substance.—*D. L. Collins.*

3919. BUNCH, C. C., and T. S. RAIFORD. Race and sex variations in auditory acuity. *Arch. Otolaryngol.* 13(3): 423-434. 1931.—The averages of the thresholds of auditory acuity in 524 white and 169 colored patients are computed according to age, sex and race. The average acuity for tones under 2,048 double vibrations was slightly higher in white ♂♂, i.e., tones of faint intensity were heard better than in white ♀♀. Near 2,048 double vibrations the averages for the two sexes cross, and the average acuity for ♀♀ was higher than for ♂♂ in all decades. The differences between colored ♂♂ and colored ♀♀ were not definite. The average for colored ♂♂ was

higher than for white ♂♂ for tones of high pitch. In each successive decade the average acuity was slightly lower for tones of low pitch. For tones of high pitch, the difference was more marked than for low pitched tones, and the difference between the averages for each age group was greater as the frequency of the tones used as stimuli increased.—*Authors' summary.*

3920. **CANDIAN, F. L. La soglia di eccitamento dei colori semplici dello spettro nei normali. Gradi di passaggio verso le anomalie. [The threshold of excitation for primary colors of the spectrum in normal persons: degrees of transition toward anomalies.]** *Ateneo Parmense* 2(3): 233-266. 1 pl. 1930.—The method employs monochromatic lights corresponding to limited sections of the spectrum, covering intervals of a minimum of 1.9$\mu\mu$ to a maximum of 7.8$\mu\mu$. The thresholds thus determined for each color of the spectrum have a conventional value, conditioned by the intensity of the luminous source and the width of the fissure of emission of the special spectroscope (the monochromator), under present conditions 1000 candle power and 0.3 mm. respectively. Under these conditions, the method permits a quantitative expression of the value of retinal excitability (threshold) for each color of the spectrum and a comparative measure of the excitability of various individuals. The average value of the thresholds determined for 200 subjects was: red, 0.27; green, 1.5; yellow, 2.55; blue, 4.45; violet, 17.34. Determination of the index of variability from the average gives a criterion for defining the limits beyond which retinal excitability for various colors may be considered abnormal.—*From author's summary (transl.).*

3921. **CREED, R. S., and R. D. HARDING. Latency of after-images and interaction between the two retino-cerebral apparatuses in man.** *Jour. Physiol. [London]* 69(4): 423-441. 1930.—By a study of the latent periods preceding the development of the negative after-images of white circular discs, Creed and Granit were able to demonstrate functional differences in the receptor apparatus of the foveal and para-foveal areas of the retina, and to obtain evidence of interaction between the mechanisms concerned in the reception of visual stimuli at varying angular distances from the fixation point. The present enquiry extends this work to the functional relations between the retino-cerebral apparatuses of the 2 eyes in man, thereby supplying data on the mechanism of binocular vision. After visual fixation of the centers of white circular discs, the time intervals which elapse before the appearance of black (negative) after-images have been measured under varying conditions. After-images projected into complete darkness (black proj.) have a longer latent period than those projected on a white screen. They also have a much more distinct halo and, with small discs, are more intensely black. With large discs they sometimes appeared colored. Binocular and uniocular after-images were found to have much the same latency when projected on a white surface. Bin. black proj. images, on the other hand, appear earlier than R black proj. or L black proj. The latter are less distinct than the former, but are generally easy to time. To account for the early arrival of the binocular image, one must assume that the uniocular processes reinforce one another (or are otherwise interacting). If the primary image is received by only 1 eye and the after-image is projected on a white screen presented only to the other eye (R→L and L→R), the latent period is longer than when the same eye is used throughout the experiment. The after-image in the former case appears to darken and remains so until it fades. It is, therefore, of black projection type, and is in successful rivalry with the white field by which the now open eye is being stimulated. The R→L image, however, appears earlier than the R black proj. Its arrival is, therefore, hastened by the formation of an image of the white screen in the L eye, and this indicates interaction at a subperceptual level between the retino-cerebral apparatuses of the 2 eyes. It is suggested that an explanation may be sought for certain differences between R→L and L→R images, and between R black proj. and L black proj. images, by reference to the habits of the observers in concentrating their attention on the field of view of one eye rather than the other. Further evidence of interaction is afforded by observations of the type Bin.→R. The evidence already adduced for interaction between the 2 uniocular mechanisms is discussed in its relation to Sherrington's experiments on binocular flicker.—*Authors' summary.*

3922. **DENKER. Über das Hörvermögen der Fische.** *Acta Oto-Laryngol.* 15(2/4): 247-260. 1931.—The method of conditioned reflexes (association of musical tones with food) was used on *Salmo fario, Perca fluviatilis, Carassius auratus, Idus melanotus* var. *auratus* and *Phoxinus laevis* (apparently 1 or 2 representatives of each, previously blinded). More than 100 experiments on the trout with 5 tones in 3 octaves were negative or doubtful in result; so were numerous experiments on the perch. The other 3 fishes, however, gave unmistakable signs of perception of the sound. The author concludes that a certain group of fishes possesses a sense of hearing, exercised through the labyrinth, while no such sense can be demonstrated in other fishes.

3923. **DODGE, RAYMOND, ROLAND C. TRAVIS, and JAMES CHARLES FOX, Jr. Optic nystagmus. III. Characteristics of the slow phase.** *Arch. Neurol. & Psych.* 24(1): 21-34. 8 fig. 1930.—The slow phases of optic nystagmus are essentially eye movements of pursuit. They are termed adequate when the point of regard consistently falls on 1 of the moving objects of interest; inadequate when the point of regard overshoots or lags behind the visual object. Angular velocities below 40° per sec. evoke approximately adequate pursuit movements, as shown in the fairly uniform photographic records of the eye movements obtained from 8 normal subjects. With gradual increase in the angular velocity the nystagmographic pattern gradually becomes less regular. At angular velocities above 90° per sec., records from the average normal subject show the following features of inadequacy in the pursuit movements: shortening, slowing, irregularity, elision and final complete failure of pursuit. Quantitative data on the relation of speed to inadequate pursuit were sought with a new instrument that recorded the eye movements in pursuit of an oscillating single object. With increasing speed of oscillation the rapid corrective eye movements in 8 normal subjects first increased and then decreased in both number and amplitude, whereas the pursuit movements steadily decreased in amplitude, occasionally reaching still fixation. Hence it seems that the most consistent measure of adequacy is the amplitude of pure pursuit, which is approximately inversely proportional to the speed of the object.

3924. **DUCRET, S., und S. KOGO. Untersuchungen über den Einfluss der Sympathicusreizung auf die Retina.** *Pflüger's Arch. Ges. Physiol.* 227(1/2): 71-80. 4 fig. 1931.—Following unilateral sympathicotomy histologic studies were made on the shape and position of the rods and cones in the two retinae of frogs. In spite of different intervals elapsing between the sympathicotomy and the enucleation of the eyes the authors could not succeed in demonstrating any differences between the two retinae either in the light or dark adapted condition. A third series was examined in which the eyes were given a moderate exposure to light just prior to enucleation. The result in these was also negative.—*F. H. Adler.*

3925. **ENGELHART, E. Der humorale Wirkungsmechanismus der Oculomotoriusreizung.** *Pflüger's Arch. Ges. Physiol.* 227(1/2): 220-234. 17 fig. 1931.—An examination of the effects of aqueous humor of the rabbit and cat on the heart of *Bufo vulgaris* failed to demonstrate the presence of "Vagusstoff," i.e., acetylcholin. In rabbits the application of three drops 1% physostigmine produced a substance in the aqueous similar in all respects to acetylcholin. If one eye was illuminated and the other kept in the dark large amounts of this substance were found in the illuminated eye and practically none in the dark adapted eye. A considerable quantity

was found in the ciliary body and the iris and the amount was increased by electrical stimulation of the third nerve. Following section of the third nerve and degeneration the substance vanished completely from the ciliary body and iris.—*F. H. Adler.*

3926. GRAMONT, ARMAND de. Application de la vision binoculaire au repérage d'une direction. *Compt. Rend. Acad. Sci.* 188(17): 1120-1122. 1929.—Experiments on binocular vision are reported in which the apparent vertical, horizontal and two oblique directions in the field of vision (45° right and left) are determined by 7 observers. Constant errors occur such that the lines appear to converge upward, confirming the results of Helmholtz and Volkmann.—*H. C. Stevens.*

3927. GUILD, STACY R., S. J. CROWE, C. C. BUNCH, and L. M. POLVOGT. Correlations of differences in the density of innervation of the organ of Corti with differences in the acuity of hearing, including evidence as to the location in the human cochlea of the receptors for certain tones. *Acta Oto-Laryngol.* 15(2/4): 269-308. 10 fig. 1931.—A method is described for representing many of the spirally arranged elements of any particular cochlea from properly oriented serial sections, in the form of graphic reconstructions, with fair accuracy. Combined with the counting of ganglion cells in the spiral ganglion, there has been determined for each of 15 ears: (a) the approximate total number of ganglion cells whose fibers supply the organ of Corti; (b) for corresponding regions of ganglion and end-organ, the average number of ganglion cells per mm. of length of the organ of Corti in the lower basal, upper basal, lower middle, and upper middle plus apical regions of the cochlea; and (c) the relative numbers of ganglion cells per mm. in the several regions. In 4 ears of young adults with good hearing the approximate total number of ganglion cells in the spiral ganglia averaged 25,614, with a range of from 23,193 to 27,810. For this group, the average number of ganglion cells per mm. of the corresponding region of the organ of Corti was: lower basal, 934; upper basal, 1,076; lower middle, 971; upper middle plus apical, 502. In 3 ears of young children the approximate total number of ganglion cells in the spiral ganglia averaged 29,019; in each ear there were more ganglion cells than in any one of the 4 ears of young adults with good hearing. For this group, the average number of ganglion cells per mm. of length of the corresponding region of the organ of Corti was: lower basal, 1,010; upper basal, 1,253; lower middle, 1,142; upper middle plus apical, 559. The hearing of these children had not been examined; but records indicate that the hearing of children with normal ears averages somewhat better for all tones than that of young adults. From the evidence furnished by the ganglion cell method the most densely innervated portion of the organ of Corti in normal individuals is that of the upper basal turn and the adjacent part of the lower middle turn, with a definite decrease in density at each end. Some preliminary attempts to count the nerve fibers in the osseous spiral lamina give the impression that there is a much greater decrease in density of innervation as the 2 ends of the organ of Corti are approached than is shown by the ganglion cell method. It is suggested that there is a correlation between these regional differences in density of innervation and the well recognized and proven differences in the energy required, in terms of ergs, for the threshold of hearing for different tones by normal individuals; it being least for tones of the middle range and progressively greater for those of both lower and higher pitch. In 3 ears, each of which had a marked loss of acuity for high tones (and a slight loss of acuity for tones up to at least 2,048 cycles per second), the approximate total number of ganglion cells in the spiral ganglia averaged 19,538; the highest and the lowest were, respectively, 20,808 and 18,504. For this group, the average number of ganglion cells per mm. of length of the corresponding part of the organ of Corti was: lower basal, 579; upper basal, 862; lower middle, 854; upper middle plus apical, 403. The amount of the difference (loss) between these figures and those for the group of young adults with good hearing is about twice as great in the lower basal region as in any other. This indicates that the lower basal region is the one most concerned with the reception of high tones.—*From authors' summary.*

3929. HOFE, K. vom. Hypertonie und kompensatorische Hypotonie am Auge. *Arch. Augenheilk.* 102(1/2): 315-324. 1929.—The author objects to the conclusions drawn by Seidel from the results of his fluorescein test in trephined glaucomatous eyes. Seidel maintained that one could draw certain conclusions regarding normal physiological processes. The author carried out a series of experiments in which from 0.1 to 0.2 ccm. physiological salt solution was injected into the vitreous of a rabbit's eye. The intraocular pressure of each eye was measured over a considerable period of time with a tonometer. The tables and graphs show that following the injection there was a considerable increase in the pressure of the experimental eye followed by a fall below normal. This fall persisted for some days. The graphs also indicate that some slight changes occur in the control eye. From these experiments the author concludes that even as simple a procedure as an injection of NaCl upsets the

physiological condition so that one should draw no such conclusions as Seidel has done from eyes which have had a trephine operation. He refers the hypertonus and compensatory hypotonus to changes in internal pressure in the globe.—*F. H. Adler.*

3930. **HUIZINGA, EELCO.** Über die galvanische Vestibularisreaktion und über die Folgen der Exstirpation des Scarpaschen Ganglions bei der Taube. *Pflüger's Arch. Ges. Physiol.* 226(6): 709-722. 4 fig. 1931.—The vestibular reaction of the pigeon to galvanic stimulation can be elicited after destruction of one labyrinth and even after bilateral removal of Scarpa's ganglion, though the current required in the latter case is about 10 times as great as prior to operation. After unilateral extirpation of the ganglion the twisting of the head occurs sooner than after extirpation of the labyrinth without removal of the ganglion.—*G. P. McCouch.*

3931. **KAHMANN, HERMANN.** Untersuchungen über die Linse, die Zonula ciliaris, Refraktion und Akkommodation von Säugetieren. *Zool. Jahrb., Abt. Allg. Zool. u. Physiol. Tiere* 48(3): 509-588. 7 pl., 9 fig. 1930.—Representatives of 29 species of mammals of the following groups were studied: Marsupialia, Insectivora, Chiroptera, Rodentia, Ungulata, Carnivora, Prosimia, Simia. Greatest attention was given nocturnal forms, in which the eye and lens are relatively large, the lens strongly curved and of highly refractive substance. Weight of lens relative to total weight of eye is large: *Mus silvaticus* and *M. agrarius*, 30%; *Epimys norvegicus*, 28%; *Cavia cobaya*, 18%; *Sciurus vulgaris*, 14%; man only 4%. As absolute weight of eye increases relative weight of lens decreases. The relatively large eyes of lower mammals seem in general functionally rudimentary as compared to those of diurnal forms; in the former vision may be overshadowed by other senses. Large size of lens coupled with hard consistency seem to render accommodation in these nocturnal animals well nigh impossible. A comparative study of the zonula ciliaris showed the development of the latter to be dependent upon that of the ciliary body. In Ungulates, Carnivores and Primates the ciliary muscle is well developed and accommodation is better than in other forms considered. Speed of accommodation is much less in Carnivores than in Primates. In the lower mammals studied, with the exception of *Sciurus vulgaris*, accommodation is lacking. A high degree of hypermetropia was found in some of the eyes examined, notably in mice and rats. With increase of absolute size of eye and corresponding decrease of relative size of lens, hypermetropia seems to grade into emmetropia; this is best seen in related forms, for example: mouse +10 D., woodmouse, with large eyes, +6 to +8 D., *Myoxus glis*, +2 D., *Sciurus vulgaris*, emmetropic. The findings support Helmholtz' theory of accommodation.—*H. Kahmann (transl. by P. A. Moody).*

3935. **LEIRI, F.** Über die verstärkte Knochenleitung bei den Stimmgabelversuchen. *Monatsschr. Ohrenheilk. u. Laryngo-Rhinol.* 64(5): 538-546. 1930.—Investigations on normal persons with artificial occlusion of the ear and on those with occlusion due to middle ear lesion show that increased bone conduction is not due alone to the fact that the tone vibrations are confined within the ear but also to the exclusion of external noises and vascular murmurs in the neighborhood. On the other hand, when the ear is stopped so that vascular murmurs cannot escape, or in tinnitus, the murmur will reduce conduction of tones of lower but not of higher frequency.

3936. **LIGHT, V. EARL.** Photoreceptors in Mya arenaria, with special reference to their distribution, structure, and function. *Jour. Morph. & Physiol.* 49(1): 1-44. 1 pl., 7 fig. 1930.—Experimental studies on the responses to light indicate that photosensitive tissue is located somewhere near the inner surface of the siphon and that the siphon is sensitive throughout its entire length. A histological study of the siphon shows cells of a special type in the photosensitive region, which are most abundant where the inner surface of the siphon is most sensitive. They are found throughout the length of the siphon, just beneath the inner epithelial layer, around both the incurrent and excurrent siphons. They receive nerve elements from branches of 16 large nerves. Each cell contains a characteristic inner feature, the optic organelle, composed of a rather large hyaline structure, the lens, which is surrounded by a network of nerve fibrillae, the retinella. Light rays, reflected from a flat mirror through the lens in these cells, are brought to a focus in the region of the retinella, irrespective of the direction of the rays. The cells are similar in structure and function to visual cells in leeches and photoreceptors in the earthworm. Available data indicate that they function as photoreceptors and that the fibrillae of the retinella are direct receptors of light stimuli. Pigment spots found in considerable number on the distal third of the siphon, and thought by some to be eyespots, are, owing to simulation of the background, probably protective in nature, rather than functional in photoreception.—*Author (courtesy Wistar Bibl. Serv.).*

3938. **MEYER, MAX F.** Hearing without cochlea? *Science* 73(1887): 236-237. 1931.—From an experimental study the author concludes that the hearing in question, claimed by G. Eichhorn for deaf persons with nerve centers intact by using a patented electrical membranous device, is due neither to direct action on the nerve nor to muscle contractions, but to a vibration of the horny skin surface caused by its electrostatic charge.

3939. **NAFE, JOHN P.** Dermal sensitivity with special reference to the qualities of tickle and itch. *Pedagogical Seminary & Jour. Gen. Psych.* 34(1): 14-27. 1927.—Application of various stimuli (needle gives optimum) to dry, wet, and oiled skin on many parts of the body gives agreement with early (1908) findings of E. Murray. Stimuli are controlled by adjustable three-way clamp and observed through microscope. Itch and tickle are qualitatively identical according to some reports. No special tickle spots were found.—*L. S. Judson.*

3940. **PEARCY, J. FRANK.** Evidence of functional rôle of basilar membrane in audition. *Amer. Jour. Physiol.* 91(1): 8-13. 1929.—A number of normal adults were given 2-4 gm. $NaNO_2$ to lower the blood pressure and the alterations in their audiograms were studied. It is considered that the alteration was due to vasodilatation of the cochlear artery in its unbranched portions, the vasodilatation producing increased weight to the basilar membrane and interfering with its auditory function. Epinephrine (15-30 minims) was administered to these individuals and their audiograms studied. Reasons are given for assuming that vasoconstriction of the cochlear artery results, the vasoconstriction decreasing the weight of the basilar membrane and increasing its auditory function. It was found that marked depression and considerable increase of auditory acuity resulted in that portion of the organ of Corti directly over the unbranched cochlear artery which responded by vasodilatation and vasoconstriction. It is concluded that the basilar membrane is actively concerned in audition although it is not denied that the tectorial membrane may also be necessary.—*Author's summary and conclusions.*

3941. POLLAK, FRANZ. Untersuchungen am überlebenden menschlichen Auge. *Graefe's Arch. Ophthalmol.* 125(2): 220-230. 1 fig. 1930.—By suitable perfusion the intrinsic and vascular musculature of the eye can be restored from a few hrs. to a day after death. Permeability of the vessel walls from postmortem changes dominated the intra-ocular pressure and produced mechanical conditions which prevented investigation of the intrinsic muscles. The iris, by pupillary changes, reacted to epinephrine and eserine, but no response to electric stimuli could be elicited. During perfusion, the blood vessels regained their irritability and reacted typically to epinephrine and eserine. It may be possible that specimens obtained immediately after accidental death will show the behavior of the muscle of accommodation.

3942. ROHRSCHNEIDER, WILHELM. Experimentelle Untersuchungen über die Veränderungen normaler Augengewebe nach Röntgenbestrahlung. III. Veränderungen der Linse, der Netzhaut und des Sehnerven nach Röntgenbestrahlung. IV. Röntgenstrahlenempfindlichkeit der einzelnen Teile des Kaninchenauges bei einzeitiger Bestrahlung. *Graefe's Arch. Ophthalmol.* 122(2/3): 282-298. 10 fig.; 383-390. 1929.—Irradiation of the rabbit eye with x-rays produces no effects on the uvea, the retina and the optic nerve; but does produce certain effects on the conjunctiva, the cornea, and the lens. These effects are classified according to the size of the dose.—*S. Hecht.*

3943. STEHR, WILLIAM C. The activating influence of light upon certain aquatic arthropods. *Jour. Exp. Zool.* 59(2): 297-335. 3 fig. 1931.—*Asellus communis* Say, *Hyallela knickerbockeri* Bate, *Cambarus* sp., *Belastoma flumineum* (Say), *Ranatra americana* Montandon, and *Lethocerus americanus* (Leidy) were investigated. All showed an inverse relationship between intensity of the stimulating light and the reaction time of the animal, which is very similar to that found in clams, tunicates, and in the vertebrate eye. Photoreception in the adult Hemiptera studied is through the eye. There is a latent period in the reaction time of these species. The limit of stimulating efficiency of light for *Lethocerus* is between 13 and 25 m.c., but is much higher in the other species. The process of dark adaptation in *Lethocerus* is regular and complete in about 50 min. The variability of all species is high and is probably due to inhibitions and other effects of the central nervous system upon the responses in question. If it were possible to measure the effect on the receptor directly, instead of measuring the motor response, it is probable that less variable results could be obtained. None of the formulae used to express the results of similar investigations express the results of these experiments accurately, but the general trend of the results is such that the photic processes of the compound eye are probably fundamentally similar to those of other types of photoreceptors.—*Author (courtesy Wistar Bibl. Serv.).*

3944. STRUGHOLD, H. The mechanical threshold of the cornea-reflex of the usual laboratory animals. *Amer. Jour. Physiol.* 94(1): 235-240. 2 fig. 1930.—Experiments were made on 10 guinea-pigs, 10 rabbits, 10 rats, 9 pigeons, 6 dogs, 3 cats and 3 monkeys. Strughold finds it very probable that the high sensibility of the center of the cornea (4 to 5 times higher than near the margin) depends upon the richness in nerve endings in this part of corneal epithelium compared with the marginal zones, as is described by a number of histologists. For experimental purposes it follows from this result that it is necessary, for comparison from case to case, to examine always the same point. The most practicable point is the center of the cornea, the threshold-values of which, concerning the usual laboratory animals, have been found to vary little.

3945. WELSH, JOHN H. The mechanics of migration of the distal pigment cells in the eyes of Palaemonetes. *Jour. Exp. Zool.* 56(4): 459-494. 4 pl., 4 fig. 1930.—The distal pigment cells in the eyes of the common shrimp, *Palaemonetes vulgaris,* move "in" and "out," along the sides of the cones, under the influence of light and dark. The proximal movement in the light was found to be due to contractile fibrils within the cells. These fibrils have their origin in the retinular cells and run out through the bodies of the distal pigment cells. The distal movement of the cells may be due to the contractile nature of the distal processes. It was found possible to make direct observations on the movements of the distal pigment cells, due to the transparency of the eyes. Measurements of rate of movement in the light and dark were made on single individuals, giving the average time for migration in the light as 40 min.; that in the dark, 90 min. A study of movements of the distal pigment cells in intermittent light showed that migration begun in the light will continue for an appreciable length of time after the animals are placed in the dark. A considerable variation in the rate of movement was found in different individuals and also at different times during light and dark adaptation, in the same individual; thus demonstrating the advisability of studying the activities of such cells by direct observation whenever possible.—*Author (courtesy Wistar Bibl. Serv.).*

3946. WORSTER-DROUGHT, C., and T. R. HILL. Observations on vibration sense with special reference to postencephalitic parkinsonism. *Jour. Neurol. and Psychopath.* 11(44): 318–323. 1931.—Definite impairment of vibration sense and deep-pressure pain was demonstrated by delicate quantitative methods (described) in 25 cases of generalized postencephalitic Parkinsonism. The authors conclude that the protopathic appreciation of vibration-sense and of deep-pressure pain depends on the thalamus and that the abnormalities of proprioception in Parkinsonism are probably due to some degree of thalamic depression by encephalitic infection.—*From authors' summary.*

3947. WUNDER, W. Bau und Funktion der Netzhaut beim Zander (Lucioperca sandra Cuv. und Val.) und einigen anderen im Balatonsee häufigen Fischarten. *Zeitschr. Wiss. Biol. Abt. C. Zeitschr. Vergleich. Physiol.* 11(4): 749-766. 9 fig. 1930.—There is a biologic connection between the disturbance of the water in Lake Balaton, Hungary, and the abundance therein of those species of fish (*Lucioperca sandra* Cuv. u. Val., *Blicca björkna* L., *Pelecus cultratus* L., *Lucioperca volgensis* Pal., *Abramis brama* L., and *Acerina cernua* L.) that have in their retinal pigment guanin, which in a dim light acts as a reflector to strengthen the light stimulus. The structure of the retina was studied in *L. sandra* and the following zones distinguished: (1) an oval field in the center of the retina, containing chiefly guanin and also a little fine melanin, in which the thickness of the retina is greatest; (2) a ring-shaped Border-zone I, in which was present not only guanin and fine melanin but coarse rod-shaped melanin; (3) a slender ring-shaped Border-zone II, which contains only melanin in the shape of delicate granular and coarse rod-shaped pigment. The change of the pigment is best observed in the center of the retina. In the dark the rods are contracted forward, the cones extended behind. The pigment-cells are shortened, and have the shape of long rectangular parallelograms. The region around the nucleus (about 1/20 of the cell) is pigment-free; next, in about 1/10 of the cell fine melanin is concentrated; the remainder of the cell is filled with guanin. In faint twilight and red dark-room light, which has the same effect, the cones are contracted and the rods lie backward, scattered in the crevices between the pigment-cells. These are lengthened by about ¼, and contracted into an isthmus at the point of concentration of the melanin; the pigment-free zone above the contraction is larger; the melanin fills about ¼ of the cell, and the remainder, to the other side of the contraction, is somewhat thickened and full of guanin. In bright light, especially sunlight, the cones contract and the rods lie far back in triangular spaces behind the principal masses of pigment. The pigment-free nuclear portion of the pigment cell is connected by only a slender stalk with the wedge-shaped pigment-containing portion, filled with equal parts of melanin and guanin, the broad end of which articulates with the

extremities of the cones. Thus the guanin-cell suffers striking ameba-like changes in shape, and the fine black pigment within the cell at the same time changes its location. Border-zone I shows similar changes in form of the pigment-cells under the influence of light and darkness, but the black rod-shaped melanin remains in the forward end of the cell; therefore the function of the guanin, at least at the points where there are great masses of coarse black pigment, is doubtful. Perhaps the black pigment changes its location in longer periods of darkness than the 2-3 hrs. which were the limits of investigation. There is nothing particular to be said of Border-zone II and its function.—*Author's summary (transl.)*.

3949. ARTOM, CAMILLO. Effetti del raffreddamento dei gangli nervosi. [Effects of cooling some nerve-ganglia.] *Arch. Sci. Biol.* [*Napoli*] 12: 640-679. 6 fig. 1928.—Experiments on the cat show that cooling of the superior cervical ganglion and of the cervical sympathetic trunk leads to a progressive diminution of the threshold excitability for dilation of the pupil. Conductivity is rapidly and reversibly blocked in the ganglion when its temperature has been lowered to 15° C, but in the nerve trunk only when it is cooled to 7° or 4° C. The curves expressing the variation of threshold excitability as function of the temperature are slightly diverse according to whether the temperature was made to vary in a descending or in an ascending manner, indicating hysteresis. The stellate ganglion also shows a much greater lability to cooling than the fibers of the cardiac accelerator nerve, the blocking temperature being about 15° C for the ganglion, and a little below 6° C for the fibers. On the other hand, afferent impulses modifying respiratory rhythm are abolished in both jugular (homologous) spinal ganglion and vagus trunk in the neck only upon cooling the parts to a little above 0° C. Cooling of either the great auricular nerve, or the second cervical (homologous) spinal ganglion, to a little below 7.5° C, blocks impulses which would give rise to "reflex retraction" of the pinna and contractions of facial muscles, and this with no marked difference between the blocking temperatures of ganglion and nerve. It thus appears that sympathetic ganglia show a much greater lability toward cooling than do nerve fibers or (homologous) spinal ganglia. It is suggested that this difference in the behavior of the two kinds of ganglia is due to the presence of synapses in the one and not in the other, the cooling causing reversible interruption of conductivity with less fall of temperature in the former than in the latter, and on account of colloidal differences in structure.—*C. D. Snyder.*

3950. BARRY, H., D. W. MacKINNON, and H. A. MURRAY. Studies in personality. A. Hypnotizability as a personality trait and its typological relations. *Human Biol.* 3(1): 1-36. 1931.—The authors describe a technique for estimating hypnotizability (H. I. or the Hypnotic Index). The standard technique devised was worked out on 73 college students (men and women) and the results expressed quantitatively on a 0-5 scale. 25% of this sample group were found to be hypnotizable to the extent of complete suggestibility with some amnesia. There were no sex differences. A coefficient of correlation of approximately .75 may be expected between 2 trials of the same test when performed within a week or so of each other by different operators. A coefficient of the same order was obtained when 2 tests, performed by the same operator but separated by an interval of several months, were correlated. The results of the hypnotic test as standardized in this study were found to correlate with the score of hypnotic tests done under other conditions (a. group test and b. Hull's swaying test) with a coefficient of .52. Suggestibility under hypnotic conditions did not correlate with suggestibility under other conditions, that is, when subjects assumed their customary attitudes (cf. results in the Hull swaying test and the group suggestibility test). The problem of explaining hypnosis in terms of needs or instincts is discussed in the text. All observations and tests bearing upon this point proved negative or inconclusive. There did not seem to be any relation for instance between hypnotizability and submission or between hypnotizability and extraversion. The problem of explaining hypnosis in terms of aptitude or psychical configuration is also discussed in the text with special reference to the concept of dissociation. Several investigations were made to determine the relationship between hypnotizability and other possible manifestations of dissociability, but the results were negative or indeterminate.—*H. A. Murray.*

3954. **CIABATTI, OMERO. Rapporti tra cervello e ganglio celiaco. Ricerche sperimentali. [Relation between brain and celiac plexus.]** *Riv. Biol.* 8(6): 688-700. 4 pl. 1926.—Experimental cerebral lesion (partial decerebration) in the dog gives rise to noteworthy modifications in the nerve cells of the celiac plexus. The cellular alteration does not concern the colorless matter, which remains unchanged, but is limited to the colored matter of the cytoplasm, giving rise to processes of chromatolysis (marked especially by peripheral deepening of the colored matter), also modifications in the form of the cell and various modifications in the form, structure, and position of the nucleus. Said structural modifications can be considered transitory; they appear (in dogs) about the 19th day after the cerebral lesion and reach the maximum degree on the 30th day; then they diminish around the 60th day; they disappear almost completely by the 90th day; by this time there has taken place an almost complete restitution of the structure of the elements of the ganglion. In constrast to what happens in the sympathetic ganglia, the gangliar elements of the cord, particularly the sympathetics of the lateral columns of the spinal cord, show no modifications in form or structure, either with respect to the colored matter, the uncolored or the nucleus.—*O. Ciabatti (transl. by C. E. Kellogg).*

3955. **COGHILL, G. E. The structural basis of the integration of behavior.** *Proc. Nation. Acad. Sci.* 16(10): 637-643. 1930.—The law of development of behavior has been demonstrated by the author in a relatively simple morphological type of vertebrate (the salamander) in which movement has been observed from its beginning to its culmination in the definitive pattern. This law consists in the expansion of a primarily integrated total pattern of action within which partial patterns arise by individuation through the restriction of both the field of motor action and the field of adequate stimulation. This law has been demonstrated in the origin of unconditioned reflexes, and it appears also to apply to the formation of conditioned reflexes, instincts and the so-called process of trial and error. The structural basis of this law is found in the growth of the nervous system; and in this also there appears to be a natural basis for the interpretation of attitude and motivation. Inhibition, conditioned, unconditioned and chain reflexes, trial and error, instinct, posture, attitude and motivation are discussed. The existence of a specific mechanism of total reactions as opposed to local reflexes is emphasized as fundamental to the interpretation of behavior.—*G. E. Coghill.*

3956. **CRISLER, GEORGE. Salivation is unnecessary for the establishment of the salivary conditioned reflex induced by morphine.** *Amer. Jour. Physiol.* 94(3): 553-556. 2 fig. 1930.—In 5 dogs given 2 mgm. daily subcutaneous doses of atropine for 30 days a salivary conditioned reflex failed to appear. No saliva secretion, conditioned or unconditioned, occurred in dogs given atropine previous to injection of morphine; but on discontinuance of the atropine injection after a time long enough to produce a fully conditioned reflex (7-9 days), the animals secreted as much saliva as at any subsequent time. Hence the effector response is not indispensable for the establishment of a typical salivary conditioned reflex, showing that less than the entire efferent limb is necessary for the conditioning process. In another group of experiments, a conditioned reflex was established and continued until the daily secretion rate was practically constant. Pilocarpine hydrochloride was then substituted for the morphine; in spite of the continuation of the effector response, the conditioned salivary reflex disappeared within the normal time. Whether or not this extinction process is retarded by pilocarpine can not be determined from the data presented, because, as Kleitman and Crisler have shown, the curves of extinction are by no means as constant as the curves for the establishment of the conditioned reflex owing to great individual variation in different animals.

3957. **DARROW, CHESTER W. Differences in the physiological reactions to sensory and ideational stimuli.** *Psych. Bull.* 26(4): 185-201. 1929.—This writer's experimental work (published in Jour. Exper. Psychol. 1929) indicates that there are two processes distinguishable physiologically as well as psychologically which have frequently been designated as "emotion"—the immediate reflex response to "sensory" excitation and the response mediated by associative processes or ideas aroused by the stimulus. A comparison of the immediate reflex effect of momentary sensory stimuli with the effect mediated by associative or ideational processes shows that the former is relatively more effective in producing changes in peripheral mechanisms such as those of vasoconstriction, perspiration or the galvanic skin-reflex, while the latter is relatively more effective in increasing the cardiac activity, as indicated by blood pressure and pulse rate. His review of the literature supports these findings with the following exceptions. Disturbing ideas occasioning extreme unpleasantness or depression may slow the heart rate. Tastes and smells, though sensory stimuli, as a rule occasion increased rather than decreased pulse rate. Long continuation of sensory stimuli is likely to be accompanied by increased heart rate. Being frightened or extremely startled following sensory stimuli is likely to be accompanied by a momentary increase in pulse rate preceding the characteristic slowing. A bibliography of 76 titles is included.—*K. S. Bernhardt.*

3958. **DYROFF, RUDOLF. Experimentelle Untersuchungen zur Physiologie des Genitaltraktes beim Weibe. (Beiträge zur Nervenversorgung.)** *Arch. Gynäkol.* 138(2): 362-458. 1929.—In hilus nerves of fetal ovary ganglion cells were found. The gonads apparently derive their parasympathetic supply from the vagus. The literature does not confirm the conception that the mode of antagonism between divisions of the autonomic system is generally stimulation and inhibition; it is another type of opposition, which in respect of motor function results in another contraction form. Motor activity of the parasympathetic causes rhythmic movements, that of the sympathetic, tonic changes, and both contain inhibitory fibres for the antagonists. Genital peristalsis is due to regulated interaction of both peripherally controlled. The autonomic and endocrine systems are so closely interrelated that they must be considered a functional entity, the basis of so-called constitution. Corpus luteum of pregnancy and the fetus produce locally increased parasympathetic tone which largely cuts off the sex organs from physiological endocrine variations. The parasympathetic tone is communicated to the whole body, and determines a stabilising reaction of other endocrine glands which leads to a simultaneous increase of sympathetic tone. Similar local and general reactions in weaker form appear cyclically as corpus luteum activity even in premenstrual phase. Endocrine functional adaptation to sympathicotonic secretion before advent of menses indicates local stabilising reaction, which is supported by the blood loss. The protection exercised by the corpus luteum over the ovum before imbedding, is confined to indirect influence: transportation of ovum and preparation of nidus. The implantation itself is dependent on the ovum's inherent power of fermentative erosion, not on preparation of the site; after implantation the ovum determines the dura-

tion of corpus luteum activity. Without implantation, automatic functional adaptation follows on corpus luteum involution and releases stronger tonic peristaltic movements which, in Primates, must be considered responsible for reduction of parasympathetic tone, and for increased muscle-tone following upon the preponderance of sympathetic tonus, the appearance of which is the basic cause of the functional change of the corpus luteum.—*W. P. Kennedy.*

3959. **ENDERLEN, und EISMAYER. Zur Entnervung des Herzens.** *Deutsche Zeitschr. Chir.* 227(1/6): 126-131. 1 fig. 1930.—The authors used dogs (number not stated); experiments on 2 cited. They conclude that definite differences exist between normal dogs and those whose hearts have been denervated. Respiratory arrhythmia is much diminished after denervation, the pulse rate increased. Poisons which influence the autonomic nervous system such as adrenalin, atropin and gynergen act more powerfully. Animals with denervated hearts are no longer equal to great efforts. They tire very rapidly and the pulse does not increase correspondingly with exercise. The fact that the influence of adrenalin, atropin and gynergen appears on the denervated heart proves that these drugs act on the periphery and that their effect can be restrained through the cardiac nerves. The lack of pulse acceleration after running permits the conclusion that we are dealing with a central chronotropic accelerating effect in normal animals. After section of the nerves the heart is not as adaptable as formerly. It can itself regulate its power extensively, and meet the exigencies of the circulation, but with intact nerves this is done much more completely and more rapidly.—*Authors' summary (transl. by J. M. Nielsen).*

3960. **GASSER, HERBERT, and JOSEPH ERLANGER. The ending of the axon action potential, and its relation to other events in nerve activity.** *Amer. Jour. Physiol.* 94(2): 247-277. 14 fig. 1930.—The electrical response of nerve must be considered as composed of 2 parts. The authors call these parts the "spike" [the probably homologous element in the muscle action potential] and the "after-potential" [a negative after-potential]. The present research deals with their relative magnitudes and their relation to other events attending the nerve impulse. The potentials have been measured with the aid of the Braun tube oscillograph and amplification giving a sensitivity of 1 mv.=26 cm. As previously described, the fast part of the spike of the axon action potential of frog's nerve ends at about 1σ (20°-24° C.). In the immediately succeeding period, the ordinary "monophasic" lead does not accurately reveal the true potential on account of the diphasic artifact of the spike; but within 1.6 to 4σ the potential is found to have fallen in between 1 and 2% of the maximum. It then declines along a decremental curve and becomes zero at 30 to 50σ, provided the nerve has been subjected to only a moderate amount of experimentation. When the 1st response after mounting is measured, the after-potentials end at 14 to 20σ (summer frogs at 20°-24° C.); therefore, in nerves of living frogs they would probably be still shorter. On the other hand, in confirmation of other investigators, the authors have found that the after-potential is greatly prolonged by fatigue. Nerves from winter frogs observed at room temperature have long after-potentials. Cooling a nerve causes a decrease in magnitude and a shortening of the after-potentials. The latter fact is in constrast with the lengthening of the spike which occurs under the same condition. The after-potential is followed by a positive deflection which is explained as an artifact analogous to the diphasic artifact of the spike, that is, as a lead from the dead-live junction through the distal electrode. The experimental basis for this opinion is as follows: a) Cooling shortens the positive deflection and the after-potential until the former fuses with the diphasic artifact of the spike. b) The deflection may be imitated in a diphasic lead by increasing the after-potential at the distal lead with veratrin, or by decreasing it at the proximal lead by cooling. In order to measure the recovery of nerve for comparison with the after-potential, 2 rapid methods were devised so that the after-potential would not be seriously altered during the measurements. One method reveals the nerve's irritability, the other its ability to respond. The spike height (ability to respond) and the irritability return to normal together at the end of the relatively refractory phase; then the irritability rises above normal, while the spike height (above the resting potential) remains constant. There is thus no supernormal response in the supernormal phase; the thresholds are lower but the spikes are alike except for the small amount of after-potential from the first response which cuts them off at the base. The relatively refractory periods of the α and β waves are alike. At room temperature neither the beginning nor ending of the refractory period coincides with any definite event in the potential wave; but in very cold nerve the relatively refractory period is greatly prolonged and ends with the negative potential. The supernormal phase starts at the end of the relatively refractory period and extends throughout the period of the after-potential. The 2 phenomena vary in duration together. The after-potential is prolonged and augmented by acid, an observation which fits with Adrian's observations on the supernormal phase. It is the after-potential, however, and not the acidity which is the necessary condition. When the after-potential persists after a long sojourn in an alkaline buffered Ringer's solution, supernormality also persists. The supernormal phase is shortened by cold in parallel with the shortening of the after-potential and in very cold nerve it disappears altogether. At this time the relatively refractory phase lasts until the end of the action potential, therefore it is reasonable to suppose that the after-potential has disappeared and that all the potential belongs to the greatly prolonged spike. An attempt is made to harmonize the foregoing observations in a theoretical discussion. It is assumed that while the spike and refractory period are controlled largely by a chemical reaction, the after-potential and supernormality are dependent on the state of the plasma membrane. To explain the shortening of the after-potential by cooling a stabilization of the plasma membrane is proposed.—*Authors' summary.*

3961. **HALPERN, I. Über die Ausbreitung von Stromschleifen im Nervengewebe bei Reizung mit Induktionsströmen.** *Pflüger's Arch. Ges. Physiol.* 225(1): 49-50. 1 fig. 1930.—Though long known, current spread is still a source of error in nerve physiology. The spread depends on the moisture and thickness of the nerve trunk. Various nerves such as the axillary of the rabbit, the sciatic of the frog and the vagus of the dog have been studied from this angle.—*H. Woollard.*

3962. **HARDY, W. B. Note on the central nervous system of the crayfish.** *Jour. Physiol.* 67(2): 166-168. 1929.—Semisection of the nerve cord was carried out in the crayfish between the 1st and 2nd thoracic ganglia. The immediate result was loss of tone in the walking limbs, abdominal muscles and uropods on the same side as the injury. After 4 days, the abdominal muscles recovered their tone and the animals were able to swim, but, owing to the continued paralysis of the uropods, they invariably landed on their backs. After the shock of the operation was over the pleopods resumed their regular beats but the paralysis of the walking legs persisted. The author concludes that the uropods, which play an important part in the orientation of the animal while swimming, are so completely controlled by the brain as to be permanently paralysed by semisection of the nerve cord, but the pleopods are apparently independent of cerebral control. The nerve cells were cut away from beneath one of the abdominal ganglia. The immediate disturbance was very slight and suggests that the connection between the nerve cell and its fibre is solely trophic.—*W. M. Tattersall.*

3963. **HEINBECKER, PETER, and GEORGE H. BISHOP. Effect of anoxemia, carbon dioxide and lactic acid on electrical phenomena of myelinated and un-**

myelinated fibres of the autonomic nervous system. *Amer. Jour. Physiol.* 96(3): 613-627. 1931.—The technique was in general similar to that used in the study of somatic nerve fibers, the nerve trunks being placed entirely within the gas chamber. As material, sciatic nerves of bullfrogs, cervical sympathetic and vagus trunks of the cat and turtle were generally used. For special purposes skin nerves of the cat and bullfrog, and Limulus nerves to the extremities were studied. Results indicate that the effect of anoxemia, CO_2 and lactic acid on autonomic nerve fibers is in general similar to the effects of these agents on somatic nerve fibers. The threshold is ultimately raised and the conduction rate lessened. There is usually a marked preliminary lowering of threshold of unmyelinated fibers. The absolute refractory period is prolonged. Absolute refractoriness is a most convenient index of the nerve's condition. Unmyelinated autonomic fibers are depressed more rapidly than myelinated autonomics. Somatic nerve fibers are less rapidly depressed than autonomic ones. The order of recovery in O is reversed. There is no indication of any change in the time relations of the spike of the axon action potential. It is lowered by anoxemia, pure CO_2 and lactic acid. The retained portion of the potential is first increased by anoxemia and pure CO_2 and weak lactic acid, and later decreased with the spike. It is also increased in depressed or injured nerves by 5% CO_2. Both potentials finally disappear and reappear simultaneously. Since the recorded potential is in general the expression of a double lead from the nerve's surface, differential depression of the action potential is inevitable because of the differential susceptibility of injured as compared with uninjured nerve. The possible effects of differential depression on the ballistically recorded action potential are discussed. The completely diphasic lead is the safest one for interpretation of the functions of nerve. The effects of fatigue on the recorded action potential are indicated. Treppe is not infrequently observed in depressed nerves.—*Authors' summary.*

3964. **HUMPHREY, GEORGE. Le Chatelier's rule, and the problem of habituation and dehabituation in Helix albolabris.** *Psychol. Forsch.* 13(2/3): 113-127. 1930.—The withdrawal response of the land snail *Helix albolabris* disappears on appropriate repetition of the (mechanical) stimulus, the snail becoming habituated to the stimulus. The disappearance of the response cannot be due to fatigue, as this term is usually understood; for (a) a single stimulus may be sufficient to effect it, (b) more intense stimulation will, under conditions not quantitatively ascertained, remove the habituation, a fact difficult to reconcile with the ordinary conception of fatigue, (c) cases were observed where the habituation took longer to re-effect after the extraneous stimulus than before. Habituation disappears after appropriate rest. It may be deepened by further stimulation after response has ceased. The hypothesis is put forward of a physiological state or process tending to diminish action; such process would be intensified by appropriate rest and extraneous stimulation. A similar hypothesis is made to explain the "extinction" of conditioned responses by Pavlov, who calls the underlying process "inhibition." The phenomenon investigated, and "extinction" of conditioned reflexes probably have the same explanation. With reference to the phenomena of habituation, the snail, as a biological system, behaves in the manner that would be expected of a system obeying Le Chatelier's rule.—*Author's summary.*

3965. **HUMPHREY, GEORGE. A note on the application of Le Chatelier's rule to biological systems.** *Psychol. Forsch.* 13(4): 365-367. 1930.—Application of Cannon's treatment of organic equilibrium to Humphrey's previous paper: "Le Chatelier's rule, and the problem of habituation and dehabituation in Helix albolabris." *Psychol. Forsch.* 13(2/3): 113-127. 1930.

3966. **JACOBSON, EDMUND. Electrical measurements of neuromuscular states during mental activities. II. Imagination and recollection of various muscular acts.** *Amer. Jour. Physiol.* 94(1): 22-34. 5 fig. 1930.—A result is classed as positive if the magnitude of the string vibrations during imagination clearly and considerably exceeds that during relaxation. In the experiment of imagining the lifting of a 10-pound weight (120 tests on 11 subjects, 8 trained, 3 untrained), the results were positive in 93% of the tests. In imagination of various acts performed with the right arm (4 subjects) results were positive for action-potentials from the right biceps-brachial region in 97.5% (159 out of 163) of the tests. In recollection of various muscular acts commonly performed with the right arm (9 subjects, 8 trained to relax, 1 untrained), for 7 out of 9 subjects, the results predominantly showed action potentials from the biceps-brachial region (in 60 out of 90 tests). In 2 of the 9 subjects, lengthened string vibrations occurred during recollection in only 12 of 54 tests. The action-potentials that are here found characteristic of imagination and recollection of muscular acts are readily distinguished from the psychogalvanic reflex because of marked differences in voltage, reaction-time, frequency per sec., wave-form, direction of potential, tissue of origin, and stimulus. Relaxation of the neuromuscular processes characteristic of the occurrence of voluntary conscious activities such as imagination of lifting a 10-pound weight is accomplished within 0.3 to 0.4 sec. on the average in the present experiments. It is confirmed that diminution of conscious activities can be brought about by muscular relaxation (Jacobson, 1925, 1929, 1930).

3967. **JACOBSON, EDMUND. Electrical measurements of neuromuscular states during mental activities. V. Variation of specific muscles contracting during imagination. VI. A note on mental activities concerning an amputated limb.** *Amer. Jour. Physiol.* 96(1): 115-121; 122-125. 1931.—V. Study of a total of 81 imagination tests with 19 control tests on 5 subjects indicates that imagination of activity of the right arm (or other part) is characterized by contraction of muscle fibers either in that part or in the ocular region or in both localities. This affords further evidence that mental activity is not confined to closed circuits within the brain, but that neuromuscular regions participate. VI. Tests on a subject in whom the arm had been amputated above the elbow joint at the age of 8 (presenting at the age of 40 a stump including the atrophic remnant of the biceps-brachial muscle group), showed that specific muscular imagination or recollection of movements in the amputated part no longer takes place. After repeated observations, the subject reports that his imagination is "shadowy" for movements of the lost part. During such mental activities, contractions (not characteristic in intact individuals) occur in other specific localities, evidently as substitutions. With these substitute contractions (and with visualization or verbalization such as may also occur in the intact), this crippled individual engages in mental activities involving the lost part.

3968. **KLEITMAN, NATHANIEL. The effect of continued stimulation and of sleep upon conditioned salivation.** *Amer. Jour. Physiol.* 94(1): 215-219. 2 fig. 1930.—In a series of dogs placed in stands and given morphine subcutaneously, salivation was produced at first by the morphine and later by conditioned reflex, on being placed in the stand. In 1 dog a continued conditioned flow of saliva was regularly observed (continuing after the morphine injection) over a period of several months. The dog tended to fall asleep in the stand, which would stop the flow of saliva; waking the dog produced a resumption of flow. Bearing in mind that these observations were limited to 1 animal and to 1 conditioned phenomenon, it appears that: (1) Application of the unconditioned stimulus does not prevent further response as a result of the continued action of the conditioned stimulus. (2) With a conditioned stimulus acting continuously, sleep cuts short the conditioned activity and awakening leads to its immediate resumption.

1930.—The effects of different nerve-sections on the heat production in the resting gastrocnemius were studied in 50 dogs. Extirpation of the lateral abdominal sympathetic chains; severance of the anterior spinal roots, or separation of the posterior roots of the same territory certainly reduce but do not suppress the heat production. Severance of the cord between the abdominal and thoracic segments does not entirely suppress the heat production, but this is totally lost as soon as the lateral abdominal chain is extirpated. Heat production in muscle results through the abdominal *sympathetic* chains and the *parasympathetic* fibers of posterior roots.—*J. J. Izquierdo.*

3970. **LABHART, FRITZ. Fortgesetzte Untersuchungen über den Einfluss des Nervus sympathicus auf die Ermüdung des quergestreiften Muskels.** *Zeitschr. Biol.* 89(3): 217-236. 15 fig. 1929.—Stimulation of the sympathetic nerves by an induction current provokes a renewed activity of muscles which have been exhausted by repeated stimulation of the motor nerves. The duration of this rejuvenating effect is greater than the one following tetanizing stimulation, it sometimes lasts for 12 min. The restoration of muscle activity by sympathetic stimulation and the disappearance of fatigue following decrease of the stimulation frequency do not represent identical mechanisms. L. discusses the mechanism of the sympathetic stimulation; the sympathetic nervous system probably shortens the interval needed for muscular restitution.—*E. VanCampenhout.*

3971. **LANGFELDT, GABRIEL. En oversikt over den kliniske undersøkelse av det viscerale nervesystem og en kritikk av de forskjellige prøvers praktiske verdi støttet paa egne undersøkelser. [A survey of the clinical research on the visceral nervous system and a critique of the practical value of various tests.]** 134p. (*Skrifter utgitt ved Klaus Hanssens Fond—Nr.* 9) J. W. Eides Boktrykkeri A/S: Bergen, 1929.—The consideration of certain physiological and morphological facts concerning the visceral nervous system shows no absolute antagonism between the parasympathetic and the sympathetic, and indicates the information concerning the peripheral terminations of both systems to be incomplete. The author's experimentation on the effects of adrenaline, atropine, and pilocarpine shows only adrenaline to have even a limited value in determining whether hyperirritability of the sympathetic system is of central or peripheral origin. Aschner's reflex, the cilio-spinal reflex, dermography, and drugs are useless in diagnosing certain mental diseases. Aschner's reflex is useful in the diagnosis of bradycardia parasympathetically conditioned.—*B. R. Lutz.*

3972. **LASHLEY, K. S. Brain mechanisms and intelligence. A quantitative study of injuries to the brain.** xiv + 186p. 11 pl., 33 fig. Univ. of Chicago Press: Chicago, 1929. Pr. $3.00.—An attempt is made to determine the relationship between some forms of adaptive behavior and brain mechanisms. The studies were all carried out in rats (135 were used). Extirpations of different parts of the brain were carried out and the influence of these injuries on the behavior of the animals determined. The problems in adaptation included 3 mazes of different degrees of complexity with food as the ultimate goal, brightness discrimination, and the problem of the inclined box. The experiments were designed to test the ability of the injured rat to learn new methods, retain old ones and discriminate degrees of brightness. On the basis of the results the conclusion is reached that adaptive behavior is directly dependent upon brain functioning and that injury to the brain results in disturbance in adaptability. This disturbance does not depend upon any special localized structure but upon the extent of the injury regardless of its localization. It is felt, therefore, that the brain of the rat functions as a whole, wherein different components are of importance for normal functioning but are not specific for any special function. It is also felt that there are no reasons why this point of view cannot be applied to higher forms such as the dog, monkey and even man. These findings show that the theories of cerebral localization and the reflex theory are inadequate and a new theory is advanced in which the mechanisms of integration are sought in the dynamic relations among the different parts of the nervous system rather than in details of structural differentiation.—*W. Malamud.*

3973. **LHERMITTE, J. Le sommeil.** 206p. Armand Colin: Paris, 1931. Pr. 10.50 fr.—A survey of our present knowledge of sleep. Among other topics the mechanism of sleep and the nature and organization of dreams are discussed. There is also a section of abnormalities of sleep, such as sleep-walking, narcolepsy and insomnia. The author made use of data from both physiology and pathology to demonstrate the existence of a sleep-regulating mechanism in the region surrounding the 3rd ventricle.—*N. Kleitman.*

3974. **MARQUIS, D. G. The criterion of innate behavior.** *Psychol. Rev.* 37(4): 334-349. 1930.—Neurology has accumulated a vast body of factual material dealing with the morphology of the nervous system, but there is as yet little experimental work on developmental physiology. In the present state of knowledge, no adequate concept of the maturation of neural patterns can be formulated. The evidence here presented is intended to justify the conclusion that there is a fundamental difference between the processes of maturation and learning. Both processes, it is true, represent an interaction of organism and environment, but learning is distinguished from maturation by this fact: It represents a modification of the organismic pattern in response to specific stimuli present in the external environment at the time of the modification. Maturation, on the other hand, is a modification of the organismic pattern in response to stimuli present in the inter-cellular and intra-cellular environments, which at the given moment are independent of external influences. Marquis has pointed out that at least in the early stages of development, the environment which is significant for the development of the organism is derived from the parent in a manner comparable to the inheritance of the germ plasm.

3975. **MINAMIKAWA, K. Experimental investigation of the effect of the nervous system on the function of the genital organs.** *Japanese Jour. Obstetr. and Gynecol.* 13(2): 157-165. 16 fig. 1930.—About 1 cm. of the sympathetic nerves surrounding the hypogastric artery near its divergence from the external iliac artery was excised in 16 ♀ rabbits. The bilateral uteri and ovaries were excised in 2 of the rabbits at each of 8 different periods after the operation. The uterus and the ovary on the side of the sympathectomy were found to increase in weight and volume, the ovary more rapidly, the uterus more permanently, than those on the other side. Two other series of experiments were carried out on an unspecified number of rabbits. In one, periarterial sympathectomy was performed as before and also bilateral oöphorectomy. At 3 later intervals both uteri were removed and compared. The sympathectomy apparently compensated to some degree for the atrophic tendency of the removal of the ovaries, for the uterus on the sympathectomized side was invariably heavier than its fellow. In the other series, both ovaries were removed, periarterial sympathectomy performed on one side and the uterus on that side also removed; later the remaining uterus was also removed and its condition compared with that of the one first removed. While results are not clearly stated, apparently they also go to support the general conclusion as to the effect of periarterial sympathectomy.

3976. **MOGENDOWITSCH, M. R. Zur Frage über die Erregungssummation in einer alterierten Nervenstrecke.** *Pflüger's Arch. Ges. Physiol.* 226(1): 104-107. 2 fig. 1930.—A nerve muscle preparation was set up in a moist chamber and the contractions recorded due to single shocks applied to the nerve. When a crystal of NaCl was placed on the nerve either proximal or distal to the electrodes, the contractions became in succession larger, tetanic, veratrine-like, weakly clonic, and then the irrita-

bility and conductivity failed in the region of the crystal.—*W. A. H. Rushton.*

3977. **RANSON, S. W., and J. C. HINSEY. Reflexes in the hind limbs of cats after transection of the spinal cord at various levels.** *Amer. Jour. Physiol.* 94(2): 471-495. 13 fig. 1930.—In cats the spinal cord was transected at levels varying from L 6 to T 4. Varying amounts of time up to 23 days were allowed for recovery. Decapitate cats and acute spinal cats were also studied. The animals were studied while supported in a hammock with legs hanging pendent. Later, kymograph records were made of the responses in the isolated gastrocnemius and tibialis anterior muscles to stimulation of the ipsilateral and contralateral tibial nerves at the ankle with rapid faradic make and break shocks. With the animal supported in the hammock there was considerable extensor tonus which showed itself best when pressure was made against the pads of the toes in the position of the positive Stütz reaction. This reaction was as well developed after transections at L 3 as after transections at higher levels. Cats with transections at or above L 3 were able to bear the weight of the posterior part of the body on the hind legs for varying periods up to 3 min. The ipsilateral flexion reflex was obtained with great regularity in all animals with transection at L 5 or above. The crossed response was more variable. Crossed flexion was more often obtained than crossed extension. Sometimes lightly touching a foot would cause crossed extension and forcefully pinching the toes together would cause crossed flexion. Electrical stimulation of the tibial nerve at the ankle more often caused crossed flexion than crossed extension both in the intact leg and when the contractions of the tibialis anterior and gastrocnemius were recorded on the kymograph. In the crossed response there is a dilemma of reaction which makes these reflexes uncertain and difficult to obtain. This dilemma is just as pronounced after high as after low transections. The contraction of the tibialis anterior in response to ipsilateral stimulation of the tibial nerve is often followed by a prolonged rebound contraction of the gastrocnemius. The after discharge in this extensor rebound contraction may last for many seconds. A diagram of a reverberating neurone circuit is given which could be used to explain after discharge.—*S. W. Ranson.*

3978. **SAGIN, K. Alcune osservazioni alla pubblicazione di Vizioli sul fenomeno di Piotrowski ed il reflesso del malleolo esterno. [Piotrowski's phenomenon and the reflex of the external malleolus.]** *Riv. Patol. Nerv. e Ment.* 33(1): 14-20. 1928.—An antagonistic reflex in the lower leg, known after the name of its discoverer, Al. Piotrowski, was declared by F. Vizioli to be so common as to be virtually a normal phenomenon. Sagin holds, in opposition, that it is a pathological phenomenon, due to a disturbance of the nervous system. —*P. Popenoe.*

3979. **SANTENOISE, D., P. VARÉ, H. VERDIER, et M. VIDACOVITCH. Vagotonie et épilepsie corticale; recherches expérimentales.** *Encéphale* 24(7): 605-618. 1929.—The authors believe that a tonic state of the vagus in dogs is concurrent with a low chronaxie of the cortical motor centers and that these animals are more liable to epileptic convulsions than those in which vagus tone is low and the chronaxie of the motor cortex correspondingly high. The injection of eserin raises vagus tone, lowers the chronaxie of the motor centers and increases the liability to epileptic seizures. Evidence is presented that hypervagotonia causes hypersecretion of a hormone produced by the thyroid gland, that this hormone increases the excitability of the motor centers of the cortex, and is therefore the cause of the predisposition which hypervagotonic dogs show to the occurrence of epileptic convulsions.—*E. A. Linell.*

3980. **SCHREIBER, GIORGIO. Studi sul pigmento cromolipoide, l'apparato fenestrato e la respirazione di supplemento del sistema nervoso. [Studies on chromolipid pigments, the fenestrated apparatus and the supplementary respiration of the nervous system.]** *Pubbl. Staz. Zool. Napoli* 10(2): 151-195. 3 pl. 1930.—The chromolipid pigment of the nervous ganglia of Gasteropods originates in connective tissue which in Aplysia is situated among the cerebral ganglia and is brought to the ganglia by amebocytes which are formed in that connective tissue. These amebocytes form pigmented syncytia which during asphyxia with CO_2 disappear and the pigment increases in the nerve cells. During asphyxia the amebocytogenic connective tissue appears to proliferate. It seems probable that there is a utilization of reserve O during asphyxia since the pigment is derived from an oxidation of unsaturated lipids. In the Cephalopoda the ganglia cells have well developed canaliculi in the cytoplasm. Eosinophilic leucocytes of the circulating blood enter these canaliculi, which demonstrates that the canaliculi are functionally open to the outside of the cell and not artefacts.—*G. Schreiber (transl. by A. Canzanelli).*

3981. **SHERRINGTON, CHARLES. Some functional problems attaching to convergence.** *Proc. Roy. Soc. [London] B* 105(737): 332-362. 3 pl. 1929.—The author gives a description of recent work bearing on the diversity of effects obtained in the motor neurone by reflex stimulation. Afferent stimuli produce states of excitement or of inhibition in the central nervous tissue, the effects of which on the motor neurone may be summation of excitement, summation of inhibition or the algebraic summation of the two. The central reactions are of longer duration than the nerve impulse of nerve trunks. Also these central processes are relatively sensitive to fatigue, variations in bloodsupply, drugs, etc. The central neurones modify the impulses which they transmit and can develop a rhythm of their own, so that the rate of their discharge can rise and fall with the intensity of central excitation and inhibition respectively.—*E. A. Linell.*

3982. **VAN DIJK, J. A. The part played by the sympathetic innervation in producing postural tone in the wing of the pigeon.** *Arch. Neerland. Physiol. Homme et Animaux* Ser. III C. 15(1): 114-125. 15 fig. 1930.—The author, who made experiments upon the wing of the pigeon, concludes that postural tone is composed of 2 components: "Contractile tone" governed by the somatic nervous system and "plastic tone" under control of the sympathetic nervous system. The plastic tone of the wing muscles is maintained by a sympathetic proprioceptive reflex-arc, of which arc the sympathetic chain is the efferent limb. Sympathetic fibres leaving the cord join the sympathetic chain by a white ramus communicans and, leaving it, join the nerves of the plexus brachialis by gray rami communicantes.—*J. W. Langelaan.*

III C. 15(1): 126-137. 1930.—Faradic stimulation of the sympathetic nerve fibers, innervating skeletal muscles, when they are in a state of fatigue, causes a gradual augmentation of the height of contraction of the muscles after a certain latency, and this augmentation, after reaching a maximum, lasts some time after the stimulation has ceased and then gradually disappears.—*J. W. Langelaan.*

3984. **WINSOR, A. L. Observations on the nature and mechanism of secretory inhibition.** *Psychol. Rev.* 37(5): 399-411. 1930.—Little consideration appears to have been given to the nature and complexity of the conditioned secretory response. An analysis of investigations and observations made with subjects where it was possible to observe quantitative changes in the secretion of 2 or more of the digestive glands at the same time, seems to warrant the assumption that the positive or negative conditioned salivary response represents but a component of an extensive and complex reaction involving all the major nutritive glands. The nature of these reactions suggests a close relationship with the

antagonistic divisions of the autonomic nervous system. The increase in saliva when food is seen may be the result of innervation of the cranial nerve supply, while inhibition of conditioned secretion may be due to sympathetic innervation. In the light of these facts the theories of secretory inhibition advanced by Cannon and Pavlov are compared. Recent investigations made in the Cornell Laboratory, showing the inhibitory influence of mild affective states on parotid secretion, seem to support Cannon's theory that inhibition is of sympathetic origin and is controlled in the optic thalamus, as against Pavlov's theory that the inhibitory process is cortical in origin and is the result of cellular activity rather than the functioning of a system of nerves. Many of the difficulties encountered by investigators of conditioned salivary responses could be explained if this close relationship of mild affective states and inhibition were assumed.—*Author's summary.*

3985. YAMAGUCHI, OSAMU. Ueber die Möglichkeit der Leitungsanästhesie im ganzen Trigeminusgebiet durch Intraneuralinjektion des N. mentalis. *Acta Scholae Med. Imp. Kioto.* 12(1): 67-68. 1 pl. 1929.—The author states that injection of the mental nerve in the rabbit with 0.3-0.4% of 0.2% cocaine in oil gave rise to distant effects such as cutaneous and skull bone anesthesia and loss of the corneal tear reflex. He elicited evidence of central effects such as fall of blood pressure, loss of corneal reflex, changes in the respiration and pupil reaction from injection of the median nerve with 5 cc. 3% ether or chloroform oil. He suggests these results might have some application to man.—*M. Beck (transl. by H. Woollard).*

3986. ALLEN, EDGAR, und MAX HOCHREIN. Über Venendruck und Schlagzahl des Herzens. *Deutsches Arch. Klin. Med.* 166(3/4): 237-243. 1930.—The venous pressure was studied in 1500 normal and pathologic cases. In most normal cases the venous pressure was between 4 and 8 cm. H_2O, with 10 cm. H_2O as upper limit; it is usually normal in pneumonic and other diseases except circulatory disturbances. For the differential diagnosis of heart disease and the early recognition of slight circulatory insufficiency the measurement of venous pressure is of special significance. These results gave no support to the view that the rapidity of the heart-beat is regulated by venous pressure.—*Authors' summary (transl.).*

3987. ALLEN, WILLIAM F. An experimentally produced premature systolic arhythmia (pulsus bigeminus) in rabbits. III. Pathway of the arhythmia impulse. *Amer. Jour. Physiol.* 96(1): 243-255. 1 fig. 1931.—The purpose of this paper is to ascertain whether the impulses producing bigeminal pulse from benzol insufflation, etc., traverse the spinal cord, to determine the route through the cord and to the heart. To exclude every known pathway from the brain to the heart except the spinal cord route, the vagi and depressors were sectioned and the inferior cervical sympathetic ganglia removed in 6 rabbits. One period of benzol insufflation was sufficient to produce a bigeminal pulse in 4 rabbits, while 2 required an additional period. In 4 rabbits the spinal cord was transected in the lower cervical region; bigeminal pulse from insufflations was blocked. Of 3 rabbits in which the spinal cord was cut at the level of the 3rd thoracic vertebra, 1 gave a bigeminal pulse from insufflation; 2 did not, nor did 2 others in which the cord was cut at the 4th thoracic. In 3 rabbits in which the cord was cut at the levels of the 6th, 7th and 8th thoracic vertebrae respectively, bigeminal arhythmia could be elicited by insufflation but was usually delayed. Both stellate (1st thoracic sympathetic) ganglia were completely removed in 9 rabbits; in no instance was bigeminal arhythmia obtained by insufflation or other means. In 2 rabbits in which the left stellate was extirpated bigeminal pulse followed the 4th and 10th benzol insufflations respectively; in 2 rabbits in which the left stellate was removed and the right sympathetic trunk cut immediately below the stellate, 7 and 10 benzol insufflations, respectively, were required to elicit bigeminal arhythmia. In 3 out of 5 rabbits in which the right stellate had been removed (1 also had the left sympathetic cord cut below the stellate) a bigeminal pulse was readily produced from insufflations; the other 2 gave no arhythmia. Sectioning the last cervical and the 1st and 2nd thoracic spinal roots in 2 rabbits and the 1st 3 thoracic roots in 1 rabbit prevented bigeminal pulse from benzol insufflation. Transection of both lateral columns in some rabbits, the dorsal and ventral columns and the median ½ of the lateral column in others, and the lateral and dorsal columns in still others blocked bigeminal arhythmia from insufflation, transection at the 6th cervical of the dorsal and ventral columns in some rabbits and the right lateral column and the outer ½ of the left lateral column in 1 rabbit did not. It is concluded that such bigeminal arhythmia is caused by impulses which descend the median ½ of the lateral columns of the spinal cord and pass to the left ventricle by way of the upper thoracic roots and the stellate ganglia. This is obviously an action not usually attributed to the sympathetics.

3988. ASHER, L., H. KAWAI, und N. SCHEINFINKEL. Das Funktionieren des Herzens und des Zentralnervensystems von Säugetieren bei hochgradigem Sauerstoffmangel. *Zeitschr. Biol.* 89(2): 139-148. 2 fig. 1929.—Urethanized rabbits, in which adequate pulmonary ventilation is produced mechanically by a special apparatus described, and in which vascular tone is maintained by continuous infusion of epinephrine, show impairment neither of the heart beat nor of arterial pressure when the O in the inspired air is reduced to 4.2% for a period of 1 hr. If the aorta be ligated at the diaphragm, the O may be reduced to 3.6%. Respiratory movements, which disappear during the period of O deprivation, return to normal shortly after admission of air. It is concluded that the heart and respiratory center will withstand profound O deprivation provided that an adequate circulation be maintained.—*V. E. Hall.*

3989. BERNTHAL, THEODORE G. Some observations upon changes in volume flow of blood accompanying changing respiratory conditions. *Amer. Jour. Physiol.* 95(2): 446-464. 1930.—The effects of variations in alveolar O and CO_2 pressures and of the intravenous injection of NaCN upon the femoral, brachial, superior mesenteric and aortic flow of blood were studied with the continuous electrometric method. Distinction between central nervous and peripheral effects was made so far as possible by comparing the responses in denervated tissues with those in tissues with intact nerve supply. In the regions supplied by the femoral and brachial arteries, the results with nerve supply intact confirm those described earlier. Low alveolar O produced an initial decrease in flow of blood which gave way to a flow above the original level. Readministration of room air resulted in a 2nd rapid and transitory increased flow with eventual recovery. High alveolar CO_2 produced a decreased flow of blood in these regions, with recovery upon readministration of room air. NaCN caused usually an initial decreased flow followed rapidly by an increase far above preadministration levels. Denervation of the region supplied by femoral or brachial

arteries resulted in disappearance of the initial decreased flow and the postadministrational increased flow which usually accompany breathing gas mixtures low in O. The administrational increased flow was not affected by denervation. Denervation of the femoral and brachial regions resulted in disappearance of the initial decreased flow usually seen upon injection of NaCN. The usual increased flow was not affected by denervation. Denervation of the femoral and brachial regions resulted in the disappearance of the initial decreased flow usually seen upon injection of NaCN. The usual increased flow was not affected by denervation. It is concluded that there are 2 mechanisms constantly at work in the control of volume flow of blood in this region,—one central nervous and the other peripheral. The results are not opposed to the possibility, previously suggested, of there being a central and a peripheral acid mechanism of volume flow control, modified by the direct action of reduced oxidations, in which the metabolism of the vasomotor centers and of the peripheral contractile elements may play a part. Attention is called to the resemblance of brain flow (previously described) to the flow in denervated tissue. The administration of gas mixtures high in CO_2 decreased the flow in the femoral and brachial arteries even though the nerve supply to the region was destroyed. Reasons are given for believing that increased viscosity of the blood and increased secretion of the adrenal glands are not factors in producing this effect. In the superior mesenteric artery the volume flow of blood was decreased by administration of low O mixtures and increased by administration of high CO_2 and high O mixtures. NaCN caused an increased flow usually preceded by an initial decrease. These effects occur independently of mean blood pressure changes. Denervation of the region supplied by the superior mesenteric artery resulted in the main in an increased flow upon the administration of low O mixtures provided constant artificial ventilation was used. If spontaneous changes in ventilation were allowed, the volume flow decreased. Denervation in the superior mesenteric artery region resulted in absence of the initial decreased flow upon injection of NaCN. It is concluded that here, as in other regions, there are 2 mechanisms,—central and peripheral,—involved in the control of volume flow changes during low O and NaCN administration, and that the results do not exclude an acid mechanism of volume flow control modified by the direct effects of deficient oxidation. The effects of high CO_2 and high O administration upon superior mesenteric arterial flow are not altered by denervation of the region. Reasons are given for believing that the superior mesenteric arterial flow cannot safely be used as an indication of the flow in abdominal viscera in general. The resultant of the changes in flow in the several regions of the body upon the total aortic flow was an increase upon administration of low O and high CO_2, no change or a decrease upon administration of 100% O, and a marked decrease followed by an increase upon the injection of NaCN.—*Author's conclusions.*

3990. BISHOP, LOUIS FAUGERES, and LOUIS FAUGERES BISHOP, Jr. A clinical study of a graphic method of recording blood pressure. *Ann. Internal Med.* 3(8): 808-814. 1930.—Removal of the personal equation in blood pressure is probably the most important point in the use of a graphic method. Some conclusions can be drawn in regard to the cardiac arrhythmias from the records of blood pressure made with this instrument, but in no sense does it replace electrocardiography for this purpose. The curves shown are purely graphs of blood pressure recording the pulsations of the brachial artery. They do not show any intracardiac manifestations. In cases where ordinary methods are very difficult, as, for example, auricular fibrillation and paroxysmal tachycardia, the graphic method is of great value.

3991. CATTELL, McKEEN, and DAYTON J. EDWARDS. The influence of hydrostatic pressure on the contraction of cardiac muscle in relation to temperature. *Amer. Jour. Physiol.* 93(1): 97-104. 1 fig. 1930.—The tension developed during the contraction of the ventricular muscle of the turtle increases as the temperature is lowered. Moderate hydrostatic pressure (950 pounds per square inch) still exerts a large fraction of its usual stimulating action on the tension developed by the muscle after cooling to between 16 and 10° C., i.e., the stimulating action of cold and pressure are in large part summated. With higher pressures (1300 to 1500 pounds) the tension reached by the cold muscle is no greater than at room temperature. When the muscle is cooled to approximately 5° C. pressure no longer causes an increase in the tension developed during contraction. It is suggested that the similarity of the influence of high pressure and low temperature on the freedom of molecular motion may account for the observed results.—*Authors' summary.*

3992. COOK, S. F., and M. I. ROSE. The recovery of the spleen from contraction induced by exercise. *Amer. Jour. Physiol.* 92(1): 240-248. 1 fig. 1930.—Following electrically induced exercise the transiently contracted spleen of decerebrate, and that of amytalized cats shows 2 phases of recovery. The 1st or rapid phase, of from 3 to 5 min., is apparently independent of the length or degree of the exercise. The 2nd or slow phase, varies in most cases with the extent of the exercise. Recovery for equivalent exercise is appreciably slower in the case of the spleen in amytalized than in decerebrate cats.—*H. E. Jordan.*

3993. CORNELL, EDWARD L. Blood-pressure readings in 1000 pregnant women. *Amer. Jour. Obstet. & Gynecol.* 17(7): 42-47. 1929.—Blood pressure readings on 1000 consecutive pregnant cases were studied. Only those patients were included who had been under care at least 1 mo. and who had viable babies, or if still born, when the pregnancy had advanced at least 7 mos. The diastolic readings at first included both 4th and 5th phase readings but as the first diastolic reading is a little more difficult to record it was discarded and the 2nd and 5th phase readings were recorded, this being easier to obtain. There is a difference of only 6 points between the 4th and 5th phase readings, the latter reading is the more accurate and should replace the former. The average readings in all cases have been somewhat lower than those usually recorded. The exclusion of the first diastolic reading did not vitiate the results although it was recorded in some cardiac cases. The patients studied were divided into 3 groups, viz.: A, with systolic readings below 129 include 584 cases; B, those between 130 and 139 including 240 cases and C, those over 140 including 176 cases. The group A cases remained practically normal throughout pregnancy, in fact had lower B.P.'s than normal non-pregnant women. Group B contained the potentially toxic cases and group C the toxic patients although there was not a single case of eclampsia. A graph accompanies this article.—*E. L. Cornell.*

3994. DRESSLER, WILHELM. Dissoziationen und Interferenzen bei partiellem Herzblock. *Zeitschr. Klin. Med.* 111(1): 23-47. 13 fig. 1929.—Two cases of a long continued dissociation of the activity of 2 heart centers of equal frequency were studied. Such a dissociation may occur only if a complete synchronism exists or if the time interval between the activity of the centers does not exceed the time of conduction of the impulse from one center to the other. Each of the 2 centers through the refractory period induced in the portion of the heart controlled protects these portions from the effect of the concurrent center. If the refractory period of the a-v conduction system is longer than a sinus period an interference dissociation may occur if the sinus rhythm is more frequent than the automatic ventricular rhythm. If the ventricular period plus the conduction period is shorter than the refractory phase a complete dissociation occurs. This accounts for the frequently observed total dissociation in cases of ventricular tachycardia. A classification of the various forms of pararhythmia is given.—*H. M. Krueger.*

3995. EDWARDS, DAYTON J., and McKEEN CAT-

TELL. The action of compression on the contraction of heart muscle. *Amer. Jour. Physiol.* 93(1): 90-96. 1 fig. 1930.—The isolated ventricle of the heart of the terrapin was arranged so that the tension of isometric contractions was optically recorded from a steel spring lever. With this method the heart muscle, subjected to a compression of about 1000 pounds per square inch, acting upon it through a completely surrounding liquid system, shows when stimulated a response about 42% in excess of the tension developed by the same preparation at atmospheric pressure. A compression force of about 1500 pounds, acting on the ventricle, gave an average augmentation of the tension response of about 68%, and with preparations employing the auricles acting together the same degree of compression gave an increase of about 142% in the power of developing tension. The contraction phase of the ventricle exhibits very little increase in duration associated with a "pressure effect" of 42% on the tension, but with higher grades of compression, giving an increase in tension of 68%, the phase of contraction shows a prolongation of 8%. It is suggested that the higher pressures may produce definite changes in the viscous-elastic properties of the muscle. The phase of relaxation exhibits a definite prolongation by pressure. The average increase in duration amounts to 9.5% at a pressure of about 1000 pounds, and 15.5% at a pressure of about 1500 pounds per square inch.—*Author summary.*

3996. **ELY, THOMAS C. The rôle played by arteries, veins and capillaries as supplementing the heart action in the forward movement of the blood.** *Med. Times* 58 (4): 95-98. 1930.—A general review.

3997. **FÅHRAEUS, ROBIN, and TORSTEN LINDQVIST. The viscosity of the blood in narrow capillary tubes.** *Amer. Jour. Physiol.* 96(3): 562-568. 1 fig. 1931.—This study deals with the influence of the capillary tube (especially of minimum diameter) on the viscosity of the blood. The blood of the 2 investigators, obtained by venepuncture, was used; 4 representative series of experiments are given. The results indicate that the viscosity of the blood is not a constant quantity, but dependent on the diameter of the tube. Below a critical point at a diameter of about 0.3 mm. the viscosity decreases strongly with reduced diameter of the tube. Consequently the resistance to the flow of blood in the arterioles (and in the small veins) is considerably less than would be the case if the streaming of the blood followed the law of Poiseuille, i.e., behaved as a fluid with regard to its viscosity.

3998. **FISCHER, M. H. Über lokale Einwirkung von Wärmestrahlung auf das Froschherz.** *Pflüger's Arch. Ges. Physiol.* 220(1/6): 539-550. 6 fig. 1928.—With a simple irradiation method, local heating was applied to the sinus, atrium, ventricle, and atrio-ventricular boundary on the isolated heart of *Rana temporaria.* With only sinus irradiation there occurs mainly a strong atrial acceleration with diminution of the extent of contraction. The ventricle follows the atrium only at the beginning, then exhibits partial block in rhythms ½, ⅓, ¼, etc., until finally complete block occurs. The block effect is regarded as a frequency phenomenon. At times there occurs at the very beginning of sinus irradiation, a momentary pause in the atrium and ventricle, whose significance remains undetermined. With longer sinus irradiation, first the ventricle, then the atrium, and lastly the sinus comes to a standstill. This may be interpreted as a gradual decrease of the pace-setting organization in the sinus, ending in its complete "heat paralysis." Local irradiation applied to the atrial or the ventricular musculature brings on a slowly spreading "thermal inhibition" of the irradiated parts with a decrease of the extent of contraction. Local irradiation of the a-v junction leads to a failure of the excitatory conduction in the atrium, and thereby to an a-v bloc. During the block, automaticity of the atrium develops and expresses itself in ventricular contractions and extrasystoles of the atrium in rhythm with the sinus. All described effects are quickly and completely reversible, when the irradiation is discontinued. These observed results are compared with the known effects of heating the whole heart, and in addition it is sought to give an interpretation of the individual effects.—*M. H. Fischer (transl. by A. H. Hersh).*

3999. **FLEISCH, ALFRED. Venomotorenzentrum und Venenreflexe. I. Mitteilung.** *Pflüger's Arch. Ges. Physiol.* 225(1): 26-41. 9 fig. 1930.—To study fluctuations in segments of the venous circulation, the femoral vein (cats and dogs) distal to the inguinal ligament was employed. A length of 30 to 40 mm., with intact innervation, was isolated. Reactions could thus be mediated only through veno-motor nerves. Inhalation of a 3 to 20% mixture of CO_2 with air uniformly produced a contraction of the isolated venous segment, from 2 to 20% of its original calibre. This effect of increased CO_2 concentration signifies stimulations of the veno-motor center. Injections of adrenalin into the jugular vein uniformly evoked an indirect contraction. Whether the veno-motor center is directly stimulated by the adrenalin, or whether the increased blood pressure effects a veno-constrictor reflex remains undecided. Acetylcholin may produce an initial indirect contraction, but more generally a primary transitory dilatation followed by a secondary contraction. Stimulation of the cardiac vagus for 10 to 20 sec. produces late in the period generally an indirect contraction, which disappears with cessation of the vagus stimulus. There is no doubt that the tonus of other portions of the venous system may be reflexly influenced. Section of the innervation renders the vein segment incapable of contractile response.—*Author's summary (transl. by H. E. Jordan).*

4000. **GARREY, WALTER E. The pace maker of the cardiac ganglion of Limulus polyphemus.** *Amer. Jour. Physiol.* 93(1): 178-185. 4 fig. 1930.—The ganglionated portion of the dorsal nerve cord on the heart of Limulus polyphemus, which is known to initiate the cardiac rhythm, is in every way comparable to the pace maker of the vertebrate heart. The actual initiation of impulses may, however, be restricted to a very small group of nerve cells, and it is shown that it is possible by experimental methods to shift this pace maker group to any level of the ganglionated cord. In each such case a coördinating mechanism forces the rest of the ganglion to assume the rate of impulse formation impressed upon it by the most active cells. Normally this pace maker group has no fixed location and is determined by fortuitous circumstances.—*Author's summary.*

4001. **GONZAGA, ARCADIO C. The normal temperature, pulse, and respiration rates of Philippine horses.** *Philippine Agric.* 19(4): 237-242. 1930.—A study to determine the normal body temp. and the rates of pulse and respiration of Philippine horses was conducted from March, 1929, to January, 1930, in which 105 apparently healthy, native horses of both sexes, ranging in age from 2½ to 16 years, and in height from 46 to 53 inches were used. The result of this study shows that the body temperature of these 105 animals which varies from 37.4° to 38.4° C. does not differ greatly from the foreign data. But their pulse rate which ranges from 38 to 50, and frequency of respiration (20 to 32 per minute) are very much higher than those obtained from the much larger American and European horses. The author concludes that the present indiscriminate practice of applying foreign data to Philippine horses is unscientific as one might regard as pathological rates which are normal.

4003. **HAUFFE, GEORG. Herz, Pulsation und Blutbewegung. Die Pulsation am Herzen und am Gefässgebiete als zwangsläufig mechanischer Vorgang und das Herz als einziger Motor zur Erhaltung des Blutkreislaufes. (Mit einem Geleitwort von FRIEDR. KRAUS.)** 244p. 9 fig. J. F. Lehmanns Verlag: München, 1930. Pr. 14 M.—Periodically a new volume is added to that small class of books which seeks to upset orthodox con-

ceptions in science and to replace them by revolutionary views of supposedly far-reaching significance. The book attempts to do this in behalf of the heart and circulation. Two radically new conceptions are developed: (1) The rhythmic sequence of the heart beat is conceived as due to mechanical properties of the elastic cardiovascular system rather than to a speculative up-building and discharge of an "inner stimulus." The tempo of the heart beat is not given by impulses formed in and discharged by the sinus node, but is due to a movement externally transferred from the peripheral circulation to the cardiac muscle. The sinus node receives excitations; it does not initiate them. Initiation of stimuli occurs in the peripheral vessels as a result of vascular changes in sufficiently diffused regions. (2) The heart and pericardium acting together form a combined force and suction pump operating somewhat after the following manner: Contraction of the ventricles expels blood into the aorta. This would dilate the aorta and raise the pressure during systole, as is commonly believed, but the author claims to have made the discovery that the size of the aorta becomes smaller and the arterial pressure falls during systole. This is explained as follows:—Contraction of the ventricles in a pericardial sac of constant size serves to unfold the auricular wall, thereby enlarging its cavities. This creates a suction which draws blood into the auricles. But this is not all. The suction component is propagated peripherally through the veins and capillaries to the large arteries. When, on the other hand, the auricles contract they fill the ventricle not only by the pressure created within but through the negative extra-cardiac pressure developed without. Lengthy explanations are given to prove that the feeble auricular contraction can indeed develop powerful effects and that the contractions of the auricular appendage determine the proper direction of the blood stream. The theories are apparently based on certain physical experiments and clinical studies of the author. The former comprise the observations—which have apparently escaped all physicists—that increased velocity of flow decreases the diameter of elastic tubes. Furthermore, the author found that with a suitable velocity a rapid series of expansions and constrictions can be produced and made to travel over elastic tubes. By varying the velocity of flow, the frequency of such periodic disturbances can be changed and even irregularities in rhythm can be inaugurated. These mechanical principles are supposed to be duplicated in the circulation. The clinical observations seem to consist of the x-ray findings that augmented minute output and increased blood flow cause a diminution in the aortic shadows and a fall in blood pressure. From this, the author apparently leaps to the corollary that the size of the aortic and arterial pressure must decrease during systole. The reviewer has looked in vain for direct proof of this assumption. The author is modest in his assertion that the work of Harvey is not completely upset by his hypothesis, but is merely given a more far-reaching significance.—*C. J. Wiggers.*

4004. HOLZLOHNER, E. Ueber den Aktionsstrom des Ventrikels und die Veränderung des Kontraktionsablaufs durch $CaCl_2$ und KCl. *Zeitschr. Biol.* 85(6): 585-598. 1 pl., 5 fig. 1927.—$CaCl_2$ causes a prolongation of relaxation and a corresponding prolongation of the electric response, which extends far into the diastole. In the frog's heart there is a close relation between the moment of relaxation and the T wave, but it is doubtful whether the two are simultaneous as Einthoven believed. The rate of rise of the diphasic and monophasic action currents is delayed by $CaCl_2$, but the rise of the mechanical response is accelerated. The reverse effect is produced by KCl. The current from the base is more affected than the apical current by KCl, by anodal action, and also by $CaCl_2$. The author also noted that $CaCl_2$ acting on a limited area caused a peculiar deformation of the monophasic action current.—*Author's summary (transl. by A. J. Clark).*

4005. IONESCO, DIMITRIE, et A. TEITEL BERNARD. Contribution à l'étude des substances actives du coeur. *Arch. Internat. Physiol.* 30(3): 267-279. 9 fig. 1928.—An alcoholic extract of the right auricle of the beef heart, properly purified and mixed with Ringer solution acts positively on the automaticity, contractility, frequency and conductivity of the frog's heart. When the frog's heart has been previously weakened by repeated washings with Ringer solution the effects just described are even more evident. Extracts from the beef ventricle and skeletal musculature act similarly, but to a lesser extent. Organ specificity does not exist. With greater concentration of the extract, toxic effects appear: sinus bradycardia, arrhythmia, negative inotropic effects going on to complete cardiac arrest. The active agent is apparently histamine. Its effect cannot be described as hormonal; these extracted substances play, however, a significant rôle in the mechanism of the heart beat.—*L. Braun (transl. by G. Bachmann).*

4006. JACOBI, ERICH. Blutdruck und Herzform bei senilen und arteriosklerotischen Psychosen. *Arch. Psychiatr. u. Nervenkrank.* 88(3): 425-434. 1929.—A study of 150 cases of senile and pre-senile psychoses, including some of longer standing and particularly those of alcoholic and luetic origin. Blood pressure and x-ray observations were made and the findings correlated with age and mental status. In pure senile dementia cases the unexpected observation was made that almost half had a very high systolic pressure. A third had typical, often advanced, arterio-sclerotic heart involvement. Twelve per cent of the clinically certain arterio-sclerotics had a pressure below 130, but they were generally alcoholics, luetics, endogenous and presenile psychotics. The most important finding was that, of those with pressures above 190, ¼ were senile and ¾ arterio-sclerotic. Numerous other similar data are discussed.—*M. Dresbach.*

4008. LANDIS, EUGENE M. The capillary blood pressure in mammalian mesentery as determined by the micro-injection method. *Amer. Jour. Physiol.* 93(1): 353-362. 3 fig. 1930.—The micro-injection method for determination of blood pressure in individual capillaries was used in studying pressure fall in the mesenteric vessels of decerebrate rats and anesthetized guinea pigs. This method permitted the measurement of mean pressure, without disturbance of flow in the observed vessel. Capillary blood pressures ranged from 22 to 49 cm. of water with ⅔ of the determinations lying between 25 to 35 cm. Average pressure in the arteriolar capillary was 30 cm. in the rat and 38.5 cm. in the guinea pig, while in the venous capillary the average blood pressure was 17 cm. in both. The fall of blood pressure did not cease abruptly at the junction of the arteriole and capillary, but continued to the venous capillary. The pressure gradients of the rat, guinea pig and frog showed a similar division of peripheral resistance between the arterioles and capillaries. A balance between average capillary blood pressure and the osmotic pressure of the plasma proteins has been observed in the rat, guinea pig and frog. The mammals, however, differ from the frog in the higher level of pressure at which this balance is maintained. Average arteriolar capillary blood pressure was above, and average venous capillary pressure was below, the osmotic pressure of the plasma proteins. The findings provide evidence in favor of the Starling hypothesis of fluid interchange in mammals.—*Author's summary.*

4009. LAQUA, K. Experimentelle Untersuchungen über die neurohormonale Theorie der Vasomotorenfunktion. *Bruns' Beitr. Klin. Chir.* 150(3): 405-413. 1 pl., 1 fig. 1930.—These experimental investigations have not confirmed the neurohormonal theory in explanation of the vasomotor trophic disturbances following central sciatic neuroma and of the hyperemia which follows periarterial sympathectomy. Of perfusion experiments on the frog's vessels, 20 out of 22, and all experiments on the isolated rabbit's ear showed that the stimulating serum has no

vasoconstrictor effect. Moreover, I believe to have established by faradic stimulation of the nerves of the extremities carrying the vasoconstrictor fibers a stimulus adequate experimentally to the physiological and pathological excitation of the vasoconstrictors. I cannot explain the occurrence in 2 cases of an undoubted vasoconstriction following the perfusion of the frog's vessels after addition of the stimulating serum. In consideration of the negative findings of all remaining 20 experiments, this constriction must be regarded as due to some incidental uncontrollable influence, since the exciting serum was prepared in both cases in exactly the same way. Even though the results of my experiments are negative, I believe that the neurohormonal theory, attractive as filling the gap in our knowledge of the cause of vasomotor trophic disturbances following central neuroma of the sciatic and of the hyperemia which follows periarterial sympathectomy, required an experimental test.—*Author's summary (transl. by G. Bachmann).*

4011. **LOEPER, MAURICE, et ANDRE LEMAIRE. Le régime des cardiaques et la nutrition du coeur.** *Presse Méd.* 38(14): 233-235. 1930.—The authors present figures based on personal work showing that the cardiac muscle contains twice as much P as the ordinary striped muscle, and a little more Fe and S; also, that the composition of the heart is not uniform. Thus, cholesterol is more abundant in the atrioventricular bundle and total lipids in the ventricle. Glycogen, in the hearts of lower animals like the snail, is uniformly distributed; in the guinea-pig and the rabbit it tends to form sparse crescent-shaped clots in all the fibers; in the calf's heart it is found in the atrioventricular zone in enormous proportions, while elsewhere are only rare droplets in the muscular fibers. Hearts fixed a few hrs. after death offer evidence that glycogen is rapidly destroyed, being somewhat more stable in the primitive than in the common muscular fibers, from which it disappears almost instantaneously. This would seem to indicate an unequal glycogenic or amylolytic activity in the 2 varieties of fibers. The transformation of glycogen is effected by amylase contained in the cardiac muscle; but this amylase also is shown to be unequally distributed, being much more abundant in the ventricular wall than in the atrioventricular zone. Hence the cells of the primitive bundle appear to function as glycogen glands, distributing to the adult fibers of the myocardium supplies of the combustible glycogen. The constant explosive disintegration of this stored fuel appears to furnish the motor force which drives the cardiac engine, and it also produces the variations in current recorded by the electrocardiograph preceding the myogram. Whatever the rôle of the S (found in the heart in higher concentration than in any other organ) or of the cholesterol in which the atrioventricular bundle is so rich, sugar appears to be undoubtedly the essential food of the heart, playing the most important part in the mechanism of muscular contraction, and therefore indispensable to cardiac patients. Glycogen and glucose are the 2 terms of a kind of chemical balance which precedes and sets off the mechanical contraction of the heart. Glycogen, the storage form, and glucose, the form for consumption, are in constant reciprocal transformation by a double reversible reaction, which in one direction may require aerobiosis and in the other anaerobiosis. To the experimental proofs previously furnished by other authors as to the important part played by sugar in the physiology of the heart, Loeper and Lemaire add reports of experiments on the snail's heart performed in collaboration with Mougeot. The fresh heart, provided with glycogen reserves, was regular in action and not responsive to glycogen or glucose; but glycogen restored the normal rhythm to a heart in which the reserves had been exhausted by ptyalin, and glucose acted sometimes as a regulator and sometimes as a tonic only on a heart fatigued or altered by changes in environment. The experience of others is cited to show that sugar reinforces the cardiac effect of numerous medicines, such as digitalis, ouabain and quinidin, or even may by itself ameliorate organic arhythmias or the tachyarhythmias of convalescence. A clinical case is also reported in which daily administration of glucose (for which other sugars may not be substituted) ameliorated the symptoms of an arhythmia which quinidin had failed to influence.

4012. **MIURA, GEN. Ueber den Wert des Kontraktionskoeffizienten und des Blutdruckquotienten bei der Funktionsprüfung des Herzens.** *Acta Scholae Med. Univ. Imp. Kioto* 12(2): 177-193. 1929.—The author investigated at the bedside the comparative value of Ishida's coefficient and the Strasburger method which, among many functional tests, is characterized as the simplest and most easily applied to the seriously sick patient. The conclusions he reached were that the Strasburger method often yields erroneous data on the functional capacity of the heart. Ishida's contraction coefficient leads much more rarely to such errors.—*G. Miura (transl. by G. Bachmann).*

Exp. Med.* 73(1/2): 1-10. 3 fig. 1930.—Researches with the Starling heart-lung preparation on dogs' hearts have led to the following conclusions. The coronary flow is independent of O utilization and venous CO_2 tension. There is therefore no chemical regulation which during increased O consumption relieves O want by means of coronary dilatation. This conclusion is not opposed to the results of Hilton and Eichholtz who found an asphyxial increase in coronary flow due to chemical action on the arterioles, since blood rendered deficient in O after passing the arterioles cannot act in the way mentioned. The degree of heart muscle activity is independent of O consumption and venous CO_2 tension. If O utilization of the heart reaches 100% a further increase in work is impossible. Even in extreme work of the heart there is no accumulation of lactic acid in the blood. The heart does not show the phenomenon of oxygen debt.—*Author's summary (transl. by W. J. Meek).*

4015. **RADT, P. Ueber den Einfluss der Strömungsgeschwindigkeit des Blutes auf die intravitale Ablagerung von Tusche.** *Zeitschr. Ges. Exp. Med.* 66(1/2): 265-283. 3 fig. 1929.—The experiments reported deal with the influence of blood velocity on the intracapillary and intracellular deposition of colloidal India ink injected intravenously. When this material is concentrated it remains in capillaries in which the blood stream is especially slow. With dilute solutions the material is deposited intracellularly in the capillary endothelium in locations where the blood stream is slow. The author reports experiments to demonstrate the dependence of deposition of the colloidal material on the velocity of the blood. He believes that all capillary endothelium possesses the property of taking up dyes in granular form. Those parts exhibiting ordinarily a special ability to take up dyes are those in which a low blood velocity is present. He does not believe that the taking up of dyes is a specific property of special endothelial cells and that therefore it is not permissible to classify a part

of these cells into a special system.—*P. Radt (transl. by G. Bachmann).*

Physiol.* 61(1/3): 64-70. 1 fig. 1931.—Electrocardiographic records on rabbits show that the decreased chronotropic effects of vagal stimulation following insulin injections is not due to any shift in position of the pacemaker but to a lowered cardiac irritability. There is some indication that the depression may be associated with an increased K content of the heart.—*W. J. Meek.*

4017. RAYMOND-HAMET. Sur les effets cardiaques de l'excitation prolongée du vague. *Rev. Pharmacol. et Thérap. Expérim.* 1(2): 97-102. 3 pl. 1928.—As was first noted by Laulanié, cardio-inhibitory effects of the prolonged excitation of the peripheral end of a pneumogastric nerve are often discontinuous. It frequently happens that during this excitation cardio-inhibitory action does not remain the same but increases and decreases several times in intensity. There are thus alternating periods with respectively maximal and minimal inhibitions. Moderate doses of acetylcholin also may produce a discontinuous cardio-inhibitory action, i.e., increasing and decreasing several times before being abolished. This points to a further resemblance between effects of electric excitation of the pneumogastric nerve and those of moderate doses of acetylcholin.—*Author's conclusions (transl).*

4018. ROESE, H. F. Ueber das Minutenvolum und den Gaswechsel des künstlich durchbluteten Säugetierdarmes. *Pflüger's Arch. Ges. Physiol.* 226(2): 184-189. 1 fig. 1930.—The denervated heart-lung-intestine preparation was used. Averages of results in 12 experiments were 235.9 cc. of blood (per kgm. bowel) per min. at 60-75 mm. Hg. pressure; 262.5 cc. per min. at 80-90 mm.; 306.6 cc. per min. at 100-115 mm. In 3 experiments with the innervated preparation somewhat higher values were obtained (261.9 cc. per min. at 65-75 mm.; 305.9 cc. per min. at 80-85 mm.). Changes in blood temperature from 38° to 31° elicited no distinct change in blood flow. Estimations of gas metabolism (Van Slyke method of blood-gas analysis was used) gave, as average figures, per kgm. of bowel per min.: at 30 min. after start of experiment, 4.357 cc. O, 5.611 cc. CO_2; at 60 min. 4.5 cc. O, 4.088 cc. CO_2; at 90 min. 2.523 cc. O, 3.569 cc. CO_2. In 3 experiments on innervated preparations the corresponding figures were 6.255 cc. O, 8.013 cc. CO_2; 3.526 cc. O, 6.713 cc. CO_2. The high respiratory quotients are attributed to unavoidable hyperventilation of the heart-lung preparation, which lowers blood CO_2 tension and leads to excessive removal of CO_2 from the bowel.—*C. F. Schmidt.*

4019. SCHELLONG, F., und E. SCHÜTZ. Ueber die Refraktärphase nach optimaler und nach abgeschwächter Erregung des Herzmuskelelementes. (VII. Mitteilung zu den Untersuchungen ueber die Grundeigenschaften des Herzmuskels.) *Zeitschr. Ges. Exp. Med.* 61(3/4): 285-304. 11 fig. 1928.—Apparatus devised by the authors enabled them to record the monophasic action current of a heart muscle strip and to study the refractory phases of the identical part which produced the action current. The refractory phase was investigated by means of the interval at the end of which a second stimulus became effective. The return of irritability during the relative refractory period was measured by the duration of the second action current which is shortened in proportion to the nearness of the second stimulus. The end of the absolute refractory period coincides with the end of the excitation process. A short period of excitation is therefore followed by a shortened refractory period. A stimulus 4 times the threshold value is effective immediately at the end of the refractory period, no matter whether the period of excitation has been maximal or shortened. The relative refractory period following a maximal excitation is longer than the absolute. The relative refractory period after a shortened period of excitation remains unchanged in length. It follows that the relative refractory period is independent of the degree or duration of the previous excitation process and depends only on the maximum irritability of which the preparation is capable. The irritability of the heart muscle is reduced to zero whether the excitation process is maximal, sub-maximal or shortened.—*W. J. Meek.*

4021. STARR, ISAAC, Jr., and LEON H. COLLINS, Jr. Studies of cardiac output in normal men. *Amer. Jour. Physiol.* 96(1): 228-242. 2 fig. 1931.—Experiments on the fundamental assumptions of the improved ethyl iodide method for the determination of cardiac output were repeated and yielded results which increased the authors' confidence in the method. This method yielded duplicate determinations whose average difference was 6.4% of their mean. The results demonstrate that the cardiac output of resting normal adult ♂♂ is essentially constant. The average level in 10 normal young adult ♂♂ in the post absorptive condition, after a prolonged rest period in the horizontal position, was 3.97 liters per min. or 2.08 liters per sq. meter of body surface. These results are quite similar to those of Grollman. The experiments indicated that food and excitement increase cardiac output. Cold caused changes in both directions; becoming warm after having been chilled was always accompanied by a decrease of cardiac output. The change from the lying to the standing position caused no significant alteration in 4 subjects; in 1 subject the cardiac output standing was constantly lower than that lying. These results are in satisfactory agreement with those of many other methods. A subject having a highly reactive type of circulation with inconstant blood pressure showed no difference in general level of cardiac output, nor in response to food, cold, position, and excitement from the other more stable subjects.—*Authors' summary.*

4022. WALINSKI, FRANZ. Blutdruck bei Hyperthermie. *Zeitschr. Ges. Physikal. Therap.* 39(5): 223-237. 1930.—The systolic and diastolic blood pressure was measured in 28 experiments in which artificial hyperthermia was induced in individuals in whom the arteries in most instances were healthy. In a large majority of cases the blood pressure ran parallel with the body temp. During the bath the diastolic pressure sank in spite of the rising systolic pressure; later it adjusted itself to the systolic pressure. In half the experiments there was observed after the return of body temp. to normal, a temporary fall of blood pressure. Pulse and respiration behaved like the blood pressure. The behavior of the systolic pressure is explained by the increase of cardiac activity, that of the diastolic pressure by the dilatation of the peripheral vessels.—*Author's summary (transl. by G. Bachmann).*

4023. WHITTEN, MERRITT B. A comparison of the blood supply of the right and left ventricles in childhood. *Arch. Internal Med.* 45(1): 46-58. 8 fig. 1930.—The celluloid corrosion method is better suited than cleared specimens or roentgenograms for studying the arterial blood supply of the ventricles. The blood supply of the septum can easily be demonstrated with only a slight modification of the technique. During the latter part of fetal life and at birth the right and left ventricles are equally vascular. At the end of the 2nd year the left ventricle shows a vascular preponderance. This preponderance becomes marked by the 6th year and enormous by the 10th. It persists throughout life in normal hearts. There is also an increasing venous preponderance of the left ventricle corresponding rather closely with that of the arteries. It is suggested that the vascularity is in some degree correlated with the weights and thickness of the ventricles. This is substantiated by the greater thickness of the left ventricle after the age of two. Also, in the case of a hypertrophied right ventricle, there occurred a corresponding increase in the right ventricular vascularity.—*H. M. Krueger.*

4024. WIGGERS, CARL J. (in collaboration with

JAMES R. BELL, and MARGARET PAINE). Studies of ventricular fibrillation caused by electric shock. II. Cinematographic and electrocardiographic observations of the natural process in the dog's heart. Its inhibition by potassium and the revival of coordinated beats by calcium. *Amer. Heart Jour.* 5(3): 351-365. 5 fig. 1930.—The natural course of events from the onset of fibrillation following faradic excitation to complete diastolic rest was studied by recording electrocardiograms and moving pictures simultaneously. In addition, intraventricular pressure curves were optically recorded during a number of experiments. The changes taking place when fibrillation was inhibited by intraventricular injections of 5% KCl and the process of recovery following similar injections of 5% $CaCl_2$ solutions combined with massage, were investigated by the same means. Fibrillation induced by faradic stimulation continues naturally for 15-50 min. and may be divided into 4 stages, on the basis of surface changes, electrocardiographic deflections and intraventricular pressure variations. The initial stage of tachysystole lasts less than 1 sec. and is characterized by the spread of rapidly recurring but coordinated contraction waves, by large electrocardiographic deflections with steep gradients and by definite if small intraventricular pressure variations. The 2nd stage of convulsive incoordination ordinarily lasts 15-40 sec. and is characterized by rapid irregular localized contractions which spread short and variable distances over the heart. They are accompanied by large electrical deflections, 600 or more per min., which vary considerably in size, amplitude and contour. The 3rd stage, tremulous incoordination, ordinarily continues 2 or 3 min. and is characterized by multitudes of irregular yet forceful shivering or trembling motions, each spreading a very short distance and with highly variable frequencies over different surface regions. They give rise to small irregular electrocardiographic oscillations having frequencies between 1,100 and 1,700 per min., and are capable of increasing the intraventricular pressure level slightly. The 4th stage of atonic incoordination is characterized by feeble wavelets of contraction spreading irregularly and at slow rates over small areas until more and more areas become quiescent, and finally the very slightest movements remain in a few areas only. The electrical deflections perhaps become slightly more regular in contour and spacing, but their amplitude becomes progressively smaller, and their frequency is gradually reduced to 400 per min. or less. Potassium chloride injected into both ventricular cavities does not modify the stages through which fibrillation naturally passes; it merely hastens the process so that fibrillation stops within an average period of 2.4 min. Intraventricular injections of $CaCl_2$ after K inhibition combined with massage, 1st inaugurate a coordinated idioventricular rhythm, characterized by slow waves of contraction sweeping over the 2 ventricles asynchronously but in coordinated fashion. After a short interval, a supraventricular rhythm is reestablished, the electrocardiogram regaining all its normal characteristics.—*Authors' summary.*

4025. WIGGERS, CARL J. (in collaboration with HAROLD THEISEN, and H. D. B. SHAW). Studies on ventricular fibrillation produced by electric shock. III. The action of antagonistic salts. *Amer. Jour. Physiol.* 93(1): 197-212. 3 fig. 1930.—The experiments reported deal with the mechanisms through which successive intraventricular injections of K and Ca salts abrogate the fibrillary state and restore a coördinated beat. Doses of KCl smaller than those utilized to arrest fibrillary contractions can produce in the normally beating heart a state resembling fibrillation, but not actually identical with it. The changes preceding and leading up to this condition are analyzed in detail and the so-called "fibrillary contractions" are compared with those resulting from faradic stimulation. We conclude that in this instance the incoördination is the result of depressed conduction, first in the bundle branches and internal layers of the ventricle, and subsequently in diverse portions of the myocardium. Incoördination follows when some fractions escape complete depression, but total cessation occurs when they are completely depressed. The so-called "fibrillation" due to use of K salts differs from that following faradic stimulation in the slower, coarser and more regular waves which run over both ventricles. The electrical deflections are larger and more regular while their frequencies (150-270 per min.) are much less than are those which follow after faradic stimulation (660-1200 per min.). The conclusion is reached that the condition produced by K is not a complete incoördination. The production of such a condition is in itself no contra-indication to the employment of KCl solution for arresting existing fibrillation, but emphasizes the importance of employing doses sufficiently large to produce complete depression in all fractions of the heart. The minimal dose that can ordinarily be relied upon to arrest fibrillation is about 50 mgm. per kgm. Evidence is presented that K salts administered intraventricularly produce their action after being distributed through the myocardium. This distribution cannot be accounted for by diffusion, nor by an overflow into the aorta and entry into the coronary system. It is chiefly forced through the Thebesian vessels by low but positive pressures within the ventricular cavities. Subsequent injections of $CaCl_2$ fail to restore coördinate beats unless fluid is massaged into the aorta and thus circulated through the coronary system. This is not due to the fact that Ca is not distributed through the walls by the Thebesian vessels as is K, but rather to the fact that the K is not readily washed out of the tissue unless assisted by massage sufficient to restore a coronary perfusion with the animal's own blood.—*Authors' summary.*

4026. ZWAARDEMAKER, H. Das Elektrokardiogramm des Automatinherzens. *Pflüger's Arch. Ges. Physiol.* 221 (4): 455-459. 1 fig. 1929.—The electro-cardiogram of the eel heart when stimulated to beat by automatin was like the electro-cardiogram of the normal heart. Agonal phenomena appeared in the mechanogram of the isolated heart on partial removal of automatin. Without automatin there was no heart stimulation or pulsation.

4028. ALPERS, BERNARD J. The reaction of the central nervous system to experimental urea intoxication. *Arch. Neurol. & Psych.* 24(3): 492-508. 11 fig. 1930.—Rabbits were injected with pure urea intraven. and subcut. to study the effect upon the neuroglial elements of the nervous system. The fibrous astrocytes in the white matter in close relation to the vessels, and in

less degree the protoplasmic astrocytes in the gray matter were affected. The change in these elements took the form of conversion into so-called ameboid glia cells, various stages in the development of which could be followed. The oligodendroglia were acutely swollen in some instances. The microglia were hypertrophied in a case of very severe intoxication, but were on the whole very resistant to the effect of toxins. The striking feature was the involvement of those glial elements in close relation to the blood vessels, suggesting that one of their functions may be the absorption of poisons circulating in the blood stream.—*B. J. Alpers.*

4029. **BODANSKY, MEYER. The effect of hydrogen ion concentration on saponin hemolysis.** *Jour. Biol. Chem.* 82(3): 567-577. 1929.—The relationship of pH to the resistance of dog and human erythrocytes to saponin has been studied and the results represented by curves. The effect of inorganic acids and bases on saponin hemolysis is believed to depend principally on their chemical combination with globulin and possibly other proteins of the cell membrane, such as globin. On the acid side of the isoelectric point of the red blood corpuscle (pH about 4.6), as the positive charge increases, the resistance of the cell to saponin diminishes. On the alkaline side of the isoelectric point, as the cells become more and more negatively charged, their resistance to saponin increases gradually to about pH 8.5, after which the resistance increases more rapidly to a maximum at about pH 10.—*Author's summary.*

4030. **BROWNING, C. H., J. B. COHEN, S. ELLINGWORTH, and R. GULBRANSEN. The trypanocidal action of some derivatives of anil and styryl quinoline.** *Proc. Roy. Soc.* [*London*] *B* 105(735): 99-111. 1929.—As tested on mice infected with *Trypanosoma brucei*, the most marked trypanocidal action was exerted by substances which contained a free basic group in one nucleus and an acylamino group in the other, especially in the styryl series. The compounds, 2(*p*-amino styryl) -6 acetylamino quinoline methochloride and 2(*p*-acetylamino styryl) -6 dimethylamino quinoline methochloride, were the most active substances, cures being occasionally produced by 1/50 of the maximum tolerated dose. Cures resulted even when ½ of the tolerated dose was administered to mice in a moribund condition whose blood was swarming with parasites. Very little prophylactic action was exerted by the latter substance and it was inactive when ingested *per os. In vitro* it had only slight lethal action on trypanosomes. Drug-resistant strains were developed by the usual method; they were also resistant to arsacetin, tryparosan and trypaflavin but not to trypanblue and Bayer 205. Rabbits treated 3 to 5 weeks after inoculation with *T. brucei*, when definite symptoms had developed, were cured in most cases by a single dose of either substance administered subc. The chemical preparations of the substances are described.—*C. H. Browning.*

4031. **CAPPELL, D. F. The late results of intravenous injection of colloidal iron.** *Jour. Path. and Bact.* 33(1): 175-196. 1930.—Colloidal Fe injected intraven. is taken up first by certain cells belonging to the reticulo-endothelial system and by certain of the circulating leucocytes. Later the Fe undergoes transformations which result in its redistribution. The most important of the later changes is believed to be the entry of Fe into some compound—possibly a loose combination with the plasma proteins; and it is probable that this linkage is brought about through the activity of reticulo-endothelial cells. This loosely bound Fe passes through capillary walls and thus Fe storage appears later in lymphatic glands and in the parenchyma cells of the liver and kidney. In the mouse the liver, spleen and lymphatic glands are the most important sites of Fe storage, especially the liver in the later stages. Excess Fe administered parenterally is dealt with similarly to excess Fe derived from hemolysis in the circulation. No ill effects follow massive accumulation of Fe in the liver cells and the pancreas does not participate in Fe storage. Accordingly nothing analogous to the lesions of hemochromatosis has been observed in the organs of animals subjected to excess Fe over prolonged periods.—*D. F. Cappell.*

4032. **CHIKANO, M. Eine neue chemische Mikromethode zur Adrenalinbestimmung. Zugleich ihre Anwendung auf die intermediären Stoffwechseluntersuchungen.** *Biochem. Zeitschr.* 205(1/3): 166-175. 1929.—The method is based on the reaction of epinephine with iodic acid. Blood or serum is deproteinized by precipitation with metaphosphoric acid. A KIO_3 solution is added to the filtrate. The mixture is boiled for 4 min. and H_2SO_4 is added. After standing over night KI is added and the remaining iodic acid is titrated with sodium thiosulfate. In pure solution 0.05-0.01 mgm. of epinephrine can be determined accurately. Epinephrine added to serum can be recovered quantitatively, whereas when added to defibrinated blood only 32-56% is recovered. Serum and blood contain substances which react with HIO_3. Urea and creatinine could be ruled out, but uric acid uses up HIO_3. The substances which react with HIO_3 are present in increased amounts during starvation or after a protein meal.—*G. T. Cori.*

4033. **CHIKANO, M., und M. KOMINAMI. Über die Spaltung des Adrenalins im Serum.** *Biochem. Zeitschr.* 205(1/3): 176-179. 1929.—Epinephrine added to serum is slowly destroyed. Determinations were made with Chikano's HIO_3 method and by the blood pressure method with identical results. In a buffered phosphate solution at pH 7.1-7.3 epinephrine is destroyed at the same rate as in serum.—*G. T. Cori.*

4034. **CRUICKSHANK, E. W. H., and D. L. SHRIVASTAVA. The action of insulin on the storage and utilisation of sugar by the isolated normal and diabetic heart.** *Amer. Jour. Physiol.* 92(1): 144-159. 1930.—The isolated normal heart responds to insulin by storing glycogen provided that the blood sugar does not fall to an extremely low level. In the diabetic heart while insulin administered in physiological dosage maintains glycogen synthesis, it does not do so after the repeated addition of 10 units of insulin half hourly to the blood perfusing the isolated heart-lung preparation: with the reduction in diabetic blood sugar there is a disappearance of glycogen and muscle sugar from the heart. The average figure for the utilisation of sugar by the normal isolated heart without the addition of sugar approximates 2 mgm. per gm. of heart muscle per hr. The addition of sugar to the perfusing blood causes increased utilisation of sugar and glycogen synthesis. The addition of insulin to normal blood perfusing a normal heart gives an utilisation of about 6 mgm. The addition of both sugar and insulin occasions an utilisation approximately 12 mgm. per gm. of muscle per hr. The perfusion of a diabetic heart with normal blood results in a sugar utilisation of about 4 mgm. per gm. of muscle per hr. On the other hand the perfusion of a diabetic heart with diabetic blood, the animals being 7 to 9 days diabetic, results in no utilisation whatsoever. This points to rather complete elimination of insulin from blood and heart muscle in 7 to 9 days after pancreatectomy. Insulin added to the diabetic blood perfusing the diabetic heart increases the power of the heart to utilise sugar up to 7 mgm. per gram per hr., but it appears to produce no synthesis of glycogen.—*E. W. H. Cruickshank.*

4035. **FERMO, CESARE de. Studii sperimentali sulle anestesie. (Il comportamento della concentrazione glicemica in rapporto alla narcosi eterea, alla anestesia locale novocainica ed all'azione della morfina.) [The blood-sugar concentration in relation to ether, novocain and morphine anesthesia.]** *Arch. Ital. Chir.* 25(3): 356-366. 1930.—Ether, morphine and novocain were administered to 4 dogs (8 experiments). All the anesthetics used caused a temporary rise in blood-sugar, greatest in amount (0.04%-0.08%) for ether, less (0.037%-0.05%) for morphine, and least (0.018%-0.023%) for novocain; of shortest duration (4-5 hrs.) for novocain, longer (5-12 hrs.) for ether, and longest (12-24 hrs.) for morphine. The disturbance of glycemic regulation in the case of ether is attributed to the diminished alkalinity of the blood.—*From author's summary (transl.).*

4036. **FIORANI-GALLOTTA, P. L. Alcoolismo.** 204p. 57 fig. Unione Tipografico-Editrice Torinese: Turin, 1929. 16 L.—The author traces the history of alcoholic beverages, and their uses in religious ceremonies. He tells of the first legislations against alcoholism, of the place held in literature and art by the grapevine and wine, the discovery of distillation and the first researches on alcohol. The bromatology and toxicology of alcohol and alcoholic beverages are discussed. Next are presented the views of different authorities as to the food value of alcohol. Also, the action of alcohol in the organism: in the G-I tract, in the blood system and tissues; its effect on respiration, on the neuro-muscular apparatus; thermic and psychical action; effect on liver, kidneys, and genitals; relation to T. B. and local and general resistance; with further observations and experiments. The author outlines the pathological action of alcoholic beverages; distinguishes between normal and pathologic inebriation; describes chronic alcoholism, alcoholic neuritis, alcoholic psycho-neuroses, gross pathological and histological lesions of the nervous system; lesions in other organs, like stomach and intestine, liver, pancreas, spleen, lung, blood vessels, kidneys, nerves, skin, genitals, male and female. The relation between alcoholism and heredity and its results on children and youths are discussed. The social causes and effects of alcoholism are given, touching upon heredity, sex, environment, pauperism, industrialism, land cultivation, etc. Very pertinent economic factors in relation to alcoholic beverages, their production and uses, their cost and mortality are presented. Finally, the author writes upon the antialcoholic prophylaxis in relation to legislations of many types; the "failure" of prohibition in the U. S.; in other countries, especially of France and Italy; the social measures, aid and provisions in regards to drunkards, their cure and their housing. He mentions various antialcoholistic leagues, their work, their remedies, their propaganda, their effort to substitute sports and other forms of amusements for alcohol drinking, etc.—*S. Jacobs.*

4037. **FORNET, W. Unbekanntes vom Insulin.** 41p. Verlag der Aerztlichen Rundschau, Otto Gmelin: München, 1929.—The urine of normal rabbits and healthy people fed with insulin pills undergoes remarkable changes. First it becomes optically active (levorotatory). Later it contains small amounts of glucose, that disappear again after a short time: "insulin diabetes" or "paradox insulin reaction." Insulin can be chemically standardized by reduction of $K_3FE(CN)_6$ as in the Hagedorn and Jensen blood sugar method. Some 20 different brands of insulin were thus examined.—*W. Fornet.*

4038. **FUJII, IJURO. Diuretine hyperglycaemia in cats.** *Tohoku Jour. Exp. Med.* 15(3/4): 285-323. 1930.—An attempt was made to administer diuretine hypodermically to the cat in a dose of 0.35 to 0.5 gm. per kgm. of body weight. Since the poisoning abolished or greatly diminished the appetite, in some cases food was not given for some days after the injection; in others a standard fluid food, composed of milk, Liebig's extract, soluble starch, glucose and water was given. The blood sugar before and after the diuretine administration and before and after giving the food was regularly investigated. On injecting diuretine the blood sugar of the cat, especially when the food was given not long before the injection, was increased during for, say, 3 to 5 hrs., the peak being reached probably within 1 hour after the injection, there was a return to normal but the sugar level rose again and reached the acme, as a rule, on the 2nd or 3rd day of the poisoning. The hyperglycemia continued as a rule 3 to 6 days or longer. This long lasting, moderate hyperglycemia was observed regardless of whether or not food was given after the diuretine administration. The standard fluid food, above given, invariably occasioned alimentary hyperglycemia, and when it was given during the diuretine poisoning, the alimentary hyperglycemia was apparently exaggerated. But the magnitude of the hyperglycemia may be regarded merely as the sum of the long lasting diuretine hyperglycemia and the alimentary hyperglycemia. The magnitude of the alimentary hyperglycemia during the poisoning was greatest on the 2nd or 3rd day of the poisoning, occasionally on the 4th day, and the exaggeration lasted 4 to 6 days at least. The transitory hyperglycemia which makes its appearance immediately after the diuretine injection and lasts for some hours only, disappeared when the splanchnic nerves and the semilunar ganglia were bilaterally interfered with. It is of central origin. Injection of the drug under the skin evokes extreme excitement which lasts about a half hour and is followed by the depressive stage. The moderate hyperglycemia lasting for several days after the diuretine injection, the alimentary hyperglycemia due to administration of the above mentioned fluid food, and its exaggeration during the diuretine poisoning were capable of developing in the cat so operated on. Therefore two forms of hyperglycemia are to be distinguished, that is, transitory hyperglycemia of central origin, which immediately follows the diuretine administration, and the long lasting hyperglycemia of long latency which is not of central origin. Glycosuria was seldom detected in the fasting cat poisoned with diuretine, but invariably when the alimentary hyperglycemia was induced in the cat under diuretine. Salicylic acid was determined in the urine. Ten to 20 hrs. after the diuretine injection the amount detectable reached the maximum. For 5 to 10 days the reaction was positive.—*Author's summary.*

4039. **FUKUYE, KANICHI. Beiträge zur Erforschung über die Störung des Gehörorgans durch das Nicotin.** [Japanese] *Kyoto Furitsu Ikwa Daigaku Zasshi* 1: 953-960. 1927.—The disturbances of the auditory organs produced in rabbits by subc. and intraven. injection of nicotine were studied. The findings included atrophy of the organ of Corti, macula and crista acustica and degenerative atrophy of the cochlear nerve, vestibular nerve and spiral ganglion.—*Author (courtesy Japanese Jour. Med. Sci. IV) (transl. by I. H. Pierce).*

4040. **GADDUM, J. H. Quantitative observations on thyroxine and allied substances. II. Effects on the oxygen consumption of rats.** *Jour. Physiol.* 68(4): 383-405. 1930.—Adult male rats from standard Wistar stock were fed on a standard synthetic diet, and a record was taken of their O consumption and movements for 3 hrs. every morning by means of the apparatus described by Richards and Collison. From these records the resting O consumption of the rats was determined. The normal value at 25° was 14.44 ± 0.07 c.c. per kgm. per min., or 700 cals. per square metre per 24 hrs. The effects on this of the administration of thyroxine and allied substances were studied. The conclusions already reached as a result of experiments with tadpoles were confirmed. The most effective way of giving thyroxine to rats is the subc. injection of an alkaline-water sol.; the intraven. injection of such a sol., or the subc. injection of a neutral suspension being relatively ineffective. The response to thyroxine was diminished after thyroidectomy and increased if another injection had been given previously. When used in the pure state the naturally occurring isomer, l-thyroxine, had more effect, on rats and on tadpoles, than d-thyroxine. Given orally to rats, I in the form of thyreoglobulin had much more effect than in the form of thyroxine. Tested on tadpoles or by subc. injection in rats, a dose of l-thyroxine was equivalent to a dose of thyreoglobulin with the same total I content. Two dipeptides containing thyroxine had, in equivalent doses, effects not very different from those of thyroxine itself, both when given by the mouth and when given subc. N-acetylthyroxine and diacetylthyroxine (Kendall) injected subc. suspended in water produced large and prolonged increases in O consumption. Diiodothyronine injected in comparatively large doses produced an increase in the O consumption both of normal and of thyroidectomized rats. Thyronine had no effect. The substance in which all the I of thyroxine is replaced by Br had a slight effect like that of thyroxine both on

normal and on thyroidectomized rats. Thyroxamine, diiodotyrosine and ββ-di-(3, 5-diiodo-4-hydroxyphenyl) alanine (which is isomeric with thyroxine) were without effect on the O consumption.—*Author's summary.*

4041. **GRUBER, CHARLES M., and PAUL I. ROBINSON. Studies on the influence of morphine, papaverine and quinidine upon the heart.** *Jour. Pharmacol. & Exp. Therap.* 37(4): 429-449. 12 fig. 1929.—Small and moderate doses of morphine SO_4 cause an increase in the height of contraction of terrapin hearts perfused through their coronary systems. Small doses of papaverine HCl likewise increase the height of contraction of excised perfused terrapin hearts. Moderate doses of papaverine HCl cause a decrease in the height of the contraction of the perfused terrapin heart. Large doses either of morphine SO_4 or of papaverine HCl cause temporary inhibition of cardiac activity. This is a more common effect of papaverine than of morphine. The first few contractions following the cardiac arrest are higher than the average. This process simulates the recovery noted after arrest by vagus stimulation. Atropine SO_4 does not abolish this phenomenon. Papaverine HCl increases the irritability of the terrapin heart until it finally causes fibrillation. A similar change can be induced by morphine though not so readily. Fifty-two % of the fibrillating hearts rendered so by the injection of either papaverine or morphine were temporarily restored to normal rhythm by the injection of quinidine SO_4. Terrapin hearts, fibrillating from excessive papaverine HCl administration, were made to beat with regularity for a short time by the administration of large doses of morphine and vice versa. The action of these opium alkaloids is the same upon excised hearts of rabbits and cats. Both morphine and papaverine cause vasodilatation of the coronary blood vessels, (confirmation of Macht). In the intact plethysmographed hearts of dogs and cats small doses of papaverine injected intraven. decrease cardiac volume. Large doses of papaverine cause dilatation of the heart.—*Authors' summary.*

4042. **HEFFERNAN, PATRICK. Some notes on the biophysics of silica and the etiology of silicosis.** *Brit. Med. Jour.* 2(3584): 489-492. 1929.—Si is a normal constituent of plant and animal tissues. It is found in animal tissues in fairly definite amounts, the quantity differing in various organs. It is exceptionally abundant in connective tissues of pulmonary tubercular lesions and embryonic connective tissue. Si serves to strengthen connective and ectodermal tissues and helps in the production of firm scar tissues. In this capacity it enters into the cell structure, probably in the colloidal form. Where inhaled in excess, Si leads to an overproduction of fibrous tissue due to the colloidal activity of fresh silica hydrosal, and not to any poisoning of the cell protoplasm by soluble Si. Silicosis is produced much more rapidly by inhaling powders made of strongly alkaline soaps and finely ground silica than by inhaling fine quartz particles, because in the presence of the stronger alkaline medium the readily adsorbed fresh silica hydrosal is more rapidly formed. Clays, carbon and perhaps other substances retard or prevent the formation of Si hydrosal or coagulate it when formed and so retard or prevent silicosis. "Asbestosis" is due to the Si content of the asbestos and is a true silicosis. The condition is not known to be produced by substances other than Si.—*A. B. Clawson.*

4046. **JANCSÓ, N. von, Jr. Die Bedeutung der retikuloendothelialen Speicherung der chemotherapeutischen Arsenobenzolderivate vom Standpunkt der chemotherapeutischen Wirkung.** *Zeitschr. Ges. Exp. Med.* 65(1/2): 98-128. 1929.—By histochemical methods the mechanism of action of the arsphenamines was shown. The various arsphenamines if injected intraven. in mice show an entirely varying behavior as far as their storage in the reticulo-endothelial system goes. As for recurrent fever, the reticulo-endothelial storage of the investigated arsenobenzol derivatives plays a very minor rôle or none at all in the mechanism of their action. This storage does not influence the spirocheticidal action. Ag arsphenamine, which forms the greatest deposit, has no stronger action, while sulpharsphenamine which has the least deposit is the most active. In the case of trypanosomiasis there exists a different relation between reticulo-endothelial storage and therapeutic action; an entirely different situation as in the case of recurrent fever. Ag arsphenamine and neoarsphenamine, which form the maximum deposit in the reticulo-endothelial system, possess the greatest therapeutic activity, while sulpharsphenamine and "Arsalyt," which form only small deposits in the tissues have no effect in trypanosomiasis of mice. It is concluded that the dischemotherapeutic action of splenectomy has no relation to the storing action of the reticulo-endothelial system and on the other hand storage in these tissues is not a prerequisite for this chemotherapeutic action.—*F. R. Greenbaum.*

4047. **KOBACKER, J. LESTER, und D. SCHERF. Versuche über die Entstehung der Digitalisextrasystolen.** *Zeitschr. Ges. Exp. Med.* 67(3/4): 372-380. 4 fig. 1929.—From 3 series of studies, one on 5 dogs and 5 cats, one on 5 cats and a third on 6 animals, it is concluded that digitalis arouses, in the last stages of intoxication in the intact mammalian heart in situ, irregular extrasystoles, never a regular bigeminy. Previous heart injury, to the point of serious degeneration of heart muscle, induced by P poisoning, does not alter the result; but mechanical injury from pressure or wound produces much earlier intoxication with a much lower dosage. K and Ca lead to a bunching of the digitalis extrasystoles. A vagus stimulation in several experiments increased the extra impulses in the ventricle.

4048. **KOBAYASHI, ATAKA. Über die Gewöhnung an Morphin und seine lähmende und erregende Wirkung.** (Japanese.) *Tokyo Igaku Kwai Zasshi.* 41: 2276-2326. 1927.—In long-continued experiments with morphine on rabbits, dogs, cats and guinea pigs, the alterations in various morphine effects have been studied. The reactions of the central nervous system and peripheral organs in tolerant and non-tolerant animals were studied comparatively. Also the pharmacological action and the continued application of the nitroso-morphine prepared by Tamura were investigated. The following conclusions were reached: 1. The increased power of the organism to destroy morphine, first found by Faust, is not sufficient to explain morphine tolerance, but there must occur a specific acquired cellular immunity. 2. It is believed with McGuigan and Tamura, that the depressant effects are produced by morphine itself, the stimulating action by its decomposition products.—*Author (courtesy Japanese Jour. Med. Sci. IV) (transl. by I. H. Pierce).*

4052. **LÉVY, JEANNE, et RENÉ HAZARD. Action de quelques mydriatiques sur l'oeil énuclée de grenouille. —Application à l'étude pharmacodynamique des éléments constituants de l'atropine (tropanol et acide tropique) et de quelques-uns de leurs dérivés.** *Arch. Internat. Pharmacodyn. et Therap.* 36(1): 26-48. 1929.—Pupillary area of the freshly excised eye is maximally increased by epinephrine 1:1000, less markedly by 1:5000 and 1:10,000; atropine and pilocarpine do not influence epinephrine mydriasis. Atropine SO_4 is mydriatic in concentration of 1:200, more markedly in 1:100; the base is more powerful than the salt; epinephrine causes further mydriasis after atropine. Pilocarpine NO_3 1:100 causes marked miosis, but does not overcome atropine mydriasis. These observations confirm Poos' belief that the dilator and sphincter muscles are distinct entities, and that the former has a dual innervation, the latter a single one. Tropine itself is mydriatic to the isolated frog pupil; this action depends on the tertiary amine, not on the alcohol group. Tropic acid is miotic, but its simplest ethers are mydriatic; the necessary groupings are an aromatic acid containing a secondary alcohol, primary and tertiary groups making the acid less powerfully mydriatic. The nature of the radical with which the acid combines is immaterial, at least among the simplest tropates. The constituents of atropine are therefore both mydriatic in the form of simple ethers, and the combination simply reinforces the action. This is true only of the excised eye of the frog, not of the eye in situ nor of the isolated mammalian iris.—*C. F. Schmidt.*

4053. **LÉVY, JEANNE, et OLIVIER GAUDIN. Dosage de la narcotine dans les mélanges morphine-narcotine et dans les préparations à base de poudre d'opium. Action de quelques alcaloides de l'opium sur l'intestin isolé de cobaye.** [Concluded]. *Bull. Sci. Pharmacol.* 37(8/9): 478-500. 1930.—The different alkaloids of opium have somewhat similar actions on the isolated intestine of the guinea-pig. However, while the phenanthrene derivatives (morphine, codeine) provoke, in small doses, a slight diminution of peristalsis the isoquinoline derivatives (narcotine, papaverine, narceine), in small doses, cause a slight excitation of peristalsis, which is, however, not constant. In strong conc. all the alkaloids of opium cause a lowering of tonus and a paralysis of peristalsis. The strength of these effects varies with the different alkaloids, morphine being the least active and narcotine one of the most powerful. The constancy of the results and the proportionality between the quantity of alkaloid and the degree of the lowering of tonus is the basis of a method for the quantitative determination of each of the alkaloids, in pure solution. Moreover, narcotine can be determined in morphine-narcotine mixtures or in those of alkaloids similar to the natural composition of opium. The action of these mixtures is compared with that of a known solution of narcotine, always diluting the mixture sufficiently to reduce the morphine and other alkaloids below their efficient concentration. While the method is satisfactory for mixtures of alkaloids it will not work for extract of opium, because of the non-alkaloidal substances present which exert an effect on the intestines. The result obtained with the extract is, however, interesting because it confirms by physiological analysis the presence of a considerable quantity of very active substances, unknown until now.—*Authors' conclusions (transl. by H. C. Wood).*

4054. **LIPSCHITZ, WERNER, PAUL MEYER, und ROBERT SALOMON. Die Grundwirkungen des Kampfers und kampferartiger Substanzen.** *Arch. Exp. Pathol. u. Pharmakol.* 148(5/6): 257-294. 8 fig. 1930.—Camphor has a diphasic action on the oxidation rate of goose erythrocytes; after raising their respiration from 20-40% there follows a non-specific action resembling narcosis superseded by another rise in respiration. Weaker solutions produce first an inhibitation, then an increase in oxidation, then a decrease. The effect of increasing oxidations is specific for all the camphor group except methylbutylketone, which is derived as a condensation product of cyclohexanon. Stimulation by camphor is due not only to its action on the cardiac mechanism, but also to its oxidation effects. It increases oxidation in rabbit erythrocytes, but does not affect the oxidation rate of the model: (animal charcoal, oxalic acid + O). The respiratory quotient of cells treated with camphor is about 1, in Ringer's solution, but is somewhat different in an isotonic solution of pure $CaCl_2$, pure NaCl, and sucrose. The partition coefficient of camphor between erythrocytes and surrounding fluid lies between 1.4 and 1.7. Partition of the I ion between erythrocytes and perfusion fluid is not altered by treatment of the cells with camphor. Blood cells frozen and then thawed after camphor treatment increase their oxidation rate from 100-200%. A camphor solution that inhibits oxidation plus a narcotic has a greater inhibiting effect on oxidations than the sum of their separate action. If the erythrocytes are washed free of the narcotic, and then camphor is added to them, it increases oxidation. Cells treated with camphor are more sensitive than untreated cells to HCN and to narcotics.

4055. **LUDWIG, WILHELM. Die Ursachen der extremen Giftwirkung der Schwermetallionen, sowie der Verunreinigungen von Wasser und Glas auf Paramaecium aurelia.** *Zeitschr. Wissens. Biol. [Abt. C.] Zeitschr. Vergleich. Physiol.* 6(3/4): 623-687 16 fig. 1927.—*P. aurelia* is injured by all solutions of $AgNO_3$ up to dilutions of 10^{-7} and 10^{-8} gm./cc. $AuCl_3$ and $Cu(NO_3)_2$ have similar effects. In these studies, death of the paramecia was taken as the criterion of toxicity; division-rate, being dependent directly upon the bacterial content of the medium, was not a consistent criterion. There is a critical discussion of similar studies of Kolisko, Krawkow and Junker. The cause of the action of $AgNO_3$ is the action of Ag-ions in increasing the permeability of the pellicle for water, resulting in an increase in the normal diffusion from outside in. This increase is proportional to the Ag-concentration and is probably conditioned by the formation of Ag-albumin compounds within the pellicle. The excretory apparatus is unable to dispose of this additional water, and, when death occurs in the more dilute solutions, the organism swells and the pellicle disintegrates. Since hypotonic solutions tend to the same effect, the author increased the toxic action of the Ag salt by decreasing the osmotic pressure of the culture medium. In this way death of the organisms was brought about in $AgNO_3$ solutions as dilute as 10^{-9} gm./cc. This gives a clue to the injurious effects observed from water distilled in Cu or Ag vessels. Ordinarily, paramecium shows no sensitivity to the osmotic pressure differences of distilled water, tap water and culture media. Impurities contained in glass that are of chief practical interest are those absorbed or adsorbed from solutions previously in contact with it. Sometimes these substances can not be or can hardly be removed by ordinary cleaning methods, but when in contact with a liquid over a long period of time are gradually given up to it. Glass exposed to $AgNO_3$ absorbed it in proportion to the concentration in the solution. Glass thus artificially "activated" with $AgNO_3$ showed in the solution with which it was kept in contact a zone of increased concentration near the glass. The toxic effect of the solution could be decreased or stopped by preventing the animals from coming in contact with the glass. Metals go into solution in water in concentrations great enough to kill paramecium. Their injurious action is not different from that of their salts, and we can dispense with the conception of an "oligodynamic action." The paper is followed by a bibliography of publications dealing with the action of dilute solutions; these writings are classified according to subject-matter.—*G. Alexander.*

4056. **MACKLER, H., and J. M. D. OLMSTED. Changes in the chemical constituents of frog's muscle induced by insulin.** *Univ. California Publ. Physiol.* 7

(9): 91-102. 2 fig. 1929.—Determinations of initial inorganic P, phosphocreatine, total P, lactacidogen, glycogen, and lactic acid have been made on individual muscles (gastrocnemii) or groups of muscles (the remaining shin muscles) of large bullfrogs. In the resting muscles of normal frogs, approximately 25% of the P is "labile" P, presumably in the form of phosphocreatine. After prolonged stimulation the labile P is decreased; the customary decrease in glycogen and increase in lactic acid takes place, but there appears to be no change in lactacidogen. When normal frogs are exercised in order to simulate insulin convulsions, the initial inorganic P and lactic acid are higher, and phosphocreatine and glycogen are lower, than normal. If the frogs are allowed to rest after the exercise, the initial inorganic P and phosphocreatine tend to return to their normal values while the glycogen tends to remain low and the lactic acid high, showing that there is no correlation between these two mechanisms. After insulin convulsions, the initial inorganic P and lactic acid are both high, and phosphocreatine and glycogen, low or even absent. Contraction can take place in absence of either phosphocreatine or glycogen, or of both.—*Authors' summary.*

4057. MERCIER, FERNAND. Action de l'hydrastine sur la respiration. [Action of hydrastine on respiration.] *Compt. Rend. Soc. Biol.* 97(33): 1468-1470. 3 fig. 1927.

4058. NAITÔ, TAMIJI. Zum Vergleich der Herzwirkung von Kampfer, Hexeton, Coramin. (In Japanese) *Chiba Igaku Kwai Zasshi* 5: 1366-1385. 1927.—The action of camphor, hexeton, and coramin was studied on the normal and the chloralized frog's heart, using a modified Straub's cannula, applying the drugs both internally (endocardially) and externally (pericardially). Camphor had no stimulating action on the normal heart, but stimulated the chloralized heart, causing increased rate and amplitude. In stronger concentrations camphor caused depression of the heart, the muscle being paralyzed. The paralysis disappeared quickly if the heart was perfused with Ringer's sol. Hexeton also acts as a stimulant for the chloralized heart; but not so certainly nor so promptly as camphor. Strong solutions give more paralysis than camphor. Coramin is still more certain in its stimulating action on the chloralized heart. In strong solutions it brings the heart to standstill in diastole; but the heart muscle is still quite able to contract on stimulation. In this the coramin is quite opposite to camphor and hexeton.—*Author* (*courtesy Japanese Jour. Med. Sci. IV*) (*transl. by C. Brooks*).

4059. NAPIER, L. EVERARD and C. R. DAS GUPTA. The value of a provocative dose of pentavalent antimony in the diagnosis of kala-azar. *Indian Jour. Med. Res.* 17(3): 749-753. 1930.—The intravenous injection of an ordinary therapeutic dose of neostibosan has the effect of increasing the number of leishmania parasites in the blood of a kala-azar patient. The greatest number of parasites will be found between 5 and 10 min. after injection. In this series the number of parasitized cells found in smears taken 10 min. after injection had been given was 34, compared to 10 parasitized cells in the same amount of blood taken from the same patients prior to injection. This increase is so marked that the procedure described may facilitate diagnosis in cases in which the more certain methods of spleen or liver puncture, or blood culture cannot for any reason be employed. The interval between giving the injection and taking the blood for examination should be 10 min. Although in the experiments reported above neostibosan was used, it is probable that any therapeutically active pentavalent compound of Sb would act in a similar way.—*Authors' conclusions.*

4060. OHNO, REISHICHI. Untersuchungen über die Beziehung zwischen Nervengiften und Elektrolyten. I. Mitteilung. Beziehung zwischen parasympathischen Giften und Calcium sowie Strontium. II. Mitteilung. Ueber den Einfluss von Kalium, Rubidium, und Natrium auf die inverse Calciumwirkung. *Kyoto Igaku Zasshi* 24: 792-801, 802-814, 1927.—If a frog's heart, perfused with K-free Ringer sol. after previous treatment with pilocarpine or acetylcholine, be further treated with a Ca sol. of medium concentration, there is observed, instead of the increase in tonus characteristic of the action of Ca, a decided decrease, or one might say an inverse Ca action. With Sr sol. such an inverse action never occurred. For the inverse reaction to occur it is necessary that the parasympathetic system be irritated to a greater degree than the sympathetic and also that the Ca conc. does not exceed M/30.—II. The action of pilocarpine and acetylcholine is more pronounced in K-free than in K-containing normal Ringer sol. The presence of K or Rb in the perfusion liquid suppresses the inverse Ca action. Contrariwise an increase in the Na content of the perfusion liquid favors the occurrence of the inverse Ca action as well as of the action of parasympathetic poisons.—*Author* (*courtesy Japanese Jour. Med. Sci. IV*) (*transl. by L. W. Butz*).

4061. POPOFF, P. Действието на Piscida erythrina върху рибитѣ. [The action of P. erythrina on fish.] [In Bulgarian.] Годишникъ на Софийския университетъ, Ветеринарно-медицински факултетъ. (*Jahresber. Univ. Sofia, Vet. Med. Fakultät.*) 3: 113-142. 1927.—A resinous minor substance was isolated from the root-bark of *P. erythrina* and its action tested on fish. It killed fish by paralysis of certain parts of the brain (diencephalon and midbrain). Another alcohol-soluble substance of piscidia resin, the so-called "second minor substance," showed an especially great activity; it was the strongest fish poison of the resin and was called "piscidin." It killed fish in a dilution of about 1: 400,000 within 10 min.—*A. Kalojanoff* (*transl. by E. V. Lynn*).

4062. PRIBYL, E. K dusikovemu metabolismu pri experimentalnich otravach. I. Subacutní otravy arsenem. [Nitrogen metabolism in experimental poisoning. I. Subacute arsenic poisoning.] [English summary.] *Biol. Spisy Vysoké Školy Zverolékařské Brno* (*Publ. Biol. École Vétérinaires*) 6: (121)-(135). 1927.—Experimental subacute poisoning in 4 rabbits by sodium arsenite has been induced and the changes in ratio between urea N and non-protein N in blood, urea N, ammonia N and total non-protein N in urine were followed. It was found that there was an increase of non-protein N in all cases. The urea N quotient in blood of the poisoned rabbits increased, but in one rabbit on the day before death the urea quotient decreased by ½ the normal value. The increased non-protein N and urea N in blood were associated with an increase of these constituents in the urine. Also in the urine the urea quotient increased above the normal value. The noticed decrease of non-protein N in one rabbit was followed by a decrease of urea N in the urine. The NH_3 excretion in poisoned animals was little changed. The initial stages of hyperemia or fatty degeneration of the liver seemed to have no influence on the blood and urine urea content, but in the advanced stages of fatty degeneration of liver, the urea content was decreased.—*Author's summary.*

4064. RENTZ, ED., und C. AMSLER. Die "Potential" oder Phasenwirkungen der Lokalanästhetika am Froschgefässpräparat. *Arch. Exp. Pathol. u. Pharmakol.* 133 (5/6): 274-283. 3 fig. 1928.—The action of alypine, novocaine, tutocain, eucaine B, and cocaine HCl upon the isolated blood vesels of the frog (method of Laewen-Trendelenburg-Backman, see Rentz, Arch. Exper. Pathol. u. Pharmakol. 131, p. 357, 1928) is that of a temporary vasoconstriction even when the rate of perfusion remains unchanged. The substitution of the poison containing perfusion fluid by normal solution after 10 min. perfusion or after returning to the original rate of perfusion also affects the blood vessels. Such effect, however, is opposite to that observed during the initial phase and decreases in intensity in the order of the drugs named. The duration of the effect due to washing also decreases. Changing the drug concentration from weaker to stronger causes a vasoconstriction, and from stronger to weaker—

a vasodilation in the case of drugs the initial action of which is vasoconstriction. The vasodilating drugs, such as psicaine and stovaine, show no effect upon washing. Further work is being done to determine the significance of the above described "phase action" of the drugs.—*E. Rentz (transl. by B. S. Levine).*

4070. **WAITZ, CARL. Experimentelles zum Oleothorax.** *Beitr. Klin. Tuberk.* 73(1): 59-72. 4 fig. 1929.—The 1st part of this study includes 4 series of experiments on oleothorax in rabbits and guinea-pigs (number not stated). Pure olive oil, mixed with 10% oil of sesame, was used, and in some experiments, 8% gomenol, the oil of one of the Myrtaceae, *Melaleuca viridiflora,* chemically akin to eucalyptus oil and the terpene group. A marked irritative action was observed, especially from the gomenol, causing exudation, perivascular cellular infiltration, formation of adhesions, etc. The 2nd part comprises cultural studies in vitro, and demonstrates the growth-inhibiting effects of oil on staphylococci, *Bacillus putrificus verrucosus* Zeissler and tuberculosis bacilli.

4071. **WATT, J. M. The action of cardiazol on the cardio-vascular system.** *Jour. Med. Assoc. South Africa* 4(2): 36-39. 5 fig. 1930.—Cardiazol or pentamethylenetetrazol produced a depressing action on the isolated cat and rabbit heart. It did not counteract the depressing effects of $CHCl_3$ on the heart. On a heart taken from a rabbit with pneumonia, cardiazol had no effect.

4072. **WAUCOMONT, R. Recherches sur la pharmacodynamie générale de l'intestin.** *Arch. Internat. Pharmacodyn. et Thér.* 36(3): 285-386. 1929.—Activity of isolated intestine is primarily a function of the alkalinity of the sol. employed: Ringer pH 7.85 was used in these experiments; pH 9.10-9.50 gave maximal contractions; pH 6.50-5.20, complete relaxation and arrest of movements. Greater alkalinity caused "systolic standstill" of the segment. Alkaloids in small amounts increase the activity and amplitude of contractions because of their basic property. In larger amounts alkaloids work in one or two ways: (1) paralyzant (trivalent N, cocaine, nicotine, atropine); (2) excitant (pentavalent N, pilocarpine, choline, muscarine, etc.). Ionic modifications in a neutral medium have no effect on contractility. In normal alkalinity Na+K in proper proportion give rise to no contractions as long as the Na+Ca maintains a reduced activity. In weak $CaCl_2$ sol. activity ceases in a state of contracture; in weak KCl sol., in relaxation with marked loss of tone. Alkaloids do not exert their action as long as the ionic composition of the nutritive medium remains normal. Caffeine and ergotamine can not be used to eliminate sympathetic function because of their action on the muscle. Alkalinizing the solution sufficiently prevents the inhibitory action of epinephrine. Nicotine and phenol paralyze the sympathetic fibers without affecting parasympathetic. Atropine in moderate doses paralyzes both. A segment so treated establishes a slow, regular rhythm with moderate tonicity and weak amplitude. This activity is of neurogenic origin; it is irreversibly abolished by methylene blue, which selectively poisons the nerve ends without affecting the muscle. Epinephrine is similarly shown to act on the intermediary substance. While the intrinsic nervous system is characteristically resistant to the action of poisons, particularly alkaloids, it is electively responsive to alkalies. The digitalis group acts on the motor neuromuscular mechanism; Ba salts affect the muscle fibers directly; veratrine relaxes and paralyzes smooth muscle. Gradual moderate distension throughout the length of a loop causes an increase in tone and augmentation of amplitude of contractions. Too strong or sudden distension causes loss of tone and diminution or abolition of contractions. These reactions are ascribed to the intrinsic nervous system. The muscle fibers freed of all nervous elements except the interstitial syncytium retain the functions of contractility and rhythmicity, an elementary power assuring at least a minimal intestinal activity. Bile salts depress the activity of the isolated loop. Rhubarb, senna, cascara and colocynth inhibit the movements and prolong the action of epinephrine. Increasing the alkalinity of the fluid reinstates contractions thus suspended. In animals with biliary fistulae and with the bile ducts ligated, small or moderate doses of the purgatives have no effect. If an alkali (soap or $NaHCO_3$) is given at the same time there is a slight increase in the amount of the stools. Strong doses have a marked purgative action. Numerous tracings, protocols and theoretical discussion are included.—*C. Reynolds.*

4073. **WOKES, FRANK. A note on the potency of Digitalis lanata.** *Quart. Jour. Pharm. & Pharmacol.* 2(2): 292-298. 1929.—A sample of authenticated fresh *Digitalis lanata* leaves has been assayed both by the frog and by the cat methods, the water-soluble constituents being obtained by means of an infusion, and the alcohol soluble constituents by means of tinctures. The infusion gave a somewhat lower result than the 2 tinctures. By the cat method it was 350 ± 22% of the standard for the former compared with 432 ± 47 and 394 ± 45 for the latter. The frog method applied to one of the tinctures indicated a lower potency than the cat method (320 ± 21% compared with 394 ± 45% resp.) but the difference barely exceeded the combined experimental error. The actual potency of the sample of *D. lanata* is probably 3½ to 4 times that of the international standard. —*Author's summary.*

4074. **WOLFF, HAROLD G. The cerebral circulation. XI a. The action of acetylcholine. XI b. The action of the extract of the posterior lobe of the pituitary gland. XI c. The action of amyl nitrite.** *Arch. Neurol. and Psychiatr.* 22(4): 686-690. 3 fig.; 691-694. 2 fig.; 695-699. 3 fig. 1929.—XI a. Intraven. injection of acetylcholine causes dilatation of cerebral arteries, veins and minute vessels, usually a rise in cerebrospinal fluid pressure and a fall in systemic arterial pressure. In the regulation of the diameter of cerebral blood vessels, the chemical content of the blood is of greater importance than its hydrostatic pressure. XI b. Extract of the posterior lobe of the pituitary gland causes constriction of pial arteries, arterioles, veins, venules and minute vessels. Vasoconstriction after intraven. injections of pituitary indicates that the diameter of the brain vessels is influenced more by the chemical content of the blood than by its hydrostatic pressure. XI c. Inhalation of amyl nitrite in cats causes dilatation of cerebral vessels. Associated with the cerebral vasodilatation, there is a fall in systemic arterial pressure and a rise in cerebrospinal fluid pressure.—*Author's conclusions.*

4075. **YOSHIDA, HARUYOSHI, und INOSUKE HAYASHI. Beiträge zur Kenntnis der Kampferwirkung auf das Froschherz.** *Nagoya Jour. Med. Sci.* 2(1): 1-5. 1927.—The isolated hearts of about 450 ♂ frogs were studied when perfused with 1×10^{-2}-2×10^{-3} concentrations of camphor in Locke-Ringer sol. At 1×10^{-4} the height and frequency of contraction are decreased, recovering when the concentration is lowered. In the heart poisoned by camphor, O perfusion brings back regular contractions in from 3 to 25 hrs., depending on the method and the richness of the perfusion. The O reversal is explained by the volatilization of the camphor in the cannula, which was determined by Bohr's method. —*I. Hayashi (transl. by C. Reynolds).*

4079. **HOLMES, BARBARA (preface by F. G. HOPKINS). Cancer and scientific research.** 160p. The Sheldon Press: New York, 1931.—A presentation of some of the facts about cancer in a form that should be easily understood by the moderately well educated non-medical reader. Special emphasis is placed upon such etiological factors as are well demonstrated in a well planned effort to educate the reader in such preventative measures as may seem indicated. No new material is presented. The material is logically and clearly presented in an unusually calm and dispassionate fashion.—*G. L. Rohdenburg.*

4080. **HOLMES, S. J. Differential mortality in the American negro.** *Human Biol.* 3(1/2): 71-106; 203-244. 1931.—A survey of the mortality of negroes and whites reveals wide differences in the death rates of the 2 races from various diseases, in part the result of the unfavorable environmental conditions surrounding the negroes. For several diseases the mortality of the negroes is less than that of the whites (measles, scarlet fever, diphtheria, and erysipelas). Since the environment is everywhere more favorable to the whites, the facts point to the existence of a hereditary racial difference in respect to these diseases. Diphtheria takes a higher toll from the negroes in the first year of life, but the relation is reversed in the 2nd and subsequent yrs. The high negro death rate from tuberculosis is due partly to environmental factors and partly to the imperfect acquisition of an immunity acquired through minimal infections. Tuberculosis in the American negro is approaching the slow chronic character manifested in the whites. How far a true racial diathesis is involved is doubtful. The mortality of negroes from pneumonia is everywhere higher than that of the whites, and in cities it is commonly 2 or even 3 times as high. In the U. S. Army during the late war negro mortality was over twice that of the white recruits for bronchial pneumonia, and nearly 3 times that of the whites for lobar pneumonia. The attack rates for bronchial pneumonia among the negroes were nearly 3 times that of the whites, and over 4 times that of the whites for lobar pneumonia. The ratios of deaths to cases, however, were actually somewhat higher for the whites in both these diseases. Ordinarily, influenza is more fatal to negroes than to whites and the attack rate is generally higher; but at the height of the great epidemic of 1918 the whites suffered more than the negroes. The Army experience, as well as the testimony of several physicians, indicates that the negroes suffer less than the whites from colds, and diseases of the nose, sinuses, throat, and ears. Cancer of the skin is relatively rare in negroes, but cancer of the uterus is considerably more common in negro than in white females. The incidence of most kinds of skin disease among negroes is low. On the other hand, negroes are particularly prone to die from diseases of the heart, nephritis, and cerebral hemorrhage, especially in cities. Negro mortality resulting from syphilis is high, and this fact accounts largely for the high proportion of stillbirths and abortions in the colored population. Congenital malformations and injuries at birth among negroes are relatively rare. The general thesis is advanced that many of the natural immunities of the negro, not only to diseases of the skin, but to infections starting in the mucous membranes of the nose and mouth, are due to the superior resistance of the ectoderm in the negro race.—*S. J. Holmes.*

4084. BONNE, C. De Ontwikkeling van een Carcinoom. [Development of carcinoma.] *Handelingen 5de Ned.-Ind. Natuurwetensch. Congres Soerabaja* 1928: 258-265. 1928.—The investigation of the initial stages of the experimental carcinomata shows, that these malignant tumors begin at several places simultaneously, and that all transitions between normal cells, thickened epithelial cell layer and true infiltráting growth can be found. From time to time resorption of the formed tumors is found. This conception contrasts with the idea of Ribbert or Boverie that the carcinoma develops only out of its own center without cancerization of the surrounding tissue. The author found some examples in human, e.g., cancers of the skin, but in many other tumors the initial stages are difficult to find, and in the later stages symptoms of cancerization of normal tissue are no longer found.—*W. J. C. Verhaart.*

4085. BORNSTEIN, SIEGBERT. Histologische Glykogenbefunde in Leber und Nieren bei mit Insulin behandelten Diabetikern. *Zeitschr. Ges. Exp. Med.* 66(5/6): 623-634. 1929.—The glycogen content of the liver and kidney is compared in diabetics treated with insulin and those not so treated. Following insulin therapy there is an increase in the intracellular glycogen in the liver, so that in severe cases it is abundant. This confirms the results of animal experimentation and those of Dick in 3 human cases. Carbohydrate depletion of the organism prevents liver glycogen increase. The anatomical finding of glycogen in the kidney, considered characteristic, is not always present in insulin treated cases and is absent in cases with sugar-free urine.—*R. A. Moore.*

4086. BRAMBILLA, SILVIO. Le alterazioni del sistema nervoso centrale in alcune avitaminosi. [Alterations in the central nervous system in certain types of avitaminosis.] *Lo Sperimentale* 84(5/6): 537-552. 1930.—Only pure degenerative changes were observed in scorbutus of guinea pigs and rachitis of rats. There was almost no activity of the glial and mesodermal cells. Avitaminosis does not produce specific neuropathologic lesions.—*M. L. Menten.*

4087. BRODIE, JESSIE LAIRD. Congenital pyloric obstruction. I. Etiology: an experimental study. *Amer. Jour. Physiol.* 89(2): 340-348. 1 fig. 1929.—Protocols are presented of 4 litters of albino rats in which 10 out of 23 young showed pyloric obstruction. The diet of the mother was minimal in the anti-neuritic vitamin. The clinical picture presented was an enlarged and very firm abdomen with extreme general emaciation. At autopsy the stomach was enlarged and packed with curd, and the vagus in all cases examined showed myelin degeneration. In the cases in which the condition was mild or cured by atropin, polyneuritis was later superimposed upon the original condition. The pyloric obstruction is therefore considered as one manifestation of vitamin B deficiency with resulting defective myelinogeny. Of the young of the 1st generation 1.2% showed this condition, and 22% of the young of the 2nd generation: 87.5% of the young thus affected were ♂♂. Comparison is made between this condition in rodents, which cannot vomit, and human babies with congenital pyloric stenosis. The age of onset, sex, and response to atropin all point to a similarity between the 2 conditions.—*Author's summary.*

4088. BUCKLEY, RICHARD C. Pontile gliomas. A pathologic study and classification of twenty-five cases. *Arch. Path.* 9(4): 779-819. 27 fig. 1930.—Of the 188 cerebellar and pontile gliomas occurring in the service of the Peter Bent Brigham Hospital, 25 were "verified, but unclassified." These 25 are here classified, and case reports are given of 15 of them. Four involved the pons alone; 21 involved the cerebellum also, the exact point of origin not being demonstrable, though the symptoms were suggestive. Ten were glioblastoma multiforme, the only examples of this type in this situation found in this clinic. They were large, soft, necrotic, hemorrhagic and cystic; they usually involved the basilar vessels and the cranial nerves, and often invaded the fourth ventricle, causing internal hydrocephalus. The average duration after onset of symptoms was 4 mos. One was an astroblastoma—the only subtentorial example of this type. Fourteen were more slowly growing forms, protoplasmic or fibrillary astrocytoma or spongioblastoma unipolare. The duration after onset of symptoms varied from 4 mos. to 4 yrs., with an average of 2 yrs. The reaction of the glial elements, connective tissue and blood vessels was greater about the periphery of the glioblastoma multiforme than about the more slowly growing forms.—*J. B. Bullitt.*

4089. CALLERIO, GIOVANNI. Les hémohistioblastes basophiles. *Rev. Belge Sci. Méd.* 2(4): 317-327. 1 col. pl. 1930.—These cells, found in the circulating blood in mast-cell leukemia, are characterized by large volume, regular contour, scanty slightly basophil protoplasm in places failing to cover the nucleus, voluminous but not very numerous deep violet granulations, distributed irregularly in the protoplasm and often in series over the voluminous, homogeneous, slightly colored nucleus, which is provided with numerous nucleoli. The author concludes that they should be regarded as circulating histioid mast leucocytes—reticulum cells not simply detached into the blood but differentiated in the leukemic direction.

4090. CAPUA, F. de. Alterazioni del sistema reticolo-istiocitario nella leishmaniosi infantile. II. I monociti nel sangue periferico dei bambini leishmaniotici. [Alterations of the reticulohistiocyte system in infantile leishmaniosis. 2. Monocytes in the peripheral blood.] *Pediatria* 37(22): 1223-1234. 1929.—In 40 children affected with infantile leishmaniosis (visceral kala azar), a constant monocytosis in the peripheral blood (25-30%) was encountered when the disease was of the long duration (6 mos.-1 yr.) while eosinophils and basophils were scarce and normoblasts almost entirely absent. In all cases, moreover, a slight percentage (4.2-5.5) of endothelial cells showed morphological characters approaching monocytes, therefore called tentatively "monocytoid endothelial cells." None contained phagocytosed leishmanias. Their likeness to true endothelial cells on the one hand, and to monocytes on the other, suggests an intermediate classification and furnishes proof of the endothelial origin of monocytes and of the transitional forms. Monocytosis and endotheliosis of peripheral blood are indicators of the mobilization and putting into the circulation of elements of the reticulo-histiocytic system and help to confirm the idea that leishmaniosis infantum shows the characteristics of a "parasitic block" of the reticulo-endothelial system.—*F. de Capua* (*transl. by J. G. Edwards*).

4091. CAYLOR, HAROLD D., and TRUMAN E. CAYLOR. An apparatus to facilitate the preparation of fresh frozen sections. *Jour. Lab. and Clin. Med.* 16(3): 312-313. 1 fig. 1930.

4092. CHAHOVITCH, X. Splenektomija i eksperimentalni rak izazvan katranom. [Splenectomy and ex-

perimental tar cancer in the rabbit.] [French résumé.] *Bull. Acad. Royal Serbe Sci. Arts, Beograde* 137(65): 97-110. 4 fig. 1929.—Vienna tar was painted twice a week on the inner surface of an ear in each of 6 normal and of 6 previously splenectomized rabbits. Within 140 days, all the normal rabbits bore papillomata; the tumors appeared earlier in the normal than in the splenectomized rabbits. Death ensued earlier in the normal cancerous than in the splenectomized cancerous animals. Evidently, splenectomy brought about changes unfavorable for tumor development.

4093. **CICINNATI, VITO.** Il comportamento delle piastrine nel sangue splenico in gattini normali, asfissiati, e avvelenati, con pirodina. [The behavior of the platelets in the splenic blood in normal cats, and in those asphyxiated and poisoned with pyrodin.] *Gaz. Internaz. Med.-Chir. e Interess. Profess.* 1928(13): 245-251. 1 fig. 1928.—If the platelets were derived from the megakaryocytes they would increase under circumstances that cause augmentation of megakaryocytes. The megakaryocyte content of the normal cat's spleen is always greater in animals a few days of age than in the adult. In asphyxiated cats there is an apparent increase of splenic megakaryocytes but the number of platelets in the splenic blood is not greater than in normal cats. In those poisoned with pyrodin there is a marked general increase in platelets but there is no parallel constant increase of splenic megakaryocytes.—*B. Bickel.*

4094. **COMEL, MARCELLO.** Ergosterismo in cuccioli allattati dalla madre trattata con dosi eccessive di ergosterolo irradiato. [Ergosterism in puppies nursed by the mother treated with overdoses of irradiated ergosterol.] *Arch. Ist. Biochim. Ital.* 2(3): 481-492. 1930.—When to ♀ dogs, nursing their puppies, overdoses of irradiated ergosterol (1.6 to 2.7 millions of rat units) are administered, the puppies may exhibit functional and anatomical symptoms of ergosterism, or intoxication by irradiated ergosterol. In the viscera 2 kinds of injuries are produced: one is characterized by degenerative processes of the parenchymal elements (in the liver, spleen, heart, kidney, etc.); the other by more or less extensive Ca depositions in the said organs, liver and spleen excepted. In the latter, a curious disappearance of lymph follicles, followed by a substitutive proliferation of splenocytes takes place. It is claimed that Ca deposition is not necessarily the primordial histo-pathological symptom, and it does not characterize absolutely the first stages of intoxication or ergosterism. Ergosterism may reach a lethal gravity prior to Ca deposition. This follows, on the contrary, always in parenchymas where degenerative processess have already occurred.—*M. Comel.*

4095. **CROWE, S. J.** Pathologic changes in meningitis of the internal ear. *Arch. Otolaryngol.* 11(5): 537-568. 35 fig. 1930.—A report, based upon the findings in 1000 pairs of temporal bones, of the microscopic changes found in various types of meningitis. In general there are illustrated extension of otitis media to the labyrinth and meninges by way of the round window, stapediovestibular articulation and fissura ante-fenestram and the extension of primary meningitis to the labyrinth by way of the perineural spaces of the auditory nerve, the perivascular spaces of the modiolar vessels and the cochlear aqueduct. While otitis media or meningitis is usually recognized, clinically, serous and suppurative labyrinthitis was rarely diagnosed until histological sections were made.—*G. Milles.*

4096. **CUSENZA, G.** Contributo allo studio dei papillomi del naso. [Papillomata of the nose.] *Arch. Ital. Otol. Rinolog. e Laringol.* 39(7): 421-433. 5 fig. 1928.—From the study of 2 cases of papillomata of the nasal fossae the possibility of carcinomatous transformation of common polyps is expressed despite contrary opinion. Accurate clinical and histological examination of the neoplasia observed in 1 of the cases led to the view that regardless of its benign origin as histologically indicated, these tumors ought to be considered as malignant by reason of their persistence.—*P. Redaelli* (*transl. by J. G. Edwards*).

4097. **CUTLER, ORAN I.** Relation of arteriosclerosis of the cerebral vessels to hypertension: distribution of arteries supplying pons and medulla. *Arch. Path. and Lab. Med.* 5(3): 365-379. 6 fig. 1928.—The normal distribution of the arteries in the substance of the pons and of the medulla was determined by stereoscopic roentgenograms after injection of the vessels, and by study of subsequent microscopic sections. The medulla in 18 cases of hypertension (systolic pressure over 200) showed slight to moderately severe sclerosis of the arteries in 8, most marked in patients with cerebral hemorrhage. "Specimens of the pons and medulla which were injected did not show noticeable tortuosity or narrowing or irregularity of the lumen of the arteries in brains showing sclerosis of the vessels in these parts. If the high blood pressure is due to a lack of blood supply to the vasomotor center, it is evident that this abnormal condition is not caused by any demonstrable anatomic changes in the arteries of this region."

4098. **DESCOMBEY, P. A.** Sur le tétanos et sa pathogénie. III. Comment concevoir la pathogénie du tétanos? *Rec. Méd. Vét.* [*École. Alfort*] 106(2): 72-89. 1929.—The author after studying the abnormal forms of the disease explains the pathology of tetanus. He amplifies the hypothesis of Marie and Morax on the rôle of the length of the nerves. The author concludes that the same pathogenic mechanism of tetanus has been involved in all mammals whatever the clinical observations. Furthermore, the variations in symptoms between different species of animals are due entirely to the absolute length of the nerves in these species; the order of appearance of contractions depends in cases such as the horse on the relative length of the nerves. The author also gives a pathogenic interpretation of tetanus of immunization and of tetanus after serum treatment. Bibliography.—*P. A. Descombey* (*transl. by C. S. Gibbs*).

4099. **DUTHIE, E. S.** Phagocytosis by bronchial epithelium in the lungs of mice. *Jour. Path. & Bact.* 33(3): 547-551. 2 pl. 1930.—Phagocytic cells arising from bronchial epithelium were described in the case of a mouse dying from a massive dose of x-rays and also in 4 mice following the inhalation of soot particles. These findings lend support to the theory of origin of the pulmonary phagocyte from the epithelial lining of the alveoli.—*E. S. Duthie.*

4100. **FAHR, TH.** Beiträge zur Pathologie des Knochenmarkes und der mit Blutbildung und Hämoglobinstoffwechsel zusammenhängenden Vorgänge. *Virchow's Arch. Path. Anat. u. Physiol.* 275: 288-304. 7 fig. 1929.—The femoral bone marrow of 500 cases was examined macroscopically. Contrary to the prevailing opinion fatty marrow throughout was found only in 14.2%. Of 16 cases who died suddenly, only 6% showed a fatty marrow. It seemed significant that in syphilis fatty bone marrow was found in 37.5% of the cases, while in tuberculosis fatty bone marrow was found only in 33%. The bone marrow was red in 100 cases of tuberculosis and 50 cases of pernicious anemia examined microscopically. In the former condition the cellular composition was mainly leucocytic and seemingly did not depend upon tubercles found in situ, while in pernicious anemia the cellular reaction was mainly erythrocytic. Author suggests that the bone marrow reaction both in tuberculosis and in pernicious anemia is due to a toxicosis with resulting cell destruction and not to direct stimulation of the bone marrow elements. Comparisons are made of the iron content in the hematopoietic organs in tuberculosis and pernicious anemia.—*G. L. Muller.*

4101. **[FELDMAN, A. A., and E. S. ORECHKIN.]** ФЕЛЬДМАН, А. А., и Е. С. ОРЕЧКИН. К патогенезу болезни Recklinghausen'a. [Pathogenesis of Recklinghausen's disease.] [German summary.] Одеський Медичний Журнал. (*Odessaer Med. Zeitschr.*) 4(8/10): 483-488. 2 fig. 1929.—In a case with an unusually large number of tumors (2313), the disease had existed from earliest childhood and was, apparently, inherited. The

woman showed marked endocrine disturbance, manifested in hyperfunction of hypophysis and in the hypofunction of ovaries, suprarenals and thyroid glands. Vagotonia was pronounced. Frequency of endocrine disorders in neurofibromatosis leads author to assume their common origin—probably, deficient development of ectoderm due to a lesion of the germ plasm.

4102. **FERRARO, ARMANDO. Familial form of encephalitis periaxialis diffusa.** *Jour. Nerv. Mental Dis.* 66 (4): 329-354. 12 fig.; (5): 479-498. 15 fig.; (6): 616-620. 1927.—The 3 patients observed were brothers and a sister, the only children of their family. The findings were a very diffuse and intense demyelination of the white matter, particularly its central portion; numerous globoid bodies in the myelin sheaths; diffusely distributed round bodies resembling globoid bodies; disintegration of the axis-cylinder. The blood vessels were normal, nerve cells in general were typical, there were fatty changes in the meninges and ependyma and degenerative changes in the optic nerve. A large proportion of the mobile gliogenous cells in these cases apparently represent a degenerative form of neuroglia cells. Possibly a primary deficiency of neuroglia cells is at the basis of the failure to elaborate Abbau products. The process of Abbau may be performed independently by the mobile type of neuroglia cells. From the point of view of differential diagnosis, the disease has to be distinguished from multiple sclerosis and diffuse glioma, but is regarded as closely related to the Pelizaeus-Merzbacker disease as anheredo-degenerative disease.—*Gladys Boyd.*

4103. **FREUND, FRANZ. Zur Histobiologie der myeloischen Leukämie bei Röntgenbehandlung.** *Virchow's Arch. Path. Anat. u. Physiol.* 269(3): 501-519. 22 fig. 1928. —Circumscribed, walnut-sized, purplish knots scattered over the trunk and limbs in a case of myeloid leukemia yielded to x-rays in about 4 wks. A knot excised before irradiation showed the transformation of all connective tissue cells into leucocytes, thus sustaining the views of Virchow and others against the theory that the leucocytes in myeloid leukemia are colonists from the spleen. A section, taken after irradiation had caused regression of a knot, showed the reverse process—the transformation of leucocytes into connective tissue cells. Accessory findings were cells similar to *Leucocytozoon ziemanni.*

4104. **FREUND, FRANZ. Über die Herkunft der Wanderzellen im Cohnheimschen Froschzungenversuch.** *Virchow's Arch. Path. Anat. u. Physiol.* 279(1): 30-44. 9 fig. 1930.—Cohnheim maintained that the migratory cells seen in traumatic inflammation of the frog's tongue are extravasated leucocytes from the bloodstream. The author, employing Cohnheim's method on the tongues of 20 living urethanized *Rana esculenta* observed an abundant migration into the tissues of migratory cells (originally with round nuclei, of which a part underwent division) visibly originating from connective tissue cells. The inflammation characterized in section preparations of the frog's tongue by the presence of oxyphil granulated cells with segmented nuclei takes place without any significant migration of cells from the blood having been observed during life. The author concludes that migratory cells found in traumatic inflammation of the frog's tongue do not originate in the bloodstream.

4105. **GESCHICKTER, CHARLES F., and MURRAY M. COPELAND. Recurrent and so-called metastatic giant cell tumor.** *Arch. Surg.* 20(5): 713-755. 26 fig. 1930.—Forty-one cases of giant cell tumor showing clinical or microscopic evidence of malignancy have been analyzed. In the clinical group, 26 cases recurring after primary curettement were studied. Recurrence in this group depended not on histologic structure, but on poor choice of treatment applied in the individual case, or on an incomplete operation. Advanced destruction of the bone shell, incomplete curettement, failure to use chemical or thermal cauterization or needless sacrifice of cortical bone at operation, as well as an age over 35, were factors predisposing to recurrence after curettement. In 7 cases showing a microscopic resemblance to malignancy, the histologic change was usually the result and not the cause of the recurrence, being dependent on intervening infection, necrosis or an accentuated healing reaction following irradiation. In 2 cases, actual sarcomas with giant cells were erroneously placed in this group. Eight cases of so-called metastatic giant cell tumors collected from the literature and from the surgical pathological laboratory of the Johns Hopkins Hospital have been reviewed. In no case were the metastatic nodules in the lungs composed of typical giant cell tumor, and in no case was an original tumor of proved benign giant cell structure associated with death from metastasis. The differential microscopic diagnosis of giant cell tumor is discussed, and a short summary of the diagnostic features of osteogenic sarcoma with giant cells included. A review of the results of various types of treatment in over 200 cases of giant cell tumor is presented.

4106. **GIFFORD, S. R., and N. K. LAZAR. Inclusion bodies in artificially induced conjunctivitis.** *Arch. Ophthalmol.* 4(4): 468-475. 2 pl. (1 col.) 1930.—By using an organism unconnected with trachoma and "inclusion blenorrhea" (*Bacillus pseudotuberculosis-rodentium*), and also by use of nicotine and croton oil, the authors produced in rabbits and guinea-pigs typical inclusion bodies identical in shape and staining reactions with those found in trachoma and "inclusion blenorrhea." The production of these bodies by chemical agents is regarded as proof that they do not represent degenerated bacteria, and indicative of their production by inflammation of the conjunctiva with swelling and lymphoid hyperplasia.

4107. **GIOIA, EDOARDO. Contributo alla patogenesi e all'anatomia patologica dei tumori maligni primitivi del polmone. [Pathogenetic and morphological studies in primary pulmonary cancer.]** *Arch. Ist. Biochim. Ital.* 2(4): 509-534. 11 fig. 1930.

4108. **GRÜTER, WILHELM. Über Bläschenbildung bei Hornhauterkrankungen.** *Sitzungsber. Ges. Beförder. Gesamt. Naturwiss. Marburg.* 64(1): 1-8. 1929(1930).— A corneal vesicle is a circumscribed cavity in the epithelium which is filled with fluid. It may occur singly or in groups as the result of mechanical, degenerative, neurogenic or inflammatory processes. An important mechanical cause is congestive edema in glaucoma, and chronic glaucoma or chronic iridocyclitis are important degenerative factors. Injury to the trigeminal nerve by whatever cause is an important factor on a neurogenic basis. Chemical and toxic substances, bacterial agents, and specific neuro-epithelial-tropic viruses are the chief factors in the production of inflammatory vesicles. Only the less virulent bacteria and viruses, however, produce vesiculation; the more virulent agents produce extensive necrosis only.—*H. M. Zimmerman.*

4109. **HECHST, BÉLA. Zur Histochemie und Histogenese der senilen Plaques.** *Arch. Psychiatr. u. Nervenkrank.* 88(1): 126-147. 5 fig. 1929.—From a study of 50 sections from cases of senile dementia Hechst concludes: The entire senile plaque, rim and interior, gives amyloid reactions and behaves in other ways like amyloid. The amyloid of the plaque originates in the central nervous system, apparently as a product of the pathological breaking up of the nerve cells, through the precipitation of the dissolved amyloid in the form of crystals, especially around the vessels. The precipitated amyloid acts as an irritating foreign body, particularly on the microglia. The Hortega cells proliferate radially around the nucleus of the plaque, contributing to degenerative processes, but neither they nor the macroglia (which forms a fibrous ring around the plaque, isolating the amyloid) take any active part in the formation of the plaque. The changes in the Alzheimer fibrillae have no relation to the amyloid, and on genetic and chemical grounds are to be clearly distinguished from the latter.

4110. **HEIJL, CARL F. A contribution to the question of congenital cysts.** *Acta Med. Scand.* 71(1/2): 67-72. 5 fig. 1929.—Suggests the possibility of the origin

of congenital cysts as due to embryonic inversions.—*M. Lederer.*

4111. **HEINE, L. Über Ciliarepitheltumoren. Mit Bemerkungen über die Reaktionen der ektodermalen Elemente der sekundären Augenblase.** *Graefe's Arch. Ophthalmol.* 125(3): 481-492. 5 fig. 1930.—When retinal detachment does not cease at the ora serrata but extends into the pars caeca, separating the pigment-free ciliary layer from the pigmented, the latter proliferates, forming a spindle-shaped thickening similar to a melanosarcoma of the choroid but differentiated from it by an intact lamella elastica. The proliferation soon assumes a tubular and glandular character and excretes a large amount of interstitial matter. The mesoderm may be involved secondarily by development of blood vessels from the uvea. On a basis of some 20 cases, 4 stages from a slight widening of the contour of the pigment epithelium to true tumor formation were differentiated. This peculiar and apparently specific reaction of the pigmented ciliary epithelium to contact with the subretinal fluids in progressive detachment occurs in zone II as shown by comparative description of the reactions of the 4 zones of the ectodermal constituents of the optic vesicle.—*From author's summary (transl.).*

4112. **HELLWIG, C. A. Zur Jodmangeltheorie des Kropfes. Morphologie der Rattenschilddrüse nach jodarmer Ernährung.** *Endokrinologie* 6(3): 161-167. 2 fig. 1930.—Experimental rats, after 119 days of I-poor feeding, show degeneration, especially of secreting cells. Comparative studies of colloid, follicle, stroma, etc., give results as expected.—*B. Cunningham.*

4113. **HEWER, T. F. R. Changes in the spleen in acute pyogenic infections.** *Bristol Med.-Chir. Jour.* 47 (177): 197-218. 3 pl. 1930.—In 180 necropsies in clinical cases of acute infection generally, in patients over 5 yrs., a high leucocytosis was accompanied by marked splenic change. Experiments were performed on cats to determine whether, during the active formation of antibodies in the absence of infection, there appear in the spleen any of the large mononuclear cells found in acute infections. The spleens of 20 infected cats (staphylococcus and pneumococcus), compared with the spleens of 7 normal cats, showed hyperplasia of the bone marrow and spleen corresponding roughly with the degree of leucocytosis—changes similar to those seen in man. In 4 cats in the serum of which high titers of diphtheria antitoxin were demonstrated after treatment with toxin, no splenic changes were observed similar to those seen in acute infections. High-grade leucocytosis, barely demonstrable antibodies, and spleens not grossly enlarged or softened but changes like those found in acute pyogenic infections of mild virulence, were seen in 5 cats treated with *Staphylococcus aureus* vaccines. Clinical and experimental pyrexia did not produce splenic change. The author concludes that in acute pyogenic infections splenomegaly is due to an increase in the number of cells in the pulp, and in the Malpighian bodies in some cases. The most striking cells are large basophilic non-granular mononuclear cells identical with myeloblasts. The degree of splenic change corresponds with the leucocytosis. The identity of the infecting organism is of less importance to the spleen than the grade of leucocytosis it produces. Pyrexia alone does not produce "acute splenic tumor." The production of "acute splenic tumor" is not essential for, or directly related with, antibody formation.

4114. **HOCHREIN, MAX. Über Angina pectoris bei Mitralstenose.** *Deutsches Arch. Klin. Med.* 169(3/4): 195-204. 1 fig. 1930.—The association of angina pectoris and mitral stenosis is discussed on the basis of the literature and 4 personal cases, 2 of which came to autopsy. The conception that the angina pectoris in mitral stenosis is due to compression of the left coronary artery by the left auricle and the pulmonary artery and the supposition that the paroxysm represents a compensatory process can not be confirmed. On the basis of the present investigation it can be explained by a deformation and kinking of the left coronary orifice. This change is caused by a pull on the mitral side of the aortic ring by the left ventricle due to the cicatricial processes in the mitral valve and chordae tendineae. Thereby the coronary ostia present a mechanical relation similar to that of true angina pectoris of syphilitic aortitis. The apparent increase in angina pectoris in mitral stenosis is probably due to the survival of such patients by proper therapy. Why the anginal symptom is almost exclusively observed in women is not clear.—*R. A. Moore.*

4115. **HORNING, E. S., and K. C. RICHARDSON. Cytological differences between normal and malignant tissues.** *Med. Jour. Australia* 1(8): 238-247. 1930.—Cytological studies of human adenocarcinoma of the breast, human adenocarcinoma of the tongue, mouse adenocarcinoma (Twort), mouse small round-celled sarcoma, Lumsden rat sarcoma and spontaneous transplantable mouse adenocarcinoma confirm the conclusion of Tello and Fãnanás that the Golgi reticulum is less readily demonstrated in neoplastic cells than in normal ones. Masses of chromidia are uniformly found in the cells of the sarcomata studied but are not a constant feature of the carcinomata. Extrusion of chromidia is characteristic of sarcomata. All the neoplasms studied show irregular hypertrophied structure of the plasmasome body, while cells of the adjacent stroma contain normal spherical compact nucleoli.—*J. C. Bugher.*

4116. **IMAI, NOBUKATSU. Experimentelle Untersuchungen über die Verknöcherung im Auge.** *Graefe's Arch. Ophthalmol.* 125 (2): 267-299. 18 fig. 1930.—After removal of the aqueous humor, 10% HCOOH (amount not stated) was injected into the vitreous humor of rabbits; ossification was found in 12 of 26 cases in which the eyeball was examined 25-195 days after injection. Various vaccines produced ossification in only 1 instance (intravitreous injection of vaccinia lymph). There were immediate signs of inflammation and exudation, both regressing in the course of a week. Ossification occurred in the prechoroidal connective tissue without calcareous deposit. The author considers it improbable that calcification of necrotic tissue precedes intraocular ossification. The calcareous impregnation of osteoid tissue is more probably due to the activity of young bone cells formed from connective tissue. Under some circumstances heterotopic bone formation may occur by direct metaplasia (cartilage or bone in sclera where almost no reactive cell increase or rejuvenation occurred). It seems questionable that heterotopic bone always is intimately connected with the cells of the vessel walls.

4117. **JAFFE, HENRY L. The resorption of bone. A consideration of the underlying processes particularly in pathologic conditions.** *Arch. Surg.* 20(3): 355-385. 16 fig. 1930.—The paper is based upon a study of the literature and a large material seen by the author. In resorption of bone, especially in fulminating and inflammatory disease, all canals in the cortex dilate, with dilatation and increase in number of their contained blood vessels. Haversian canals may coalesce. Enlargement of the canals may be associated with the appearance of Howslip's lacunae. The Haversian canals become tortuous and lengthened and longitudinal sections of inflamed compact bone may show cross-sections of the canals. In vascular resorption of bone, enlargement of existing vessel canals is more important in reducing bone substance than the formation of Volkmann's canals. Because of the intimate anastomoses between the vessels of cortex and medulla, inflammatory changes in the cortex are accompanied by similar changes in the medulla, with resorption of spongy trabeculae, analogous to enlargement of vessel canals of the cortex. There are differences in the character of the vascular changes of resorption in the various inflammatory diseases of bone and in the varying degrees of Ca deficiency in the diet. The amount of dilatation of the vessel canals depends on the degree of vascularization, speed and extent of resorption being less when fewer vessels are present and when granulation tissue is more

cellular. Osteoclasts play little part in vascular resorption, and it has not been determined whether the process is preceded or accompanied by decalcification. Enlargement of vessel canals is accompanied by changes in the ground substance of the bone, particularly in the Ca salts. In the region of resorption these appear as large, irregular, coarse granules, whereas in normal bone they are irregular, fine granules. The manner of decalcification and the part played by vessels and granulation tissue are speculative. Decalcification may be brought about by local and general agents, and the extent of decalcification depends upon the cause. Osteoclasts are capable of resorbing bone, but extensive resorption of bone occurs in their absence. Their presence or absence depends upon the cause and the course of resorption, and they are merely an expression of the way in which the tissues are responding to a stimulus. In embryonic life the osteoclast is derived from the mesenchyme, while in later life, both normally and pathologically, it is a reactive cell arising from fusion of resting wandering cells of the tissues supplemented by mononuclears of the circulation. Osteoblasts and bone cells may be present in osteoclasts by virtue of phagocytosis. All osteoclasts observed by the author have acidophilic cytoplasm. Osteoclasts can absorb bone but are of only secondary importance. They finally probably either degenerate locally or enter blood vessels and are removed. They arise locally in Howslip's lacunae as reactive cells, the stimulus to osteoclast formation varying with the resorptive process. The osteoclasts then remove the decalcified bone. Degeneration of bone cells and enlargement of bone cell lacunae are not important in the actual resorption of bone, but such bone is more subject to resorption.—*B. C. Russum.*

4118. **[KOLESNIKOV, N. M.]** КОЛЕСНИКОВ, Н. М. К патологической анатомии костных поражений при мальтийской лихорадке. **[Osteal lesions in Malta fever.]** Русский Журнал Тропической Медицины [*Russ. Jour. Trop. Med.*] 6(9): 598-602. 1928.—In 336 guinea pigs, infected naturally during an epizootic, various forms of bone lesions were found in 13.03%. Only young animals were affected with micrococcal goneitis. Synovial membranes and marrow showed specific granulomas, formed by epithelioid and giant cells, which undergo necrosis and result in abscesses. Localization of granulomas was most frequent in synovial membranes. Periosteal tissue reacted more strongly than the marrow to the infection. In the ribs, periostitis, osteomyelitis, and panosteitis were equally frequent.

4119. **[KOTLER, R. I.]** КОТЛЕР, Р. И. Изоагглютинация и морфологические индексы у туберкулезных больных. **[Blood groups and morphological indexes of tuberculous patients.]** [French summary.] Вопросы Туберкулеза. [*Voprosy Tuberkuleza*] 7(6): 632-637. 1929.—Observations embraced 237 cases. Pulmonary tuberculosis was found in all 4 blood groups. The 4th group predominated among the advanced stages of phthisis, while 2nd group was relatively small. No correlation was found between the statics and dynamics of the process and the blood groups. Hemoptysis and laryngeal tuberculosis were more frequent in the 1st group. There was correlation between indices of Pignet and Brougche, and none between these indices and the blood groups.

4120. **KÓZA, M. Chondroblastom in der venösen Blutbahn.** *Virchow's Arch. Path. Anat. u. Physiol.* 272(1): 166-204. 13 fig. 1929.—An increasingly painful cartilaginous tumor of the deeper periosteal layers (enchondroma or chondroblastoma) of the right femur developed in a 13 yr. old girl within a few months, and rapidly extended both into the medullary cavity of the femur and into the veins of the systemic circulation (upper femoral vein, iliac veins, lower vena cava and the right heart) as a solid lobulated cylindrical body. Branches extended even into the pulmonary arteries and capillaries; finally the extremities of the growth lost their vessels and became pure cartilaginous tissue. Still there was no infiltration or metastasis. Blocking of the circulation produced death. The author concludes, from this case and others previously reported, that the predilection of cartilaginous tissue for the vessels, and the physical peculiarities of its intercellular structure (productive of pressure atrophy in the surrounding tissues) account for the not infrequent penetration of the blood vessels by chondroblastomata, and that the clinical malignancy of the tumors is due to the structural and biologic properties of cartilaginous tissue. So-called metastases of such tumors are probably only cartilaginous emboli.

4121. **KROSTENSON, ANDERS. Thrombenbildung in der vena iliaca communis sinistra.** *Acta Med. Scand.* 73: 5-82. 1930.—During autopsies (tuberculosis, cancer, endocarditis, etc.) were detected thrombi in the valvular sinuses of vena iliaca communis sinistra. They possess a structure typical for the white thrombus. They are gradually subjected to regressive changes, and are replaced by the changed intima as described. The cause of formation of the thrombus in vena iliaca com. sin. lies possibly in the derangements of nutrition of the endothelium, caused by chronic exhausting illnesses. Thrombosis is favored, however, by mechanical factors as well related to the topography of the mentioned vessel. The position of the vena iliaca communis sinistra in relation to the intervertebral disks, in the most prominent part of the lumbar section (4-5 L), in the presence of a strong lordosis, favors the development of a compression of the vein and together with a vital change of endothelium, may call forth a local formation of the thrombus. The mentioned obliterating thrombosis can form independently of former pregnancies (pressure of the uterus), swellings of the ventral cavity, etc. The resulting fibrosis with stenosis of vena iliaca communis sinistra predisposes to the development of varices and thromboses of the veins of the left foot.—*W. H. Stefko.*

4122. **KUP, J. Zur Frage der Ätiologie der Fettsucht.** *Endokrinologie* 6(2): 102-122. 6 fig. 1930.—Histological examination of autopsy material led the author to group the cases of obesity observed as follows according to origin: castration, 3 cases—2 operative and 1 x-ray; hypophysis, 2 cases—1 fibrosis, 1 degeneration; epiphysis, 2 cases—hyperfunction, based on size; adrenal cortex, 2—tumor; pancreas, 14 cases—hyperfunction; pluriglandular, 1—involving pancreas, hypophysis and thyroid; diabetic, 1; following disease, 1. No evidence of a pure thyroid obesity. Other possible sources although not observed by the author are thymus, thyroid and certain infectious diseases. Five cases of obesity showed no relation to endocrines.—*B. Cunningham.*

4123. **LAMBIN, P., et B. CORNIL. Les érythrocontes de Schilling dans l'anémie pernicieuse.** *Rev. Belge Sci. Méd.* 2(3): 249-252. 1 fig. 1930.—The authors conclude that Schilling's erythrocontes are merely a special form of precipitate of the basophil substance of young erythrocytes, and that the azurophil rodlets displayed by Giemsa's classic staining method represent a rare form of fragmentation of Cabot's rings.

4124. **LAWRENCE, JOHN S., and STEPHEN J. MADDOCK. Variations in the number of white blood cells in dogs following Eck fistula.** *Arch. Path.* 9(2): 461-472. 1930.—Marked monocytosis occurs in dogs within the 1st week following Eck fistula. Splenectomy done at the same time as the fistula tends to prevent this monocytosis. Dogs with reverse Eck fistula do not show this response. Intimal damage, anemia and operation are not responsible. A diminution of the number of eosinophils in the blood of dogs follows various types of operations on the vascular system. The average number of lymphocytes is constantly diminished in such dogs.—*From authors' summary.*

4125. **LEINATI, FAUSTO. Sulla liponecrosi sperimentale del sottocutaneo. (Prima nota.) [Experimental subcutaneous liponecrosis.]** *Atti R. Accad. Fisiocritici* [*Siena*] 3(8/9): 93-111. 1928.—From traumatic liponecroses in the subcutaneous tissues of rabbits and guinea-pigs, some of them normal individuals, others castrated

or thyroidectomized, the author concludes: (1) characteristic small foci of liponecrosis can be produced in animals of both groups; (2) as compared with the control group, the symptoms of the group with a gland removed differ in greater distinctness of the lesions, more prolonged inflammatory reaction, more rapid and abundant development of connective tissue around the lesion, appearance of pseudo-cysts when the lesions are disappearing; (3) the mechanics of causation are not simple, but represent a complex interaction of factors that produce the saponification of the normal fats.—*F. Leinati (transl. by P. Popenoe).*

4126. **LEVINSOHN, G. Zur Anatomie des kurzsichtig gemachten Affenauges und ihre Bedeutung für die Myopiegenese.** *Arch. Augenheilk.* 100/101: 138-163. 19 fig. 1929.—Essed and Saewarno, on the author's suggestion, placed 7 monkeys, aged ½ to 1½ yrs., in boxes for 6 hrs. on each of 6 days per week in such a position that the whole body and the vertical axis of the head were horizontal. In 5 of the 7 instances the hypermetropic eyes were thus converted into myopic eyes. As a rule, myopia began after 3 mos. and increased until the end of the experiment (15 mos.). In one of the 5 animals there were small and in another large temporal sickles; in a third animal the fundus was hyperemic. The first 2 animals had protrusio bulbi. The eyes of 3 controls remained normal. The author investigated anatomically 4 prs. of the myopic eyes and 1 pair of eyes from a control. These were fixed in formalin, embedded in celloidin, sectioned (partly serially), and stained with eosin-hematoxylin, van Gieson, and Weigert's elastic and orcein stains. Most of the sections were first depigmented by Alfieri's method. The anatomic substratum of the conus formation which occurred in these animals was comparable to the anatomic changes which usually occur in human axis myopia. The changes in this experimentally produced myopia are most probably produced by a pull, which affects the ocular bulb commonly on the temporal border of the entrance of the optic nerve. This is produced by the effect of gravity on the eye.—*H. M. Zimmerman.*

4127. **MAGALHÃES, OCTAVIO de. Contribuição para o conhecimento das lesões provacadas pelo "Oidium brasiliense" (O. Magalhães—1914). [Lesions caused by the "Oidium brasiliense."]** [With English transl. p. 37-47.] *Mem. Inst. Oswaldo Cruz* 22: 27-134. 28 pl. 1929.—The characteristics of the nodules caused by the *"Oidium brasiliense"* are:—(1) presence of the parasite in the resistant form; (2) absence of giant cells; (3) presence of epithelioid cells; (4) infiltration of polymorpho-nuclear neutrophils and sometimes eosinophils and mononuclears; (5) perivascular infiltration; (6) presence of connective inflammatory tissue surrounding the center; and (7) absence of plasma cells or fuchsinophil cells.—*O. de Magalhães.*

4128. **MAGLIULO, ALFONSO. Contributo allo studio delle ossificazioni muscolari post-traumatiche.** *Lo Sperimentale* 84(5/6): 301-392. 32 fig. 1930.—The results, based on a clinical study of 14 cases and a histopathologic study of 1 case of ossification of anterior brachial following luxation of the elbow, indicated that there was a metaplasia of the interfascicular connective tissue of muscle with subsequent direct ossification, although the embryonic fibroblasts possibly were differentiated into osteoblasts.—*M. L. Menten.*

4129. **MARINESCO, G., St. DRAGANESCO, O. SAGER, et A. KREINDLER. Recherches anatomo-cliniques sur la localisation de la fonction du sommeil.** *Rev. Neurologique* 36(5): 481-498. 10 fig. 1929.—The authors had previously produced sleep in cats by puncture of the 3rd ventricle and injections of $CaCl_2$ and ergotamine in the lateral ventricles. In this paper they describe 3 cases of tuberculous meningitis and 1 of cerebral tumor, all with pathologic sleep, in which necropsy showed important lesions in the gray substance around the 3rd ventricle and the vegetative nuclei of the infundibulo-tuberian region—just the regions lesion of which had produced sleep in the cat. In a case of cerebellar tumor without troubles of sleep, although there was great distension of the 3rd ventricle with extreme compression at the level of the ventricular floor, the gray substance around the aqueduct of Sylvius was normal, thus, in the authors' opinion, maintaining the normal sleep function.

4130. **MASSON, P. The significance of the muscular "stroma" of argentaffin tumors (carcinoids).** *Amer. Jour. Path.* 6(5): 499-514. 2 pl., 7 fig. 1930.—After discussing 7 cases observed in the appendix, the author concludes: Originating in the nerves of the mucosa, peviously hypertrophied, carcinoids penetrate the myenteric plexuses progressively without destroying them and without provoking their hyperplasia. They merit the name of neurocarcinoid. Invasion of the connective tissue and of the lymphatics is secondary. Connective tissue infiltrated by carcinoids does not originate muscle fibers. On the contrary, when the nerves are invaded by carcinoids, the corresponding muscle coats undergo hyperplasia restricted to the territory of the infected nerve. The muscle fibers formed in the interstices of carcinoids, then, are not an integral part of these tumors; they result from proliferation of preëxisting muscles provoked by the presence of argentaffin cells in their nerves. This myogenic action of the argentaffin cells seems due to a product of limited diffusibility secreted by the cells into the nerves (neurocrinia). As a working hypothesis, one may suppose that the normal argentaffin cells of the intestinal muscosa function like the cells of carcinoids, and that their secretion poured into the plexus of the mucosa plays a rôle in the functioning of the muscularis mucosae.—*Author's summary and conclusions.*

4131. **MAZZACUVA, GIUSEPPE. Sulle alterazioni istologiche epato-renali nell'occlusione intestinale sperimentale. [Histological alterations of liver and kidney during experimental intestinal occlusion.]** *Riv. Patol. Sperim.* 5(4/5): 343-358. 14 fig. 1930.—Intestinal occlusion is followed by degenerative and necrobiotic processes in liver and kidney, supporting the autotoxic theory of occlusion.—*M. Comel.*

4132. **NAKAIZUMI, YUIKMASA. Untersuchungen über die postmortalen histologischen Veränderungen in der Retina des Kaninchens, mit bes. Berücksichtigung auf den Zeitlauf nach dem Tod.** [In Japanese.] *Nihon Gankwa Gakkwai Zasshi* 31(7): 1927.—Histological examination of the retina of the rabbit after death shows first a destruction of the external zone of the layer of rods and cones, which gradually extends to the inner zone. The inner layers of the retina become swollen next and the swelling extends toward the vitreous humor. Following this change the nuclei become difficult to stain while the Mueller's fibers become evident. Then numerous vacuoles appear in cells of the retina layer, especially the granular layer. Next follows a general intense autolytic destruction of the retina. In 24-38 hrs. after death, scarcely any nuclei or fibers can be stained. Temp. has little effect.—*O. Mori (courtesy Japanese Jour. Zool.) (transl. by T. J. Putnam).*

4133. **NANDROT, et CH. GRANDCLAUDE. Volumineux fibrome du cubital.** *Ann. Anat. Path. et Anat. Norm. Méd.-Chir.* 5(7): 751-755. 1 fig. 1928.—The authors discuss a large tumor of the median and ulnar nerves, in which (as distinguished from true neuromas) there were no nerve fibers but only fibrillar elements discontinuous with the cellular protoplasm. This—a pure fibroma—represents in the author's opinion a rare tumor, absolutely different from those gliomatous tumors developing from the sheath of Schwann.

(German summary, p. 34-37.) 3 pl. 1928.—The author injected bacteria, toxins, and drugs (not named) into the knee

joint cavity in rabbits. Injection of staphylococci produced the most marked reactions, and streptococci, pneumococci, and colon bacilli, in order, caused less change. Bacterial toxins and drugs caused necrosis with resulting formation of granulation tissue and ankylosis. Stronger toxins or drugs retarded necrosis and the formation of granulation tissue. With weaker toxins, there occurred regeneration, following a partial necrosis. The marginal portion is the first to be affected, especially at the bounding surface (Grenzlinie). This "Grenzlinie," from its reaction to these injections, is interpreted as a line of resistance for the protection of the bone marrow. Typhoid bacilli produce only slight lesions, tubercle bacilli cause slow changes, with formation of granulation tissue and ankylosis. Introduction of staphylococci often results in formation of hyaline cartilage, use of streptococci results in myxomatous degeneration of the bone marrow, and use of tubercle bacilli in the appearance of round and epithelioid cells but not of Langhan's giant cells. Introduction of sea sand or bone dust causes, after a time, some necrosis with regeneration; cutting, partial section, or injection of poisons into the sciatic nerve causes no change to any of the structures. Uric acid, injected subcutaneously in small amounts, causes round cell and leucocytic infiltration in the periosteum, bone marrow, and bursa near the joint; injection of larger amounts results in hyaline degeneration of the meniscus and soft parts of the joints. Some parts show regeneration.—*From author's summary (transl. by J. Miller).*

Saratow*) 7(3): 215-225. 1929.—The author observed 5 patients. Removal of pathological spleen resulted in increase of hemoglobin and of the number of erythrocytes. Polycythemia, both of short and long duration, and presence of Jolly bodies were not rare. Splenectomy always resulted in lymphocytosis.

4144. **SAKURAI, S.** Über das Leukozytenbild bei leprösen Koreanern. [In Japanese, with German summary.] *Acta Dermatol.* 16(4): 369-376. 1930.—The leucocyte picture was studied in 35 cases of non-leprous and 69 of leprous Koreans (23 of lepra nervosa, 21 of lepra maculosa, 12 of lepra tuberosa and 13 of lepra totalis). The great prevalence of various parasitic diseases among Koreans frequently produces a relative increase in eosinophils. In certain forms of leprosy the neutrophils are decreased and the lymphocytes increased. The percentage of increase in lymphocytes is greatest in macular leprosy, greater in lepra nervosa than in tubercular leprosy, and least in lepro totalis. The monocytes (large mononuclears and transition forms) are also increased in tubercular leprosy and lepra totalis. The percentage of basophils is the same in leprosy as in health.—*From author's summary (transl.).*

4145. **SEVERI, ANTONIO.** Sulle alterazioni istologiche sperimentali da ittiolo. [Experimental histologic lesions with ichthyol.] *Lo Sperimentale* 84(5/6): 457-487. 8 fig. 1930.—In mice, guinea pigs and rabbits ichthyol intravenously injected or applied to skin is said to produce, besides degenerative lesions in the various organs, hyperplasia of the epithelium of the bronchi, bile ducts and capsule of Bowman.—*M. L. Menten.*

4146. **SOMERFORD, ALEX. R.** Cancer of the skin. A statistical note. *Lancet* 219(5593): 1008-1009. 1930.—Squamous-celled carcinoma and basal-celled carcinoma were studied in patients of Manchester and Salford Hospital for skin diseases, as to sex and age-incidence, occupational incidence, and situation of lesion. It was found that "by far the most common situation of both forms of cancer is the skin of the face. This fact is against an occupational cause, since the face is the part of the body least likely to be brought into contact with irritating substances used in any occupation."

4147. **STAMMER, ANNEMARIE.** Über multiple Basaliome der Haut des Rumpfes. Typ Epithelioma Pagetoid Darier. 29p. Dissertation. Universität Hamburg, 1929.

4148. **STEFKO, W.** Zur pathologischen Histologie des N. phrenicus und N. vagus bei Lungentuberkulose. *Beitr. Klin. Tuberk.* 73(4): 399-408. 7 fig. 1930.—The histologic changes in phrenic nerves from tuberculous cases, as observed in 11 out of 56 specimens obtained by phrenicoexairesis and 6 out of 11 obtained at necropsy, began as scattered proliferations of the perineurium and endoneurium, which gradually led to degeneration and atrophy of the nerve fibers, probably reflected in the movements of the diaphragm and in the respiratory process itself. These changes differ from those in the vagus nerve both in pulmonary tuberculosis and in acute dis-

eases, which are found at first in the myelin substance and the sheath of Schwann, and only in acute cases involve extensive and regular thickening of the perineurium.

4149. **STERN, RUBY O. A study of the histopathology of tabes dorsalis with special reference to Richter's theory of its pathogenesis.** *Brain* 52(3): 295-316. 2 pl., 1 fig. 1929.—From a study of post-mortem material from 9 cases of pure tabes, 3 of tabo-paresis, 8 of general paralysis, and 27 control cases taken at random, the author concludes that neither Richter's theory nor Hassin's modifications can explain the pathogenesis of tabes. The cells of which Richter's specific "granulation" tissue is composed are characteristic endothelial cells; they were present in 22 of the control cases, and hence are evidently not due to the spirochete. Contrary to Hassin's view, they may occur in normal radicular nerves in the same number and with the same distribution as in tabes, and hence can have no essential connection with the pathologic process of this disease. Stern suggests that in tabes the aorta may act as a focus from which spirochetes may exert their toxic effects on the central nervous system.

4151. **[TSIPEL'ZON-ROGINSKAÏA, TS. Z.] Ципельзон-Рогинская, Ц. З. К вопросу о состоянии белой крови при малярии. [White corpuscles in malaria.]** [German summary.] Русский Журнал Тропической Медицины. [*Russian Jour. Trop. Med.*] 6(9): 565-569. 5 fig. 1928.—Repeated examinations of 17 patients (8 tertian, 6 quartan, 3 tropical malaria) showed neutropenia as a most important characteristic. Lymphocytes increased in percentage, but absolutely always remained within the norm. Monocytes, eosinophils, and basophils also remained normal. Plasma cells were found in all cases of tropical malaria, rather frequently in tertian and less often in quartan.

4152. **[VISHNEVSKIĬ, N. G.] ВИШНЕВСКИЙ, Н. Г. Паразитологические и гематологические наблюдения в случаях Malariae quartana. [Parasitological and hematological observations in quartan malaria.]** [French summary.] Русский Журнал Тропической Медицины. [*Russ. Jour. Trop. Med.*] 7(2): 87-93. 1929.—15 patients were examined. Systematic quinine therapy caused shizonts to disappear in 3-4 days; gametes in 8-11 days. Before therapy, marked leucopenia was noticed in majority of patients. Neutropenia was pronounced, while absolute numbers of lymphocytes and monocytes never rose above the norm. Eosinophils sharply decreased, and in many cases disappeared. After therapy leucocytic formula was nearly restored to normal; only neutrophils, though increased, were still below the norm; monocytes increased in some cases, and decreased in others, remaining however within 150-400 per cc.

4153. **VIZIOLI, F., e M. GOZZANO. La resistenza delle neurofibrille nelle alterazioni a tipo retrogrado delle cellule nervose.** *Boll. Soc. Ital. Biol. Sperim.* 5(6): 1031-1034. 1930.—Retrograde alterations (from polyneuritis) were present especially in the cells of the anterior columns of the spinal cord, the alterations of the chromophil substance (studied with Nissl's method) being very marked, while the neurofibrillae (studied by Donaggio's method) were modified but preserved.—*M. Comel.*

4154. **WALCHER. Über vitale Reaktionen.** *Deutsche Zeitschr. Ges. Ger. Med.* 15(1): 16-57. 1930.—The length of time a body has been dead can be determined in various ways. Some of the nuclear degeneration and blood stasis appears to be a reaction to drying rather than to length of time after death. Reaction of blood vessels to ligatures, with or without injection of a perfusion fluid, was the most reliable measure of time after death. In order to obtain accurate standards, the blood, skin, and blood vessel conditions of corpses dead from ½ hr. to more than 20 days were studied carefully. Determinations were also made on the newborn.

4155. **WALLART, J., et CH. HOUETTE. Présence de fibres musculaires striées dans un ligament large.** *Bull. Histol. Appl. Phys. et Path.* 7(9): 303-307. 1930.—A tumor of striated muscle fibers was located in the body of the broad ligament of the oviduct of a girl.—*J. G. Sinclair.*

4156. **WEILLE, FRANCIS L. Asthma. XI. The pathology of allergic tissue as seen in the nose and in the accessory sinuses.** *Arch. Otolaryngol.* 12(6): 785-798. 15 fig. 1930.—Tissue (160 specimens) was removed from the nose and accessory sinuses in 26 patients having asthma or vasomotor rhinitis or both. Occasional pus pockets were present in membranes from the sinuses. Microscopic examination showed: (a) metaplasia, at times, of the epithelium; (b) possibly metaplasia of individual epithelial cells; (c) thickening of the basement membrane; (d) edema or fibrosis of the tunica propria in ⅔ of the specimens; (e) active mucous glands, dilated serous glands; (f) increased vascularity, no special smooth muscle hypertrophy; (g) prominence but not predominance of eosinophils as infiltrating cells in tissues of patients with asthma who had been operated on once; (h) regeneration of tissue elements in patients operated on a second time; (i) marked contrast between "pale" and "red" vasomotor mucous membrane. The thickened lining, so frequently reported in the antra of patients having asthma or vasomotor rhinitis, on the basis of the present study offers about 1 chance in 9 of harboring pus pockets, and therefore of itself being a focus of infection.—*Author's summary.*

4157. **WILLIS, HENRY STUART, and PAUL BRUTSAERT. Tumor-like structures in the lungs of guinea pigs artificially exposed to silica dust.** *Amer. Rev. Tuberculosis* 17(3): 268-278. 9 fig. 1928.—In 7 out of 80 pigs subjected to prolonged inhalation of silicon carbide dust, small nodules of epithelial cells were found surrounding fibrotic bronchi. Such lesions were never found in normal or other experimental animals. The question of neoplasia was decided in favor of a probable injury and repair lesion resulting in hyperplasia of the epithelium of the bronchial mucosa. Continuity of the bronchial lumen and the lumina of these abnormally located nests of epithelial cells was demonstrated in 2 instances. Mitoses were not found and the cells appeared in a normally arranged, single layer.—*W. W. Herrmann.*

4158. **ZACHARJEWSKAJA, M. A. Klinische und histologische Untersuchungen über die Arteriolosklerose der Nieren.** *Virchow's Arch. Path. Anat. u. Physiol.* 276(2): 380-446. 7 fig. 1930.—Microscopic studies were made on 44 kidneys, 18 of which were removed from patients with hypertonia with and without symptoms of sclerosis of the renal arterioles. Almost without exception the arcuate arteries and the initial portion of the interlobular showed hyperplastic changes of the intima. Hyperplasia of the intima was due to several conditions. Age was apparently a factor. In the arterioles hyaline degeneration and fat deposits were found. The mutual relation of these vascular changes varied. Sometimes a high grade hyperplasia of the intima was associated with a low grade sclerosis of the renal arterioles; a high grade arteriolosclerosis, however, was without exception associated with a high grade hyperplasia of the intima. Localization of the hyalinization and fat infiltration of the kidneys depended on the degree of sclerosis of the arterioles. In severe cases degenerative changes occurred in the vasa afferentia or in the vasa afferentia and interlobular arteries; in mild cases only the interlobular arteries were affected. Measurements of the blood vessel walls showed that no thickening of the muscularis was associated either with sclerosis of the arterioles or with hyperplasia of the intima of the large arteries. Apparently when the intima, at least in the cortical arteries of medium caliber, thickens, the muscularis as a whole becomes thinner, especially in advanced age. Still less were changes in thickness of the muscularis

dependent on the degree of sclerosis of the arterioles. The frequency of presclerotic changes in glomeruli was proportional to the degree of sclerosis of the arterioles. Changes in the cortical tubules depend not only on atrophy that is produced by their inactivation but also on lack of nutrition due to constriction of the arterioles. The thickening of the stroma of the connective tissue in the medullary substance was more closely connected with the degree of sclerosis of the arterioles than with age. Sclerosis of the renal arterioles bore no definite relation to heart enlargement. The relationship of the degree of renal insufficiency and the number of degenerate glomeruli could not be definitely established. Many glomeruli may be destroyed before definite renal symptoms appear. Functional changes in vascular tonus produced changes in the glomeruli since the tonus changes could decrease the blood supply of the glomeruli. The frequent occurrence of red blood cells in the urine in sclerosis of the renal arterioles is connected with the hyalinosis and fatty degeneration of the glomerular loops, which frequently produce effusions of blood in the capsular space; they may, however, be produced or reinforced by blood stasis.

4159. ZANETTI, GIOVANNI. Sulla struttura ed istogenesi della gomma cerebrale. *Riv. Patol. Nerv. e Ment.* 34(3): 299-347. 21 fig. 1929.—The author's conclusions from a study of 3 cerebral gummas admit 2 types, the nodal and infiltrating gummas. In the first type there are proliferation of vascular and neuroglia tissue, exudative and regressive changes. The second sclerosing type shows neuroglial reaction which is perivascular in position, less well delimited and less clearly demonstrable with the material at hand.—*E. A. Baumgartner.*

4162. ACHARD, CH., M. BARIÉTY, et A. CODOUNIS. Les variations de l'équilibre protéique du sérum dans la tuberculose pulmonaire. *Bull. Acad. Méd.* 102(31): 153-158. 1929.—On the basis of study of 32 tuberculosis patients the authors declare that tuberculosis is ordinarily accompanied by increase in total blood protein, due especially to hyperglobulinemia with decrease in serin, the increase in the first and the decrease in the second combining to lower the albumin quotient. The authors declare that the fall of the quotient is independent of fever, of hemoptysis and of local anatomical condition: it depends solely on the general nutrition. The quotient has been found normal in apyretic, fibrous forms of the disease accompanied by good general condition; it is extremely low in cachectic cases at the last stage of the disease, in which apparently serin is destroyed and an excess of globulin is produced.

4163. BARLOW, O. W. The influence of inorganic iron on the anemia of rice disease in pigeons. *Amer. Jour. Physiol.* 93(1): 156-160. 4 fig. 1930.—Addition of ferrous carbonate as Blaud's pills during a 6 week period, in quantities ranging from therapeutic to toxic dosages, to the practically Fe free rice diet does not benefit the anemia which develops in rice disease. The larger dosages actually accelerated the usual rate of blood destruction in both rice disease and in normal birds. The ineffectiveness of Fe administration on the anemia of rice disease extending over a 14 week period is explainable by the absence of a body Fe deficit, in spite of the diminished Fe intake. Preliminary histological studies have shown that the hemosiderin deposits in the livers of pigeons are most extensive in rice disease (with extreme anemia), somewhat less after fasting, and least in normal birds. The body Fe storage which parallels the development of anemia in fasting and in rice disease thus further indicates the importance of inanition as a causative factor in the development of rice disease. With the exception of vitamin B, all known deficiencies of the polished rice when added to the diets of pigeons have been ineffective in relieving or controlling the phenomena of rice disease. The vitamin B deficiency of polished rice therefore appears to be the primary if not the only causative factor in the development of this condition.—*Author's summary.*

4165. BARRAL, PH., et J. ROUSSET. Dosage du soufre urinaire dans quelques dermatoses exfoliantes. *Bull. Soc. Française Dermatol. et Syphiligr.* 1929(7): 712-714. 1929.—Repeated determinations in 4 cases of generalized exfoliating erythrodermia and 1 case each of Duhring's disease, congenital ichthyosis, and of generalized erythrodermia caused by the action of P_2S_5 on the skin. In all cases except the last the total urinary S was much below normal; in all, the ratios between the various forms of S were disturbed.

4166. BECK, STEPHAN, und ERNST LENDEL. Die interferometrische Frühdiagnose des Carcinoms durch Provokation. *Fermentforschung* 11(4): 490-514. 1930.—A total of 137 cases were studied; excluding all those which could not be verified either histologically after operation, or roentgenologically, 42 tumor cases remained and 20 controls. Interferometric tests before provocation in the cancer cases gave 60.5% correct results, and 83.6% afterward; in the controls, 46% before, 70% afterward. Provocation gave especially good results in small tumors and early cases.

4167. CASTEX, MARIANO R., y MARIO SCHTEINGART. La colesterinemia, la calcemia y la potasemia en los hipertensos. *Rev. Soc. Med. Interna y Soc. Tisiol.* 5(2): 199-206. 1929.—Findings in 42 cases of hypertension are tabulated. Blood cholesterol was normal in 8 cases, slightly increased in 11, and markedly increased in 23. In 1 case there was a depression of blood Ca, in 2 a slight increase, and the remainder were normal. The blood K was slightly diminished in 1 case; all the others were normal. The authors regard the cholesterolemia present in the majority of cases, not as the cause of hypertension (there was no relation between the cholesterol figure and the degree of hypertension) but as the result of the lesion which produced the hypertension. They dismiss as fantastic the theory that there is any relation between the Ca: K ratio and hypertension.

4168. COLLAZO, J. A., P. RUBINO, und B. VARELA. Hypervitaminose D. Knochenbildung und Wachstumsstörungen bei Ratten nach grossen Dosen bestrahlten Ergosterins. *Deutsche Med. Wochenschr.* 55(43): 1794-1795. 1 fig. 1929.—Experiments (number not stated) showed cessation of growth in young rats fed 5 mgm. of irradiated ergosterol daily, in rats born of mothers in which hypervitaminosis had been induced, and in normal newborn rats suckled by rats suffering from hypervitaminosis.

4169. COOK, JEROME E., and MICHAEL SOMOGYI. The rate of glycolysis in erythremia (Polycythemia vera).

Arch. Internal Med. 44(6): 813-817. 1929.—In 2 patients with erythremia (1 with no increased white count), there was a greatly increased rate of glycolysis, independent of the red cell count as influenced by phenylhydrazine and showing no direct relation to proportion of young red (reticulated) cells.

4170. **COTTE, G., et G. PALLOT. Hormones ovariennes et ovarite scléro-kystique.** *Compt. Rend. Soc. Biol.* 99(19): 72-74. 1928.—Discussion of the possible relations between the contents of the cysts and the clinical symptoms of the disease.

4171. **EASTLAND, J. S., and E. G. SCHMIDT. The Andrewes diazo reaction in nephritis.** *Arch. Internal Med.* 43(4): 472-482. 1929.—The test is simple and of prognostic value when extensive renal damage is present. As performed on the sera of patients with renal diseases, a positive result was always associated with marked N retention and low phenol red excretion. Patients with a positive diazo reaction usually had marked acidosis. No definite relation between blood creatinine concentration and the intensity of the diazo reaction was noted. —*B. C. Russum.*

4172. **EISLER, BÉLA. Über das Verhältnis von Kalium zu Calcium und den Magnesiumgehalt des Liquor cerebrospinalis.** *Zeitschr. Ges. Exp. Med.* 61 (5/6): 549-559. 1928.—Potassium, Ca and Mg were determined in 154 fluids. In purulent meningitis K and Ca did not change markedly. Magnesium increased considerably. In tuberculous meningitis K rose 15 to 20% above the normal and Ca diminished, so that there was alteration of the normal K/Ca and Mg/Ca. No characteristic changes were found in serous meningitis, nor in luetic diseases of the central nervous system. A marked increase of K and Mg was noted after the malarial treatment in 2 cases of paresis. A low Ca content was observed in tetany and spasmophilia.—*S. Katzenelbogen.*

4174. **GARDNER, LEROY U. Will the inhalation of siliceous dusts activate a partially healed focus of tuberculous infection?** *U. S. [A.] Treas. Dept. Publ. Health Repts.* 45(6): 282-288. 1930.—Normal guinea pigs were infected by inhalation of tubercle bacilli of attenuated virulence (Strain R_4). At serial intervals thereafter between 54 and 400 days, groups of 4 animals were removed to each of 3 dusting chambers where they were exposed until they died (or were killed) to the inhalation of quartz, granite and carborundum dusts. In normal guinea pigs such infection produces primary tubercles in the subpleural airspaces of the lung with involvement of the tracheobronchial lymph nodes. These lesions rarely spread but heal by resolution after a period of 18 mos. to 2 years. Macroscopic tuberculosis of the abdominal viscera almost never occurs. This experiment demonstrates that dust inhalation, begun as late as 206 and even 400 days after infection, will reactivate healing primary tubercles and result in generalized chronic tuberculosis of the lungs and other organs. Of the animals exposed to quartz 73.6% showed spreading disease; of carborundum, 31.8% and of granite 26.3%. Soft coal and marble dusts had no effect upon such infection. Where dust deposits and tubercles are in close juxtaposition, spread of infection occurs. Phagocytes which have ingested quartz particles are stimulated and migrate into the tubercles in great numbers. Other types of dust are less stimulating to the phagocytes and so spreading tuberculosis is less frequent.—*L. U. Gardner.*

4175. **GOLDRING, WILLIAM, and JOHN WYCKOFF. Studies of the kidney in acute infection. I. Observations with the urine sediment count (Addis) in acute rheumatic infection.** *Jour. Clin. Investigation* 8(4): 569-575. 1930.—By means of the sediment count it has been shown that an appreciable number of formed elements are excreted in the normal urine. This number has been determined. In a series of 16 patients with acute rheumatic infection, excretion of protein and formed elements occurred in excess of the normal. The red blood cells in this group differed from those in the normal group, in their laked and crenated appearance. The abnormal excretion rate of formed elements persisted for 4 to 10 wks. after subsidence of the acute attack of rheumatic infection. There was a direct relationship between the height of the temp. and the excretion of protein and formed elements. —*Authors' summary.*

4176. **HARRISON, TINSLEY RANDOLPH, and COBB PILCHER. Studies in congestive heart failure. I. The effect of edema on oxygen utilization.** *Jour. Clin. Investigation* 8(2): 259-290. 4 fig. 1930.—The O and CO_2 contents of arterial and femoral venous blood have been determined in patients with heart disease, in individuals with edema but no cardiac disease, and in subjects with no edema and no heart disease. The femoral venous O content tends to be high in patients with edema. The O utilization tends to be lower in edematous legs. The changes found at a given time bear no relationship to the progress of the disease, but are proportional to the amount of edema present, regardless of whether it is increasing or decreasing. When patients are in a state of digitalis intoxication or have diminished alkali reserve of the blood, the O utilization tends to be high, regardless of the amount of edema. The amount of CO_2 gained by the blood parallels, in general, the amount of O lost by the blood in the various conditions which have been mentioned. As these studies have been concerned with the blood from edematous tissues they may have value in the interpretation of edema as a symptom. These studies have led the authors to believe that edema causes an increased local blood flow. This seems to be brought about in the following manner: Edema (acting in the tissues, as in the lungs, as a barrier to the diffusion of O)→ diminished tissue O tension → increased local blood flow and decreased O utilization. The symptoms of congestive heart failure are not essentially due to diminished minute output of the heart. Since utilization is faulty it is possible for the cardiac output to be increased and at the same time inadequate. Edema, itself a symptom of congestive heart failure, throws an additional load on the heart and is thus secondarily a further cause of "heart failure." The patient with "heart failure" suffers, when at rest, from circulatory inefficiency rather than from cardiac insufficiency.—*Authors' summary.*

4177. **HØST, H. F., and VICTOR BÜLOW-HANSEN Jr. Studies on ketonuria.** *Acta Med. Scandinavica* 71 (3/4): 325-349. 1929.—The total daily ketonuria (van Slyke's method) has been studied in 13 healthy, nondiabetic persons living on ordinary diets and in 12 diabetic patients with various diets with and without insulin. The physiological ketonuria varied between 0.005 and 0.386 gm. In the diabetic patients the ketonuria was about the same whether the body subsisted on exogenous fats and protein, or was forced by undernutrition (hunger) to subsist on the endogenous fats and protein. The ketonuria was less on from 40-60 gm. protein than on a small supply (6-20 gm.), and tallying with this was the circumstance that the ketonuria and the N in the urine were to some extent in inverse proportion. Increase in fats in the diet (from 127 to 180 gm. and from 140 to 160 gm.) was followed by an increase in ketonuria. The relation between ketonuria and FA/C (Woodyatt) varied considerably in the different patients. Three of them had normal or almost normal ketonuria, although their diet was decidedly ketogenic. Insulin had no direct influence on ketonuria. Neither did hyperglycemia. A febrile infection (angina), on the other hand, caused a great increase in ketonuria. Eight of the patients were dismissed from the hospital with ketonuria more or less raised. Only in one the diabetes became worse. In 5 the disease after 2 years showed no sign of becoming worse, a circumstance which supports

the opinion that a small increase in ketonuria is not injurious.—*H. F. Høst.*

4178. JAEGER, ERNST. Eine bisher nicht beschriebene Form von Bindehauterkrankung. Ein Beitrag zur Pathologie der Bindehaut. *Klin. Monatsbl. Augenheilk.* 84(3): 373-380. 2 fig. 1930.—A painful inflammatory infection of the left eye was under observation for 3 yrs.; 3 outbreaks occurred, the 1st on the lower lid, the 2nd on the nasal half of the bulbar conjunctiva (these cured by excision of necrotic tissue) and the 3rd on the upper lid (spontaneous recovery). No evidence of either bacterial or traumatic origin of the lesion could be found; the inflammatory process was found to have begun in the submucous layers. Therefore an endogenous origin was assumed, presumably pathological processes in internal cell metabolism producing local death of cells, the primary cause of the local disturbance of metabolism being unknown.

4179. JOHN, HENRY J. A summary of the findings in 1100 glucose tolerance estimations. *Endocrinology* 13(4): 388-392. 1929.—From an analysis of a series of 1100 glucose tolerance tests (using 100 gm. of glucose by mouth), the author concludes the following: We can draw the following conclusions: Patients with glycosuria are not all diabetics. About ⅔ are non-diabetic and ⅓ are diabetic, a finding which indicates the necessity of investigating each case carefully to determine its exact status. When glycosuria occurs in pregnancy it is important to study the case carefully as the incidence of diabetes in this group is not insignificant. The discovery of glycosuria in an examination for life insurance often leads to unfair discrimination. In my series shown in Table I, 62.2% of such cases were non-diabetic. These subjects are perfect life insurance risks. Hyperglycemia in a routine examination (2½ hrs. or more after a meal or during fasting), even though slight, should not be disregarded, for in my series 40% of such cases were diabetic. When there is diabetic history in the family the diabetic incidence is higher than otherwise. Obesity carries a high incidence of diabetes, to say nothing of other evils. Normal or subnormal weight protects the individual against diabetes more than any other single factor. It means that the individual eats moderately and that but a small load is thrown on the insulogenic function of the pancreas. Glycosuria in the presence of hyperthyroidism carries with it a high incidence of diabetes, and should not be ignored. The problems presented by such cases should be rigidly investigated. Hypothyroidism is the reverse of hyperthyroidism and the incidence of diabetes among subjects of hypothyroidism is slight. Acromegaly carries with it a high diabetic incidence. Hypopituitarism carries with it a low incidence of diabetes. Hypertension carries with it a high diabetic incidence. Tuberculosis (glycosuria), arthritis, carcinoma and syphilis carry with them a high diabetic incidence. Skin diseases carry with them low diabetic incidence. Diabetes occurred in 29.9% of patients under 20 years of age, these cases having been investigated because of their glycosuria.—*H. J. John.*

4180. JOHNSON, SCOTT, and WALTER J. SIEBERT. Experimental myocarditis. *Amer. Heart Jour.* 3(3): 279-286. 2 fig. 1928.—A single injection of 0.025 gm. caffeine sodium benzoate with 0.2 cc. of adrenaline caused myocarditic lesions in practically all the rabbits used [47]. The most frequent site of this lesion was in the papillary muscles of the left ventricle. Next in frequency were the myocardium of the left ventricle at the upper ½ of the anterior aspect, which in some cases encroached upon the myocardium of the left auricle, then the upper ½ of the posterior aspect of the left ventricle. The lesions appeared a few days after the injections and consisted of (a) interstitial edema; (b) hypertrophy of the muscle fibers and nuclei; (c) degenerative changes in the muscle fibers, which varied in severity from loss of cross striations and increase in intensity of the longitudinal striations, to granulation, vacuolization and solution; (d) connective-tissue proliferation; (e) proliferation of the endocardium adjacent to the myocardial lesion and hemorrhages into the endocardium; (f) pericarditis, and (g) fatty degeneration of the myocardial cells in and immediately around the myocarditic lesions. The lesions were most marked from 12 to 21 days after the injections and were progressively less evident both grossly and microscopically at later periods. [47 rabbits were given each a single intravenous injection of 0.025 gm. of caffeine sodium benzoate in a 1 cc. watery solution, followed several min. later by an injection of 0.2 cc. of a 1 to 1000 solution of adrenalin (Parke-Davis), administered slowly.]—*Authors' conclusions.*

4181. KASSIRSKY, J. A. Über den Grundumsatz bei der Spru. *Arch. Schiffs- und Tropen-Hyg.* 33(5): 283-287. 1929.—In severe cases of sprue the following symptoms were observed: Disturbed metabolism, loss of weight up to 50% and a more or less intense decomposition of protein. Anemia is one of the fundamental symptoms. This is supposed to be due to overcompensation of the organism. Much O is required, which causes intensity of breathing and heart action. There is no relation between acidosis and metabolism. There is an overproduction of amino-acid and blood and tissues contain β-oxybutyric acid and lactic acid.—*P. G. Heineman.*

4182. LARSEN, REUBEN L. A theoretical consideration of the etiology of the toxemias of pregnancy. *Amer. Jour. Obstet. & Gynecol.* 18(3): 374-379. 1929.—Cell permeability is dependent upon and varies with the mineral salt content of the cells. An excess of Ca ions causes increased permeability while an excess of Na or K ions causes decreased permeability. There is an unusual demand for Ca during pregnancy and, inasmuch as there is a strain placed on all bodily functions at this time, the endocrine system may suffer, particularly the parathyroid glands. Thus a Ca deficiency may result from low intake or deficient metabolism. Such a deficiency in the liver cells leads to increased permeability, an outpouring and exhaustion of glycogen and, in a vain endeavor to compensate, the cells pour out their own toxic proteins, products which would not pass through the membranes of cells with normal permeability. This results in "morning sickness" or may go on to hyperemesis gravidarum in early pregnancy and, if the condition is not corrected or the organism does not become adjusted to it, in later pregnancy the cumulative action manifests itself as eclampsia. Because of the compensatory and complementary actions of Mg and Ca, it is suggested that the salutary action of $MgSO_4$ may be greater than can be attributed to its sedative action alone. Because of the interdependence of calcium and phosphorus in other conditions, it may be that this latter element also plays a rôle in the etiology of these toxemias.—*R. L. Larsen.*

4183. LAZZARINI, LANFRANCO. Contributo allo studio dell'adiposi dolorosa. (Ricerche cliniche, istochimiche, fisicochimiche). *Clin. Med. Italiana* 60(3): 255-277. 6 fig. 1929.—The author reports a case of Dercum's disease and findings of a study of the tumefactions removed. He offers evidence to show that these tumefactions are composed of fat similar to the subcutaneous fatty tissue. He believes that these swellings are caused by fatty infiltration due to local incapacity (probably caused by vago-sympathetic disequilibrium involving the trophic branches) to assimilate the fat normally deposited there.

4184. LOUROS, N., und E. GAESSLER. Das "Stoffwechselbild" bei der Puerperalsepsis. *Arch. Gynaekol.* 140(1): 43-65. 9 fig. 1930.—The following conclusions are based on study of 9 cases, 4 of fatal streptococcus infection, 2 fatal staphylococcus infection, 1 fatal mixed infection, and 2 ending in recovery. Taking first carbohydrate metabolism, fatal bacterial sepsis is marked by rise in lactic acid, change in blood reduction values and resulting acidosis. Secondarily the blood protein picture is characterized by fall of total plasma protein, increase in fibrinogen and globulin, and consequent displacement of the fibrinogen-globulin-albumin proportion toward the globulin side. The submolecular proteins (amino-acids) were, surprisingly, not increased in any

case. Fat metabolism showed an increase in total fats with a decrease in total cholesterol and its ester. In ionic metabolism the striking facts were decrease in Na, increase in K, Mg and P, and approximately normal Ca values. Acidosis was confirmed by lowered H (Hasselbalch method) and alkali reserve. The determining factor appears to be, not an oxidation-inhibiting process, but a disturbance in hepatic metabolism. The lactic acid formed in the body is not, as normally, resynthesized in the liver, but is poured out into the blood in toxic and constantly increasing amounts. This acidification of the organism encounters a lowered alkali reserve. The rise in lactic acid is accompanied by a rise in blood sugar, but the latter falls again immediately before death, owing to the constantly decreasing capacity of the liver for glucose mobilization. Hence follows the conclusion that septic death is a liver death.

4185. McCLELLAN, W. S., and R. R. HANNON. A case of osteitis fibrosa cystica (osteomalacia ?) with evidence of hyperactivity of the parathyroid bodies. Metabolic study III. *Jour. Clin. Investigation* 8(2): 249-258. 1930.—Ca and P balances are presented for the subject C. M. who was observed continuously for 154 days. Distinct improvement in the physical condition occurred during his stay in the hospital. An intake of 1.0 gm. of Ca was found necessary to keep him in positive Ca balance. The positive balance was increased by increasing the intake. No definite benefit could be ascribed to cod liver oil or quartz lamp therapy. Thyroid and pituitary extracts diminished the amount of Ca retained. The excretion of Ca in the urine was not affected by increased intake of Ca but was increased as a result of giving thyroid extract. The excretion of Ca in the feces was elevated by increasing the intake and there is suggestive evidence that it is slightly increased by giving pituitary extracts. The excretion of P in the urine was not significantly affected by either intake or glandular therapy. The P in the feces varied with the intake. A positive P balance was maintained throughout the entire period of observation even in those periods when there was definite loss of Ca from the body. The removal of 2 parathyroid glands caused only slight changes in the levels of serum Ca and P and no changes in the basal metabolic rate.—*Author summary.*

4186. MERZBACHER, L. Die Beziehungen der natürlichen Malaria zur Syphilis. Ergebnisse einer Studienreise nach den Nordprovinzen Argentiniens. *Deutsche Zeitschr. Nervenheilk.* 113(1/3): 1-49. 1 fig. 1930.—The author was a member of a commission for study; he visited the northern provinces of Argentina where malaria is endemic and syphilis is frequent, visited hospitals, interrogated physicians, health officers and other officials, and made a personal study of 120 cases. His 2 chief conclusions are: (1) Natural malaria is capable of checking the development of severe metasyphilitic symptoms. (2) The frequency of serologically positive cases and of pathologic colloid reactions furnishes evidence against the ability of natural malaria to effect a complete disinfection of blood and cerebrospinal fluid. Merzbacher reconciles the apparent contradiction by pointing out that an abnormal colloid reaction shows merely that the fluid has not yet been restored to normal; it does not prove that cure may not follow. The abnormal colloid reaction may be merely the persistence of a pathologic sign destined to disappear as the disease becomes more benign. He considers the rarity of severe forms of metasyphilitic diseases in malarial regions a most significant fact.

4188. NEVER, HENRY E. Avitaminose und Verdauungsorgane. II. Mitteilung. *Pflüger's Arch. Ges. Physiol.* 224(6): 787-792. 2 fig. 1930.—In a dog with duodenal and ileac fistulas avitaminosis produced marked disturbances of digestion with deranged pyloric reflex and delayed transit of food. The delayed resorption of fats and the lengthened sojourn of the fatty acids in the intestine may be the primary factor which produced all the others.—*From author's summary (transl.).*

4189. NUTTING, ROLAND E. Capillary bronchitis. The effect of the administration of oxygen on the healing process. *Amer. Jour. Dis. Children* 37(5): 1051-1054. 3 fig. 1929.—In the case reported, life was prolonged 26 days by continually administrating O. Many bronchioles were occluded by fibrous tissue. Death apparently was due to asphyxia caused by this attempt at healing.—*G. N. Ludwig.*

4190. OLCH, I. Y., and HARRY C. BALLON. Experimental abscess of the lung following ligation of the pulmonary artery and incision and suture of the pulmonary parenchyma. *Arch. Surgery* 19(6): 1586-1594. 5 fig. 1929.—In 10 dogs, ligation of the pulmonary artery to the right lower lobe and simple incision and suture of the pulmonary parenchyma of the corresponding lobe was followed by the formation of an abscess of the lung in 8 instances. No appreciable increase in fibrous connective tissue was observed in the lung over periods up to 4 weeks following ligation of the pulmonary artery. The lobe did not decrease in size, nor did the alveoli appear to be smaller. Simple incision and suture of the pulmonary parenchyma resulted in a scar which resembled a scar elsewhere in the body and was not followed by the development of an abscess of the lung. Phrenicotomy performed on the corresponding side apparently in no way influenced the end result.—*Authors' summary.*

4191. PARTURIER, GASTON, FAUQUE, et MAUCEAU. Les épreuves musculaire et respiratoire chez les hépatiques. *Presse Méd.* 38(7): 99-101. 1930.—Rest-N of the blood, azotemia, uricacidemia, cholesterolemia and glycemia, before and after ½ hr. muscular effort,

were determined in 15 normal subjects and 46 patients with various hepatic complaints (16 serious, 15 medium and 15 light cases). In the normal subjects there was a rise of azotemia and glycemia and a fall in cholesterolemia after the exercise. In the severe hepatic cases there was a fall in glycemia and in urea; the less serious cases approached the normal type. The same tests were made on 6 normal controls and 34 patients taken at random among hepatic and diabetic patients and others, before and after inhalation of CO_2. In the normal subjects the only change was a slight elevation in glycemia. Of the 34 diseased subjects, 10, including 2 with mild diabetes, showed a slight rise in glycemia; 10, including 3 with serious diabetes, showed a fall in glycemia; 14, including 7 with very grave diabetes, showed glycemia unchanged. In 50 tests before and after inhalation of O, as in the case of CO_2, only the glycemia was subject to variation. In normal subjects there was no change, or a slight rise; in hepatic subjects there was a more or less decided fall, the amount apparently corresponding more or less to the severity of the pathologic condition. "It is as if the glucose consumed by hyperoxygenation was immediately replaced by a healthy liver, and as if a diseased liver were able to accomplish the task only with a noteworthy tardiness."

4194. **PEEL, ALBERT A. FITZGERALD. Transient inversion of the "T" wave in electrocardiograms in cases of acute rheumatism with cardiac complications.** *Glasgow Med. Jour.* 112(6): 291-303. 19 fig. 1929.—A series of 6 cases of acute rheumatism with cardiac complications have shown inversion of the "T" wave in lead 3 as a transient phenomenon; the phase of inversion is accompanied by a diminution in the amplitude of the "T" wave in lead 2. Variations in the "T" wave of this nature can be demonstrated in the majority of cases with active endocarditis; but a certain number appear to run their course without showing any such variations. Comparison of these cases with cases of cardiac dilatation in Graves' disease suggests that the "T" inversion in the rheumatic cases is due to actual myocarditis rather than to a toxic action on the heart muscle. Inversion of the "T" wave in lead 3 is more than twice as frequent in subjects with acute rheumatism as in persons with normal hearts and some other disease. The discovery of an inverted "T" 3 in a case of acute rheumatism should be regarded as highly suggestive of the presence of active myocarditis until it has been shown to be constant and "normal" for that individual, and provided "digitalis inversion" and the inversion resulting from pre-existent cardiac lesion have been excluded.—*Author's summary.*

4195. **PUCSKO, OTHMAR. Der Einfluss verschiedener Kostformen auf den Ketonkörper- und Zuckerspiegel bei Diabetes mellitus.** *Wien. Arch. Inn. Med.* 15(1): 123-130. 1928.—The author investigated certain established dietary routines in vogue in their relation to ketogenesis and found the following: The older types of diets, such as the tolerance-day according to Allen and others, which are high in protein, produce high ketogenesis. The newer diets, Falta's, are more favorable. A pure plant protein causes a quick rise of ketones in the blood followed by a fall. The restriction of calories alone without reference to the type of diet also has a beneficial influence on ketogenesis.—*H. J. John.*

4196. **RAINE, FORRESTER, and MARGARET C. PERRY. Intestinal obstruction: experimental studies on toxicity, intra-intestinal pressure and chloride therapy.** *Arch. Surg.* 19(3): 478-511. 1929.—In intestinal obstruction the blood nonprotein N and chloride decrease were related to the part of the gut obstructed. Recovery after release of obstruction was more rapid when there had been reabsorption of the contents of the obstructed gut. The rabbit's life was prolonged and the therapeutic value of chlorides was greater as the intra-intestinal pressure in the obstructed bowel was diminished.—*M. L. Menten.*

4198. **ROSENTHAL, EUGENIO. Sul diabete degli infermi portatori di tumori. [The effect of tumors on diabetes.]** *Rin. Med.* [*Napoli*] 7(1): 13-14. 1930.—The author cites several clinical observations indicating that the development of carcinoma in diabetic patients checks the diabetes. In 1 patient, long diabetic, a carcinoma of the head of the pancreas had closed the bile-duct, and intensification of the diabetes was expected. Instead, the glycosuria diminished and disappeared as the carcinoma developed, and did not reappear even when the patient ate sugar. The facts may be explained either by Warburg's observation that tumor-cells require large quantities of carbohydrate for their development, or by Ruffo's discovery in malignant tumors of active insulin-like substances.

4199. **RUSZNYÁK, STEPHAN. Untersuchung zur Frage der Gesamtblutmenge des Menschen unter normalen und pathologischen Verhältnissen. II. Mitteilung. Nierenkrankheiten und Hypertonien.** *Deutsches Arch. Klin. Med.* 158(1/2): 98-118. 1927.—Renal disease (64 cases) is accompanied by a decrease in blood volume. This is also true when renal disease is complicated by edema and increased blood pressure. Only in cases of contracted kidney is there a tendency toward an increase of blood volume. In hypertension without renal involvement (24 cases) the usual findings are decreased blood volume and increased blood concentration. The findings are explained on a basis of lowered capacity of the vascular system—*B. S. Walker.*

4200. **SCHWENTKER, FRANCIS F., and WILLIAM W. NOEL. The circulatory failure of diphtheria. II. The carbohydrate metabolism in diphtheria intoxication.** *Bull. Johns Hopkins Hosp.* 46(4): 259-271. 1930.—In rabbits dying of severe diphtheria intoxication there is found a marked pre-lethal hypoglycemia. In the less severe intoxications, so that death occurs later in the disease, the pre-lethal blood sugar value becomes progressively higher until after the third day a definite hyperglycemia becomes evident. There is a marked reduction, indeed, in most cases a complete absence of hepatic and muscular glycogen during the toxemia. In humans as well as in rabbits there is found a definite inability to assimilate dextrose from the blood stream in diphtheria; this is progressive with the toxemia. Insulin retains to some extent its power to cause the assimilation of the dextrose in diphtheria intoxication. The authors are inclined to picture the mechanism in diphtheria intoxication as follows: In the first stages of the toxemia, there is an increase in the metabolic processes of the body; the glycogen stores in the liver and muscles are reduced to dextrose. This is evidenced by the increased blood sugar in the early stages. Very probably, there is also an increased activity of the thyroid and adrenal glands. If the intoxication is severe, the glycogen and dextrose are rapidly consumed in the process and, when death supervenes, there is found a definite hypoglycemia and a complete absence of hepatic and muscle glycogen. If, however, the intoxication is of longer duration, there becomes apparent a progressive inability on the part of the body to assimilate carbohydrate. Most of this is probably due to a suppression of the production of insulin; it may be due in part to a continued activity of the thyroid-adrenal apparatus. When this stage has been reached, there is a progressive

rise in the blood sugar values but the body is unable to utilize any of the dextrose. The absence of glycogen in the liver and muscles is evidence on this point. Naturally enough, when the body is no longer able to assimilate the dextrose, nutritional disturbances are set up and cellular degeneration occurs. This eventually leads to circulatory failure and death.—*F. F. Schwentker.*

Chem.* 186(3): 124-132. 1929.—In a case of chronic myeloid leukemia, 100 l. of urine were collected and treated according to the method of Krüger and Salomon with ammoniated $AgNO_3$ to secure the purine by crystallization in pure form. There were found only methylxanthine (originating from the caffeine) (heteroxanthine 1.47 gm., l-methylxanthine 0.2 gm., paraxanthin 0.54 gm.) while the purine bases were excreted only in traces (adenin 0.03 gm. and hypoxanthin 0.04 gm.). In addition 1.08 gm. of carnin was recovered.—*H. Teitge (transl. by W. F. Jacobs).*

4202. **TOFFANIN, U. Ricerche sulla reazione intracutanea di McClure ed Aldrich.** *Policlinico [Sez. Prat.]* 37(1): 7-10. 1930.—The McClure-Aldrich reaction, used in 83 cases of various kinds, gave, in general, a nearly normal reaction time in infectious diseases (30 cases) and affections of the digestive tract (9 cases); prolonged reaction in senile marasmus (1 case) and in exudative pleuritis and polyserositis (6 cases); and a short reaction in renal lesions with edema (2 cases) and in subacute myocarditis (2 cases).—*From author's summary.*

4203. **VAN ALLEN, C. M., L. S. HRDINA, and J. CLARK. Air embolism from the pulmonary vein. A clinical and experimental study.** *Arch. Surgery* 19(4): 567-599. 14 fig. 1929.—Experimental studies on more than 100 dogs indicate that bronchovenous fistula may be produced by simple thoracentesis and may form a portal of entry for air into the pulmonary veins. Gravity is a determining factor distributing air in the blood circulation. Embolism of the heart (coronary) and brain are the vital effects. The position of the animal determines which of these are primary in a given case. Tolerance for embolism is greatest when the head of the animal is well depressed and least with the head up.—*From authors' summary.*

4204. **VAN ALLEN, C. M., W. E. ADAMS, and L. S. HRDINA. Embolism in bronchogenic infection of the lung.** *Arch. Surgery* 19(6): 1279-1291. 8 fig. 1929.—The lung appears to be in general much more resistant to necrosis and suppuration than are other tissues; however, in the lung, abscess develops much more readily from embolic than from intrabronchial inoculation. Experiments on 64 dogs sustained the hypothesis that the greater vitality of the lung than of other tissues in pyogenic infections is due to a greater blood supply, and that embolism or any other condition which reduces the pulmonary blood supply thereby reduces the vitality of pulmonary tissue to the general level of the tissues of the body.

4205. **WEINGROW, SAMUEL M. The interparoxysmal respiratory rate of epileptics.** *Jour. Nervous and Ment. Dis.* 70(4): 373-378. 1929.—From clinical observations (number of cases not stated) it is concluded that: the range of the interparoxysmal respiratory rate of adult essential epileptic males differs from that of the normal. Luminal medication extending over periods of years does not affect the limits of this range in the individuals studied. The average respiratory rate of idiopathic and symptomatic adult male epileptic patients whether or not receiving luminal falls within normal limits. Sleep per se has little effect upon the respiratory rate of the cases studied. The effect upon the interparoxysmal respiratory rate in epileptic individuals of drugs superimposed upon luminal needs further study.—*Author's conclusions.*

4206. **WENDT, H. Über das Verhalten der Cholesterinester im Blutserum Leberkranker.** *Klin. Wochenschr.* 8(26): 1215-1218. 1929.—Human bile contains a ferment that hydrolyzes cholesterol esters. Dog bile does not contain such a ferment; hence human bile contains only free cholesterol whereas dog bile contains cholesterol and its esters. Ligation of the common bile duct leads, in the dog, to an increase in the concentration of cholesterol and of cholesterol ester in the serum. In hepatopathics, with pronounced icterus, it is not uncommon to find a reduction in the cholesterol ester content of the serum. This reduction is probably due to hydrolysis of the cholesterol esters of the blood by the ferment that has seeped out of the gall bladder.—*M. Hanke.*

4207. **WISHNOFSKY, MAX, and CHARLES S. BYRON. Carbohydrate metabolism in acromegaly.** *Jour. Lab. and Clin. Med.* 15(3): 216-220. 1929.—The authors challenge the opinion of Davidoff and Cushing that the oversecretion of hypophyseal substance is the cause of diabetes mellitus in acromegaly. If this were the sole factor, either all acromegalics should have diabetes mellitus, or none. But, while disturbed carbohydrate metabolism is present in all cases of acromegaly, diabetes mellitus is present in only a fraction of the total number. Moreover, acromegaly is caused, so far as known, by oversecretion of the anterior lobe of the hypophysis, while it is the posterior lobe alone that influences carbohydrate metabolism. Insulin has 2 actions on sugar metabolism; it promotes glycogenesis and also oxidation of glucose. Pituitrin neutralizes the glycogenetic action of insulin, but does not affect its oxidizing action on glucose. In the opinion of Wishnofsky and Byron, the carbohydrate disturbance in acromegaly may be incidental to that disease or to concomitant diabetes mellitus.

4208. **ZIMMERMAN, H. M., and JOHN A. HILLSMAN. Chronic passive congestion of the liver. An experimental study.** *Arch. Path.* 9(6): 1154-1163. 2 col. pl., 2 fig. 1930.—In dogs the vena cava was ligated; 3 in which about 90% occlusion was obtained died 11, 30 and 60 hrs., respectively, after ligation; others, in which 50% occlusion was obtained, lived to be examined from 6 days to 216 days after ligation. The conclusions are: Necrosis of the liver follows simple mechanical obstruction to the outflow of blood, the extent of the necrosis being proportional to the amount of obstruction. The necrosis can involve the whole liver 11 hrs. after the ligation of the inferior vena cava. Ascites is early associated with necrosis of the liver, which is consequent on the obstruction of the inferior vena cava. As early as 6 days after the partial ligation of the inferior vena cava there is evidence in the liver of repair, as manifested by the numerous mitotic figures and the increase in the connective tissue in the areas around the central veins. Nineteen days after partial ligation of the inferior vena cava, the liver shows grossly the picture of chronic passive congestion. Active proliferation of connective tissue is seen around the central veins. In 41 days there are marked distention of the subcapsular venous sinusoids and marked fibrosis of the areas about the central veins, with large vascular spaces newly formed in this scar tissue. The cystlike formations in the connective tissue around the central veins are branches of these vessels. The fibrosis ceases to increase in extent after 85 days and is essentially of the same extent 216 days after the ligation of the inferior vena cava. Central fibrosis of the liver can result without infection being present, and is due to an active proliferation of connective tissue.—*Authors' summary.*

ANIMAL PATHOLOGY

INFECTIOUS AND OTHER DISEASES OF LOWER ANIMALS

Inst.* 25(1): 32-34. 10 fig. 1930].—The authors conclude that pressure necrosis causing loss of either the upper or lower mandible is apparently due to the fine consistency of the ration fed; it may also be due to lack of fibrous material in the ration. It is apparently due to a combination of factors, such as close confinement in brooder battery and finely ground food, leading to apparent continued eating of dry mash without taking sufficient drink to cleanse the mouth. Removal of the adhering food and simple disinfection of the mouth parts correct the condition. The change from a finely ground food to a granular one removes the cause of impaction.—*Authors' summary.*

4214. **DAVID, HANS. Zur Frage der Sonderstellung der Rattenschädlingsbakterien innerhalb der Gruppe des Bact. enteritidis Gärtner.** *Zeitschr. Fleisch- u. Milchhyg.* 40(10): 203-206. 1930.—Evidence is brought forth to show that the Bonner Ratin strain possesses the same biochemical and serological characteristics as the original Copenhagen Ratin, Liverpool virus, Morratin, virus Compagnal (Paris), etc., and that it differs from other enteritidis Gärtner strains. The epizootic in cattle which occurred at Düren and which was described by Haffner as being due to rat pathogens was caused by a typical representative of the Gärtner bacillus group III (Bahr) (paracoli Jensen).—*H. J. Stafseth.*

4215. **DOEVE, W. C. A. Cascado een chronische huidziekte bij rundern. [Cascado, a chronic cutaneous disease of cattle in Celebes.]** [With English and French summaries.] *Ned.-Indische Blad. Diergeneesk.* 43(1): 30-65. 10 fig. 1931.—In the deeper parts of the skin the author found fungous elements which he regards as *Penicillium* and provisionally names *P. bovis* (p. 52). Though cascado was not induced by rubbing pure cultures of this fungus into scarified skin of calves, the author regards it as a factor in the following way: By physical and chemical influences there arises first a slight inflammation of the skin, on the secreta of which the fungus grows. The fungus produces toxins or irritating substances causing itch, and the inflammation grows worse. The fungus then obtains a still better medium, grows more abundantly and penetrates to the deeper parts of the diseased skin. The horny stratum and the corium grow excessively. As the natives use "cascado" for other cutaneous diseases, the author proposes the name "tinea sclerotica bovis."

4216. **DUNÉR, I. B., och SVEN WALL. Nötkreaturstuberkulosens utbredning i Sveriges skilda län år 1929 bedömd med hjälp av tuberkulosprocenten funnen vid köttbesiktning av kött av vuxna nötkreatur vid rikets samtliga köttbesiktningsanstalter. [The extent to which tuberculosis in cattle existed in the different districts of Sweden in 1929, examined with reference to the percentage of tuberculosis found on inspection of the meat from adult cattle at all the meat-inspection stations in the kingdom.]** [With English summary.] *Skandinavisk Vet.-Tidskr.* 21(3): 74-96. 1 map. 1931.

4217. **EIDHERR, ALFRED, und HEINRICH REICHEL. Ist die Ascoli-Reaktion zur Aussonderung milzbrandinfektiöser Häute geeignet?** *Arch. Hyg. u. Bakt.* 105(5): 262-271. 1931.—In 200 pelts, 27 were infected with anthrax by culture test; the modified Ascoli reaction was positive only once.

4218. **EMMEL, M. W. The susceptibility of the guinea fowl to brucella disease.** *Jour. Amer. Vet. Med. Assoc.* 32(2): 228-232. 1931.—Feeding of massive doses of 2 strains of each of the species of *Brucella* produced an infection in guinea fowls, which was not fatal within 120 days. Lesions were similar to those produced in other birds by the same infection. What appeared to be a case of natural *Brucella* infection in 2 guinea fowls is described.—*Author's summary.*

4219. **GUIEYSSE-PELLISSIER, A. Le tissu lymphöide des branchies des poissons.** *Compt. Rend. Soc. Biol.* 106(10): 805-808. 1931.—Examination of fish living in the Juine, a badly polluted stream, showed a growth of lymphoid tissue on the gills which was not found in sea fish caught in the vicinity of Roscoff. These growths may be pathologic in nature.—*E. Weiner.*

4220. **HOBMAIER, M. Duck disease caused by the toxin of Cl. botulinum type C.** *Proc. Soc. Exp. Biol. & Med.* 28(3): 339-340. 1930.—Preliminary paper.

4221. **JAMES, W. A. Streptococcus pyogenes meningeal abscess causing paraplegia.** *Jour. Amer. Vet. Med. Assoc.* 32(1): 94-95. 1 fig. 1931.—Direct smears from an abscess in a pig revealed a great number of cocci and diplococci. Cultures of the pus on blood-agar plates revealed a hemolytic streptococcus (*Strep. pyogenes suis*) as cause of the abscess, with resultant pressure on the spinal cord in the thoracic region.

4222. **JOHNSON, HOWARD W., and I. FOREST HUDDLESON. Natural Brucella infection in swine.** *Jour. Amer. Vet. Med. Assoc.* 31(6): 849-862. 1931.—*Brucella* infection in swine appeared to be due to 1 species, viz., *Brucella suis* Traum. The rapid agglutination test is an accurate method of following the course of infection.

The disease is apparently self-limiting, since the majority of animals recovered within 5 mo. from the time agglutinins first appeared in the blood. Infected sows or gilts conceive less readily. The infection appears to be confined chiefly to the lymphatic tissues. The capacity of *Br. suis* to invade the gravid uterus does not appear to be marked. The field survey indicates that the disease is prevalent in Michigan.—*Authors' summary.*

4223. **JULLIEN, A. De certaines tumeurs et inflammations du manteau de la seiche. [Tumors and inflammations in the mantle of the cuttlefish.]** *Arch. Zool. Exp. et Gén. Notes et Rev.* 67: 139-158. 3 fig. 1928.

4224. **LAUE, W. Untersuchungen über die Brauchbarkeit der Milch-Labhemmprobe nach K. Schern.** *Milchwirtsch. Zentralbl.* 60(1): 1-6. 1931.—Schern suggested that the action of rennet on milk may be used to determine whether or not an animal has inflammation of the udder. He believes that rennet fails to curdle the secretion of an infected gland, or else curdles it only after a longer time than milk from a healthy gland. The author was unable to confirm Schern's observations, and states that the reaction of milk to rennet is less accurate in diagnosing inflammation of the udder than are microscopic, cultural, and chemical methods.—*E. G. Hastings.*

4225. **MALLNER, F. Pelztierkrankheiten, ihre Vorbeugung und medizinische Behandlung. [Diseases of fur-bearing animals, prevention and medical care.]** (*Handbuch der industriellen Pelztierzucht.*) 343p. 67 fig. G. Löffler: Riga; A./G. Walters & Rapa: Riga, 1930.

4226. **MELLO, TAYLOR de, e MOACYR ALVES de SOUZA. O bacillo da Ruiva dos porcos; sua constatação no Brasil. (B. rhusiopathiae suis; first confirmation in Brazil.)** [With English abstract.] *Rev. Zootech. e Vet.* [*Rio de Janeiro*] 17(1): 41-47. 1931.—In a pig imported from the U. S. A. growths were found on the valves of the heart from which the bacillus of swine erysipelas was isolated. It was identified by cultural pathogenic, biological and serological properties.

4227. **NEIVA, CICERO. Sobre a associacao bacteriana na peste bovina. [Secondary microorganisms associated with rinderpest in cattle.]** *Arch. Inst. Biol.* [*São Paulo*] 4: 39-49. 1931.—Secondary microorganisms of the *Salmonella*, *Aerobacter* and *Escherichia* genera apparently play important rôles in the lesions of rinderpest in animals weakened by the ravages of the virus. Of the microorganisms studied, *Salmonella enteritidis* seemed to be most important. All the microorganisms lost their virulence after being cultured on artificial media in the laboratory for 9 yrs.—*From author's abstract* (*C. S. Gibbs*).

4228. **NOWICKI, W., et K. PANEK. Histopathogénie de la réaction provocatrice chez les chevaux morveux.** *Compt. Rend. Soc. Biol.* 106(10): 851-854. 1931.—Autopsy and microscopical examination of horses treated with morvotensin (specific extract from glanders bacilli) showed that its injection produces an exaggeration of the specific morbid process, as shown by intense hyperemia, sloughing of tissue and inflammatory lesions. This occurred only in horses presenting pre-existant modifications due to glanders. The degree of exacerbation is directly connected with the more recent glanders lesions.—*E. Weiner.*

4229. **PFEIFFER, HEINRICH, und HANS JÜRGEN STAMMER. Pathogenes Leuchten bei Insekten.** *Zeitschr. Wiss. Biol. Abt. A. Zeitschr. Morph. u. Ökol. Tiere* 20(1): 136-171. 9 fig. 1930.—*Bacterium* **haemophosphoreum,** isolated from a caterpillar of *Mamestra oleracea,* was shown to be pathogenic for insects. No other groups of animals were susceptible. It is not identical with any of the other 3 known photogenic bacteria pathogenic for invertebrates. Infection occurred only when the organism was injected directly into the hemolymph (M. L. D. 1×10^{-7} mgm.). Feeding experiments with cultures of phosphorescent insects were negative. No toxin was demonstrated. Death seems to be due to a chemical change in the hemolymph. Immunization against 5-10 times the M. L. D. was successful in a large number of experiments. Repeated injection of dead bacteria, especially of old cultures, seemed to increase the susceptibility of meal worms. Since pathogenic phosphorescent bacteria can cause phosphorescence in insects, experiments were carried out with phosphorescent Lampyridae and with *Ceroplatus.* With the Lampyridae a phosphorescent secretion seems probable. With *Ceroplatus testaceus* Dalm. certain fat tissue is phosphorescent, especially the skin fat. Phosphorescence was observed in larvae, pupae and 2-day imagines. Eggs and older imagines (no fat) failed to phosphoresce. No bacteria were discovered in the above; possibly a phosphorescent secretion is present. No cultures were obtained from the above. Only *Lampyris noctiluca* among these insects could not be infected with *Bact. haemophosphoreum.* This is attributed to an unfavorable composition of the hemolymph.—*H. Pfeiffer* (*transl. by C. B. Morrey*).

4230. **POOL, W. A. The etiology of "louping-ill."** *Vet. Jour.* [*London*] 87(4): 177-200; (5): 222-234. 1931.—After a critical review of published investigations from 1896 to date, the author doubts whether an infective agent is present within the bodies of affected sheep. The facts that "louping-ill" is a serious scourge in many parts of the country, and that a high death-rate and the occurrence of severe illness are striking features of its manifestations, compel doubt of experimental results in which the only evidence of a positive reaction in the naturally susceptible animal is the appearance of high temp. In a wide series of experiments involving inoculation by the various methods described, and with a variety of tissues from sick animals, the occurrence of paralytic symptoms on odd occasions might not necessarily be due to a specific infective factor.—*From author's summary.*

4231. **RODE, P. Recherches sur la destruction dans le sol d'un microbe pathogène: Bacillus typhi murium Loeffler.** *Ann. Epiphyties* 15(4): 237-252. 2 fig., map. 1929.—The author shows that *B. typhi murium* is particularly sensitive to drying. Among other things he points out the following biological peculiarities: In soil the organism is resistant to cold, maintaining its virulence for a relatively long time (1 mo. or less). Under normal conditions and with moderate temp., it disappears rapidly from the soil (24 hrs. to 4 days). This is attributed to desiccation, to indirect action of other microorganisms (production of acidity), and to paucity of soil nutrients. In view of these facts, the author outlines the precautions to be taken in the use of *B. typhi murium* (virus of Danysz) for destroying rodents.—*P. Rode.*

4232. **ROSEN, S. GUSTAVE. Ephemeral fever (three days' fever) of cattle in Palestine.** *Vet. Jour.* [*London*] 87(5): 244-246. 1931.—Record of an epizootic, apparently the first to occur in Palestine.

4233. **ROTTGARDT, ABEL. Simbiosis entre el bacilo de Preisz-Nocard y el bacilo piógeno de Poels en los ovinos. [Symbiosis between the bacillus of Preisz-Nocard and Bacillus pyogenes Poels in sheep.]** *Bol. Min. Agric. Nacion* [*Buenos Aires*] 30(1): 73-78. 1 fig. 1931.—In the pyogenous lesions of sheep the author demonstrated the presence of *B. pyogenes* Poels in symbiosis with the Preisz-Nocard bacillus. *B. pyogenes* facilitated in a certain manner the intoxication and infection by the Preisz-Nocard bacillus.—*Author's conclusion* (*transl.*).

4234. **SEEKLES, L., B. SJOLLEMA, en F. C. van der KAAY. De invloed van injecties met bloedcalciumgehalte-verlagende zouten bij runderen en de vergelijking der symptomen met die bij runderziekten met verlaagd bloedcalciumgehalte. [Injections of sodium oxalate decreasing the calcium content of the blood serum in relation to symptoms in cattle ill as a result of decreased blood calcium content.]** [With English, French, and German summaries.] *Tijdschr. Diergeneesk.* 58 (14): 750-755. 1931.—Experiments with cattle showed that intravenous injection of Na oxalate causes a decrease of Ca in the blood serum. With low Ca concentration there is a relative rise in tonus of the para-

sympathicus. The irritability of the animals is decreased and their gait is atactic. These symptoms do not coincide with the lowest point of Ca level, but occur when there is already a considerable increase in serum Ca. Clonic convulsions, on the other hand, occur at the point at which Ca constituents have reached a minimum, immediately before death. Intravenous injection of Na citrate does not cause a lowering of Ca in the serum. The symptoms of milk fever can not be explained alone by decrease of Ca in the blood serum. Decrease in blood Ca provokes a disturbance in the regulatory mechanism of the animal.—*Authors' summary.*

4235. **[SHTEFKO, V. G.]** Штефко, В. Г. Сравнительная патологическая анатомия легочного туберкулеза обезьян в связи с филогенетической эволюцией туберкулезного воспалительного процесса. **[Pathological anatomy of pulmonary tuberculosis in monkeys.]** [With French summary.] Вопросы Туберкулеза. [*Voprosy Tuberkuleza*] 7(2/3): 165-178. 1929.—The author studied the disease in a series of 12 monkeys. Tuberculous inflammation in *Cercopithecus* proceeds after the type of alterative inflammation, corresponding to the anergic state of the organism toward tuberculosis. The author explains the patho-anatomical differences from human tuberculosis as due to profound difference in mesenchyma. The lesions in *Cynocephalus* showed some histological resemblance to those of the primary infection in man, yet differences were noted. According both to published data and to the author's observations, tuberculosis is more frequent in monkeys of the Old World than in those of the New.—*B. Van Rosen.*

4236. **SOUZA, MOACYR ALVES de. A gangrena gasosa dos bovideos. [Gas gangrene of cattle.]** [With English abstract.] *Rev. Zootech. e Vet.* (*Rio de Janeiro*] 17(1): 57-63. 1931.—An outbreak of malignant edema is for the first time described in Brazil. 11 strains of the isolated *Vibrio septicus* were neutralized by anti-gangrenous serum. Monovalent bovine and rabbit serum obtained with the isolated organism protected guinea pigs. —*From author's abstract.*

4237. **TOPLEY, W. W. C., M. GREENWOOD, and JOYCE WILSON. A strain of Bact. aertrycke with unusual epidemic characters.** *Jour. Path. & Bact.* 34(4): 523-531. 1931.—A strain of *Bact. aertrycke* is described, which was of moderately high virulence as tested by intraperitoneal injection in mice but had relatively little power of inducing fatal infections among mice exposed to contact infection. It did, however, spread from mouse to mouse under these conditions, giving rise to latent infections associated with increased resistance to subsequent contact infection with a virulent strain.—*W. W. C. Topley.*

4238. **TULLBERG, KJELLÅKE. Jämförande virulensbestämning av två olika abortbacillstammar genom intravenös infektion av dräktiga kor. [Comparative determination of virulence of two strains of abortus bacillus by intravenous infection of pregnant cows.]** [With English summary.] *Skandinavisk Vet.-Tidskr.* 21(6): 202-207. 1931.—The virulence of 2 strains of *B. abortus* was tested by simultaneous intravenous infection of pregnant cows which had been bred at nearly the same time. The infection-doses were in all cases the same. 2 cows infected with the 1st strain aborted 33 and 82 days after infection, respectively. Of the 2 cows infected by the 2nd strain, one aborted 106 days after infection, the other calved normally 128 days after infection.—*From author's summary.*

ANIMAL IMMUNOLOGY

GENERAL AND BACTERIAL

S. BAYNE-JONES, *Editor*

(See also in this issue Entries 3276, 3280, 3745, 3749, 3759, 3791, 4066, 4113, 4226, 4236, 4294, 4410, 4413, 4415, 4430, 4431, 4433, 4446, 4448, 4449, 4456, 4463, 4468, 4471, 4485, 4501, 4512, 4535, 4556, 4569, 4571, 4602, 4877)

GENERAL

4239. **ARLOING, FERNAND, et LUCIEN THÉVENOT. Contribution à l'étude de l'action du virus tuberculeux filtrable sur la marche de la tuberculose expérimentale du cobaye.** *Compt. Rend. Soc. Biol.* 100(14): 1203-1205. 1929.—Guinea pigs treated, after tuberculization, with filtrates of the infecting culture, showed a slightly greater resistance to the course of the disease than controls; as did animals treated before and after tuberculization with a filtrate other than that of the infecting culture.

4240. **ASSIS, ARLINDO de. Sobre a technica do preparo da vaccina B. C. G. [Technique of preparing BCG vaccine.]** [With English summary.] *Brasil-Med.* 45(15): 338-341. 3 fig. 1931.—The paper deals with some practical modifications in the preparation of BCG-vaccine, including neutralization of Sauton's medium in presence of phenolphthalein (instead of phenol-red), direct utilization of known bacterial growths (instead of weighing them), and certain other practical steps in Calmette's vaccination technique.

4241. **AZZI, AZZO. Sul valore specifico dell'azione immunizzante del vaccino antistafilococcico alla Wright e della stomosina corrispondente. [Specific activity of Wright's antistaphylococcic vaccine and of the corresponding stomosine.]** *Arch. Ist. Biochim. Ital.* 3(1): 11-28. 5 fig. 1931.—Wright's vaccine and stomosine have a greater activity than milk, the vaccine acting especially in the first stage of infection, and the stomosine when the infection is at its height. The curative dose is less than the preventive. The action is explained by an increase of phagocytic and bactericidal power of blood, accompanied by an increased activity of the reticulo-endothelial system of liver and spleen, and by rise of body temp.—*M. Comel.*

4242. **BARNES, L. A. Studies in local immunity.** *Res. Studies State Coll. Washington* 2(3): 107-109. 1931. —Abstract of a dissertation. General results and conclusions are given of a series of experiments which, in general, failed to substantiate Besredka's theses as to the rôle of local immunity in avoidance of infections.

4243. **BLAZEK, V. Studium koagulace bilkovin sera krevního v kapkách u morčat zdravých a morčat infikovaných sněti slezinnou. [Coagulation of blood sera with chemical precipitants in healthy and anthrax-infected guinea pigs.]** *Biol. Spisy Vysoké Školy Zvěrolékařské Brno* (*Publ. Biol. École Vét. Brno*) 6: (145-151). 1927.—A study of the precipitation of the serum of 10 adult guinea pigs with 11 different precipitants showed a typical figure for sesquichloride of iron. The serum of 10 guinea pigs infected with anthrax was then tested, and it was found that there is a slow lowering of coagulability when tested with the following precipitants; sulphate of iron, sesquichloride of iron, trichloracetic acid, sulphosalicylic acid, and pyrogallol.—*Author's résumé* (*transl. by D. H. Bergey*).

4244. **BOHART, RUBY M. A study of sensitization in experimental tuberculosis.** *Amer. Rev. Tuberc.* 21 (3): 383-399. 1930.—Tubercle bacilli killed by carbol fuchsin in 0.2 mg. quantities given intracutaneously, sensitized guinea pigs to tuberculin. If given in 1.5 mg. amounts the sensitization persists for 1 yr. or more. Ether-killed bacilli behave similarly. Larger quantities of heat-killed tubercle bacilli are necessary for sensitization than of chemically killed organisms. Tubercle bacilli killed by ultraviolet or tuberculins and the proteins derived from them, do not sensitize guinea pigs.—*M. M. Lurie.*

4245. **EAGLE, HARRY. Specific agglutination and**

precipitation. I. The mechanism of the reactions. *Jour. Immunol.* 18(5): 393-417. 1930.—Agglutinating and precipitating antibodies are a specifically altered fraction of serum globulin. The antigen-antibody complex, whether sensitized red cells, agglutinated bacteria, or precipitate formed by soluble protein and corresponding antiserum, contains this antibody globulin, demonstrable chemically, immunologically, and by a change in cataphoretic, flocculating, interfacial, and complement-fixing properties of the antigen towards those of the protein with which it has combined. With cellular antigen, this antibody is present as an invisible film of specifically adsorbed protein; while in the precipitation reaction, it may constitute the bulk of the material formed. There are therefore 3 factors which determine specific flocculation: (1) the hydrophilic antigen is covered with (2) a film of immune globulin denatured by its combination with antigen. In absence of electrolytes, the charge due to ionization of this protein suffices to prevent aggregation. Minute concentrations of (3) electrolyte, however, depress this surface charge below the critical value necessary for stability. The resultant aggregation is therefore primarily of the immune globulin surfaces, and only incidently of the associated antigen. With insufficient immune-serum, only a very small part of the cell surface is covered with antibody globulin; most of the impacts are between hydrophilic antigen surfaces, ineffective in producing cohesion. With increase in immune serum, the greater is the proportion of antigen surface covered with sensitizing denatured protein, and correspondingly the greater is the proportion of effective impacts. The optimum pH for flocculation is intermediate between that of the original cell and that of the antibody globulin, shifting towards the latter as the degree of sensitization is increased (i.e., more extensive antibody film). At the optimum reaction, ionization, and therefore surface charge, are minimal; no added electrolytes are necessary to produce aggregation. In more acid or more basic reactions, the surface charge due to ionization of adsorbed protein causes a mutual repulsion of particles; but traces of electrolytes depress this charge and allow cohesion of the denatured antibody films. The flocculating ion is always the one opposite in charge to the ionized protein, and its flocculating efficiency increases enormously with increasing valence. The further from the isoelectric zone, the greater are the degree of ionization and the amount of electrolytes necessary to depress the surface charge below the critical value.—*H. Eagle.*

4246. [FELDSTEIN, A. O.] ФЕЛЬДШТЕЙН, А. О. **О влиянии больших доз сыворотки на развитие анафилаксии. [Influence of large doses of serum on development of anaphylaxis.]** [With French summary.] Одесский Медицинский Журнал. (*Odessaer Med. Zeitschr.*) 4(5/7): 363-366. 1929.—Experiments on guinea pigs and observations on man lead to the conclusion that large doses of serum (up to 1 liter and more) are not dangerous. The organism loses the faculty of sensitization in a short while and production of specific antibodies is impeded. Serum disease developed less often and grave phenomena were practically absent (isolated exceptions are possible). The maximum of anaphylactic complications was reached after doses of 300-400 cc.; further increase of dosage acts in reverse fashion. A large subcutaneous dose (up to 100 cc.) gave lasting desensitization and made safe any further injections.—*B. Van Rosen.*

4247. **FRIEDENREICH, V. Sur les sous-groupes du groupe sérologique A. Nature de l'agglutinine "irrégulière"** α_1. *Compt. Rend. Soc. Biol.* 106(9): 770-773. 1931.—All the sera in a series of A_2 and A_2B, containing variable amounts of α_1, had temp. curves characteristic of "cold" agglutinins. In sera B and O there was a very high content of α_1 active at 37°. There is then no essential difference between the "cold" agglutinin and the "irregular" agglutinin with respect to temp. curves. With respect to specificity, it resembles an isoagglutinin. In the absorption with isoagglutinins, it was found that at 37° all the active agglutinin is fixed, while there remain large quantities active only at lower temp. The isoagglutinin is composed of a series of fractions with different temp. amplitude. An anti-A serum, after absorption at 37° and then at 21° with erythrocytes A_2, shows a curve similar to that of an "irregular" α_1. This seems to be an intermediate form between an isoagglutinin and a "cold" agglutinin. The "irregular" α_1 is serologically identical with the lower fractions of the total α_1. The higher fractions are thought to be fixed by the A receptors of the organism and therefore do not appear in the serum.—*E. Weiner.*

4248. **FURUHATA, TANEMOTO, and TAKAYOSHI KISHI. A study on the geographical distribution of blood groups of the Japanese. II.** *Japan Med. World* 8 (5): 115-120. 1928.—The author cites his work on typing of 425 families and his hypothesis of human blood group inheritance, based on 3 multiple allelomorphs. The Japanese racial index, which is the largest in Kyushu, gradually decreases as it proceeds from south to north. The A factor is more frequent in Kyushu. Typing has shown that the natives of Formosa belong to the Pacific American, Indo-Manchurian, and Japanese types. These facts show that in Formosa there seem to live several groups of different origin, without intermingling.—*Cora M. Downs.*

4249. **GEDROYC, M. de. Recherches sur la toxicité du tissu nerveux introduit par la voie parentérale.** *Compt. Rend. Soc. Biol.* 100(14): 1245-1246. 1929.—Emulsions of nervous tissue of crayfish, lizard, frog and bird were injected into rabbits. None of the phenomena of fatal shock were induced. Emulsions of mammalian nervous tissue were not found toxic for *Deilephila euphorbiae,* for reptiles or for batrachians. Tissue from embryonic rabbits, when injected into adult rabbits failed to cause fatal shock. The author concludes that the toxicity of mammalian nervous tissue appears during ontogeny.

4250. **GEDROYC, M. de. Le choc anaphylactique chez des mammifères sensibilisés par le tissu nerveux embryonnaire.** *Compt. Rend. Soc. Biol.* 100(14): 1247-1249. 1929.—Rabbits sensitized with homologous embryonic nervous tissue were treated with emulsions of nervous tissue of embryo and of adult rabbits, of adult dogs, neurotoxic serum from a rabbit which had had 3 injections of adult nerve emulsion, emulsion of the brain of a frog and of an owl. Animals receiving brain emulsion of adult rabbits and dogs died, those receiving embryonic and frog tissues showed a drop in blood pressure followed by an increase. Neurotoxic serum and emulsion of owl brain had no apparent effect. The author concludes that these reactions should be considered as non-specific.

4251. **GILDEMEISTER, E., und PAUL HILGERS. An welchen Blutbestandteilen haftet das nach kutaner Impfung des Kaninchens in den Blutkreislauf gelangende Vakzinevirus?** *Zentralbl. Bakt. I. Abt. Orig.* 117(4/5): 258-262. 1930.—Blood taken from a rabbit on the 4th or 5th days after cutaneous inoculation with the authors' neurolapin strain of vaccine virus, was citrated, separated into its constituents by differential centrifugalization and each part tested for virus by injecting into the testicle of a rabbit. After 6-8 days the testicle was removed, ground up and tested for virus on the cornea of a rabbit's eye. 3 days later the eye was enucleated and tested by Paul's method. Virus was found chiefly in the leucocyte fraction and to some extent in the plasma.—*E. C. L. Miller.*

4252. **GOLDEN, GERALD. Distribution of blood groups in South American Indians.** *Lancet* 219(5579): 278-279. 1930.—These observations were made on Brazilian Indians of the Caraji tribe. The technique used was that of Beth-Vincent, except that the proportion of blood to serum was approximately 1:10 to 1:5. Results on 61 Indians showed: Group I 3(5%), II 3(5%), III 31(51%), IV 24(39%). As a control, 43 persons of Brazilian nationality were examined, with the following results: Group II 21(49%), III 3(7%), IV 19(44%); no Group I individuals were found. The author used the Moss classification.—*J. A. Kennedy.*

4253. **HACKENTHAL, H. Über das Verhalten des Kuhpockenvirus beim allergisch reagierenden Wiederimpfling.** *Zentralbl. Bakt. I. Abt. Orig.* 117(4/5): 251-257. 1930.—26 soldiers were vaccinated and, for 2 wks., daily smears were made from the throats of 2 of them (in rotation) and 5 cc. of blood were taken from their veins. The throat smears were inoculated onto scarified corneas of guinea pigs; the leucocyte fractions of the blood specimens were similarly inoculated, and also injected into guinea pig testes. Vaccine virus was found in the throats of 1 of the 2 soldiers tested at the end of 8 hrs., in both soldiers tested after 24 hrs., and in 1 soldier on the 5th and 9th days, respectively. Virus was found in the blood of 3 of 4 soldiers, tested on the 1st day, in both of those tested on the 2nd, 4th and 6th days, and in 1 tested on the 8th, 9th and 10th days. Soldiers 3, 4, 9, 12, 19, 23 and 24 showed allergic manifestations. Virus may have reached the throat through the blood stream, though the possibility must be kept in mind of a droplet infection from an adjacent case.—*E. C. L. Miller.*

4254. **HIRSZFELD, LUDWIG. Konstitutionsserologie und Blutgruppenforschung.** 235p. 12 fig. Julius Springer: Berlin, 1928. Price $6.07.—The work comprises chapters on the concept of iso-antibodies, inheritance of group-specific blood-substances, serologic human races (phylogenetic origin of iso-agglutinable characteristics; blood-groups in anthropology), physiologic and immune-biologic bases of iso-auto-agglutination, subgroups, group-specific differentiation during ontogenesis, the chemical characteristics of iso-agglutinable substances in human blood, group determination in pathology, and the theoretic bases of constitution serology.

4255. **HIRSZFELD, L., W. HALBER, und J. LASKOWSKI. Untersuchungen über die serologischen Eigenschaften der Gewebe. I. Über gruppenspezifische Differenzierung der Normal- und Krebsgewebe. II. Über serologische Eigenschaften der Neubildungen.** *Zeitschr. Immunitätsforsch.* 64(1/2): 61-113. 1929.—I. A summary on reactivity of alcoholic extracts of organs and neoplasms with group-specific immune sera. Group-specific differentiation was obtained with most, but not all, organs. The liver contains a considerable amount of iso-agglutinogen when near a carcinoma; group-substance is not always associated with detectable metastases. It is suggested that presence in such cases of A-substance causes an inhibition with soluble derivatives of the cancer, for which the existence of a biochemical metastasis is proposed. Carcinoma in group-A individuals always contains group substance. Sarcoma appears to contain no isoagglutinogen. Forssman antigen was not found in human organs or in cancer. Kidney extracts generally reacted with goat hemolytic serum independently of blood groups. Antigens reacting with anti-A sera were frequently found in organs and neoplasms of individuals of groups O and B, though such serological "malformations" are not associated with cancerous degeneration. Cancer in Poland is distributed in all blood groups, with a slight preponderance in B. II. By immunization of rabbits with aqueous suspensions of cancer tissue or with lipoids extracted from cancer with pig serum, an antiserum is obtained in some 10% of cases, which reacts specifically with extracts of most gastric tumors, exceptionally with tumors of other parts of the digestive tract, and rarely with those of other regions. Reactivity of tumor extracts seems to be connected with cellular degeneration in the neoplasm. Presence of cancer-body is independent of blood groups. Organ extracts of non-cancerous persons rarely react with anti-cancer serum. In some cases of cancer, presence of the cancer-body was established in organs in which metastases were not apparent; this is presumed to be due to a biological infiltration of cancer antigen into nearby tissues. Metastases generally react like the primary growth, though they occasionally fail to exhibit the serological specificity of the primary tumor. Cancer antigen, like isoagglutinogen, is alcohol-soluble and it is therefore presumed that with cancerous alterations of cells a disturbance of lipoidal metabolism occurs which is detectable serologically, and that cancer lipoids are specifically related to the tumor.—*R. T. Hewlett.*

4256. **INOUE, S. Beiträge zur Rieckenbergschen Reaktion.** *Zentralbl. Bakt. I. Abt. Orig.* 117 (1/3): 80-86. 1930.—Rieckenberg's reaction is performed by mixing 1 loop of the following reagents on a slide, covering with a cover glass sealed with vaseline and observing under the microscope after 20-30 min. at room temp. The reagents are (1) decreasing dilutions of inactivated patient's serum with saline, (2) mixture of guinea pig blood (complement and blood cells) with 2% citrate salt solution, and (3) culture of the spirochaete to be tested. The blood cells act as an indicator, the test organisms apparently clinging to them; bacteria and ink granules serve the same purpose. The author believes this "loading antibody" is distinct from agglutinins and tropins. The reaction can be demonstrated only with motile spirochaetes, but the antibodies may be produced by injection of killed organisms. By this and other tests the author demonstrated that *Spirochaeta icteroides* (Noguchi) and *S. icterohemorrhagiae* are identical, that the spirochaete of Akiyami Type A is an independent species, and that the spirochaete of Akiyami Type B and *S. hebdomadis* are identical. The reaction can be used to detect wild rats infected with *S. icterohemorrhagiae.*—*G. H. Robinson.*

4257. **JACOBSOHN, GEORG, I. JUNDELL, und NILS LÖNBERG. Einige weitere Versuche zur aktiven Immunisierung gegen Scharlach.** *Acta Med. Scandinavica* 71(1/2): 38-46. 1929.—3-4 injections of 100-1000 skin test doses of toxin resulted in 30-47% negative Dick reactions. Increase of dosage caused a considerable number of severe reactions (fever, exanthem). The Dick reaction is a reliable index of susceptibility, as shown by the incidence of scarlatina in a regiment; 6.5% of Dick-positive individuals, 1% of those with a doubtful reaction, and only 0.2% of Dick-negative persons, developed the disease.—*L. C. Havens.*

4258. **JAKIMOW, W. PH. Zur Frage über die Rezidivrassen der Spir. obermeieri bei experimenteller Rekurrens.** *Zeitschr. Immunitätsforsch.* 64(1/2): 9-15. 1929.—The relation between the original and the relapse strain was studied by means of the adhesion test and protective inoculation experiments in animals infected with a Berlin strain of *Spir. obermeieri.* The relapse strain was biologically distinct from the original strain in about 50% of the cases. The relapse strain passed through a series of rats, gradually lost its characters and reverted to the original type. In 3 instances a new type of spirochaete appeared, biologically distinct from both the original and the relapse strains. Mice passively immunized with antibodies of the original strain and subsequently inoculated with this strain showed complete immunity in 40%, incomplete protection in 37.5%, and no protection in 16%, of the animals.—*R. T. Hewlett.*

4259. **JETTMAR, H. M. Blutgruppenuntersuchungen in der Nordostmongolei und der Nordmandschurei. [Studies in blood groups in northeastern Mongolia and in Manchuria.]** *Mitteil. Anthropol. Ges. Wien* 60(1): 39-47. 2 maps. 1930.—The author studied the distribution of the 4 Landsteiner blood groups among 3 sorts of peoples: (1) 114 Mongolians were examined and the following incidence of the 4 groups was found: O, 28.6%; A, 23.2%; B, 31.3%; AB 16.9%. (2) Among 668 Chinese, the incidence was O, 28.1%; A, 29.5%; B, 33.2%; and AB, 9.1%. (3) Among a group of 196 individuals made up of several races occupying the region of the Amur River, the incidence was O, 39.3%; A, 18.9%; B, 36.2%; AB, 5.6%.—*P. Levine.*

4260. **KAUFFMANN, FRITZ. Die Serologie des Paratyphus Breslau-Bacillus.** *Zeitschr. Hyg. u. Infektionskr.* 110(3): 526-536. 1929.—The serologic characteristic of the bacillus is its special receptor, which in all pure Breslau strains is demonstrable by means of specific immune serum, and which is absent in Schottmüller, Newport, Suipestifer and Gärtner bacilli. The Breslau

type is not to be regarded as a "minus" variant of the Schottmüller types (as believed by Uhlenhuth and Seiffert), but as completely independent serologically. A special Freiburg type was not distinguished because the majority of the Breslau types are identical with the so-called Freiburg type. A few Breslau types do not always have a complete receptor apparatus, but this does not justify their designation as a new type. The claim again advanced by Seiffert, of the relatively frequent occurrence of a Schottmüller strain, pathogenic for mice, could not be confirmed.—*Maud L. Menten.*

4261. **KETTEL, KARSTEN, und O. THOMSEN. Quantitative Untersuchungen über die menschlichen Isoagglutinine Anti-A und Anti-B.** *Zeitschr. Immunitätsforsch. u. Exp. Therap.* 65(3/4): 245-253. 1930.—A quantitative study of the titer of isoagglutinins A and B in the blood groups O, A and B.—*N. W. Larkum.*

4262. **KITAURA, Y. Studien über intraperitoneale Anwendung des Antivirus. I.** *Jour. Oriental Med.* 14(5): [Japanese; with German summary, p. 50-51.] 1931.—After intraperitoneal injection into rabbits, of 2 cc. of sterile NaCl solution, sterile normal bouillon, or antivirus of *Staphylococcus pyogenes aureus* a dose of sterilized suspension of these staphylococci was intravenously injected, and blood from an ear vein examined for phagocytosis ½, 1, 2, 4 and 8 hrs. later. Bouillon culture filtrate in all cases promoted phagocytosis more than did physiologic saline or normal bouillon. Filtrates from bouillon cultures 1, 4, 7, 10, 13, 16 or 19 days old displayed different properties: within 1 wk. after the beginning of culture the activity increased and reached a peak level which it maintained for about 1 wk. and then gradually declined. Antivirus from 7-10-day-old cultures, at the apex of activity, was comparatively non-toxic; at 10 days or later the cultures were highly toxic, intraperitoneal injection causing death of the animal in collapse. The alkalinity of the filtrate increased with age of culture.

4263. **KOMIYAMA, T. The action of salts upon bacteriolysis.** *Jour. Oriental Med.* 14(5): [Japanese; with English summary, p. 46.] 1931.—Na citrate and K oxalate in 1% solution, and Na_2SO_4, $MgSO_4$ and KNO_3 in 2% solution, completely inhibited bacteriolysis in vitro, inhibition being due chiefly to the action of the salts on complement, rather than on the bacilli or other bacteriolytic elements. Na phosphate (concentration not stated) failed to completely inhibit bacteriolysis; Na acetate (0.1-3%) encouraged bacteriolysis.

4264. **KUPELWIESER, ERNST, et al. Versuche über die Nachweisbarkeit immunisatorisch bedingter Fermentprozesse. V. ERNST KUPELWIESER. VI. ERNST KUPELWIESER, und ERNST NAVRATIL.** *Biochem. Zeitschr.* 178(4/6): 298-318. 2 fig.; 319-323. 1926.—A series of studies was made on problems connected with Abderhalden's reaction. These installments deal especially with attempts to detect by refractometric means and by Sörensen's formol titration of amino acids, evidences of the breakdown of unchanged protein antigen when mixed with the serum of an immunized or anaphylactic animal. With serum from anaphylactic or hypersensitive animals there was no evidence of digestion of the protein antigen. In the serum from immunized animals, ferments were found, which caused proteolysis of the antigen.—*S. Bayne-Jones.*

4265. **LAROCHE, GUY, CHARLES RICHET, fils, and FRANÇOIS SAINT-GIRONS; foreword by CHARLES RICHET; transl. by MILDRED P. ROWE, and ALBERT H. ROWE; preface by ALBERT H. ROWE. Alimentary anaphylaxis (gastro-intestinal food allergy).** 139p. Univ. California Press: Berkeley, 1930. Pr. $2.—A translation of the French monograph which appeared in 1919, and of footnotes added in 1929 by the original authors. It discusses many aspects of the allergic disturbances following ingestion of various foods by persons with special hypersensitivity to them. Chapter I gives some evidence on the experimental production of alimentary anaphylaxis conditioned by absorption of unaltered protein from the gastro-intestinal tract, and classifies the symptoms of gastro-intestinal food allergy. In Chapter II, these symptoms are considered in detail in relation to the severe, mild, chronic and hereditary forms of alimentary anaphylaxis. Chapter III (2pp.) summarizes some of the observations made on modifications of the blood from alimentary anaphylaxis. To this group of blood-vascular reactions Widal has given the name hemoclastic crisis. Chapter IV, "Experimental studies" records results of attempts to produce sensitization via the alimentary tract. The authors regard these results as proof that the organism can be sensitized by ingestion. Chapter V, "Pathogenesis," contains material modified by later studies of the authors; absorption of incompletely digested or unchanged proteins from the gastro-intestinal tract, coupled with hepatic lesions, are the essential features in the pathogenesis. Chapter VI deals with diagnosis; Chapter VII, with treatment. The last section is a bibliography of 8 pages, unchanged from its form and content in the 1919 monograph.—*S. Bayne-Jones.*

4266. **LUBINSKI, HERBERT. Beiträge zur Rezeptorenanalyse. Die serologischen Beziehungen zwischen Typhus- und Gärtner-Bazillen. [Serological relations between typhoid and Gärtner bacilli.]** *Zentralbl. Bakt. I. Abt. Orig.* 106: 200-209. 1928.

4267. **LUCACER, M. Tiroxina e sensibilizzazione percutanea. [Thyroxin and percutaneous sensitization.]** *Biochim. e Terapia Sperim.* 18(2): 64-68. 1931.—Some processes of percutaneous sensitization, e.g., phenylhydrazine and old tuberculin, are accelerated by simultaneous percutaneous administration of thyroxin.—*M. Comel.*

4268. **LUMIÈRE, AUGUSTE. La toxicité des sérums d'anguille, de murène et de certains autres poissons est-elle due à leur pouvoir globulicide?** *Compt. Rend. Soc. Biol.* 100(14): 1209-1210. 1929.—Toxicity of the sera of eels and morays depends on the globulicidic power of the serum, and symptoms following injection of heated sera which have lost this power in general resemble and are responsive to treatments for protein or colloid shock.

4269. **MacDONALD, RONALD A. Streptococcal allergy in acute rheumatic infection.** *Arch. Dis. Childhood* 5 (25): 60-72. 1930.—The author considers the literature and his own work on various streptococci isolated from tonsils, teeth, nasopharynx, feces and blood and post-mortem cultures from joints and nodules of rheumatics. Cultures from tonsils and feces of rheumatic and non-rheumatic patients are very similar, with a slightly larger % of green streptococci from feces of rheumatics. The allergic skin reactions to various streptococci and their autolytic products are considered, and 2 definitions of the condition are quoted. Some of the bacteriology and other anomalies of rheumatism are explained on an allergic basis.—*H. L. Gruchl.*

4270. **MAEJI, Y. Studien über die Pneumokokken. I. Beiträge zur Kenntnis der Typenspezifität der Pneumokokken.** *Acta Scholae Med. Univ. Imp. Kioto* 12(2): 229-237. 1929.—The author immunized rabbits and mice with killed pneumococci. The organisms were killed by exposing saline suspensions to 100° C. in a steam sterilizer for 15 min. or by boiling for 30 min. Sera of rabbits immunized with organisms killed by the 1st method showed a higher agglutinin content than with organisms killed by the 2nd method. In both series immunization was carried out on 2 animals immunized against each of types I, II, and III pneumococci. In every instance the sera contained a larger amount of agglutinin for homologous types and relatively smaller quantities for heterologous types. To determine whether sera of immune rabbits protected against heterologous as well as homologous types, mice were given an intraperitoneal injection of serum 3 hrs. before receiving an injection of 100-1000 M.L.D. of cultures. The sera protected mice against heterologous as well as homologous types. Another series of tests was carried out by immunizing young mice (10-14 days old) orally. Mice so immunized against types I and II showed protection against the 3 types. Oral immunization with type III organisms was un-

successful. Results of the several series of tests show that type specificity against the 3 types of pneumococci is not as sharply limited as is generally believed. Agglutinins as well as protective substances develop in the sera of immunized animals in somewhat lower concentration for heterologous types.—*D. H. Bergey.*

4271. **MANAI, ANDREA, e MARIO LIMULA. La determinazione dei gruppi sanguigni negli abitanti delle zone settentrionali dell'isola di Sardegna. [Determination of the blood groups among the inhabitants of northern Sardinia.]** *Minerva Med.* 9(32): 202-207. 1929.—The percentage of the different groups proved to be essentially the same as among the Mediterranean peoples. By determining the percentage in p, q, r, the prevalence of race, R, was stated. The analysis of the blood of whole families, or of that of mothers and sons, showed that here too, heredity is in accordance with Mendel's rules.—*A. Manai (transl. by F. W. Fornet).*

4272. **MARKOWITZ, J., HIRAM E. ESSEX, and FRANK C. MANN. Studies on immunity to rattlesnake venom (crotalin).** *Amer. Jour. Physiol.* 97(1): 180-199. 1 fig. 1931.—When injected into dogs or added to their blood in vitro, rattlesnake venom causes erythrocytes to swell. This fact was used in developing a new technique for assaying the antihemolytic titer of rattlesnake antivenin. Immunity in a given animal is measured in terms of the least quantity of crotalin necessary to cause a 10% increase in volume of erythrocytes under standard conditions. Dogs, when first immunized, develop antibodies very slowly. About 90 days after discontinuance of crotalin injections, their demonstrable immunity completely disappears; but when injections are begun again, antibodies develop far more rapidly and to a much higher degree in previously immunized dogs. This agrees with results obtained by others who used horse serum and typhoid bacilli as antigens. Washed erythrocytes of an immune dog transferred to plasma of a non-immune dog were as vulnerable as those of a non-immune dog. These cells are protected solely by the antibody content of the plasma. Blood pressure of immune dogs with high titers is practically unaffected, whereas dogs with low titers show a very decided depressor response to the standard dose of crotalin. Passive immunity was conferred on dogs by injections of immune rabbit plasma and commercial antivenin. Both were effective in preventing the usual vasodepressor reaction of normal dogs, following injections of crotalin. The authors found no evidence that antivenin reverses the injury from crotalin. It appears that recovery of blood pressure which follows injection of antivenin into a crotalinized animal is due to the natural compensatory mechanisms that can manifest themselves when further injury is prevented. To determine whether cellular immunity to crotalin exists, a study was made of perfused hearts of immune rabbits. Such hearts were incapacitated just as rapidly as hearts from non-immune rabbits, indicating that cellular immunity is lacking in the heart tissues, and probably in the musculature as a whole.—*Authors' summary.*

4273. **MATSUOKA, K. Influence of nucleic acid salt upon the agglutination of the blood.** *Jour. Oriental Med.* 14(1): Japanese; English summary, p. 1. 1931.—Agglutination time of human and rabbit blood was reduced both in vitro and in vivo (intravenous injection).

4274. **MEGRAIL, EMERSON, and HENRY WELCH. Antigenic power of ultra-violet irradiated tetanus toxin.** *Proc. Soc. Exp. Biol. & Med.* 28(5): 494-495. 1931.—Tetanus toxin, detoxicated by two 2-min. successive exposures to ultraviolet (i.e., irradiated by "C" carbons at 25 cm. distance in apparatus kept below room temp. by a current of cool air) apparently retained its antigenic potency: 5 subcutaneous injections were given at 6-7 day intervals; inoculated 3 wks. later with 1-10 M.L.D. of fresh tetanus toxin, no sign of tetanus developed within 45 days.

4275. **MERCIER, RAYMOND. Lipoïdes et états anaphylactiques; nouvelle méthode d'antianaphylaxie.** *Presse Méd.* 38(65): 1091-1093. 1930.—The author's theory of anaphylaxis (based on that of G. Billard) is that it is due to a disturbance of humoral equilibrium, not of the foreign protein alone but also of the electrolytes and lipoids attached to the protein molecule, and that the coefficient of energy with which the foreign substance disturbs the equilibrium depends on the quantitative relations between the various electrolytic, amino-acid, and lipoidal constituents. Billard reported desensitization of patients with anaphylactic conditions by use of mineral waters. The author refers briefly to 3 series of experiments on guinea pigs, in which he produced desensitization by use of lipoids. Series A guinea pigs received horse-serum to which emulsion of horse lipoids had been added. In series 2, injection of horse serum was followed by several injections of horse lipoids. In series 3, the horse serum was followed by injection of guinea pig lipoids. All the animals underwent the various injections without symptoms of anaphylactic shock.

4276. **MITSUSE, B. The strength of an immune body in the artery and vein, and the mechanism of causing the difference in the strength.** *Jour. Oriental Med.* 14(1): Japanese; with English summary, p. 7. 1931.—The author found in the serum of rabbits immunized by cholera bacilli mixed with horse or cow serum, a complement fixation substance reactive to the lipoid antigen generally used in the Wassermann test, in addition to a specific immune body against cholera bacilli. The antibody of the serum of an artery of an animal immunized with the serum was slightly more powerful than that of a vein. The immunizing reaction of the venous serum was made slightly more powerful by an irrigation with O. The immunizing reaction of an artery was made slightly less powerful by an irrigation with CO_2. Hence, the difference in the action of the immune body of the serum of an immunized animal is due to the difference in the contents of O and CO_2.—*Author's summary.*

4277. **MONTANARI, ARRIGO. Sopra una nuova specie di agglutinazione: la licopodio agglutinazione. [A new type of agglutination: lycopodium agglutination.]** *Sperimentale* 85(1): (*Proc. Fiorentina Med. Accad.*) I-II. 1931.—Lycopodium suspensions were made in saline after the lycopodium had been washed and boiled in water. Serum at dilution 1:10 gave agglutination in 15% of 70 cases.—*Maud L. Menten.*

4278. **MURPHY, WILLIAM E. Anaphylactic changes in the nasal mucosa of guinea-pigs.** *Arch. Otolaryngol.* 13(6): 842-845. 2 fig. 1931.—Of 10 experimental guinea pigs, 8 were sensitized by intraperitoneal injections (5 by horse serum, 3 by very dilute filtered egg albumin), and 2 kept as controls. At the end of 2 wks. for those sensitized to horse serum and 3 wks. for those sensitized to egg albumin, a 2nd dose of the respective sensibilinogen was given, eliciting anaphylactic response in 4 of the 5 given horse serum (with recovery in 1) and in 2 of the 3 given egg albumin. The nasal mucosa showed eosinophilia, congestion and petechial hemorrhage.

4279. **NISHIURA, Y. Versuche zur Entgiftung verschiedener Bakterientoxine und des Immunisierungsvermögens derartiger Präparate.** *Zeitschr. Immunitätsforsch.* 64(3/4): 238-270. 1929.—The hemotoxin contained in bouillon cultures of *Vibrio kadiköj* is significantly weakened by 0.2% formaldehyde at 36° after 16 hrs.; after 90 hrs. it is completely inactive. With 0.5% HCHO, total inactivation is attained in 16 hrs. Such altered hemotoxin still possesses a certain binding power for antitoxin and can inhibit hemolysis of blood cells by fresh toxin. In comparison to the avidity of the unchanged toxin, however, that of the toxoid is very small. By repeated injection of a rabbit with the toxoid, an active antihemotoxin was obtained. Flocculation by specific serum was weaker in the toxoid bouillon than in the toxin. The hemolysin was inactivated by 0.01-0.02% salicylaldehyde. Protective action and antitoxin-binding power were not detected in this preparation; nevertheless it produced antitoxin in rabbits. Detoxication by 0.5% furfural lasted 8-10 days at 36°. This toxoid possessed small protective power and weak antitoxin-binding power, and an antihemolytic serum was

obtained by its use. This also, when mixed with toxin, neutralized a large part of the guinea pig lethal dose. Both acetaldehyde and chloral (0.5%) produced a toxoid which gave immune sera neutralizing both hemolysin and acutely lethal toxin. Acetone did not give a toxoid. Phenol, Na benzoate, salicylic acid, m-hydroxy benzoic acid, and o-amino benzoic acid gave toxoids after 16 hrs. at 36°. These toxoids caused no hemolysis, possessed weak protective power for erythrocytes, weak antitoxin-power, and produced an immune serum. N/10 HCl or NaOH destroy the hemolytic activity of the toxin, as does also heating for 16 hrs. in thin layers, i.e., oxidation. Hemolysin destroyed by the latter treatment can be partially reactivated by digestion with colon bacilli. Both hemolytically inactive and reactivated products possessed a weak antitoxin-binding power. Hemotoxin heated 0.5 hr. at 80° became completely inactive, but produced antitoxin in rabbits. By long shaking alone, during which a precipitate is produced in the bouillon, only a partial destruction of hemolytic activity was observed. Tetanus toxin and diphtheria toxin were detoxicated by aldehydes and benzene derivatives, but only the aldehyde toxoids produced significant immunity.—*L. W. Butz.*

4280. **[PLISETSKIĬ, M. A.]** Плисецкий, М. А. К вопросу о фагоцитозе при туберкулезе легких. **[Phagocytosis in pulmonary tuberculosis.]** [With French summary.] Вопросы Туберкулеза. [*Voprosy Tuberkuleza*] 7(5): 495-502. 1929.—Examination embraced 5 healthy subjects, and 47 tuberculous and 3 non-tuberculous patients. Monocytic phagocytosis in healthy subjects was 15%-21%; neutrophilic index, 16-23%. In tuberculosis (69% of grave cases), the author found weakening of phagocytic index of monocytes; there was also a certain parallelism between the degree of this weakening and that of increase of erythrocyte sedimentation. Phagocytic index of neutrophils was lowered in 38% of grave cases. The author deduces parallelism between phagocytic faculty and intoxication of the organism.—*B. Van Rosen.*

4281. **RALPH, R. S., and G. I. DAVIES.** The Vernes resorcin test and tuberculosis. *Lancet* 218(5574): 1397-1399. 1930.—Sera of 375 individuals—200 with active tuberculosis, 150 with other diseases and 25 normal—were tested by Verne's flocculation method. It was found that a negative reaction definitely excludes active tuberculosis, but that a positive one may be due to other causes. The activity of tuberculosis diminished correspondingly with the optic density of the serum. Inactive cases gave a negative reading even in presence of tubercle bacilli in the sputum. The erythrocyte sedimentation rate paralleled the flocculation of the sera by resorcin in 130 tuberculous and normal individuals. In general, there is a tendency for the globulin fraction of serum to increase with increase in optic density of the serum, but the parallel is only a vague one. The common factor operative in sedimentation rate and in flocculation of sera is perhaps the colloidal lability of the blood in tuberculosis.—*M. B. Lurie.*

4283. **SACQUÉPÉE, E., M. LIÉGEOIS, et J. FRICKER. Recherches sur l'agglutinabilité conférée au streptocoque par les filtrats de produits scarlatins.** *Compt. Rend. Soc. Biol.* 100(14): 1187-1189. 1929.—Filtrate of the urine of scarlatina patients did not lose its power to confer agglutinability on a streptococcus, when treated with heat or iodine. The erythrogenic power, and the ability to endow susceptible sera with the power to obliterate scarlatina exanthems and to neutralize toxins, were not modified.

[Blood group determination in paternity cases: the first 500 cases at the Institute of Legal Medicine, University of Copenhagen.]** *Deutsche Zeitschr. Ges. Gerichtl. Med.* 15(6): 535-563. 1930.

4285. **SAITOO, G. Ueber den Einfluss des Monokaliumphosphates auf die Agglutination.** *Jour. Oriental Med.* 14(4): Japanese; with German summary, p. 38. 1931.—With addition of monopotassium phosphate the agglutination titer was considerably higher.

4286. **SCHMIDT, S. Immunisation des chevaux avec des toxines et anatoxines purifiées.** *Compt. Rend. Soc. Biol.* 106(9): 767-770. 1931.—30 horses were grouped into lots of 5 according to degree of natural immunity. Each lot was inoculated with one of the following: crude diphtheria anatoxin, ordinary diphtheria toxin, purified toxin, purified concentrated toxin, purified anatoxin, or purified concentrated anatoxin. Samples of blood were taken on the 22nd and 33rd days, and the animals were bled on the 40th and 42nd days. Concentrated anatoxin gave the highest degree of immunity. Concentrated toxin depressed the mechanism for producing antitoxin. Best results were obtained with purified toxin. Toxins are more effective than anatoxins, but the latter produce immunity more quickly. Purified toxins and anatoxins are superior to the corresponding unpurified products.—*E. Weiner.*

4287. **SCHÖTT, E. D. Einige Worte über Titrierung bei Blutgruppenuntersuchungen.** *Acta Med. Scandinavica* 71(1/2): 115-146. 23 fig. 1929.—Apparatus for diluting sera for titration and for sterile storage of sera is described. Sources of error in blood group determination are also discussed, viz., pseudoagglutination, cold agglutination, the Thomsen phenomenon, etc. Sera kept sterile maintain potency better than filtered sera or sera to which preservatives are added.—*A. S. Wiener.*

4288. **SORDELLI, A., y ELVIRA MAYER. Las precipitinas para el agar. [Precipitins for agar.]** *Rev. Soc. Argentina Biol.* 7(1): 69-70. 1931.—Sera of animals immunized by intravenous injection of suspensions of *B. anthracis* and typhoid bacilli contain precipitins for agar, owing to solution of this substance in the media from which the suspension is made.—*J. T. Lewis.*

4289. **SORDELLI, ALFREDO, y FERNANDO MODERN. Producción de suero antidiftérico. [Antidiphtheria serum preparation.]** *Rev. Soc. Argentina Biol.* 7(1): 71-81. 1931.—Rapid immunization of previously selected horses is made by injecting toxin 3 times in 3 weeks. Immediately after, the antitoxic value of the serum remains constant or increases slightly in spite of bleeding up to 12 liters. Within 4 weeks after the last injection the antitoxic value decreases the more rapidly the higher the value obtained. Reinjection of toxin during the decrease, again increases the value within 5-10 days after the 1st injection. The highest value is obtained in 12-19 days. The antitoxin value per gm. of protein or globulin is not influenced by bleeding and reinjection of toxin.—*J. T. Lewis.*

4290. **TAKAHASHI, K., und S. NAGATA. Beiträge zur Kenntnis der Weil-Felix-Reaktion bei experimenteller Fleckfieberinfektion des Kaninchens.** *Jour. Oriental Med.* 14(3): Japanese, with German summary, p. 28-29. 1931.—Experiments on 58 rabbits indicate that a positive Weil-Felix reaction is produced in rabbits only by typhus infection.

4291. **TEISSIER, P., J. REILLY, E. RIVALIER, et H. CHAMBESSÉDÈS. Nouvelles recherches sur l'immunité et la sérothérapie anti-endotoxiques. I. Le sérum anticoqueluceux.** *Jour. Physiol. et Path. Gén.* 27(3): 549-564. 1 pl. 1929.—Serum of immunized animals is unable to neutralize the endotoxins of the Bordet-Gengou whooping-cough bacillus; hence active immunization is very hard to obtain. If the culture of the organism be treated with formaldehyde, the proteins responsible for the endotoxic effects are detoxicated. After repeated inoculations with the formolized culture, guinea pigs ultimately develop an immunity against the original endotoxins. It is hoped by these means to obtain (1) an anti-endotoxic serum, and (2) a means of immunization against whooping-cough.—*W. R. Fearon.*

4292. **THOMPSON, RICHARD. Allergic reactions in vaccinia-immune rabbits.** *Jour. Immunol.* 19(1): 63-77. 1930.—Evidence is given to indicate that allergic reactions occur in only a certain % of vaccinia-immune rabbits. While a state of hyperimmunity tends to re-

duce the amount of induration in the allergic reaction, there is no conclusive evidence that the negative results in some animals are due to this hyperimmunity. The chief factor determining the occurrence or non-occurrence of an allergic reaction is the individual factor in the animal. From apparently successful passive transfer—general and local—of the allergic state and from the apparent acceleration of vaccinal reactions by treatment with immune serum, it seems probable that the allergic reactions are due to antigen-antibody reactions. —*R. Thompson.*

4293. **TILLGREN, J., und ANNA-LISA ALLANDER. Müllers Ballungsreaktion als Ergänzung zu den Wassermann-Untersuchungen.** *Acta Med. Scandinavica* 71 (1/2): 147-164. 1 fig. 1929.—The authors report comparative tests of 1105 cases, using the Wassermann, Müller and Sachs-Georgi reactions. Of this number, 759 were omitted from the tables, because no history of lues or scarlatina accompanied the test material; they were considered controls. The original Müller conglobation test was carried out, excepting that the Müller extract was diluted with 0.9% NaCl instead of 0.85%. This test has the advantage of being easily read because of absence of blood corpuscles. Of 345 tests, 125 were made with all 3 showing − results. Of the remaining 220 cases, 144 were + with both the Wassermann and the Müller reactions. The Müller was − in 17 + Wassermanns and in 33 + Müller reactions the Wassermann was −. The authors conclude that the Müller reaction is valuable as supplementary to the Wassermann. They further observe that the Müller reaction was + in a number of cases of post-scarlatinal conditions.—*P. G. Heineman.*

4294. **[TOGUNOVA, A. I., B. I. MIGUNOV, and Z. L. BAIDAKOVA.]** Тогунова, А. И., Б. И. Мигунов, и З. Л. Байдакова. **BCG.** Экспериментальное изучение вирулентности. Пассажные культуры. **[BCG. Experimental study of virulence. Passage cultures.]** [With French summary.] Вопросы Туберкулеза. [*Voprosy Tuberkuleza.*] 7(5): 485-493. 1929.—39 guinea pigs served as subjects. Subcutaneous and intraperitoneal inoculation with 1st and 2nd passage strains did not affect the general condition of the animals, which gained in weight. Intradermal tuberculin reaction became pronounced in 3-5 wks., then weakened or became negative. Cultures of all passages, injected subcutaneously, caused transitory lesions, mostly local and similar to those caused by the original BCG. Intraperitoneal injection of cultures of the first 2 passages provoked lesions in some guinea pigs in the abdominal cavity, mostly in the epiploon, characterized by profuse exudation of polynuclear leucocytes by persistent limitation of foci with connective tissue, and by their lysis in the course of time. No caseous changes were observed. At the site of accumulation of leucocytes, intense phagocytosis and disintegration of bacilli were noted. Some guinea pigs, following intraperitoneal infection, showed rudimentary tubercles in liver and spleen, unobserved in those killed in later stages. Cultures of the 8th passage, inoculated subcutaneously, gave phenomena usual for BCG, which were quickly lysed. Intracardiac injection gave no specific lesions. Limitation and incapsulation of the foci were pronounced. In later stages, fibrous metamorphoses were found. Spread of the local process was shown in some cases by submiliary nodules in liver and spleen, which were gradually resorbed. Necrosis of isolated nodules was an exception. Progressive changes, typical of virulent strains, were not obtained with any of the passage cultures.—*B. Van Rosen.*

4295. **WARD, HUGH K. Observations on the phagocytosis of the pneumococcus by human whole blood. I. The normal phagocytic titer, and the anti-phagocytic effect of the specific soluble substance.** *Jour. Exp. Med.* 51(5): 675-684. 1930.—Using Todd's technique, a constant amount of defibrinated, whole blood was mixed with varying amounts of pneumococcus culture, sealed in pyrex tubes, and incubated in a rotating apparatus for 24 hrs.; the phagocytic titer is expressed in the number of organisms killed. The titer of blood from 10 healthy subjects tested against pneumococcus types I, II, and III varied over a considerable range in the same subject with different types, and in different subjects with the same type. Number of cells being constant, these variations were due to humoral rather than cellular constituents. Sia's work is confirmed in that the type-specific carbohydrate depressed the phagocytic titer of normal blood against homologous pneumococcus only. However, the titer was not depressed in early cases of untreated pneumonia, even against the type causing the infection.—*A. B. Sabin.*

4296. **WARD, HUGH K. Observations on the phagocytosis of the pneumococcus by human whole blood. II. The neutralization of the anti-phagocytic action of the specific soluble substance by antiserum.** *Jour. Exp. Med.* 51(5): 685-702. 1930.—Depending on concentration, anti-pneumococcus serum, when added to a mixture of human blood, living virulent pneumococci, and homologous pneumococcus-specific soluble carbohydrate, shows different zones of activity. In high concentration there is phagocytic inhibition; on further dilution there is effective phagocytosis which diminishes with increased dilution; with very dilute antiserum the anti-phagocytic effect of the specific carbohydrate remains unneutralized. It is suggested that the inhibition zone is caused by non-specific interference of specific precipitate with leucocytic ingestion of pneumococci. The inhibition zone and the anti-phagocytic action are more marked with Type III than with Type I pneumococci.—*A. B. Sabin.*

4297. **WEISS, EMIL. Further studies on the precipitation test for syphilis.** *Jour. Infect. Dis.* 47(4): 354-358. 1930.—An antigen has been devised, based on a comparative study of Kahn's antigens, which has the following advantages over Kahn's antigens: the technic of preparation is simpler, the specific zone is considerably wider, it does not require additional sensitizing or correcting. It is prepared as follows: Dry beef heart is extracted with ether in the ratio of 1:13 for 40 min. in the ice-box. The extract is then discarded and the tissue dried. To the dried tissue 95% alcohol is added in the ratio of 1:5; alcoholic extraction is carried out at 37° C. for 3 days. This extract is then filtered and left over night at room temp. The extract is refiltered and 0.6% cholesterol is added.—*H. A. Austin.*

4298. **WOLFF, ERIK. Erfahrungen mit 'isoagglutinatorischen Blutgruppenbestimmungen in Paternitätsachen.** *Acta Med. Scandinavica* 71(1/2): 54-63. 1929.—Of 165 paternity cases, in 9 the child had an agglutinogen not possessed by either parent. As by this method 15% of illegitimacies are detected, in 60 of the 165 cases the putative father was not the true father. In 2 of 7 cases where one of 2 men was the father, one of the men could be eliminated, making possible indirect determination of paternity. An analysis of the mother-child combinations fully supported the Bernstein theory. The Swedish laws in paternity cases are discussed.—*A. S. Wiener.*

4299. **YAMAGIWA, KATSUSABURO, SHIGEO TSUKAHARA, und SHIGEKI MORIMOTO. Experimentelle Studie über die Antikörperbildung gegen das Impfkarzinom bei der Maus. VI.** *Gann [Tokyo]* 23(2): 11-30. 3 pl.; Japanese, 175-250. 1929.—Immunization of rabbits with a human mammary carcinoma gave rise in the spleen of immunized animals to substances exerting an inhibitory influence on growth of a transplantable mouse mammary carcinoma. The inhibitory effect of such a spleen extract is only slightly less marked than that of spleen extracts from rabbits after immunization with mouse carcinoma. The latter extracts also inhibit growth of a genetically unrelated mouse tumor, such as tar cancroid.—*C. W. Jungeblut.*

4300. **YOUNG, J. S. The effects of repeated intrapleural injections of electrolytes in the rabbit—acquired insensitiveness of the lung epithelium to a proliferative stimulus: the bearing of the observations on tissue resistance.** *Jour. Path. and Bact.* 34(3): 357-377. 1931.—Lung epithelium can acquire a high degree of resistance

to an electrolyte solution to which it is normally susceptible. This increased resistance is such that it inhibits development of epithelial proliferation under circumstances enumerated. The significance of these observations is discussed with reference to the nature of the biological processes concerned in the onset of proliferation and also, briefly, with regard to tissue resistance and immunity in general.—*J. S. Young.*

LOWER ANIMALS

4301. LIER, G. A. van. Onderzoek op en bestrijding van tuberculose te Pekalongan, gedurende de jaren 1927 en 1928. [Control of tuberculosis in Java.] [With German and English summaries.] *Ned.-Indisch. Blad. Diergeneesk.* 42(6): 589-600. 1930.—Equal tuberculin reactions (+ or ±) on 2 succeeding days or an increased reaction on the 2nd day give reliable indications as to the existence of a tuberculous infection. Animals showing a + or ± reaction on the 1st and no reaction on the 2nd day, are to be regarded as suspected. Of animals with a + discharge on the 1st and a ± discharge on the 2nd day, thus showing a decreasing reaction, a fair % will be found non-infected. Results obtained with the ophthalmic tuberculination are more reliable than those achieved with the subcutaneous method. Animals, showing a positive or dubious subcutaneous reaction, are to be regarded as tuberculous; the eye-reaction in such a case will turn the balance. The ophthalmic tuberculination often fails in cases of heavily infected animals (A) or in those of recent infection (B). The A-animals have undoubtedly reacted in a former stage of the disease, only the reaction has diminished. The B-animals often start to react within a short time and then show a positive section finding.—*Author's summary.*

4302. STAFSETH, H. J. Cutaneous immunization against fowl pox. (Proc. 21st Ann. Meet. Poultry Sci. Assoc. 1929.) [In: *Bull. Alabama Polytech. Inst.* 25(1): 80-88. 5 fig. 1930].—Fowl pox can be controlled by use of a living virus vaccine cutaneously administered. Best results are obtainable in birds that have not reached sexual maturity. As a mild reaction confers complete immunity with less unfavorable results, attempts should be made to secure moderate local lesions by use of a highly diluted or attenuated virus, or by applying the vaccine in such a way as to prevent too severe takes. By using a highly diluted virus, birds may be vaccinated with safety during winter. A local reaction following vaccination is a reliable indication that immunity will be established in 2-3 wks., while absence of local reaction means that no immunity is being produced; hence, a representative number of vaccinated birds should be examined for local lesions within 10-14 days.—*Author's conclusions.*

4303. TULLBERG, KJELLÅKE. Experimentell prövning av den subkutana abortvaccinationens immunvärde hos ko. [Experimental testing of the immune value of subcutaneous inoculation of cows with abortus bacterin.] [With English summary.] *Skandinavisk Vet.-Tidskr.* 21 (7): 222-229. 1931.—4 pregnant cows were infected with equal amounts of *Bacillus abortus;* 2 of them had been previously inoculated subcutaneously with abortus bacterin. In the 2 controls, the fetuses were expelled 59 days (average) after infection; in the 2 bacterin-inoculated cows the fetuses were expelled 67 days (average) after infection. Thus some cows, after a single subcutaneous inoculation with abortus bacterin, seem to display increased resistance up to 2 mo. after treatment.

4304. [VISHNEVSKIĬ, P. P.] ВИШНЕВСКИЙ, П. П. Результаты опытов с BCG. на мелких лабораторных животных и рогатом скоте. **[Experiments with BCG on laboratory animals and cattle.]** Вопросы Туберкулеза. (*Voprosy Tuberkuleza.*] 7(2/3): 187-194. 1929.—Both BCG. and tubercle bacillus "Bov. 3" strain were used; 8 passages failed to heighten their virulence and they proved practically avirulent for guinea pigs and rabbits. Intravenous injection into rabbits caused reactions similar to submiliary tuberculosis, which, however, led to no further lesion and disappeared without traces. Both strains were absolutely non-pathogenic to calves. Guinea pigs and rabbits had only brief, heightened resistance which, on infection with a strong tuberculous virus, merely retarded death of vaccinated animals as compared to controls. Vaccination of calves with BCG. created stable resistance for at least 1½ yrs. against even large intravenous doses of strong virus. Preventive qualities of "Bov. 3" were weaker in artificial infection, but in natural infection they were equal to BCG.—*B. Van Rosen.*

Mem.* 17. 53-59. 1930.—Infection experiments with cercariae of *S. spindale* on monkeys (*M. sinicus*) indicate a spontaneous cure, only early developmental stages being found post mortem. Disappearance of schistosomulae from the portal blood appears to be due either to an obscure immunity or to an inherent unsuitability of blood for later developing forms. Following recovery, there is a period of enhanced refractiveness during which schistosomulae fail to develop beyond penetration of the skin. After 3 mo. normal susceptibility is regained and on reinfection the schistosomulae develop as in a host not previously infected, showing the period of enhanced refractivity to be transient in nature.—*R. O. Christenson.*

4309. ADLER, S. A study of the sandfly population in endemic foci of infantile kala-azar in Italy. *Bull. Ent. Res.* [*London*] 22(1): 105-113. 2 pl., 2 fig. 1931.—Studies were made of the sandfly population in the neighborhood of Naples and in Catania with special attention to houses in which cases occurred in contrast with places free from the disease. In both foci human and canine visceral leishmaniasis was present. Of all the cases in Naples 9.5% and in Catania 13.3% were in infants under 12 months. Cases of infantile and canine visceral leishmaniasis have been found in the same house on several occasions. The sandflies present were *Phlebotomus papatasii* Scop., *P. perniciosus** Newst., *P. sergenti* Parrot, *P. parroti* var. **italicus*** (p. 107), and *P.* **vesuvianus*** (p. 108). *P. papatasii* was most numerous, and feeds mainly in the early evening. *P. perniciosus* was next in abundance, and was found oftener in stables than in sleeping rooms. Of 1547 ♀♀ dissected none was infected with *Leishmania*. *P. papatasii* was infected with Italian strains of *Leishmania infantum* by feeding on cultures through membranes. The infection rate was low, but in contrast to Indian strains of *L. donovani* in the same sandfly the infection, once established, did not die out.

4310. ADLER, S., and O. THEODOR. The exit of Leishmania infantum from the proboscis of Phlebotomus perniciosus. *Nature* [*London*] 126(3188): 883. 1930.—This can take place during the act of biting and the *Leishmania* can enter a new host in the absence of any active interference on the part of the latter.

4311. ALCOBÉ y NOGUER, SANTIAGO. Contribución al estudio de los Sarcosporidios. [Sarcosporidiosis.] *Mem. R. Acad. Cien. y Artes* [*Barcelona*] 21(10): 257-290. 4 pl. (1 col.) 1928.—The parasites studied were found in muscle tissue of the esophagus of goats and sheep. The wall of the adult cyst is composed of 3 concentric layers: an external muscular one of muscle fiber contiguous with the cyst wall; a middle layer of typical collagenous tissue; and an inner one also composed of connective tissue, not identified as either collagenous or elastic, in which 3 secondary layers may be distinguished. This connective tissue is thought to be pathologically altered by the pressure due to the parasite. Whether the sarcosporidia develop in the interior of a muscle or within the interstitial connective tissue is unknown; in the 1st case it would be necessary to assume that the parasitized muscle fiber is totally destroyed. In the anterior protoplasm of the spores, which appear homogeneous in transmitted light, were found with darkfield illumination refringent granules of isotropic substance. The nucleus of the spore was identified by the reaction of Feulgen; it lies in the posterior ⅓ of the spore, is ovoid, contains chromatin granules and a siderophilous karyosome which emigrates into the protoplasm, where it disappears. In the spore also are siderophilous granules. It was found experimentally that the substance constituting the anterior part of the spore (possibly the sarcocystine) does not have its origin in the siderophilous granulations, because they degenerate at the same time.—*S. Alcobé y Noguer* (*transl. by E. R. Becker*).

4312. ANDREWS, JUSTIN, CARL M. JOHNSON, and V. J. DORMAL. Lethal factors in experimental infections of Trypanosoma equiperdum in rats. *Amer. Jour. Hyg.* 12(2): 381-400. 1930.—Experiments included tests of blood pH in 28 rats at intervals during infection with *T. equiperdum;* ave. CO_2 capacity of plasma of 37 rats dying with *T. equiperdum* infection, and of 41 controls; changes in the gas content of 10 urethanized and 10 non-urethanized rats; changes in O content of blood of 2 series, each of 35 rats (number diminished by accidents), inoculated with *T. equiperdum* and the same number of controls; and changes in all the cases in a similar 3rd series. That the rats die of asphyxia is indicated by the symptomatology, the pathology, and blood chemistry. The trypanosomes, after reaching a certain concentration in the blood, agglutinate. These emboli interfere with circulation, sometimes causing complete occlusion of the vessels, stasis, clot-like formations, and pulmonary edema. Proper aeration of the blood is prevented and anoxemia follows, with consequent accumulation of lactic acid in the tissues resulting ultimately in a non-volatile, uncompensated acidosis. Probably the trypanosomes, multiplying, use up the blood glucose in increasing amounts; to maintain normal sugar level in the blood, glycogen is withdrawn from the liver. Progressive degeneration of the liver due to anoxemia prevents storing of more glycogen, and the liver glycogen becomes exhausted and the circulating blood sugar is decreased. Possibly the damage to the liver interferes with glycogen withdrawal before the storage supply is exhausted (this would account for the varied reports of complete and only partial glycogen depletion in the liver). Thus the reaction is an irreversible one. Administration of glucose and $NaHCO_3$, separately or together, did not consistently prolong life of infected rats. Apparently the glucose failed because it vitalized the trypanosomes without appreciably affecting the host, due to the defective liver. Alkaline treatment was likewise useless.—*From authors' summary.*

4313. ANTEQUEDA, EMILIO A. Investigaciones parasitarias en los perros de Buenos Aires. [Parasites of dogs in Buenos Aires.] *Quinta Reunión Soc. Argentina Patol. Region. Norte Jujuy* 1930: 1020-1053. 25 fig.; also in: *Rev. Med. Vet.* [*Buenos Aires*] 12(3): 87-119. 25 fig. 1930.—The presence of several parasites is established in dogs in Argentina. The enteric spirochaetes, *Treponema regaudi* (Lucet) Macfie, *Spironema* sp., and a new species are commensals. The formation is described of bodies in intestinal villi like those that H. Noguchi considered cultural forms of rabies. An intestinal coccidian (*Diplospora bigemina* Stiles) occurs. In the heart and liver there are nodules containing nematodes, and nematode larvae often occur in the cortex of the kidney. A microfilaria was found in blood, but no adults. On the skin occurs a mallophagan, *Heterodoxus longitarsus* (Piaget, 1880). In the abdominal cavity of this a developmental stage of the dog microfilaria occurs (the 2nd stage of Grassi and Calandruccio). —*E. Antequeda* (*transl. by A. S. Pearse*).

4314. ARNDT, W. Wollhandkrabbe und Lungenegel. *Sitzungsberichte der Gesellschaft Naturforschender Freunde zu Berlin* 1929 (1/3): 1-3. 1929.—In Asia *Eriocheir sinensis* is an intermediate host of *Paragonimus westermanni*. The question arises of the possible danger of infection in Germany, where the crab has been introduced. The mollusks *Tiara* and *Ampullaria*, other known intermediate hosts, do not occur in Germany; therefore there seems to be no danger of infection, either from *Eriocheir* or from the introduced North American *Cambarus affinis*, which might become an intermediate host under suitable conditions.

4315. BARBER, M. A., W. H. KOMP, and C. H. KING. Malaria and the malaria danger in certain irrigated regions of southwestern United States. [*U. S.*] *Public Health Repts.* 44(22): 1300-1315, 1829.—From 1926 to 1928 surveys were made at various points along the

Rio Grande in Texas, along the Rio Grande and Pecos in New Mexico, in the Salt River Valley, Arizona, and the Imperial Valley of California, where irrigation was practiced. The irrigation canals themselves were not often found producing anophelines, which were found abundantly in the drainage ditches, seepage areas and flooded pastures. No breeding was detected in the Imperial Valley. *Anopheles pseudopunctipennis* was found in all other localities. In the lower part of the Rio Grande Valley, *A. quadrimaculatus* was abundant; higher up in Texas and New Mexico, *A. maculipennis* was abundant. A long standing focus of endemic malaria was discovered near Espanol, northern New Mexico, but in Dona Ana County, in the southern part of the same state, malaria first made its appearance in certain areas in 1925. *Plasmodium vivax* is the prevailing parasite, although one small outbreak of estivo-autumnal malaria in Dona Ana County was observed in 1927. The population is mixed and contains many recent immigrants. The distribution of *Gambusia* and the routine dusting of the drains with Paris green are recommended for control.—*M. F. Boyd.*

4316. BARTSCH. Die Räude der Pferde als Kriegstierseuche. [Scab of the horse as an epidemic disease of war animals.] *Ergänzungsbände Zeitschr. f. Veterinärk. Heft 1.* 1-59. 6 fig. 1928(1930).—This includes a historical sketch of scab; its significance as an epidemic war disease in isolated countries and its control; its significance before, during and after the war in Germany and its control there; causes of the spread in the army and among domestic animals during the war; some observations on the disease during and after the war; disposition of scabby and of recovered horses.

4317. BASU, B. C. Studies in the Anopheline fauna and malaria of Bhagalpur (Bihar and Orissa). *Ind. Med. Gaz.* 65(7): 375-379. 6 fig. 1930.—A list of the Anopheline spp. with descriptions of their breeding places* is given. *Anopheles stephensi* is considered to be responsible for the transmission of malaria in the town of Bhagalpur, in which there has been a great rise in malarial incidence in the last quarter century. Other carriers, e.g., *A. culicifacies* and *A. fuliginosus,* are also recorded but their numbers are negligible owing to unsuitable breeding grounds. Superficial differences in some specimens of *A. stephensi* are noted. Remarks on the clinical aspects of malaria are included.—*S. Ribeiro.*

4318. [BELÏAEVA, I. D.] БЕЛЯЕВА, И. Д. К вопросу о совместном течении малярии и туберкулеза у детей. **[Simultaneous course of malaria and tuberculosis in children.]** Вопросы Туберкулеза. [*Voprosy Tuberkuleza*] 7(10): 1258-1273. 1929.—Study was made of 124 children, aged 1-14, of whom 50% were aged 10-12. Most of them were ill both with malaria tertiana and with tuberculosis, either localized or in the form of chronic tuberculous intoxication. No interaction could be noticed between these two diseases, and their simultaneous and parallel course proceeded independently. Quinine therapy acted on malaria in the usual way, no aggravation of the tuberculosis being noticed. Nor did tuberculosis seem to make malarial parasites resistant to quinine.

4319. [BELITSER, A. V.] БЕЛИЦЕР, А. В. Инфицирующие лошадей пироплазмом стадии клеща **Dermacentor reticulatus F.** в средних губерниях РСФСР. **[Stages of D. reticulatus infecting horses with piroplasmosis in Central RSFSR.]** Русский Журнал Тропической Медицины, Медицинской и Ветеринарной Паразитологии. [*Russ. Jour. Trop. Med., Med. and Vet. Parasitol.*] 7(4): 258-262. 1929.—The author found that though in its mature stages *Dermacentor reticulatus* infects horses with piroplasmosis, as a larva it is incapable of causing infection. To determine whether in the intermediate stage (nymph), *Dermacentor* can infect horses, infected mature specimens taken from sick horses were placed in the laboratory; nymphs resulting from their eggs were placed on healthy horses. Nymphs produced no effect, and horses remained well. To prove that this lack of infection was due neither to insusceptibility of the horses, nor to freedom of infection on the part of the nymphs, mature specimens, developed from the same batch of nymphs, were placed on the same horses, and one of the horses contracted piroplasmosis. Apparently, *Piroplasma caballi,* though present in the nymph and larva, becomes infectious only in the imago stage of *Dermacentor.*

4320. [BELITSER, A. V., and A. A. MARKOV.] БЕЛИЦЕР, А. В., и А. А. МАРКОВ. К вопросу о проходимости **Tr. equiperdum** через слизистые оболочки у лошадей при экспериментальных условиях. **[Penetration of Trypanosoma equiperdum through mucous membranes of horses under experimental conditions.]** Русский Журнал Тропической Медицины, Медицинской и Ветеринарной Паразитологии. [*Russ. Jour. Trop. Med., Med. and Vet. Parasitol.*] 7(5): 365-367. 1929.—Ten horses, aged 9-20 (4 ♂ and 6 ♀), were used, all healthy and with mucous membranes apparently intact; 3 of them had their mucous membranes scarified for control purposes. Blood of a guinea pig containing *T. equiperdum* was applied to the surface of conjunctiva in ♂♂, and on the mucous membrane of the vagina in ♀♀. All 10 horses became infected, irrespective of the condition of the mucous membranes. In the literature, mucous membranes, when intact, are considered impenetrable for *T. equiperdum.* However, all horses described in the literature were young. Apparently in mature horses the mucous membranes are easily penetrated by *T. equiperdum.*

4321. BELLI, CARLO MAURIZIO. Igiene coloniale. 235p. 75 fig. Unione Tipografico Editrice Torinese: Torino, 1928. Pr. 25 L.—The author discusses the 3 African colonies of Italy (Libya (subtropical), Eritrea (tropical) and Somaliland (equatorial)), under the headings geography, climatology and nosology (a rapid review of the principal diseases). Physiologically, warm climates have a special effect on skin, renal function and nervous system. Apart from pathological effects due to actinic rays, and heat, usually assisted by alcohol, the author classifies the common diseases as (1) infective, (2) due to vegetable or animal parasites, (3) dietary deficiencies. Predisposing causes are personal, environmental, climatic and social (contact with natives). Prevention of (1) consists in proper handling of the case (diagnosis, isolation, quarantine, disinfection, treatment, immunization) and attacking insect and animal carriers. Prevention of (2) (helminths, insects, mycoses) lies in treatment and sanitation, and of (3) in correction of diet. Poisonous animals and plants are described and discussed. Much space is devoted to acclimatization, individual and racial. The author agrees with Sambon that it is not the influence of climate on man which hinders colonization of the tropics, but a fiercer competition with other organisms from man to wild beasts, from venomous serpents to protozoa and bacteria. Science has done much to dominate disease but the racial acclimatization of the whites in the tropics has been successful only in a few spots (e.g., Hawaii), as judged by undiminished birthrate and the quality and culture of succeeding generations. The author concludes that whites can colonize and populate the subtropics but can only exploit the tropics. Success in the latter depends on the physical, psychic and social qualities of the colonist, protection from pathogenic organisms, personal hygiene (esp. temperance) and sanitation. Final chapters deal with urban sanitation; the planning, construction and hygiene of private and collective habitations (incl. hospitals, barracks, schools, prisons, and public latrines); food; personal hygiene (clothing, exercise etc.), and the organization, equipment and management of military and exploring expeditions in the tropics.—*L. W. Hackett.*

4322. BOGDASCHEN, N. Über die Verbreitung von Pentastomum denticulata in den Mesenteriallymphknoten des Schafes in der Sowjetunion. [Distribution in U. S. S. R. of P. denticulata in the mesenteric lymph nodes of the sheep.] *Tierärztl. Rundschau* 37(23): 401-402. 1931.

4323. BOYD, MARK F. An introduction to malari-

ology. 437p. 82 fig. Harvard University Press: Cambridge, 1930. Pr. $5.00.—The history of malaria, especially in the U. S. A., is discussed, and the present world distribution given One-fourth of the book is devoted to a critical review of the literature on the natural history of malaria. The human phases are covered by discussions of: sources of infection, relapses and resistance, splenomegaly, infectivity of the patient, invasion, and some ill-defined contributory factors such as economic status and degree of nutrition. The following mosquito phases are discussed: susceptibility of species, host and habitat preferences, mosquito density, proportion of ♀♀ which are potential carriers, factors determining mosquito production, length of flight, and effects of climate, season and topography. The actions and interactions of the foregoing factors in the production of endemic and epidemic malaria are treated and summarized. The parts played by vital statistics, malaria histories, and sampling in a malaria survey are discussed. The information required is listed and methods of recording it described. There is detailed and extensive discussion of spleen size and the various methods of measuring it. On the parasitological side, the methods of making, staining and examining blood smears are given; also formulae and staining procedure for the various blood stains. There are colored plates illustrating the appearance of the various forms seen in thin and thick films. Some of the general factors which may affect the interpretation of information gained in the survey,—economic condition, immigration, housing, etc.,—are considered. The way in which the malaria index is finally expressed and interpreted is given. About ⅓ of the space is devoted to the natural history of anopheline mosquitoes. Morphology, systematics, geographical distribution, and length of developmental cycle is followed by treatment of the egg, larval, pupal, and imaginal stages in detail, especially the morphological, physiological, and ecological aspects of the larval and imaginal stages in relation to malarial transmission. The parasites and predaceous enemies of mosquitoes are listed. The materials needed and the technique used in anopheline surveys receive detailed description. Instructions are given for killing, preservation and study of anopheline material. In determining what mosquitoes are the vectors, consideration is given to the two indices of infection, natural and experimental, with a weighing of different points of view as to their comparative values. The technique of dissection of mosquitoes and examination for oocysts and sporozoites is given. Studies of dispersal and flight of *Anopheles*, methods of identification of blood meal, meteorological observations helpful in a survey, and the use of topographical and geographical maps are given consideration. Some relations of surveys to control work are discussed, the conclusion being that a thorough survey should make possible an opinion as to practicability of control or eradication, a decision as to the best measures to be used in control, and a plan by which control may be put in operation; or it may lead to the conclusion that extended orientation studies are required before control can be begun.—*C. G. Huff.*

4324. BRUYNOGHE, R., et P. VASSILIADIS. Contribution à l'étude des Eperythrozoaires coccoides. *Trav. Inst. Bact. Univ. Louvain* 1927-1928: 12p. 2 fig. 1929; also in *Ann. Parasitol. Humaine et Comp.* 7(5): 353-364. 1929.—In studying non-pathogenic parasites which appear in the blood after splenectomy in certain rodents (rats, mice, dwarf-mice, field mice), the authors established the transmissibility of the parasites to splenectomized animals; the differences between *Eperythrozoon coccoides* Schilling and *Eperythrozoon* **dispar*** (p. 361), from *Arvicola arvalis* and *Mus minutus;* the transmission of the parasites by lice; and the therapeutic efficacy of arsenicals (neosalvarsan, tryparsamide, etc.). Attempts at artificial culture failed.—*R. Bruynoghe* (*transl. by L. A. Barnes*).

4325. CARDAMATIS, J. P. Méthode de coloration des plasmodes et des protozoaires qui persiste sans changement pendant 25 ans. [Staining of plasmodia and protozoa which remains unchanged for 25 years.] *Bull. Soc. Path. Exotique* 23(8): 787-789. 1930.—A mixture of 3 solutions (1% methylene blue with sodium carbonate, 1% methylene blue, and 0.1% eosin B.A. extra) is made in proportions of 3:1:12 and dropped on the surface of the dry preparations.

4326. CHODUKIN, N. J. Über die Kinder- und Hundeleishmaniosis. *Arch. Schiffs- u. Tropen-Hyg.* 34 (8): 423-429. 1930.—Study of leishmaniosis in Tashkent has included since 1925 necropsy on ownerless dogs and investigation of 64 foci of infection. Of 25,000 dogs, 2% were affected with leishmaniosis. The numbers of dogs, particularly of dogs allowed to frequent human dwellings, showed close relation with the numbers of human cases of leishmaniosis in any given locality. The isolation of sick dogs and other sanitary measures was followed by fall in human cases of leishmaniosis. Crossed agglutination and absorption experiments showed no distinction between *Leishmania canis* and *L. donovani.* Experiments in which *Phlebotomus papatasii* was allowed to feed on infected dogs proved the possibility of the conveyance of the infection by this blood-sucking fly. Chodukin is convinced that the dog is the true carrier of leishmaniosis and that, in Turkestan at least, the pathogenic organism of canine and human leishmaniosis is the same. He suggests that Central Asia may be the original home of leishmaniosis, and that the specific preferences shown elsewhere for certain tissues may be characteristics acquired later.

4327. CILENTO, R. W., and A. H. BALDWIN. Malaria in Australia. *Med. Jour. Australia* 1(9): 274-282. Map. 1930.—Nothing is known of the incidence of malaria among the aborigines during the pre-Caucasian eras. At present a few minor endemic foci among this race are known, but in general they are free from the disease. Probably cases of malaria occurred as early as 1828 at Moreton Bay (Brisbane), and in 1829 at Raffles Bay (N. Australia), in the latter case introduced from Timor. Neither of these resulted in the establishment of endemic foci. Subsequently up to 1880, malaria was apparently occasionally introduced, both in the southerly and the most northerly parts of the continent, and made a doubtful local headway, failing to establish itself except in the territory around the Gulf of Carpentaria. This failure is largely attributed to sparseness of population. Between 1880 and 1890, temporary concentrations of population resulting from mining activities gave the disease considerable impetus, so that this decade is regarded as the most malarious in the history of the continent. Since then the disease has been in almost continuous decline, and ceased to exist endemically in the southern states. At present malaria is confined to a small area in n. w. Australia, to 2 zones in Northern Territory, and 2 in North Queensland. The infection is almost solely confined to cattlemen, miners, sugar cane laborers and aborigines. Cairns is the only town involved. *Anopheles annulipes* and var. *amictus, bancrofti, punctulatus* and var. *moluccensis, atratipes* and *stigmaticus* are known to occur. Their relative importance as vectors in Australia is not settled; *punctulatus* and its variety *moluccensis* have been incriminated in New Guinea, while *annulipes* has been used to convey induced malaria. The distribution of the latter species is, however, more extensive than that of the disease.—*M. F. Boyd.*

4328. CORSON, J. F. Observations on Trypanosoma rhodesiense in sheep and goats. *Jour. Trop. Med. and Hyg.* 33(24): 385-389. 1930.—From experiments on more than 40 goats, more than 60 sheep and nearly 100 rats, Corson concludes that the characters by which *T. rhodesiense* is distinguished from *T. gambiense,* such as high infectivity and virulence for laboratory animals, rapid multiplication and the occurrence of numerous posterior-nuclear forms in the blood of these animals, were preserved by the trypanosome during maintenance for 6 months in sheep and goats. The trypanosomes showed also, on the whole, a somewhat greater susceptibility to the action of normal human serum, when tested in subinoculated white rats, than was shown when

rats were directly infected from man. So far as can be judged from these direct passage experiments, a herd of sheep and goats can remain infected with *T. rhodesiense* for at least several months and possibly throughout its existence as a herd, where opportunities occur for the transmission of the infection. The animals are infective throughout the course of the disease, which is short and acute.

4329. **DEPPE. Gehirnmalaria eines Säuglings mit folgender Lähmung der linken Körperhälfte.** [Cerebral malaria of an infant with subsequent paralysis of the left half of the body.] *Arch. Schiffs- u. Tropen-Hyg.* 35 (3): 184-188. 1931.

4330. **DESCHIENS, R. Recherches sur l'infection des voies biliaires par les lamblies.** *Arch. Malad. Appar. Digest. et Malad. Nutrit.* 20(8): 951-957. 1930.—The only positive sign of experimental infection of the bile ducts by giardias is their presence in the gall-bladder or bile ducts either after operation or immediately after the animal has been killed. In man, on the basis of this criterion, Deschiens found 3 cases of infection of the bladder by *Giardia intestinalis* and 9 cases of non-infection of the bladder in patients presenting intestinal infection by *Giardia*. In 12 mice showing intense infection of the intestine by *G. muris*, giardias were not observed in the bile ducts. Intestinal infection by giardias is common therefore, and infection of the bile ducts rare or exceptional.—*Author's summary (transl.)*.

4331. **DESCHIENS, R. Les entamibes de la bouche (E. gingivalis Gros, 1846) peuvent-elles être hématophages?** *Bull. Soc. Path. Exotique* 23(2): 177-180. 1 pl. 1930.—Inclusions, about the size of erythrocytes and staining like them, are frequently seen in vegetative forms of *Entamoeba gingivalis* obtained from gingivitis or pyorrhea. These elements, studied in 2 human and 6 simian cases of gingivitis with pyorrhea, did not in the natural state present the coloration or the regular form of red blood-cells, but rather suggested the nuclei of leukocytes. May-Grünwald-Giemsa staining also indicated that the inclusions are of nuclear nature and hence are not erythrocytes.

4332. **[DMITRIEV, I. D.]** ДМИТРИЕВ, И. Д. О соотношении между водным фактором и комарийностью, комарийностью и заболеваемостью малярией. **[Relation between water factor and mosquitoes, mosquitoes and malaria.]** Русский Журнал Тропической Медицины, Медицинской и Ветеринарной Паразитологии. [*Russ. Jour. Trop. Med., Med. and Vet. Parasitol.*] 7(5): 318-325. 1929.—Author conducted his investigation in Batum, where malaria is widely spread among the population. He used as controls Red Army soldiers, who were not indigenous to this locality and free from malaria. Correlation between the number of larvae in water reservoirs and the number of mature mosquitoes was traced, as well as the rising tide of malaria, depending on the number of mosquitoes. Measures leading to destruction of larvae resulted finally in smaller amount of infection.

4333. **DRAKE, C. J., and R. M. JONES. The pigeon fly and pigeon malaria in Iowa.** *Iowa State Coll. Jour. Sci.* 4(2): 253-261. 2 pl. 1930.—*Pseudolynchia maura*, the intermediate host of *Hemoproteus columbae* (the cause of pigeon malaria), is described with special reference to biology and control. The fly seldom leaves its host and does not feed upon other domesticated or wild birds. It gives birth to full-grown larvae which begin to transform into the resting stage immediately after deposition. The puparium changes in color successively from white through yellow, orange and brown to a jet black in the course of 2-3 hrs. It also becomes strongly indurated. In Iowa pupal transformation required 35 days. The newly emerged fly must have a meal of pigeon's blood within a short time in order to live. By cleaning nests and spraying them with waste crank case oil and dipping pigeons in pyrethrin—soap dip, complete eradication of the fly was accomplished on a large pigeon farm.—*H. J. Stafseth.*

4334. **DUKE, H. LYNDHURST. On the occurrence in man of strains of T. gambiense non-transmissible cyclically by G. palpalis.** *Parasitology* 22(4): 490-504. 1930.—A strain of *Trypanosoma gambiense* isolated from a European 1 or 2 years after his infection, according to the interpretation adopted of the story of his illness, was tested exhaustively with clean laboratory-bred *Glossina palpalis* and was found to be incapable of infecting the glands of the fly, although infections of the intestine were not uncommon. 4612 flies were dissected in these experiments; 66 flies developed massive gut infections; 75% of these lived long enough for the glands to become infected, but in no case did this occur. Three other strains of *T. gambiense*, all freshly isolated from man, were also examined, respectively 767, 456 and 1050 flies being dissected and none developing gland infections. All these strains therefore are non-transmissible by tsetse by the normal cyclical method. With yet another human strain 855 flies were dissected and a percentage found with their glands infected, showing that a strain may retain its transmissibility by tsetse up to the death of the host even in cases where to judge from the condition of the patient the infection had lasted many months. As a rule, however, as an infection with *T. gambiense* progresses the transmissibility of the parasite by tsetse diminishes, and may eventually disappear altogether.—*H. L. Duke.*

4335. **[DYMOV, D. K.]** ДЫМОВ, Д. К. О распространении лейшманиоза у собак Туркестана. **[Distribution of leishmaniosis among the dogs of Turkestan.]** Русский Журнал Тропической Медицины, Медицинской и Ветеринарной Паразитологии. [*Russ. Jour. Trop. Med., Med. & Vet. Parasitol.*] 7(8): 540-543. 1929.—In the cities of Kokand, Samarkand, and Shakhrizîabs, 269 stray dogs were killed in 1927. Leishmaniosis was found in only 6, although in 1913, Iakimov, who examined 49 dogs there, found 44% infected. Possibly this low percentage may be explained by the killing of 1800 stray dogs in Samarkand prior to the investigation. In Shakhrizîabs, where no such measures were taken, out of 61 dogs 5 were infected. On the other hand, only one case of human visceral leishmaniosis has been registered in this city, while in Samarkand, where the percentage of infected dogs was extremely low, human visceral leishmaniosis was found in 250 cases. This disproportion leads to the assumption that human and canine leishmaniosis have hardly anything in common, and that, apparently, the dog is not a virus reservoir, as has been supposed.

4336. **FLETCHER, T. BAINBRIGGE, and S. K. SEN. A veterinary entomology for India. Part XII.** *Jour. Central Bur. Animal Husb. and Dairy., India* 4(3): 90-104. 2 pl. 1930.—Four species of bot flies are described, the 3 most common in India being *Gasterophilus intestinalis bengalensis*, *G. nasalis*, and *G. pecorum*. The larvae parasitize the stomach of horses. The morphology of ova and larvae is described, leading to identification of the species. Treatment of parasitized horses and control measures are discussed. The head maggot, *Oestrus ovis*, infests the nostrils and frontal sinus of sheep. A popular control measure consists of providing sheep with salt troughs smeared with tar which adheres to the nose and repels the flies. *Cephalopsis titillator* deposits larvae in the nostrils of camels; larvae on the mucous membrane of the naso-pharynx cause much irritation, resulting in violent sneezing. The larvae of *Cobboldia elephantis* infest the stomach of elephants, sometimes in such numbers as to interfere with food passage. The larvae of *Gyrostigma sumatrensis* infest the stomach of Sumatran and African rhinoceroses.—*G. W. Rawson.*

4337. **FISCHER, W. Die Amöebenruhr. [Amoebic dysentery.] [In: W. KOLLE, und A. v. WASSERMANN. Handbuch der pathogenen Mikroorganismen. 3. Aufl. W. KOLLE, R. KRAUS, und P. UHLENHUTH. Bd. 8, Lief. 9.] p. 181-212. 1 col. pl., 6 fig. Gustav Fischer: Jena; Urban & Schwarzenberg: Berlin u. Wien, 1927.**

4338. **FÜLLEBORN, F. On the larval migration of**

some parasitic nematodes in the body of the host and its biological significance. *Jour. Helminth.* 7(1): 15-26. 2 fig. 1929.—Penetration of the host skin by larvae of *Ancylostoma, Strongyloides stercoralis,* and other nematodes may be assisted by thermotaxis but apparently is a purely mechanical phenomenon. Experiments showed that the path traversed is through the blood and lymphatics to the heart, thence to the lungs and through the walls of the capillaries and air-vesicles to the bronchioles, bronchi, trachea and pharynx. Swallowing of saliva carries the larvae to the intestine. In the lungs some larvae pass to the pulmonary vein, thence to the left heart and, in the aorta, conveyed only in the central part of the blood-stream, reach all organs of the body, producing characteristic hemorrhages on the kidney surface. Frequency and extent of bleeding depend on the structure of the tissue invaded. Larvae of *Ascaris lumbricoides* introduced into the stomach are mostly suffocated by lack of O. A few bore through the walls and, passing first to the liver, complete their normal development in the intestine; these are no longer liable to suffocation in the stomach. Larvae of *Uncinaria stenocephala* can develop in the stomach without previous migration, but enter the glands of the mucosa to reemerge after some days. A similar phenomenon is described for *Trichuris vulpis, Heterakis gallinae, Trichostrongylus,* and *Oesophagostomum columbianum.* The mouth-spear of the youngest Trichotrochelidae larvae is reminiscent of that of *Dorylaimus* and suggests the origin of the group. Larvae of *A. lumbricoides* may take a similar path to those of *Strongyloides,* but mostly pass with the blood of the portal vein to the liver, vena hepatica, right heart and lung. Abdominal infection is accidental. By invasion of the aorta, larvae are transported to all host tissues and have been found in the kidney, heart, brain, and muscles. Pre-natal infection of the lungs of puppies by larvae of *Toxascaris canis* occurs via the placenta, the intestine being invaded later; that of the mother is immune. The origin of larval migration is the ingestion of infected secondary hosts, the definitive host finally becoming also an intermediate one.—*F. J. Meggitt.*

4339. **[GRÜNER, S. A.]** ГРЮНЕР, С. А. Носовой овод у лошадей и его значение при сапе лошадей. **[Nasal gadfly in horses and its importance in glanders.]** Труды Сибирского Ветеринарного Института. [*Rept. Siberian Vet. Inst. Omsk, USSR.*] 10: 303-322. 1 pl. 1928/1929.—On the basis of literature and study of horses killed when found suffering from, or under suspicion of glanders, the author concludes that the nasal gadfly, *Rhinoestrus purpureus* (Brauer), not only fastens itself to the nasal partition and nasal cavities, where it causes inflammation, but is also found under the brain membrane and even in the region of the cerebellum. Contrary to other opinions, the author believes that the larvae do not cause wounds in the nasal cavity, but catarrh of the mucous membrane, then feed on the pus secretion. Probably the larvae produce the same effect on certain tissues of the brain. In a horse suffering from glanders these larvae are thrown out and may be carriers of glanders. A complete description of the gadfly and the difference in the larvae of *Gastrophilus intestinalis, G. veterinus, G. haemorhoidalis, G. pecorum,* and *R. purpureus* is given.

4340. **HINDLE, EDWARD, and FENG LAN CHOW. Experiments with malaria and mosquitoes in Shantung, China: with a note on the value of local species of fish for the destruction of mosquito larvae.** *Trans. Roy. Soc. Trop. Med. and Hyg.* 23(1): 71-80. 1929.—In Tsinan the only endemic type of malaria is benign tertian; even this is not very common, largely on account of fish which devour mosquitoes. From experiments involving feeding mosquitoes on cases of malaria, it is concluded that the species of *Anopheles* which are found in Tsinan, *A. hyrcanus* v. *sinensis* and *A.* (*Myzomyia*) *pattoni,* both serve as transmitters of *Plasmodium vivax;* but *A. pattoni* is a much more efficient vector than *A. hyrcanus* var. *sinensis,* which is infected with difficulty. Also *A. hyrcanus* var. *sinensis* is essentially an out-of-door species while *A. pattoni* frequents houses. The number of mosquito larvae eaten by single fish in 6-24 hrs. was tested for *Pseudorasbora parva, Rhodeus* sp., *Carassius auratus, Pseudogobio sinensis, Aplocheilus latipes, Misgurnus anguillicaudatus* and *Eleotris swinhonis.* All species used devoured mosquito larvae readily. *Pseudogobio sinensis* and *E. swinhonis* were the most efficient.

4341. **HOEPPLI, R. Neuere pathologische Befunde bei experimenteller Trypanosomiasis und Leishmaniasis.** *Arch. Schiffs- u. Tropen-Hyg.* 33(Beih. 3): 101-113. 4 fig. 1929.—Description of findings in experiments reported by Regendanz: *Ibid.* 33(Beih. 3): 97-101. 1929.

4342. **[ISAICHIKOV, I. M.]** ИСАЙЧИКОВ, И. М. К фауне паразитических червей домашних плотоядных Крыма. **[Parasitic worms in domestic carnivorous animals of Crimea. (Continuation.)]** Труды Сибирского Ветеринарного Института. [*Rept. Siberian Vet. Inst. Omsk, USSR.*] 9: 133-169. 1 pl. 1927.—Heterophyidae not previously discovered in domestic carnivores and *Capillaria felis cati* were found. The infection of Kerchenskii dogs with *Metagonimus romanica* may be due to sea fish. The finding of *Cryptocotyle concavum* in dogs and cats showed that the parasite may also attack carnivorous animals as well as birds. *Ascocotyle italica* Allessand. is reported from Russia in dogs, and in cats for the 1st time. From the cat are reported also *Tauridiana pontica,* and **PONTICOTREMA** (Heterophyidae) **euxini*** (p. 142).

4343. **JAMES, S. P. Specimens made during an enquiry into the influence of temperature on the exflagellation of the gametocytes of the benign tertian malaria parasite.** *Trans. Roy. Soc. Trop. Med. & Hyg.* 23(1): 3-4. 1929.—Low temp. (10 and 19° C.) retarded exflagellation. At 0° C. no change was observed even after 24 hrs. At 25° C., ♂ gametocytes flagellated in 5-7 min.

4344. **KAGY, EDWIN S., and ERNEST CARROLL FAUST. Effect of feeding raw liver to dogs infected with Endamoeba histolytica.** *Proc. Soc. Exp. Biol. & Med.* 28(3): 252-253. 1930.—Preliminary paper. Cultures in vitro of a canine strain of *E. histolytica* on liver infusion agar confirmed the findings of Cleveland and Sanders: the organism was able to carry through its entire life cycle. This strain was cultivated in vivo (dogs); daily observation for 10 mo. showed no forms other than trophozoites passed in stools. When a single portion of 250 gm. of fresh calf's liver was fed to each of 4 such dogs on balanced diet, cysts were found in the stools of 3 after 7 days. In all 4, the bowel movements were reduced after the liver feeding and the feces became less fluid. The authors believe the appearance of cysts may be related to the dehydration of the contents of the large bowel.

4345. **KLIGLER, ISRAEL J. The epidemiology and control of malaria in Palestine.** 240p. 22 maps, 32 fig. University of Chicago Press: Chicago, 1930. Pr. $5.00. —The topographical and climatological factors which contribute to the prevalence of malaria throughout Palestine are the limestone formations, the dunes, and the rainfall. The heavy winter rains partially flow down the hills to the sea. The waters flowing along the winter wadis erode holes which form persistent pools in which *Anopheles* breeds. Sand dunes or sandstone outcrops usually block the course of the wadis near the sea, resulting in extensive coastal marshes. Springs in the foothills flow into neglected creeks. In the hills the inhabitants build cisterns for storage, as in Jerusalem and Safad; these constitute the principal anopheline breeding places. The large Huleh Marshes above the Sea of Merom make the surrounding plain and headwaters uninhabitable because of malaria. *A. bifurcatus* breeds only in cisterns in Palestine. There is no good evidence that this is a distinct race different from the species found in other regions of the world. Breeding probably continues in cisterns throughout the year, though adults are not commonly seen in the winter. This species is an important carrier in urban and rural highland districts depending on cisterns for their water supply; but is

of little importance in the foothills and places where natural water is available. *A. elutus* breeds from Mar. to Dec., is a house-visitor and is the most important malaria carrier in Palestine. The other important carriers are *A.* (*Myzomyia*) *sergenti* and *A.* (*M.*) *superpictus*. The other species found were *algeriensis, hyrcanus* (*sinensis*), *pharoensis*, and *multicolor*. *Plasmodium falciparum* is extremely rare in the spring, but the fall epidemic is severe. Numerous cases of *P. vivax* occur during late winter and early spring; there are epidemic outbreaks in June, July, and Aug. *P. malariae* is rare but, if present, is more common during the winter. The blood and spleen rates are highest in the age group 5-9 years. The importance of social factors in the epidemiology is shown by the existence of 2 groups side by side, the one (Jewish) having a high epidemicity and a low endemicity, while the other (Arabs) have a high endemicity and low epidemicity. The Jewish agricultural population is made up of recent city-dwellers living in close communities with good physicians at hand and with schools. Being less accustomed to hardships they are more susceptible to infection, but treatment maintains a low endemicity. The Arabs have no physicians, are of low intelligence and regard illness as of supernatural origin. They have a higher native resistance but the infections are chronic. The movements of population groups have a vast influence on the epidemiology. The Bedouins are practically 100% infected. They have no fixed abode but wander over the country seeking pastures and water. The immigrant, non-immune population in search of work encounter the infected nomadic Bedouins and the Fellahs. The pilgrimages to sacred places bring thousands into malarious regions who return to their homes bearing infections. Control of *A. sergenti* and *A. superpictus* has been successful through deflecting the flow from the springs in different directions at intervals of 5 or 6 days, or by impounding the water in the stream for 2 or more days. Paris green proved preferable as a larvicide to kerosene and cresol. *Gambusia* in clean canals has yielded good results. The native *Tylapia* has proved useful and possesses the added advantages of being able to keep tanks clean by eating vegetation and of being edible. No antagonistic action of *Chara* on larvae was found. In areas where no mosquito control has been possible (Hedera, Benjamina, Gan, Shmuel, and Jissr) there has been no spontaneous regression of malaria. The first three demonstration areas where antilarval measures were employed yielded in 1921 a malaria reduction of 82-91% at an annual per capita cost of $1.40-$2.36. At present, control is being carried on in 11 districts comprising a population of 40,000. The average per capita cost for all districts has been fairly constant for four years,—$0.50. In regions where antilarval measures were not feasible or were ineffective, attempts were made to control malaria by (1) killing of adult mosquitoes in houses, and (2) by quinine prophylaxis; neither was effective. Typical drainage works of a permanent character in specific areas are described.—*C. G. Huff.*

4346. LAUNOY, L., L. PANISSET, et Mlle. PRIEUR. Un cas d'évolution lente du surra expérimental chez le chat. *Rec. Méd. Vét. Exotique École Alfort* 4(1): 27-30. 1931.

4347. [MARKOV, A. A.] МАРКОВ, А. А. О нахождении трипанозом крупного рогатого скота Trypanosoma theileri Lav. в С. С. С. Р. [Trypanosomes of large cattle, T. theileri Lav., in U. S. S. R.] [French summary.] Русский Журнал Тропической Медицины. [*Russ. Jour. Trop. Med.*] 6(8): 522-524. 1928.—Distribution of this parasite in Russia.

4348. MARTINI, E. Klima und Seuchen vom Standpunkte des Entomologen. *Trans. 4th Internat. Congress Ent., Ithaca, 1928* 2: 463-477. 1929.—The distribution of insect-borne diseases is limited by the temp. requirements of both carrier and causative organism. Emphasis is laid upon the distinction between critical and threshold values of environmental factors and the recognition of this distinction is held to support the belief in the existence in connection with all insect-borne diseases of a territory inhabited by the carrier but not the parasite. This and the other interrelations of host, carrier and parasite are illustrated from the field of malaria, special attention being given to the relation between two opposing factors in the endemic development of malaria: number of *Anopheles* mosquitoes and number of domestic animals in proportion to the human population. The spread of infection is also influenced by temp. as it affects the metabolic rate and viability of the carrier, length of its imaginal life, and rate of development of the parasite. The season of outbreak of a disease depends not only on the biology of the carrier but also on that of the parasite, the peak of an epidemic not necessarily following closely upon the peak of abundance of the carrier. The importance of the exoskeleton in protecting insects against the dangers of evaporation is stressed and is illustrated by the behavior of various Culicidae. In the development of epidemics those relations that obtain between climatic factors, such as humidity and precipitation, and the conditions due to human habitation are considered significant. Other climatic factors are discussed briefly.—*E. M. Walker.*

4349. MATSUI, KAICHI, and ASAO KUMATA. Studies on fish disease. A new Copepod parasite of the fresh water eel. [In Japanese.] *Suisan Kôsyû. Sik. Hok.* 23(4): 131-141. 3 pl. 1928.—*Lernaea elegans* Leigh-Sharpe, 1925, is described and its life history, occurrence and control considered. The parasite is found attached chiefly to the mouth cavity of the eel, but also on the body surface of cyprinids and cyprinodonts. It has a symbiotic alga, *Cassatiovolvox copepodicola,* in its intestinal epithelium. The head of an infected eel has a distorted appearance. The parasite occurred rather abundantly in a culture pond for eels and caused losses. It can not thrive in water of high salinity.

4350. MAURICE, G. K. The history of sleeping sickness in the Sudan. *Sudan Notes & Rec.* 13(1): 211-245. 9 pl. 1930.—This is mainly an historical account of the medical and sanitary measures used in combating epidemics between 1911 and 1929. The rôles of *Glossina palpalis* and *G. morsitans* as carriers of human trypanosomiasis are briefly outlined and an account of the spread of the disease in Africa is of distributional interest. Several photographs illustrate typical fly habitats and methods used in their control.—*W. W. Bowen.*

4351. [MELIK-ADAMÏAN, S. S.] МЕЛИК-АДАМЯН, С. С. О врожденной малярии. [Congenital malaria.] Русский Журнал Тропической Медицины. [*Russ. Jour. Trop. Med.*] 7(2): 75-78. 1929.—In Sukhum and Azerbaijan (endemic malarial regions) out of 23 infants, examined 8-20 hrs. after birth, 8.5% were positive for plasmodia; in Zangelan district, out of 27, aged 1-10 days, 33%; in Ali-Abad, out of 27, aged 1-10 days, 18.5%. Out of 605 children under 3 years, 46 had plasmodia. Though born in winter, their first malarial attack occurred in March-April, when no fresh primary infection was possible. All this bespeaks congenital malaria. In all the cases the mothers were malarial.

4352. MESNIL, F. Sur l'adaptation des trypanosomes à l'homme. *Bull. Soc. Path. Exotique* 23(7): 719-721. 1930.—Mesnil, experimenting with serum from the case described by Vaucel [see B. A. 6(2): Entry 4396], accepts the conclusion that *Trypanosoma rhodesiense* is only *T. brucei* recently adapted to man.

4353. MORISHITA, KAORU. A flagellate protozoan found in a human blood smear. *Taiwan Igakki Zasshi* [*Jour. Med. Assoc. Formosa*] 306. 58-59. 1 pl. 1930.—A crithidian flagellate was found in examining a blood smear from a Formosan girl. The source of the organism was not revealed; probably it was not from the blood stream of the patient or from the staining reagents. —*E. C. Faust.*

4354. MORISON, GUY D. Observations on the number of mites, Acarapis woodi (Rennie), found in the tracheae of the honey-bee. *Bee World* 12(7): 74-76. 1931.

4355. **NARRO, RAFAEL B. Un flagelado patogeno. "Pirotrypanum" o "Piroplasma trypanum."** [A pathogenic flagellate.] *Rev. Mexicana Biol.* 7(4): 79-88. 4 fig. 1927.—An organism, isolated from a fatal disease of cattle resembling piroplasmosis, is described. Intracellular forms in the blood cells measure 2-7μ. After a period of intracellular development they leave the blood cells and grow to 40μ. The intracellular stage resembles *Piroplasma bigeminum;* the extracellular form, *Schizotrypanum cruzi.* It is concluded that this organism is not a stage in the life cycle of *Piroplasma* but is a new form occupying a position between *Piroplasma* and *Trypanosoma,* and it is given the provisional name PIROTRYPANUM (p. 88).—*J. McA. Kater.*

4356. **NATTAN-LARRIER, L., et B. NOYER. Trypanosome du dromadaire et trypanosome du cheval au Maroc.** *Bull. Soc. Path. Exotique* 23(7): 747-760. 1930.—Trypanosomes from the horse and the dromedary in Morocco were not identical in their action on small laboratory animals: the equine trypanosome frequently produced abortion in the guinea-pig and did not traverse the placenta; the dromedary trypanosome did not cause abortion but passed easily into the fetal blood and produced infections in the offspring. Both trypanosomes were readily affected by human serum, the dromedary type the more readily. These trypanosomes, if not belonging to different species, must have been profoundly modified by sojourn in their respective hosts.

4357. **NATTAN-LARRIER, L., et B. NOYER. Trypanosome du dromadaire et trypanosome du cheval au Maroc. X.** *Bull. Soc. Path. Exotique* 24(2): 112-122. 1931.—The passage of the Moroccan horse trypanosome successively through 9 pregnant mares did not produce a strain capable of infecting the fetus in utero. Similar passage of the Moroccan dromedary trypanosome through pregnant ♀♀ endowed it with the capacity, not originally present, of infecting the unborn fetus. Experiments in vitro showed that the horse trypanosome did not settle on placental fragments in the test tube, while the dromedary trypanosome not only affixed itself to the surface but penetrated the interior of fragments of dromedary placenta. Previous experiment had shown certain differences in biologic characteristics between horse and dromedary trypanosomes. The question whether they belong to distinct species was submitted to serologic test. Lysis of either horse or dromedary trypanosome was produced by either anti-dromedary or anti-horse serum. Immune serum from a rabbit infected with horse trypanosomes protected 1 mouse entirely against horse trypanosome infection and delayed death in a 2nd mouse infected with dromedary trypanosomiasis; the control mouse died of equine trypanosomiasis. Serum from a rabbit infected with dromedary trypanosomes protected 3 mice completely, the one against dromedary, the other against horse trypanosomiasis. The authors conclude that the 2 trypanosomes belong to the same species, but the one strain has become adapted to the horse, the other to the dromedary and neither is now capable of infecting the host of the other.

4358. **NAPIER, L. EVERARD. The artificial feeding of sandflies.** *Indian Jour. Med. Res.* 18(2): 699-706. 1 pl., 2 fig. 1930.—From limited preliminary observations it is concluded that: (1) in the absence of red blood corpuscles little proliferation of either *Leishmania donovani* or *L. tropica* occurs in *Phlebotomus argentipes;* (2) both species develop equally well in this sandfly in the presence of red blood cells; (3) in *P. minutus* (*babu*), *L. donovani* does not proliferate or, at least, does not proliferate so readily as in *P. argentipes.*

4359. **[NEVĬADOMSKIĬ, M. M.] НЕВЯДОМСКИЙ, М. М. О возбудителе рака. [Cause of cancer.]** [German summary.] Одеський Медичний Журнал. [*Odessaer Med. Zeitschr.*] 5(3/5): 233-236. 1930.—The author describes a parasite found in every cancerous growth of mice, rats and men. It is a sporozoan belonging to Schizogregarinida, since it has a pronounced stage of schizogony. The cycle in cancers of mice and rats is described. In these gregarines, the author reports still another parasite, which he believes to be the true exciter of human cancer, the gregarine being only an intermediate host. This parasite belongs to Sarcosporidia; only certain stages in its development were observed. Injecting cultures containing spores of this parasite into mice produced a cancerous growth. In human cancerous growths, the author reports both gregarines and their parasites. He declares that he obtained in culture development of spores of the exciter of human cancer.

4360. **NIESCHULZ, OTTO. Zoölogische bijdragen tot het Surraprobleem. VI. Overzicht over de tot nu toe bereikte resultaten. [Zoological contributions to the Surra problem. VI. Review of results to date.]** *Handelingen 4th Nederlandsch Indisch Natuurwetensch. Congres Weltevreden* 1926: 329-338. 2 pl. 1926.—Transmission has been effected with *Tabanus rubidus* Wied., *T. striatus* Fabr., *T. immanis* Wied., *T. ceylonicus* Schin., *Chrysops flaviventris* Macq., and *Haematopota cingulata* Wied. Transmission was easily obtained with an interval of 1-15 min., very probable after ½ hr. with *T. rubidus, T. striatus* and *H. cingulata,* negative after ½ day, positive in 1 exceptional case with *T. rubidus* after 1-3 days, negative after long periods up to 30 days. Feeding infected flies on 2 susceptible horses in succession infected both. The disease was transmitted from a naturally infected but clinically healthy buffalo (kerabu). Direct transmission and after ½ hr. interval failed with *Stomoxys calcitrans.* The complete development of the commonest spp., *T. rubidus* and *T. striatus,* was followed in the laboratory. They lay respectively 386-533 and 193-418 eggs in 6-11 mm. long packages. *Chrysops* lays in a flat layer, *H. cingulata* singly or in small groups, *T. striatus* has 7 larval stages: 1st not feeding, lasts ± 15 min.; 2nd to 6th stages feeding, each 2-10 days; 7th is prepupal stage, feeding followed by lethargy, lasts 14-159 days; pupal stage 8-12 days; total 44-210 days. *T. rubidus* is similar; some have 8 larval stages; pupal stage 9-13 days; total 51-192 days. For specific determination chitinous plates of larvae and cephalic tubercles and penultimate abdominal segment of pupae are important. Numerous breeding places are recorded; larvae were all found in soil, mud, or sand close to water in woods or open country. *T. rubidus* and *T. striatus* larvae also found at pools of water containing over 2% salt. At Tapanoeli (Sumatra) larva of *T. bubbermani* and at west coast of Sumatra larvae of *T. pararufiventris,* both new spp. (no description). Most important parasites are *Phanurus* sp. At Buitenzorg from Dec. to Mar. 60% of the eggs were parasitized. The parasites develop in 10 days and copulate immediately after escaping. A ♀ produces 25-103 offspring (6 observations). Fresh and 1-3 day old eggs could be infected experimentally.—*H. O. Mönnig.*

4361. **NIESCHULZ, OTTO. Zusammenfassung der Ergebnisse einiger Surraübertragungsversuche auf Java und Sumatra.** *Arch. Schiffs- u. Tropen-Hyg.* 33(5): 257-266. 1929.—Investigations involving several insect species and over 14,000 specimens indicate that as carriers of Surra the Tabanidae are most important. From Java and Sumatra 17 *Tabanus,* 3 *Chrysops,* and 4 *Haematopota* spp. were shown experimentally to be carriers, *Tabanus* spp. being most efficient. Carrying capacities of each species over various time intervals are given. Closely related *Tabanus* and *Chrysops* species may possess very different carrying capacities. In all attempts Muscidae (*Stomoxys, Lyperosia, Musca*) failed to transmit Surra when horses were used as experimental hosts, but were effective on small laboratory animals. At least some species of mosquitoes (especially *Anopheles fuliginosus*) may transmit Surra over very short time intervals but are regarded as having very little practical significance as carriers.—*L. M. Dickerson.*

4362. **NÖLLER, WILHELM. Die Züchtung der parasitischen Protozoen. [The cultivation of parasitic Protozoa.]** In **S. von PROWAZEK Handbuch der pathogenen Protozoen** 3: 1815-1967. Illust. Johann Ambrosius Barth: Leipzig, 1928. Pr. 16 M.—This compendium is accompanied by a 27-page bibliography.

4363. **ODA, TEIBUN, KAORU MORISHITA, and HIROSHI NAMIKAWA. Studies in the treatment of malaria. I. General introduction and routine methods. II. Experimental treatment with plasmoquine. (I Report.) Effect of the short course treatment in various forms of malaria. III. The therapeutic effect of Saiko, an indigenous drug in the Orient, upon the malarial infections.** *Taiwan Igakki Zasshi [Jour. Med. Assoc. Formosa]* 30(1) (no. 310): 8-13. 1931.—After presenting the history of malaria therapeusis and considering the efficiency and ineffectual properties of the several malaricidal agents, the results are presented on one week's standard treatment with plasmoquine (without and with quinine) on the 3 species of malarial plasmodia. Observations were made up to 9 weeks. The relapse rate in tertian infection was 12.5% with plasmoquine alone, and 14.5% with combined therapy; no relapses in quartan infection occurred in both types of therapy; in malignant tertian, the relapse rate with plasmoquine alone was 100%; in combination with quinine, 42.8%. Data concerning the splenic index, hemoglobin percent, body weight and toxic manifestations are included. Clinical experiments with "Saiko" showed it to have no malaricidal value.—*E. C. Faust.*

4364. **ODRIOSOLA, R. Ein Beitrag zum Studium der Protozoenerkrankung des Darmes beim Kinde.** *Arch. Schiffs- u. Tropen-Hyg.* 34(12): 643-651. 1930.—*Endamoeba histolytica, E. coli, Giardia, Chilomastix, Blastocystis hominis* and other intestinal protozoa have been found in stool examinations of children in Paraguay, particularly in dysenteric cases. These organisms are not only responsible per se for the dysentery but also during a latent period provoke an enterogenous toxemia, with a variety of clinical symptoms. Changes in the blood picture and involvement of the spleen and other haematopoietic organs are at times recorded. Chronic parasitism may affect the glands of internal secretion, with a tendency to infantilism.—*E. C. Faust.*

4365. **OTTOLENGHI, D. La lotta contro la malaria nelle bonifiche. [The struggle against malaria in connection with land reclamations.]** *Italia Agric.* 67(7): 467-475; (8): 528-540. 8 fig. 1930.—Italy is the classical country for land reclamations to restore to agriculture great tracts of land which are inundated either permanently or periodically. These regions are almost always the seat of an endemic malaria more or less intense so that it is important to combat the fever while draining the soil. The author discusses first the fact that if this drainage is complete, the fever is completely wiped out. Following this, he explains the principal problems of the anti-malarial struggle in the regions which are being drained and the means by which these problems are met. He also gives information from personal experiences concerning practical conditions, choosing as a field for his researches the celebrated land reclamations of the Province of Ferrara.—*D. Ottolenghi (transl. by C. W. Dawley).*

4366. **POPOW, P. P., und D. N. SASSUCHIN. Ueber die Parasiten der Eidechse Agama caucasica Eichwald 1831.** *Zentralbl. Bakt. I Abt. Orig.* 120(1/2): 93-96. 1931.—Examination of 6 specimens of this lizard showed Kurloff's bodies and *Haemogregarina lacertae* in the blood, *Thelandros cinctus* v. Linstow ♂ and ♀ in the intestinal canal, and encysted larvae of *Agamospirura* sp. in the muscles.

4367. **QUÉRANGAL des ESSARTS, J. Parasitisme accidentel du tube digestif par un acarien de la famille des tyroglyphinés; le Tyroglyphus farinae.** *Presse Méd.* 38(70): 1176-1177. 1930.—In more than 1000 stool examinations, the author found 8 cases of accidental infestation with *Tyroglyphus* or *Aleurobius farinae,* which is ordinarily found only in wheat or flour.

4368. **[RASVETAEV, V. N.]** РАСВЕТАЕВ, В. Н. **Опыт прививки малярии животным. [Inoculation of animals with malaria.]** Русский Журнал Тропической Медицины. [*Russian Jour. Trop. Med.*] 6(10): 644-648. 1928.—18 rabbits, inoculated intravenously and intraperitoneally, gave negative results, as did 9 mice and 2 rats. 3 fox-terriers showed a clinical picture similar to malaria, but no plasmodia in blood. 6 kittens (aged 1 month) gave different results; all reacted to the inoculation, but showed no plasmodia. One (reaction very strong) was reinoculated with another species of *Plasmodium;* 7 days later it showed clinical, malaria-like picture, and in the blood were forms similar to schizonts of *Plasmodium malariae.* During the paroxysms, formations in blood resembled merozoites. The autopsy revealed hyperemic kidneys, enlarged liver and spleen.

4369. **REGENDANZ, PAUL. Pathogenicity of Trypanosoma lewisi and blood sugar in infections with Trypanosoma lewisi and Bartonella muris ratti.** *Ann. Trop. Med. & Parasitol.* 23(4): 523-526. 1929.—The presence of *T. lewisi* may activate an infection with *Bartonella* even in non-splenectomized rats. The latter infection may be eliminated by the arsphenamines, whereas the former can be treated successfully only with arsenophenylglycine. The data on blood sugar are inconclusive.—*M. W. Kamm*

4370. **RICHTERS, und FRISCHBIER. Die Bekämpfung der Sklerostomiasis des Pferdes vom Standpunkt der Hygiene und Therapie.** *Berliner Tierärztl. Wochenschr.* 46(31): 493-502. 6 fig. 1930.—Vigor and state of nutrition of the horse on the one hand and degree of worm infestation on the other are not always mutually related; likewise month of greatest worm incidence and month showing most frequent gastro-intestinal disturbances. An appreciable proportion of colic cases must be traced to circulatory and paralytic disturbances of the intestinal canal caused by sclerostomiasis. Colic diseases are more frequent in early years but are less fatal than in the more sparsely affected later years with higher mortality. Sclerostome larvae survived in feces outside the body for 16 mo. Motion pictures were taken of larvae migrating in large numbers on glass, blades of grass and fungus hyphae. The larvae were resistant to fertilizers (Thomas meal, Chile saltpeter and kainit) but died in 1-2 hr. in finely broken feces to which had been added quicklime and dilute milk of lime. For destroying the parasite in the stable the biothermic method (packing the manure) should be used. Against ascarids, antimony tartrate and CCl_4 are effective; sclerostomex, atoxyl, chenopodium oil and equivermon are ineffective for sclerostomiasis. Tartar emetic is the most effective means against sclerostomiasis. Larvae in the thrombus of the anterior mesenteric root are also killed. Other control measures are discussed. *Richters (transl. by O. L. Williams).*

4371. **ROBERTS, F. H. S. The occurrence of a beetle (Onthophagus granulatus Bohen) in the stomach of domesticated animals.** *Queensland Agric. Jour.* 35(3): 171. 1931.—In Australia, a dung beetle, *Macropocopris symbioticus* Arrow, lives in the anus of wallabies. The writer believes this is the first report of such beetles in the intestinal tract of lower animals. This note also records *Onthophagus granulatus* in the stomach of a horse and several calves which had died; however, death may have resulted from other causes.

4372. **SALT, GEORGE. A further study of the effects of stylopization on wasps.** *Jour. Exp. Zool.* 59(1): 133-163. 2 pl. 1931.—Stylopized individuals of *Belonogaster* are morphologically unmodified, but their coloration shows a slight diffuse erythrism. No external effect of stylopization is found in *Vespa.* Stylopized specimens of *Odynerus* are often altered in both structure and color. The alterations of the secondary sexual characters are such as to produce an assimilation and in some cases an interchange of certain of these characters. Specimens of *Chlorion* and *Sphex* infested with Strepsiptera are sometimes changed in structure and color. Affected females tend slightly toward the male condition in certain secondary sexual characters. Stylopized females of *Chlorion* and *Sphex* probably fail to construct nesting burrows. Many stylopized individuals of *Odynerus, Chlorion,* and *Sphex* may be looked upon as intersexes. Different characters are modified by stylopization in a more or less definite sequence; this orderly and pro-

gressive modification seems to be one of the distinguishing characters of intersexes. Effects of stylopization have been found, among wasps, in *Odynerus, Chlorion,* and *Sphex,* but are absent in *Belonogaster, Polistes,* and *Vespa.* This difference is attributable to the different feeding habits of the 2 groups of genera, since the first 3 feed on a fixed ration of food, while the last 3 feed progressively. Probably the external abnormalities of stylopized individuals are due to metabolic disturbances produced in them by their parasites.—*Author (courtesy Wistar Bibl. Serv.).*

4373. **SAUTET, JACQUES. Contribution à l'étude de la dysenterie amibienne expérimentale chez le chat.** *Rev. Méd. et Hyg. Trop.* 22(2): 67-72. 1930.—In only 3 out of 9 cats inoculated with amebic feces from 5 human cases were amoebae or amebic lesions found, though 3 of the cats that remained negative died 4-11 days after inoculation.

4374. **SCHILLING, CL., und K. F. MEYER. Piroplasmosen.** [In: **W. KOLLE, u. A. v. WASSERMANN. Handbuch der pathogenen Mikroorganismen.** 3 Auflage. **W. KOLLE, R. KRAUS, und P. UHLENHUTH.** Bd. 8, Lief. 9.] P. 1-94. 4 col. pl., 34 fig. (7 col.). Gustav Fischer: Jena; Urban & Schwarzenberg: Berlin u. Wien, 1927.—With 22 pages of bibliography.

4375. **SCHILLING, CLAUS. Spontaneous and experimental infection.** *Jour. Trop. Med. and Hyg.* 33 (22): 334-336. 1930.—It had previously been shown by Schilling and others that laboratory and wild or "genuine" strains of *Trypanosoma brucei* differ both in antigenic qualities and in virulence, the "genuine" having slight virulence to mice, but developing high and constant virulence by 9 passages through mice. In Schilling's recent experiments a single passage of a laboratory strain through its natural vector, *Glossina morsitans,* is sufficient to wipe out this acquired virulence and restore to it the characters of a "genuine" strain.

4376. **SCHNEIDER, OTTO. Subtropische, unter dem Bilde der Syphilis oder des Sodokufiebers verlaufende Insektenstichinfektion. [Subtropical insect-bite infections simulating syphilis or sodoku fever.]** *Arch. Schiffs- u. Tropen-Hyg.* 35(2): 109-110. 1931.

4377. **SCHUMAKER, EUGENE. Relation of Balantidium coli infection to the diet and intestinal flora of the domestic pig.** *Amer. Jour. Hyg.* 13(2): 576-584. 1931.—In determinations on cecal material from 79 pigs, heavy infections with *B. coli* were accompanied generally by an intestinal flora with greater numbers of aciduric organisms and lesser numbers of lactose fermenters and proteolytic anaerobes. The converse was also true; light infections were, in general, accompanied by a lesser number of aciduric organisms and a greater number of lactose fermenters and proteolytic anaerobes. Although high infections were accompanied by a very slightly more acid reaction of the cecal content, it is doubtful whether this finding has any significance. Large amounts of starch, both microscopic and macroscopic, were found in the cecum in pigs heavily infected. Heavy infections were accompanied by a diet high in carbohydrate in the form of grain. This was manifested by the nature of the intestinal flora and by the presence of undigested carbohydrate in the immediate environment of the parasite.—*Author's conclusions.*

4378. **SCHWETZ, J., et L. FORNARA. Y a-t-il des formes d'évolution des trypanosomes chez l'hôte vertébré?** *Bull. Soc. Path. Exotique* 22(9): 862-871. 2 pl. 1929.—In trypanosomiasis in cattle at Stanleyville, often not a single trypanosome was found in the peripheral blood of a dying animal, though they were seen in the heart's blood. In the capillaries of the heart, lungs, spleen, etc., of some animals, however, were leishmanioid or "chromatic" bodies, which the authors believe to be not a degenerative form indicating destruction of the trypanosomes, but something analogous to the division form of *Plasmodium falciparum.* Each consists of 2 nuclear masses, 1 large and 1 small, generally without any distinct surrounding protoplasm or membrane. The small nuclear mass is sometimes by the side of the large one and sometimes within a kind of vacuole in the latter, recalling thus the "latent bodies" of Moore and Breinl. Leishmanioid bodies were found also in some of the organs of an infected hog. They occur only in the capillaries.

4379. **SCHWETZ, J., et F. CABU. Note préliminaire sur les Grahamella-Bartonella des rats splénectomisés de Stanleyville (Congo Belge).** *Bull. Soc. Path. Exotique* 23(5): 464-473. 2 pl. 1930.—The authors describe observations and experiments from which they conclude that Brumpt is right in judging *Bartonella muris-ratti* and *Grahamella muris-ratti* to be synonyms. The latter name should be preserved, not merely because of priority, but to avoid confusion with the other and entirely distinct *Bartonella* forms. [See also A. Lwoff. Grahamella et Bartonella. *Bull. Soc. Path. Exotique* 23(5): 473-474. 1930.]

4380. **SCHWETZ, J., and N. STORCK. On a case of triple infection in a cow—Piroplasma bigeminum, Gonderia mutans and Trypanosoma uniforme.** *Trans. Roy. Soc. Trop. Med. and Hyg.* 23(6): 637-639. 1 pl. 1929.—Three hematozoa were found in a single animal, the *Piroplasma* infection occurring only this one time in 1000 cattle. *T. uniforme* occurs much more frequently in Stanleyville than *T. vivax,* the common Belgian Congo form.—*M. W. Kamm.*

4381. **SEEGERT, JOACHIM. Untersuchungen über Mal de Caderas, ihre Behandlung mit Naganol-Antimosan und die Frage der Übertragung. [Mal de Caderas; its treatment with naganol and antimosan, and its transmission.]** *Arch. Schiffs- u. Tropen-Hyg.* 34(2): 99-123. 14 fig. 1930.—The author provisionally believes that the transmitting agent of the trypanosome is a leech found in waters frequented by affected horses. There appears to be no natural immunity, and a horse once affected seems to be more susceptible to another attack. There are horses, however,—reason unknown,—which have survived the extinction of 2 or more herds.

4382. **SERGENT, EDW., ET. SERGENT, et A. CATANEI. Paludisme des oiseaux. Étude de Plasmodium rouxi chez son hôte vertébré.** *Arch. Inst. Pasteur Algérie* 7(2): 165-180. 1 pl. 1929.—*P. rouxi* occurs in Algerian passerine birds. A very young state always contains 2 unequal pigment granules. The most numerous forms are rectangular 2-4μ long x 1-1.5μ wide. The parasite does not curve around the nucleus of the red cells. The 4 merozoites are arranged around the pigment. The gametes are the largest forms. Experimentally, *P. rouxi* presents the following characteristics: a long incubation period (21 days on the ave.); a rather long acute attack in which the maximum number of parasites is reached only after 1-3 weeks, with maximum never so high as that attained by *P. relictum;* a state of chronic infection lasting several years without being cured and in the course of which parasite recurrences are observed. The organism is very pathogenic, mortality in laboratory inoculated canaries being 30%. Splenomegaly is constant.—*Authors' résumé (transl. by C. W. Dawley).*

4383. **SERGENT, EDMOND, A. DONATIEN, L. PARROT, et F. LESTOQUARD. Transmission héréditaire de Piroplasma bigeminum chez Rhipicephalus bursa. Persistance du parasite chez des tiques nourries sur des chevaux.** *Bull. Soc. Path. Exotique* 24(3): 195-198. 1931. The fact that *P. bigeminum* passes from the adult tick, *R. bursa,* to the larvae of the next generation was demonstrated in 2 experiments. In 2 other experiments *P. bigeminum* persisted in *R. bursa* nymphs taken from horses as well as from cattle into the adult stage of the 2nd generation. In 3 more experiments infected ticks taken from horses were as capable as those from cattle of conveying piroplasmosis to cattle. The number of ticks used in each experiment was about 50-240.

4384. **SIMER, PARKE H. A preliminary study of the cestodes of the spoonbill, Polyodon spathula (Wal.).** *Trans. Illinois State Acad. Sci.* 22: 139-145. 1929.—Of 3 cestode intestinal parasites of the spoonbill, the most common was *Marsipometra hastata* (Linton); 2 are new

to science, *M. parvi* (p. 142) and *M. confusa* (p. 44). All but 1 of the 139 fishes studied were affected; the ave. number per host was about 400, with a maximum of over 5000. No remarks are made concerning the effects of parasitism on the host fish, since an uninfected one rather than an infected one might be regarded as abnormal. No intermediate hosts for the parasites could be discovered.—*Evermann & Clark.*

4385. **SIMMONS, R. J. Notes on a tsetse belt in western Uganda.** *Bull. Ent. Res.* [*London*] 19(4): 421-433. Map. 2 pl. 1929.—Prior to 1900-05 South Ankole was free from tsetse. About 1906-07 *Glossina morsitans* crossed the Kagera northwards at Kakitumba, Nyaruambu, and Kafunza (Tanganyika). Cattle in those areas were moved north on the advent of the fly, thus spreading it in small numbers, mainly northwards. The epizootic recorded in Ngarama and Bukanga in 1910-11 was due to "direct" transmission following the introduction of infected cattle from the south. The influx of man in 1914-15 through the Nyaruambu and Kafunza centers, chiefly the former, caused marked disturbances and rapid spread of the fly, principally along the line of communication to the north. The sudden withdrawal of the human element resulted in marked diminution of fly density, and the advent of rinderpest in 1919 destroyed an important alternative food supply, thus giving further impetus to the reduction. After 27 years the tsetse had retired to those two points from which it had originally spread. The Kakitumba center had not suffered human invasion, as did the foregoing, and no great activity of *Glossina* has therefore been recorded. The picture presented is that man himself has proved the greatest factor in that wide and rapid spread of *Glossina* which Ankole experienced during 1907-1917. The impressions formed from detailed work are: (1) The Ntundu Valley is now the primary center, and serves as a feeder to the Kabiganda and Nyaruambu fly-areas; (2) the fly depends on game for its existence; (3) transportation by man and his vehicles constitutes a grave factor in the spread of the tsetse; (4) smoke-houses, supported in certain circumstances by clearings, should prove valuable factors in control; (5) a motor car is a most useful adjunct in the making of tsetse surveys.—*Author's summary.*

4386. **[SMIRNOVA, E. V., and P. I. SIMANIN.] СМИРНОВА, Е. В., и П. И. СИМАНИН. К вопросу о соотношении количества гамет в крови малярика с количеством ооцист на желудке Anopheles. (Sur la question de la corrélation entre le nombre des gamètes du sang de paludéens et le nombre des oocystes sur la paroi gastrique de l'Anopheles.)** [In Russian, with French summary, p. 69-70.] *Russian Jour. Trop. Med.* 6(1): 38-46. 1928.—The authors experimented with infection of *Anopheles maculipennis* Mg. by *Plasmodium praecox*. In stating the results of 11 experiments the parasite number in each case is reckoned per 500 leucocytes: (1) of 5 ♀ *Anopheles* nourished on a patient whose blood contained 65 gametocytes (37 ♂ and 28 ♀), 2 became infected: 1 had 33 oöcytes present in the tissues, the other 20. (2) Of 6 ♀ mosquitoes which fed on malaria-infected blood containing 37 gametocytes (17 ♂, 20 ♀), 3 acquired the infection; 1 disclosed 2 oöcytes, and the other 4; 3 mosquitoes remained unharmed. (3) Of 4 ♀ *Anopheles* which ingested blood containing 96 gametocytes (56 ♂ and 40 ♀), 2 ♀♀ became infected: 1 showed 15 oöcytes, the other 1. (4) Of 4 ♀ mosquitoes nourished with blood containing 94 gametocytes (34 ♂ and 60 ♀) 2 acquired the infection,—one with 2 oöcytes, the other with 1. (5) Of 14 ♀♀ which ingested blood containing 9 gametocytes (4 ♂, 5 ♀), only 1 became infected and showed 3 oöcytes. (6) Of 9 ♀♀ which sucked blood containing 46 gametocytes (24 ♂ and 22 ♀), 6 became infected: the 1st disclosed 5 oöcytes, the 2nd 3, the 3rd 3, the 4th 4, the 5th 5, and the 6th 2 cysts. (7) Among 3 ♀ *Anopheles* nourished on a patient whose blood contained 43 gametocytes (20 ♂ and 23 ♀) the 1 insect which became infected showed 4 oöcytes. (8) A ♀ mosquito ingested blood containing 125 gametocytes (50 ♂ and 75 ♀); it became infected and showed 8 oöcytes. (9) Of 2 ♀♀ nourished on a patient whose blood contained 42 gametocytes (19 ♂ and 23 ♀), 1 became infected and presented 4 oöcytes. (10) Among 5 ♀ mosquitoes fed on blood containing 62 gametocytes (32 ♂ and 30 ♀), 3 became infected: 1 showed 47 oöcytes, one 93, and the 3rd 56. (11) Among 6 ♀♀ fed on blood which contained 31 gametocytes (10 ♂ and 21 ♀), 4 became infected and carried 10 oöcytes, 5, 7 and 6 respectively. Thus the number of oöcytes of the gastric muscular system is not directly proportional to the number of ♀ gametocytes ingested. The number of gametocytes, per c. mm. of malarial blood, required to produce a probable infection of 50% of the mosquitoes will not be below 150-200.—*From authors' summary* (*transl.*).

4387. **SNIJDERS, E. P. Autochtone amoeben-dysenterie in Nederland in verband met de epidemiologie dezer ziekte.** *Nederlandsch Tijdschr. Geneesk.* 73(50): 5834-5848. 1929.—Several cases of indigenous amoebiasis in the Netherlands are described, together with details of their clinical, diagnostic and epidemiological features. In proportion to the few cases of actual dysentery in Holland, the number of cyst carriers is much greater. This is not necessarily due to a particular type of organism; the difference may be due to the climate.—*E. P. Snijders* (*transl. by D. A. Koch.*).

4388. **SUTTON, HARVEY. Geographical control of disease in Australia.** *Rept. Australasian Assoc. Advanc. Sci.* 19: 480-486. 1 map. 1928 (1929).—Trachoma occurs in districts with high summer temp., low rainfall, dust, glare, and flies; hookworm in the 50-in. rainfall belt north of Kempsey; hydatid in the sheep districts which are areas of somewhat constant moderate rainfall; filaria and dengue are conditioned by the presence and abundance of the mosquito vectors.—*R. T. Hewlett.*

4389. **SWELLENGREBEL, N. H., and A. de BUCK. Correlation between intestinal and salivary infection in Anopheles maculipennis.** *K. Akad. Wetenschappen Amsterdam Proc.* 34(1): 183-185. 1931.—In *A. maculipennis* the incidence of intestinal infection with the malarial parasite allows of a more accurate estimate of the actual number of sporozoite carriers than does the incidence of salivary infection. At present there is no reason why this conclusion should not apply also to other spp. For practical purposes, in establishing the rate of mosquito infection in nature, precedence should be given to the examination of the gut if circumstances do not allow of a more complete investigation.—*Authors' conclusions.*

4390. **TERADA, B., and S. ONO. The toxicological investigation in the toxic substance obtained from the larvae of Hypoderma sp. of Mongolian cattle at the oesophageal stage.** [In Japanese, with English abstract.] *Jour. Jap. Soc. Vet. Sci.* 9(3): 212-220. 3 pl. 1930.—The toxic principle in the larva is precipitated by alcohol or ether. The dried precipitate retains its toxicity for several months. The minimum lethal dose of this precipitate in the rabbit is 3-5 mgm. per kgm. by intravenous injection. This toxic substance in dilute solution is precipitated by CO_2 and half-saturated $(NH_4)_2SO_4$, but not by N/500 H_2SO_4. It is slightly dialyzable and adsorbed by bone charcoal. The toxin resists 60° C. for 30 min., but is destroyed at 100° C. The ash shows no toxic action. The toxin seems to be closely related to globulin. The sudden fall of blood pressure in the carotid artery following intravenous injection of the toxin is due to the marked rise of the blood pressure in the pulmonary artery. The toxin raises the tonicity of the excised small intestine of the rabbit and the contraction of the excised uterus.—*From authors' abstract.*

4392. **TSUCHIYA, H. A study of variabilities in dimensions and numbers of discharged cysts of Giardia lamblia (Stiles, 1915) from day to day under normal**

conditions. *Amer. Jour. Hyg.* 13(2): 544-567. 1931.—All feces of 2 human carriers were examined for 36 and 28 days respectively. The total outputs of daily stools were weighed, the number of cysts found per day and per gm. noted, and 100 cysts per day for each carrier measured and these measurements studied statistically. The study showed constant fluctuations in the number of discharged cysts per gm. or per day from day to day, the variability being comparatively regular and cyclical but not to the extent reported by Porter and Boeck, these being 14 days and 7 days respectively. The dimensions of the cysts showed a cyclical variation. A negative correlation existed between the number and the size of the cysts, i.e., as the number of cysts of each strain increased, the volume, length and breadth of the cyst decreased. A possible explanation is offered. The consistency of the stool in the 2 subjects studied is not related to the numbers or dimensions of cysts discharged, showing that the physical factors which influenced the consistencies of the stool had no effect on the development of the cysts and that the principle governing the latter is to be considered as strictly biological. There was a positive correlation between the length and breadth of the cysts, indicating that the length did not increase at the expense of the breadth. Rodenwalt and Reuling's (1921) contention that the younger cysts are always longer and slender was not tenable in all instances.—*From author's summary and conclusions.*

4393. **TURCU, TITUS.** Die zeitliche Verteilung und das Mengenverhältnis der Makrogameten und Mikrogametozyten bei menschlicher und Vogelmalariainfektion. [Chronological distribution and relative numbers of macrogametes and microgametocytes in human and bird malaria.] *Arch. Schiffs- u. Trop.-Hyg.* 31(5): 212-232. 1927.—Thirty cases of treated human malaria showed regularly the presence of gametocytes of both sexes with the ♀ gametocytes more numerous always. In scarce findings exceptions occurred. In acute attacks of bird malaria the gametocytes ran parallel with the illness, both sexes were always present, generally the ♀ gametocytes were more numerous.—*A. de Buck.*

4394. **TURNER, A. W., and D. MURNANE.** On the presence of the non-pathogenic Trypanosoma melophagium in the blood of Victorian sheep, and its transmission by Melophagus ovinus. *Australian Jour. Exp. Biol. and Med. Sci.* 7(1/2): 5-8. 1 pl. 1930.—The authors confirm Hoare's findings as to the infection of *Melophagus ovinus* with *Trypanosoma melophagium* by ingestion of sheep blood, and infection of sheep by ingestion of *M. ovinus.*

4395. **TYZZER, ERNEST EDWARD.** Coccidiosis in gallinaceous birds. *Amer. Jour. Hyg.* 10(2): 269-383. 8 pl., 2 fig. 1929.—*Eimeria* oöcysts derived from infected chickens have usually been considered a single species, but this view is no longer tenable. The name *"Eimeria avium"* also appears to be without status. Young chickens purchased as day-old chicks, and incubator-hatched and brooder-reared turkeys, pheasants and quail were employed. Methods for keeping laboratory stock free from infection, for isolating special strains of *Eimeria,* and also the various controls for experimental infections are outlined. In chickens, 4 species of *Eimeria* are recognized: *E. tenella* [*Coccidium tenellum*] Railliet and Lucet, causing acute disease typically with hemorrhage into the caeca and lower intestine; *E.* **mitis** (p. 294), not notably pathogenic; *E.* **acervulina** (p. 296), causing grayish spots in upper small intestine with chronic disease and wasting; and *E.* **maxima** (p. 299), associated with thickening of the intestinal wall and in some cases with blood-tinged exudate. These species are differentiated on the basis of their distribution in the intestine, morphological features, including size and shape of the oöcyst, time required for the development of oöcysts and for their sporulation, pathogenicity, and host reaction. The development of *E. tenella* was followed throughout, and marked differences were found in the reaction of the epithelial cells to successive generations; in one stage of infection, the gland epithelium acquires invasive properties and becomes phagocytic. A *Cryptosporidium* morphologically identical with *C. parvum* of the mouse also occurs occasionally in the chicken. *Eimeria* **phasiani** (p. 315), and *E.* **dispersa** (p. 316), are found in the common ring-necked pheasant, and an organism morphologically similar to *E. dispersa* is found in the common bob-white or quail. In the domestic turkey *E. meleagridis* Tyzzer and *E.* **meleagrimitis** (p. 321) are recognized. Resistance to *E. dispersa* is not readily acquired by the quail so that heavy infections may occur in mature birds. In collaboration with E. ELIZABETH JONES, a study was made of the host limitation of spp. of *Eimeria.* No cross infections were obtained in chickens, pheasants, turkeys and quail with *E. acervulina, E. phasiani* and *E. meleagridis.* Cross infections were obtained in turkeys and occasionally with chickens with *E. dispersa* from quail, and this organism was readily transmitted from pheasant to quail. Since *Eimeria* infections are self-limited, it was found possible to utilize given lots of birds for successive tests. Immunity in all instances proved to be specific, i.e., immunity to any given species furnished no protection against infection with any other. Nuclear division was studied in the schizonts of *E. tenella* and evidence is furnished to show that the chromatin is included in the karyosome and that the multiple granules found in the polar expansions of the spindle of the dividing nucleus are centriolic in character. Following a consideration of the value of measurements, characteristics of coccidium infections of birds and their complications, the specific reactions of parasite and host cell are compared. Diagnostic and control measures are briefly outlined. Owing to the wide distribution of coccidia in commercial flocks, the presence of small numbers of oöcysts in the discharges is of no great diagnostic significance. In summary it is pointed out that the most acute pathogenic changes are associated with organisms that attain large size and penetrate deeply, e.g., the asexual forms of *E. tenella* and the gametocytes of *E. maxima. E. acervulina,* which produces only slight injury, becomes pathogenic when present in great numbers over a long period. Since the multiplication of the spp. of *Eimeria* studied is limited by cyclical influences, the extent of the infection is dependent upon dosage or the number of sporozoites that invade the epithelium. The number of oöcysts ingested is at best only a rough index of dosage since many pass through the intestine without hatching.—*E. E. Tyzzer.*

4396. **VAUCEL, M.** Identification du trypanosome d'une infection humaine de laboratoire. *Bull. Soc. Path. Exotique* 23(7): 715-719. 1930.—A laboratory assistant who had handled only nagana virus (considered pathogenic for the lower animals alone) was found infected with trypanosomes. Animal experiments identified these with the *Trypanosoma brucei* of nagana, which usually are very sensitive to human serum. Vaucel regards the strain found in this case as having acquired new resistance to human serum. [See also B. A. 6(2): Entry 4352.]

4397. **VOGEL, HANS.** Helminthologische Beobachtungen in Ostpreussen, insbesondere über Dibothriocephalus latus und Opisthorchis felineus. *Deutsche Med. Wochenschr.* 55(39): 1631-1633. 3 fig. 1929.—Examination of feces chiefly of children, among coast dwellers on the Bay of Courland, yielded *D. latus* in 36%, *Ascaris lumbricoides* in 52%, *O. felineus* in 8%, and *Trichuris trichiura* in 84% of the cases. A new 1st intermediate host of the broad tapeworm was found in the copepod *Diaptomus vulgaris.* Human infection with *Bothriocephalus* occurs in this region almost exclusively through consumption of raw liver of the eel-point ("Quappe"), esteemed as a delicacy by the fisherfolk. It is suggested that the therapeutic effect of the liver may counteract the anemia which the tapeworm infection tends to produce, and may thus account for the infrequency of anemia among this highly infested population. Counts of infestation among various fishes and results of experimental infection of monkeys and dogs are given.

4398. WICKWARE, A. B. Parasites and parasitic diseases of economically important waterfowl. *World's Poultry Congress* 4(Sec. C): 379-385; résumé sect., 46-47. 1930.—The paper calls attention to the danger of the parasitic diseases of waterfowl, particularly migrants such as geese, ducks, whistling swans, etc., including the menace to those species under domestication by direct and indirect contact with such migrants. A disease of ducks apparently due to a blood parasite, *Leucocytozoon anatis*, is dealt with at length, while a report of investigations of an obscure condition causing an inordinate death rate amongst whistling swans is discussed. Brief mention is also made of diseases of the Canada wild goose observed by the writer at a game sanctuary. Other forms of parasitism little understood, due to flukes, tapeworms, etc., are described.—*From author's résumé.*

4400. YAKIMOFF, W. L. Der Kampf gegen die Piroplasmose der Rinder im Leningrader (Petrograder) Gouvernement. 6. Abhandlung: Ergebnisse eines fünfjährigen Vorgehens. *Zeitschr. Infektionskrankh. Haustiere* 37(3/4): 197-204. 1930.—From 1923 to 1927, 2127 cattle infected with piroplasmosis (*Babesiella bovis*) were treated, ages 1 to 23 yrs.; 407 had been sick in preceding yrs. The temperature had been 37° in 0.3%, 38° in 7.0%, 39° in 24.7%, 40° in 34.6%, 41° in 27.3%, and 42° in 5.7%. The author used the following treatments: (1) Ichthargan, 978 animals, mortality 6.5%, dose 1-1.5 gm. intravenously; (2) Protargol, 123 animals, mortality 11.3%, dose 2-2.5 gm. intravenously; (3) Arrhenal, 443 animals, mortality 10.6%, dose 3-3.5 gm. intravenously and 4 gm. subcutaneously; (4) Trypanblue, 370 animals, mortality 8.1%, dose 3-5 gm. intravenously; (5) Argoflavine, 2 animals, mortality none, dose 1 gm. intravenously; (6) Albargine, 7 animals, mortality 28.5%, dose (insufficient) 1 gm.; (7) Silversalvarsan, 7 animals, mortality none, dose 1 gm. intravenously; (8) Silvernovoarsolan (Russian product), 5 animals, mortality 60%, dose 1 gm. intravenously; (9) Luargol, 6 animals, mortality none, dose 1 gm. intravenously; (10) Apiroplasmine, 4 animals, mortality 50%. Mortality of the disease, without treatment, 1925, 39.8%; 1926, 50-60%; 1927, 40%. Mortality after specific treatment, 1925, 5.9%; 1926, 10%; 1927, 10.4%.—*W. L. Yakimoff (transl. by J. W. Scott).*

4401. YAKIMOFF, W. L. Zur Frage über den Parasitismus der Süsswasserfische. I, II, III, IV, V. *Arch. Protistenk.* 66(2): 297-300, 301-306; 67(1): 215-218, (2/3): 501-508. 1 pl., 509-516. 6 fig. 1929.—The fish studied were from Lake Pidmosero, Province of Leningrad.—(I) *Trypanosoma remaki* L. and M. found in *Esox lucius* is reported for the 2nd time in Russia. (II) *Grahamella* ehrlichi (p. 305) was found in *Perca fluviatilis*. There were as many as 12 parasites in 1 erythrocyte. No free forms were found. This is the 1st time *Grahamella* has been found in other than a mammalian host. (III) *Chlamydophrys* sp.* was found in *Rutilus rutilus*. (IV) *Eimeria* rivierei* (p. 507) from *Perca fluviatilis*, Russia. A table of *Eimeria* spp. and their fish hosts and size is given. (V) Parasites in blood cells of *Esox lucius* are described as *Bartonella* nicollei* (p. 515).—*W. L. Yakimoff (transl. by F. G. Wallace).*

4402. YAKIMOFF, W. L. Zur Frage über Piroplasma bigeminum in Russland (USSR.). *Arch. Protistenk.* 70 (1): 119-130. 3 pl. 1930.—A detailed description of the parasite causing cattle haemoglobinuria is given. There are pear shaped forms (solitary and double, the latter measuring 2.28—4.80μ × 1.14—2.28μ, on the ave. 3.16μ × 1.71μ, they are longer than the radius of the erythrocyte); round ones (1.4—3.15μ, ave. 1.9μ); oval and amoeboid forms. The number in an erythrocyte is 1-4 (arranged in a cross). Infection of the erythrocytes reaches 21.4% (ave. 10.9%). Each parasite contains 2 (rarely 1) masses of chromatin. The piroplasmic index (the relation of length to breadth) of the pear shaped forms is 1: 1.2—3.28 (ave. 1: 2.10), i.e., *P. bigeminum* is twice as long as broad. The divergence of the angle of the pear-shaped forms is acute (in 70-100% of the parasites). The parasite is centrally located in the erythrocyte (88.2-100%). The proportion of the divergent forms is (on the ave.): pear shaped, 56.7%; amoeboid, 18.1%; oval, 4.0%; round, 21.6%. The piroplasmic formula (relation of pear-shaped to round and oval forms) is on the ave. 1: 0.45, i.e., the pear-shaped forms predominate. The difference between *P. bigeminum* and *Francaiella colchica* is difficult to determine. *F. colchica* belongs to a group of small piroplasmas, with the angle of divergence of the double forms, is less than the radius of the erythrocyte, the relation of pear-shaped to round forms is 1: 3.7 on the ave., 1 mass of chromatin, the piroplasmic index 1: 2 on the ave.—*W. L. Yakimoff.*

4403. YAKIMOFF, W. L., und E. F. RASTEGAÏEFF. Zur Frage über Coccidien der Ziegen. *Arch. Protistenk.* 70(1): 185-191. 5 fig. 1930.—The authors found in a ♀ goat, besides *Eimeria arloigni* Mar., *E.* ninae kohlyakimov* (p. 191) and *E.* galouzoi* (p. 191). After cultivation with potassium bichromate (1: 1000) spores and sporozoites were seen.—*W. L. Yakimoff (transl. by H. B. Yocom).*

4404. YAKIMOFF, W. L., W. S. BELAWINE, und E. F. RASTEGAÏEFF. Zur Frage über Rindercoccidien im Nordkaukasus. *Arch. Protistenk.* 70(3): 643-654. 2 fig. 1930.—Hemorrhagic colitis of cattle in North Caucasus is caused by *Eimeria zürni* Rivolta and *E. smithi* Yakimoff and Galouzo, the same parasites that cause dysentery in cattle in northwest Russia. The forms from the two regions are identical in morphology and dimensions; the period of sporogony is considerably longer in *E. smithi* in North Caucasus than in northwest Russia. Sporulation of both species begins within a day following administration of 5% $K_2Cr_2O_7$. Mixed, as well as single infections, occur. Treatment with ichthargan (per os and per rectum) effects cure.—*Authors' summary (transl.).*

4405. YAKIMOFF, W. L., und Mme. MITZKEWITSCH. Ueber Piroplasmose der Renntiere. [Piroplasmosis of Tarandus rangifer.] *Berlin. Tierärztl. Wochenschr.* 46 (18): 282. 1930.—Of 58 reindeer from northern Russia 17 were found infected with *Francaiella tarandi rangiferis* Kerz. Dimensions of the forms: round, 1.25-1.56μ; oval, 1.56 × 0.25-2.16 × 1.25μ; bacilliform, 1.56 × 0.02μ; pyriform (solitary), 1.37 × 0.05-2.50 × 0.03μ; comma-shaped, 1.56 × 0.41μ. The index (width: length) was 1: 2.1-1: 2.6. Chromatin bodies 1. Erythrocytes with 1 or 2 parasites, occupying a central position. This chronic infection may explain the great mortality amongst these animals.—*W. L. Yakimoff (transl. by J. H. Schuurmans Stekhoven).*

4406. YAKIMOFF, W. L., et E. F. RASTÉGAÏEFF. Sur les coccidies des poules en Russie (U.R.S.S.). (Note préliminaire.) *Bull. Soc. Path. Exotique* 23(7): 714-715. 1930.—Three types found in a severe epizootic in chickens in northern Caucasia are described. The 1st type, a round coccidium, is identified with *Eimeria tenella* Raillet and Lucet. No attempt is made either to identify the other 2 with previously known spp. or to name them as new spp. The 2nd type is yellowish-brown, ovoid, measuring 25.2-36.4μ × 18.2-26.6μ (ave. 31.2 × 22.5μ); some oöcysts begin to sporulate at the end of 48 hrs., the majority only after 5-6 days or later. The 3rd type, also yellowish-brown and ovoid, has one less pointed extremity and measures 20.4-25.5μ × 15.3-20.4μ (ave. 23.9 × 17.7μ), with a small refringent point at one end; sporulation begins in about 48 hrs.

Haustiere* 37(1): 70-81. 1 pl. 1930.—In 1928 of blood smears from 39 cattle sick with haemoglobinuria, 61.5% contained *B. bovis* and 38.4% a parasite regarded as *F. caucasica.* The forms are round

(2.28μ), oval, amoeboid, pear-shaped (lancet or paired bigeminate, 2.12-2.46 $\times$ 0.76-1.14μ), and rarely anaplasmoid. The ratio of the pear-shaped forms to the round forms is 1:10.4. The angle of divergence of the paired bigeminate forms is obtuse. The percentage of erythrocytes infected is as high as 12.9. The number of parasites in 1 erythrocyte is 1-4. *F. occidentalis* was found in 1927.—*W. L. Yakimoff (transl. by J. W. Scott).*

4408. YORKE, WARRINGTON, A. R. D. ADAMS, and F. MURGATROYD. Studies in chemotherapy. 1. A method for maintaining pathogenic trypanosomes alive in vitro at 37°C. for 24 hours. *Ann. Trop. Med. and Parasitol.* 23(4): 501-518. 1929.—Typical experiments with technique and tabulated results are given using strains of *Trypanosoma equiperdum, T. gambiense,* and *T. rhodesiense* maintained for years in mice. Fresh and deactivated sera from rabbits, sheep, horse, or hog at body temp. are better media for maintaining trypanosomal suspensions than saline, Ringer's solution, or nutrient broth. The parasites lived longest in concentrations of approximately 1000 per c. mm., surviving in the same number for 24 hrs. at 37°. The length of life of the parasites is largely dependent on the amount of sugar present. The given temp. was used to investigate ultimately the trypanocidal action of drugs in live dogs. —*M. W. Kamm.*

FILTERABLE VIRUSES, BACTERIOPHAGE, ETC.

GEO. H. SMITH, *Editor*

(See also in this issue the subsection "Infectious Chloroses" in the section Phytopathology; and Entries 3452, 3498, 4227, 4230, 4302, 4441, 4481, 4488, 4490, 4493, 4543, 4569, 4604, 5603)

GENERAL

4409. BECKWITH, T. D., A. R. OLSON, and E. J. ROSE. The effect of X-ray upon bacteriophage and upon the bacterial organism. *Proc. Soc. Exp. Biol. & Med.* 27(4): 285-286. 1930.—30 min. exposure of 7 strains of *Bacillus coli* bacteriophage (young cultures, in the phase of positive logarithmic growth) to x-rays in lead-free glass tubes, at 14-in. distance from the target of a tube actuated by 75,000 volts, resulted, in the case of 3 of the strains, in reduced effectiveness towards their respective strains of bacteria.

4410. BURNET, F. M., and J. MACNAMARA. Immunological differences between strains of poliomyelitic virus. *British Jour. Exp. Path.* 12: 57-61. 1931.—A poliomyelitic virus from a child dying in Melbourne showed distinct immunological differences from the Rockefeller Institute "mixed virus" strain. In cross immunity experiments, monkeys paralyzed by the Melbourne strain and recovered, succumbed to the Rockefeller strain; and 1 monkey surviving attack by the Rockefeller strain succumbed to the Melbourne strain. In neutralization tests in vitro, a serum affording some protection against the Melbourne strain did not modify the infectivity of the Rockefeller virus.—*J. Bland.*

4411. CLIFTON, C. E. A method for the purification of the bacteriophage. *Proc. Soc. Exp. Biol. & Med.* 28(1): 32-33. 1930.—Staphylococcus bacteriophage suspended in Martin's broth at pH 7.8 was adsorbed on $Al(OH)_3$, and, after washing, released by treatment with 0.5% solution of secondary ammonium phosphate. The Al is filtered off by suction. The bacteriophage recovered in the filtrate was active at a dilution of 10^{-7}; tests of the filtrate for proteins were negative.

4412. DOCHEZ, A. R., KATHERINE C. MILLS, and YALE KNEELAND, Jr. Study of the virus of the common cold and its cultivation in tissue medium. *Proc. Soc. Exp. Biol. & Med.* 28(5): 513-516. 1931.—Nasopharyngeal washings collected from individuals during the first 24 hrs. of a typical attack of common cold were passed through a Seitz filter and, with addition of cysteine hydrochloride, were preserved anaerobically under vaseline seal at room temp. and in ice-box, for 4-13 days. Inoculation of human volunteers and chimpanzees led to common colds in 9 of 12 trials. After repeated passage through human volunteers, resulting in apparently increased virulence, the suspension of nasopharyngeal washings was concentrated 7 times by vacuum distillation, and after 5 days in the ice-box the concentrated virus was inoculated into a tissue medium composed of chick embryo suspended in Tyrodes' solution or in a buffered bouillon prepared from a special peptone to which 0.1% of gelatine had been added. After as many as 15 subculturings in this medium, the original virus by that time diluted $\frac{1}{2}$ quadrillion, inoculation of volunteers with the virus cultures was followed by severe colds in 2 of 3 trials. Controls inoculated with the medium without virus were negative.

4413. ECKSTEIN, A., und M. SARVAN. Klinisch-experimentelle Untersuchungen über die Vaccinations encephalitis. IV. Über den Verlauf der Vaccination bei Affen, deren Allgemeinbefinden experimentell geschädigt wurde. V. A. ECKSTEIN. Über die Permeabilität der Meningen bei normalem Verlauf der Vaccination. *Zeitschr. Hyg. u. Infektionskr.* 111(5): 659-668; 669-671. 1930. —IV. The course of intracutaneous vaccination was studied in 13 *Macacus rhesus,* including 3 controls, 4 splenectomized, 3 chronically starved and 3 chronically alcoholized monkeys. In the controls the local reaction appeared between the 3rd and 4th days after vaccination and healed in 8-12 days, as in previous observations. All the animals showed virulicidal action (most marked on the 21st day in the monkey treated with the most dilute lymph). The monkeys chronically alcoholized reacted locally like the controls. In 2 of the starved monkeys, virulicidal action was displayed on the 21st day; the local reaction tended to severe ulceration, was late in appearance and slow to heal. In the 3rd animal, which was very weak, vaccination was unsuccessful and no virulicidal action appeared. In 2 of the splenectomized animals, vaccination ran its course as in the controls; in 1 the reaction was late (16-28 days after vaccination) with a recurrence on the 45th day of pustules containing vaccine virus and tending to ulceration; no virulicidal action. In the 4th monkey, 2 vaccinations 20 days apart produced no local reaction, although vaccine virus was present in the blood 19 days after the 1st vaccination; no virulicidal action. None of the experimental animals showed signs of nervous disturbance, although the course of vaccination was greatly modified in the starved and splenectomized monkeys. Even the splenectomized monkey which relapsed after recovery showed no encephalitic phenomena in the sectioned brain. V. In 9 persons 5-22 yrs. old and vaccinated for the 1st time, the permeability of the meninges as tested by Walter's Br method, corresponded in all cases to the normal.

4414. ELFORD, WILLIAM JOSEPH. A new series of graded collodion membranes suitable for general bacteriological use, especially in filterable virus studies. *Jour. Path. & Bact.* 34(4): 505-521. 1931.—A new series of graded collodion ultrafilter membranes is described. The principles and technique of membrane preparation are discussed in detail. The membranes are possessed of excellent uniformity and a wide range in permeabilities is available. They provide a basis for refined filtration methods so urgently needed in studies of filterable viruses.—*W. J. Elford.*

4415. KLIGLER, I. J., and L. OLITZKI. Cataphoresis experiments with typhus virus. *British Jour. Exp. Path.* 12: 69-74. 1931.—Experiments were done in both Todd's and Kligler's cataphoresis apparatus. The typhus virus was usually in the form of brain suspensions. In 1 or 2 experiments blood was used. Typhus virus wanders to the positive pole over the range pH 8—6; at pH 5 and 4 it is destroyed. It was impossible by cataphoresis to

obtain virus from tissues of animals recovered from typhus infection, as was done by Olitzki and his associates for other filterable viruses. It was impossible to separate virus from virus-antiserum mixtures by cataphoresis of suspensions at pH 6.0 and 8.6.—*J. Bland.*

4416. **Le SOUDIER, Mlle., et J. VERGE. Sur l'obtention de bactériophages d'après la technique de P. Rosenthal.** *Compt. Rend. Soc. Biol.* 106(10): 783. 1931.—Results were entirely negative.

4417. **LEVADITI, C., P. LÉPINE, et R. SCHOEN. Au sujet des neuro-infections mortelles autostérilisables. L'encéphalite herpétique du renard.** *Compt. Rend. Soc. Biol.* 100(14): 1166-1171. 3 fig. 1929.—A case of fatal autosterilizable encephalitis, induced by herpes virus injected into the brain and into the cornea, is described. Symptoms were similar to those of human lethargic encephalitis. Lesions of the nerve cells were not herpetic in nature. Fragments of the cerebral cortex, olfactory bulb, sciatic nerve, pancreas, adrenal and liver, when emulsified and injected into rabbits, gave no evidence of herpes virus.

4418. **LEVADITI, C., P. RAVAUT, P. LÉPINE, et Mme. R. SCHOEN. Sur les propriétés d'un virus pathogène pour le singe, présent dans certains bubons vénériens de l'homme.** *Compt. Rend. Soc. Biol.* 106(9): 729-730. 1931.—The inguinal glands of certain patients having venereal sores have the clinical aspect of inguinal lymphogranulomatosis and contain a filterable virus pathogenic for certain species of catarrhinic apes. This virus is destroyed by glycerine but can be conserved at least 10 days in the frozen cerebral tissue of infected animals. When administered intracerebrally, it causes in simians either a fatal meningo-encephalitis or a virulent disease without demonstrable lesions.—*E. Weiner.*

4419. **LEWTHWAITE, RAYMOND. Clinical and epidemiological observations on tropical typhus in the Federated Malay States.** *Bull. Inst. Med. Res. Federated Malay States* 1930(1): (1-42). 1930.—Observations are recorded of 164 cases of tropical typhus, so named to mark close similarity to the typhus of the western world, and to stress 2 differences; that, apparently, the disease did not flare up in devastating epidemics, nor was it louse-borne. 2 forms are noted: one is termed the "W" form (urban), the other the "K" form (rural or scrub). The former is of rarer occurrence. In clinical features the 2 appear to be identical; serologically they contrast sharply. Also, the W cases are largely among indoor workers; among the K cases, there are no indoor workers. It is apparently not a seasonal disease. The most hopeful lines of epidemiological investigation suggested lie in a search of the pruning coolie in the field for ectoparasites; examination of the fauna in material handled by the pruner; and identification of the ectoparasites of local rats.—*I. V. Hiscock.*

4420. **LOYGUE, M. Infection expérimentale du cobaye type Fontes-Valtis, obtenue avec le liquide céphalorachidien d'un malade atteint d'une forme particulière de méningo-encéphalite tuberculeuse.** *Compt. Rend. Soc. Biol.* 100(14): 1186-1187. 1929.—Of 2 guinea pigs injected with the cerebrospinal fluid (apparently negative for Koch bacilli), 1 died in 5 wks., with extreme emaciation as the only symptom. The 2nd, killed at 4½ wks., showed hypertrophy of the intertracheobronchial ganglia (negative for Koch bacilli) and a small sternal abscess containing large numbers of the bacillus. The author suggests a connection between the atypical lesions in the brain of the patient and the atypical (ultravirus) reaction of the animals.

4421. **MODROW, IRMENGARD. Filtration und Ultrafiltration des Maul- und Klauenseuchevirus.** *Zeitschr. Hyg. u. Infektionskr.* 110(4): 618-643. 1929.—In the Bechhold ultrafiltration method, a 1% acetic-collodion suspension of the virus is filterable, while a 9% suspension is retained. Strains of the virus vary in ability to pass the ultrafilter. Strain A passes the filter in 2.8% suspension while strains B and C are retained. It is now possible to separate A from B and C on the basis of ultrafilterability, and also to concentrate dilute suspensions by ultrafiltration. If the ultrafiltration results are taken as indicative of the size of the virus, one may conclude that strain A lies between litmus or egg albumin and hemoglobin; B and C are larger.—*D. H. Bergey.*

4422. **MONTEIRO, J. LEMOS. Presença de "rickettsias" nas cellulas endotheliaes da membrana de Descemet em animaes inoculados na camara anterior do olho com o virus do typhus exanthematico de São Paulo. (Nota preliminar.)** [Presence of rickettsias in the endothelial cells of Descemet's membrane in animals inoculated in the anterior chamber of the eye with virus of the exanthematous typhus of São Paulo.] *Brasil-Med.* 45(21): 468-469. 2 fig. 1931.

LOWER ANIMALS

4423. **ALSTON, J. M., and H. J. GIBSON. A note on the experimental transmission of "louping-ill" to mice.** *British Jour. Exp. Path.* 12: 82-87. 1931.—Berkefeld filtrates of the brains of sheep dead of "louping-ill" were inoculated intracerebrally into mice, with production of a disease characterized by tremors, unsteadiness of gait, muscle spasm, clonic convulsions, paralysis, and death. The disease bore considerable resemblance to louping-ill. Of 38 mice inoculated with control brain tissue 2 developed similar symptoms. The disease can be transmitted by mouse passage, is highly infectious, and is transmitted to uninoculated mice caged with the inoculated.—*J. Bland.*

4424. **BRUNO, BENEDICTO. A epizootia de Matto Grosso. [An epizootic at Matto Grosso, Western Rosario District.]** [With English abstract.] *Rev. Zootech. e. Vet.* [*Rio de Janeiro*] 17(1): 15-40. 1931.—In 1925 a peculiar, apparently infectious disease was observed in cattle, in a less degree in horses, and rarely in hogs. It has 2 distinct clinical types: a paralytic form, far more frequent; and a rabid one, rarely found. Symptoms are given in detail. Death occurs in 5-10 days, and losses have been large. The disease can be experimentally transmitted to sheep, goats, rabbits and guinea pigs. Dogs, especially, are resistant to all methods of inoculation. The main arguments against any relation to rabies are: Absence of rabid dogs in the regions and the resistance of these animals to the disease; resistance of pigeons to virus inoculation by the intraocular route; failure of the virus to survive in glycerol; differences in the symptomatology observed in rabbits and guinea pigs, when inoculated with rabies material or the Matto Grosso bovine virus; failure to detect Negri bodies in the horn; and undiminished period of incubation in guinea pigs inoculated in series.

4425. **DAUBNEY, R., and J. R. HUDSON. Enzootic hepatitis or Rift Valley fever. An undescribed virus disease of sheep, cattle and man from East Africa.** *Jour. Path. and Bact.* 34(4): 545-579. 3 pl. (2 col.). 1931.—A virus disease affecting sheep, cattle, goats and man is described from the Rift Valley, Kenya Colony. The disease causes a mortality of over 95% in very young lambs, abortions and a moderate mortality in ewes and cows, and a transient fever accompanied by severe pains in the region of the joints in man. The disease is not contagious, and there is evidence to suggest that it is transmitted by a mosquito.

4426. **GRAHAM, ROBERT, FRANK THORP, Jr., and W. A. JAMES. A filtrable virus-like agent in avian laryngotracheitis.** *Jour. Amer. Vet. Med. Assoc.* 31(4): 506-517. 7 fig. 1931.—Bacteriologically sterile filtrates prepared from composite laryngeal exudates and body tissues of naturally infected fowls in 2 outbreaks of laryngotracheitis inconsistently produced subacute inflammatory changes in the larynx of healthy fowls. The infective nature of the filtrate-induced disease was demonstrated by repeated transfer to healthy fowls. The acute type was not induced experimentally by sterile filtrates in intralaryngeal instillation, but symptoms approaching the acute malady were occasionally observed. The infective character of the unfiltered inoculum was demonstrated in susceptible fowls. Mandler filtrates were

less infective than unfiltered inoculum, as judged by symptoms and gross lesions. The bacteriologically sterile, filterable-virus-like agent in the laryngeal exudate of subacutely infected fowls remained viable at ice-box temp. for 30-60 days. The communicable character of the subacute disease of young chicks to mature fowls was demonstrated by direct laryngeal swabs.—*Authors' summary.*

4427. **GYE, W. E. A note on the propagation of Fujinami's fowl myxo-sarcoma in ducks.** *British Jour. Exp. Path.* 12: 93-96. 1931.—Fujinami's results on fowl myxosarcoma are confirmed. The tumor is capable of giving rise to tumors in ducks, and these are again transferable to chickens. In very young ducklings the tumor usually proves fatal. It can be transmitted to ducks by cell-free filtrates; transmission therefore depends on an adaptation to another species of bird, rather than on some peculiarity of the cancer cell, enabling it to grow indefinitely in a foreign host. This adaptation of a fowl tumor "agent" is striking evidence in favor of the view that the "agent" is a virus.—*J. Bland.*

4428. **JACOTOT, H. Un procédé pour conserver et pour transporter le virus pestique.** *Compt. Rend. Soc. Biol.* 106(9): 706-708. 1931.—Minced spleens from calves infected with rinderpest kept their virulence at 0° C. for 5-7 mo. Virulent blood, defibrinated and preserved in the same way, was not virulent in a dose of 5 cc. after 1 mo. Virulence of the spleen pulp was tested by injection into calves of 1 gm. of pulp, diluted just before using with 9 cc. of physiological saline.—*E. Weiner.*

4429. **KLIGLER, I. J. Recovery of fowl-pox virus from vaccines by cataphoresis.** *British Jour. Exp. Path.* 12: 42-45. 1931.—By cataphoresis it is possible to recover at the anode, active virus from phenolized and dried fowl-pox vaccines suspended in phosphate buffer solutions at pH 7.0. The virus was never found at the cathode. By direct scarification, active virus could be demonstrated in both vaccines prior to cataphoresis.—*J. Bland.*

4430. **SMITH, WILSON. Lesions of the adrenal glands of rabbits caused by infection with herpes virus.** *Jour. Path. & Bact.* 34(4): 493-503. 2 pl. 1931.—Some strains of herpes virus were found capable of causing specific necrotic lesions in both cortex and medulla of the adrenal glands. Lesions only occasionally followed introduction of virus into skin, testes or brain, whereas intravenous inoculation of an adequate dose produced them in nearly every case. Affected adrenals contained abundant herpes virus in the early stages and were always bacteriologically sterile. Typical herpetic intranuclear inclusion bodies were often present. Herpes-immune serum inoculated together with the virus in all cases prevented formation of adrenal lesions. Normal serum and vaccinia-immune serum had no such protective action.—*W. Smith.*

4431. **ZWICK, W., und J. WITTE. Über die Widerstandsfähigkeit des Virus der Bornaschen Krankheit gegen Trocknung und über Schutzimpfungsversuche mit getrockneter virushaltiger Gehirnsubstanz.** *Berliner Tierärztl. Wochenschr.* 47(3): 33-35. 1931.—Virus dried over $CaCl_2$ in vacuo and kept in a darkened refrigerator retained its pathogenicity for rabbits for 326 days. Repeated subcutaneous inoculation of dried infected rabbit brain protected rabbits against a lethal cerebral inoculation. Experiments are being conducted on the protective inoculation of horses with dried virus, instead of the formerly used glycerin virus.—*Authors' summary (transl. by A. L. Brody).*

Evidence indicates that the bacteriology of simple cholecystitis differs from that in cholecystitis with cholelithiasis, but that constitutional and other factors play an important rôle.—*Frances R. Vanzant.*

4437. **CLOSE, H. G. Some observations on acute tonsillitis.** *Guy's Hosp. Repts.* [*London*] 80(1): 45-55. 1930.—From data on 25,629 cases of acute tonsillitis at Guy's Hospital over a 7-yr. period, the author concludes that this disease occurs more frequently among adults than is usually supposed. The peak of infection is reached in the autumn. Acute tonsillitis is more than a minor ailment. Like scarlatina, it usually has a hemolytic streptococcus etiology and similar biochemical changes in the blood.—*D. A. MacPherson.*

4438. **DINGER, J. E., et FRANÇOISE VERSCHAFFELT. Recherches expérimentales sur quelques souches de leptospires.** *Ann. Inst. Pasteur* [*Paris*] 45(3): 396-414. 2 fig. 1930.—A purified culture of a strain of *Leptospira* from the city water of Ghent was subcutaneously inoculated into 4 and intraperitoneally into 2 mice; the organisms were visible in the blood and peritoneal exudate 5 hrs. later, but the next day they had disappeared, having produced no injurious effects. A 2nd strain occurred in the urine of uninjected mice from Ghent. A 3rd strain was isolated from a patient with mud fever ("Schlammfieber"); it showed no relationship to pathogenic or saprophytic strains or to the *Leptospira* of icterohemorrhagic fever or Weil's disease. Repeated passage of these strains through mice indicated that they can be used instead of guinea pigs for study of leptospiras, that the organism infecting the mice of Ghent is not derived from water, and that the *Leptospira* of Weil's disease is not due to a progressive adaptation of aquatic leptospiras to man.

4439. **EARLAM, M. S. S. Urea-splitting staphylococci in urinary tract infections.** *Brit. Jour. Urol.* 2(3): 233-247. 1930.—When studied by Laidley's technique, 6 of 32 strains of *Staphylococcus pyogenes aureus,* 2 of 6 strains of *Staph. citreus,* 22 of 55 strains of *Staph. albus* and 1 of 7 other strains split urea more often than usually supposed. These strains did not differ otherwise from the other staphylococci, except possibly in having a greater tendency to infect the urinary tract.

4440. **ESCOMEL, E. A propos des ckara [kcara] pinta ou caratés dans le Sud du Pérou.** *Bull. Soc. Path. Exotique* 24(3): 215-222. 1931.—"Kcara" is the name given by Peruvians to all diseases discoloring the skin. The author distinguishes 3 "true kcaras," of which 2 are mycotic and contagious; the 3rd, non-mycotic. The 1st mycotic kcara is due to a *Penicillium* which produces red or bi-colored plaques; it is found in the valleys, and is known in Central America as "pinta" or "caratés." The other mycotic and contagious kcara is

caused by a fungus which the author does not further identify; it produces polychrome plaques—blackish, bluish, red and yellow. The 3rd, the "great white kcara," involves and blanches the entire skin of the body, giving it an artificial, translucent appearance like the skin of a blister and changing the racial appearance of the negro or Indian. It is not transmitted by contact, and the author's attempts to inoculate himself and another physician were unsuccessful. He insists that it is neither macular leprosy nor pellagra, though he believes that it is of alimentary origin associated with excess of maize products. He suggests that it may be due to a parasite which is favored by avitaminosis due to prolonged boiling of the maize.

4441. FEJGIN, BRONISLAWA. On the nature of the etiologic agent of typhus fever. *Jour. Prevent. Med.* 3(5): 391-404. 1929.—On the basis of isolation of organisms similar to, or identical with, *B. proteus X 19* from lice (carriers of typhus virus) and infected guinea pigs, the author suggests that this organism is the causative agent of typhus. He brings into consideration the rôle of bacteriophage as a factor in alteration of the organism and its virulence.—*M. S. Fleisher.*

4442. FRANK, MAX. Beitrag zur Kenntnis der Erreger der Colipyurie. *Arch. Kinderheilk.* 92(3/4): 254-269. 1931.—The strains of *Bacterium coli* isolated in 31 cases of pyuria in childhood (26 infants, 5 children) could be separated into 15 groups by biochemical behavior. Most frequent was a type corresponding to *Bact. neapolitanum;* the other frequent types were *Bact. coli communior, Bact. coli commune,* and 1 differentiated from *Bact. neapolitanum* only because it did not ferment dulcite. Most of the types of *Bact. coli* could be isolated from the intestine and vagina in healthy children of the same age.—*From author's summary (transl.).*

4443. GAMMEL, JOHN A., and E. E. ECKER. The virulence of Spirochaeta pallida in culture. *Arch. Dermatol. & Syphilol.* 23(3): 439-444. 1931.—Spirochaetes which may be morphologically typical and motile failed to infect rabbits 72 hrs. after removal of syphilitic tissues from the host, when inoculated intratesticularly. Similarly, in certain media (gelatinized human, sheep and rabbit sera) typical, motile spirochaetes were observed for a period of wks. and mos., but failed to grow in subcultures. These cultures also, even if they retained their morphologic characteristics and motility, did not retain their virulence for rabbits for more than 48 hrs. There is no parallelism between motility and virulence. At present no reliable culture medium is known in which virulent spirochaetes can be successfully grown.—*Authors' conclusions.*

4444. GIOVANARDI, A. Ricerche sull'origine intestinale di alcune infezioni acute (infezioni tifoidee e carbonchiose). II. [The intestinal origin of some acute infections. II.] *Bull. Sci. Med.* 101(4): 348-355. 1929.—Given by mouth in broth suspension, the paratyphoid B bacillus of human origin and the typhoid bacillus sometimes passed through the stomach of normal rabbits into the intestine. Adherent to leaves or suspended in milk, the human paratyphoid B, the Gärtner bacillus and the anthrax bacillus passed constantly and in considerable numbers into the intestine of rabbits or guinea pigs, there to be eliminated with the feces for about a week. The paratyphoid B bacillus, some hrs. after ingestion of infected food, began to traverse the intestinal walls, lodging first in the local lymphatic system, passing thence into the blood to be eliminated through the biliary system, and sometimes lodging for long periods in the liver, the spleen or the peripheral lymph-nodes. The Gärtner bacillus was found capable of producing in the rabbit a subacute and usually benign paratyphoid infection; administration of ox-gall conduced to mortality from septicemia. Intestinal anthrax infection was induced in rabbits and guinea-pigs by administration of germ-cultures on leaves or in broth. In the guinea-pig the infection seemed frequently to penetrate the intestinal wall, producing characteristic anatomo-pathologic changes. In the rabbit the passage of the paratyphoid bacillus through the buccopharyngeal mucosa to the submaxillary ganglia and the blood could not be experimentally produced.—*From author's summary (transl.).*

4445. GONZALEZ, SANTIAGO. Sobre la presencia de un bacilo paratuberculoso en los esputos. [Presence of Bacillus paratuberculosis in sputum.] *Rev. Soc. Argentine Biol.* 5(3): 107-109. 1929.—An organism is described, having the staining characteristics of *B. tuberculosis* but differing from it in growth on media and in absence of a capsule. The author deplores the practice of some bacteriologists in making a diagnosis of tuberculosis from simple acid-fast stains without additional tests of growth on media.—*A. R. Harnes.*

4446. GREEN, RICHARD. Some observations on the leprous reaction (synonyms: leprotic fever, the acute exanthem of leprosy; lepra reaction, etc.). *Trans. Roy. Soc. Trop. Med. & Hyg.* 22(4): 367-380. 21 fig. 1929.—This paper is mostly a review. As regards the theory of the leprous reaction, the author believes that it is an acquired condition of allergy towards *Mycobacterium leprae* already in the tissues. The most effective treatment in the majority of cases, according to the author is by desensitization with adrenalin or ephedrin.—*E. V. Pineda.*

4447. HASSELTINE, H. E. Recent progress in studies of undulant fever. [*U. S.*] *Public Health Repts.* 45(29): 1660-1667. 1930.—A review.

4448. HOEN, E., A. GRÜNFELD, und L. TSCHERTKOW. Bestimmung der Toxizität frisch gezüchteter Diphtheriekulturen in vitro mittels der Ringpräzipitation. *Centralbl. Bakt. I. Abt. Orig.* 107(6/7): 459-464. 1928.—Determination of the toxicity of filtrates of a few strains of *B. diphtheriae* in vitro by means of the ring precipitation test agreed with results in vivo.—*K. Goodner.*

4449. [IZABOLINSKIĬ, M. P.] ИЗАБОЛИНСКИЙ, М. П. К вопросу о безвредности штамма B. C. G. **[Innocuousness of BCG strain.]** Вестник Микробиологии, Эпидемиологии и Паразитологии (*Rev. Microbiol., Épidémiol. et Parasitol.*) 9(2): 211-216. 1930.

4450. JORDAN, PAUL. Über die Häufigkeit des Vorkommens von Streptokokken auf normaler Haut. *Arch. Dermatol. u. Syph.* 159(1): 152-155. 1929.—The author found pathogenic streptococci in about 15% of the healthy human skins examined.

4451. KUHN, M.-J. Evolution des lésions produites par le bacille bilié de Calmette et Guérin (BCG) chez le cobaye. [Development of lesions produced by BCG in guinea pigs.] *Compt. Rend. Soc. Biol.* 97(33): 1520. 1927.

4452. [LINDFORS-ALEKSINA, L. A.] ЛИНДФОРС-АЛЕКСИНА, Л. А. Выделение культур туберкулезных бацилл из патологического материала по способу **Hohn'a. [Isolation of tubercle bacillus cultures from pathological material by Hohn's method.]** [With French summary.] Вопросы Туберкулеза. [*Voprosy Tuberkuleza*] 7(11): 1357-1362. 1929.—The pathological material consisted of 140 specimens of sputum, serous and purulent exudates, pus from bone lesions, and urine. Collaborators, employing the methods of Löwenstein and of Sumiyoshi, obtained positive results in 70%; the author, using Hohn's method, obtained positive results in 93-95%. This was true of bacterioscopically positive material; with bacterioscopically negative specimens, positive results varied, depending on material, from 15 to 58%. Obtaining 15% of cultures from bacterioscopically negative sputa confirms the opinion that many cases, formerly dismissed as abacillary, are, in reality, merely "oligobacillary." The large % of cultures obtained from pus taken from osseous lesions speaks in favor of bacillary rather than toxic origin of surgical tuberculosis.—*B. Van Rosen.*

4453. MATHIS, C., et C. DURIEUX. Entretien, au laboratoire, des souches de Spirochaeta duttoni. *Bull. Soc. Path. Exotique* 24(2): 150-153. 1931.—The virus of *S. duttoni* var. *crocidurae* was carried through 3 series of mice, one of 6 and the other two of 7 passages each,

cerebral emulsion being used for inoculation. The infections were mild and the few mice that died presented no evidence that death was due to spirochetosis. There was, however, no attenuation of virulence in the strain, for it was always possible to produce a fatal infection by using blood instead of brain substance.

4454. MAZZA, SALVADOR, y FORTUNATO CANEVARI. Ulceras blastomicósicas de la lengua. [Ulcerous blastomycosis of the tongue.] *Quinta Reunion Soc. Argentina Patol. Reg. Norte* 1: 226-230. 4 fig. 1930. —Characteristics of this disease are given but the causal fungus was not identified.

4455. MAZZA, SALVADOR, L. STÁBILE de NUCCI, y E. J. CANAL FEIJÓO. Blastomicosis cutânea de forma lenta por criptococo (n. sp.). *Quinta Reunion Soc. Argentina Patol. Reg. Norte* 1: 293-308. 21 fig. 1930. —Case report of a 10-yr.-old child of the Chaco region of Santiago, with ulcerous, scabby lesions of 7 yrs.' duration and of the appearance of tuberculous scrofula on the ears, upper lip, left hand, chin, knee, and nasal mucosa. Sections of the lesions taken at biopsy revealed a fungus in the tissue, and granulation with the foreign body type of giant cells. Subcutaneous inoculation of pulp into rats gave nodules of similar structure. A *Cryptococcus* was cultivated, which was agglutinated by serum of the patient to a dilution of 1:2560 and which produced a positive skin reaction when a warm suspension was injected into the patient. The fungus grows on ordinary culture media at room temp., but not at 37°. Cultural characters are given. It has been called *Cryptococcus mitis* Mazza, 1929.—*S. Mazza (transl. by G. H. Robinson).*

4456. MEISEL, H., et E. MIKULASZEK. Agglutination des bacilles isolés dans le rhinosclérome. [Agglutination of bacteria isolated in rhinoscleroma.] *Compt. Rend. Soc. Biol.* 97(33): 1495-1498. 1927.

4457. MOON, V. H., and H. L. STEWART. Experimental rheumatic lesions in dogs and in rabbits. *Arch. Path.* 11(2): 190-206. 14 fig. 1931.—Inoculations of *Streptococcus viridans* from a case of bacterial endocarditis in man, into 4 young dogs and 4 young rabbits, not previously sensitized, produced clinical features very similar to, and lesions identical with, those of rheumatic disease, strengthening the evidence that streptococci of low virulence are the direct cause of rheumatic disease.

4458. NATIVELLE, R. Un bacille des gangrènes cutanées. [A bacillus of cutaneous gangrene.] *Ann. Inst. Pasteur* [*Paris*] 45(2): 169-202. 11 fig. 1930.—*Bacillus gangrenae cutis* Milian was isolated from 14 cases of cutaneous gangrene. Morphologic and cultural characters are described.

4459. NEGRONI, PABLO. Actinomyces y actinomicosis experimental. *Rev. Soc. Argentina Biol.* 6(9/10): 539-552. 1930.—Intravenous and intraperitoneal inoculation of Actinomyces virulent for man did not infect guinea pigs or rabbits. Intratesticular inoculation gave typical lesions.—*J. T. Lewis.*

4460. NEGRONI, PABLO. Cryptococcus sp. aislados de epidermomicosis. [Cryptococcus sp. isolated from epidermomycosis.] *Rev. Soc. Argentina Biol.* 6(9/10): 648-652. 1930.—Description of cultural characteristics.—*J. T. Lewis.*

4461. OTTENBERG, REUBEN. The rate and location of removal of bacteria from the blood in human disease. *Arch. Path.* 11(5): 766-774. 1931.—While in 5 cases of bacterial endocarditis the number of bacteria in blood from the vein of the arm and of the 2 internal jugular veins were about equal, in 8 cases of lateral sinus infection the number of bacteria in blood from the arm vein was smaller than that in one or both jugular veins. In view of the regularity of appearance of the phenomenon in sinus cases, it was probably not due to examination exactly at the time of an occasional "shower" of bacteria, which are probably fed somewhat steadily into the general circulation. The rapidity of circulation makes dilution an improbable explanation for the difference in number of bacteria in the general circulation and in the infected vein, which is attributed to rapid filtration, the exact site of which is unknown, but certainly is not the peripheral tissues, since simultaneous cultures from a brachial or radial artery and 1 or more peripheral veins showed no significant differences in number of colonies in each.

4462. PANCOTTO, ETTORE. Contributo allo studio dell' influenza dei terreni avitaminati sulla virulenza batterica. [Influence of avitaminized culture media on bacterial virulence.] *Bull. Sci. Med.* 98(3): 137-143. 1926. —The author reports experiments with anthrax and colon bacilli and 3 anti-anthrax vaccines. He concludes that passage through avitaminized media does not increase bacterial virulence, but in some cases decreases it.

4463. PIAZECKA-ZEYLAND, E. Isolement du BCG des ganglions lymphatiques de cobayes vaccinés par ingestion. *Ann. Inst. Pasteur* [*Paris*] 45(4): 439-442. 1930.—From experiments, the author concludes that BCG introduced into the alimentary tract of newborn guinea pigs settles, at least in part, in the cervical and mesenteric ganglia, but survives for only a short time; and that the digestive tube of adult guinea pigs is less permeable than that of the newborn.

4464. PILLAT, ARNOLD. Bakteriologische Befunde bei Praexerosis corneae. *Graefe's Arch. Ophthalmol.* 125 (2): 173-206. 20 fig. 1930.—One of the earliest, most constant, and most important signs of prexerosis corneae caused by vitamin A deficiency is the bacteriological condition of the cornea, the most frequent organisms being, in order: xerose bacilli, pneumococci, staphylococci, diplobacilli, and Koch-Weeks bacilli; the first 2 may appear exclusively. The hitherto unknown appearance of staphylococci on the cornea is explained by the epidermal-like change of the corneal epithelium by continued mechanical stimulus. All these organisms are regarded as saprophytes which find degenerated epithelial cells their best medium. They were found not only on the cornea, but also on the bulbar conjunctiva and even in the palpebral conjunctiva in amounts exceeding any other disease. Frequently, Bitot's flecks show fewer organisms than the apparently normal, neighboring bulbar conjunctiva. In mixed cases of prexerosis and kerato-conjunctivitis eczematosa, fewer saprophytes are usually found than in uncomplicated cases of the deficiency disease.—*From author's summary (transl.).*

4465. PUNTONI, VITTORIO. (Preface by G. SANARELLI). Manuale di Microbiologica Medica. 750p. 327 fig. Studio Editoriale degli'Istituti Universitari Socrate Bucciarelli: Rome, 1930. Price 90 L.

4466. RIVAROLA, JUAN BAUTISTA. Investigacion de bacilos acidoresistentes en la sangre. [Investigation of acid-fast bacilli in the blood.] *An. Inst. Nacion. Parasitol.* [*Paraguay*] 4(4): 33-34. 1931.—Note on technique.

4467. SCOMAZZONI, T. Il pH del liquido cefalorachidiano e la sua influenza sulla spirocheta. [The pH of the cerebrospinal fluid and its influence on the spirochaete.] *Gior. Ital. Derm. e Sifil.* 71(4): 1216-1230. 1930. —In 20 cases of early syphilis (blood Wassermann positive and biologic reactions in cerebrospinal fluid either positive or negative), the pH of the fluid fluctuated within normal limits. In 4 of 6 cases of incipient general paralysis, the fluid (positive) showed a practically normal pH. Spirochaetes placed in the negative fluid from early syphilitic cases and positive fluid from cases of general paralysis showed no marked differences in survival. The author suggests that when such differences are observed, they are more probably due to differences in resistance of the strains of *Treponema* than to differences in pH of the cerebrospinal fluids.

4468. SIMIČ, T. V. Das Auftreten und die Bedeutung von Bakteriämie bei Diphtherie. *Zentralbl. Bakt. I. Abt. Orig.* 120(7/8): 385-392. 1931.—Of 22 clinical cases of diphtheria which came to necropsy, 7 yielded *B. diphtheriae* both from local lesions and from blood. Of 14 guinea pigs injected subcutaneously with cultures from several of these cases, 2 developed bacteriemia. It is concluded that this sporadic occurrence of bacteriemia

is due on the one hand to the virulence of the strain of bacilli, its capacity to multiply and produce toxins quickly, and on the other to the individual receptivity of the infected organism. Further experiment showed complete curative power of immune sera prepared by use of the toxins of the given strains of diphtheria bacilli, provided these were given at the right time. Ramon anatoxin was completely prophylactic against subsequent diphtheria infection.

4469. **SOROMENHO, L. Spirochaetes in the faeces of patients with blackwater fever.** *Lancet* 219(5593): 1015-1016. 1930.—In 7 cases (white) of blackwater fever, organisms were present and were identified as *Treponema eugyrata* Werner. Similar organisms were found in the feces of 2 natives with intestinal disorders. The author suggests the possibility that these spirochaetes are pathogenic rather than saprophytic.

4470. **SOSA, HECTOR. Detalle de técnica para el aislamiento del gonococo en las uretritis agudas. [Isolation of gonococcus in acute urethritis.]** *Rev. Soc. Argentina Biol.* 6(9/10): 678-681. 1930.—By diluting urethral pus in broth before inoculating agar ascitis plates, a considerable increase in the number of colonies is obtained. If inoculation is not made immediately, ascitic fluid should be added and the tubes kept at 18-22° C.—*J. T. Lewis.*

4471. **SPENGLER, GUSTAV. Die Bangsche Krankheit beim Menschen.** *Wien. Arch. Inn. Med.* 19(1): 145-198. 1929.—Infection with Bang's bacillus is generally produced by consumption of raw cow's milk or milk products. No cases transmitted from man to man are on record. Health departments should test all sera for presence of Bang's bacillus. During the disease, fever may appear suddenly or slowly; it is present periodically, alternating with normal temp. Sweating, neuralgia and arthralgia appear; the pulse is slow, and liver and spleen may be enlarged. Diagnosis is made by agglutination tests. 4 cases among 12 people were observed in 1 establishment. A latent infection may become obvious in connection with some other disease. Serum therapy has not been successful, but vaccination is promising. Milk should be pasteurized and contact with infected animals should be avoided.—*P. G. Heineman.*

4472. **TISSEUIL, J. Sur un cas de lepre nodulaire à évolution tuberculoïde secondaire.** *Bull. Soc. Path. Exotique* 24(1): 17-21. 1931.—At the outset, abundant bacilli were found in typical groupings; at a later stage, sections of the biopsy specimen revealed no bacilli but numerous Langhans giant cells—the 1st unmistakable observation of a secondary tuberculoid leprosy.

4473. **TROSSEL, IRENE von. Erfahrungen mit dem Tuberkelbacillen-Kulturverfahren nach Hohn.** *Beitr. Klin. Tuberk.* 73(5): 619-624. 1930.—By animal inoculation, 8 cases of clinically proved tuberculosis were positive, 8 cultures were positive, 7 were doubtful, and the remainder, negative. The cultures checked with the autopsies more often than did animal inoculations. A positive test by the Hohn method did not always indicate a pleuritis. A positive culture from the urine, however, was indicative of renal tuberculosis, but the type, whether "open" or "closed," was not indicated.

4474. **TYLER, JOSEPH R. Transmission of experimental trachoma by contact.** *Science* 70(1825): 612-613. 1929.—Note on transmission of *Bacterium granulosis* through caging together of inoculated and uninoculated *Macacus rhesus.*

4475. **WAIL, S. S. Die Tuberkulose der Haut und ihre Wechselbeziehungen zur Tuberkulose der inneren Organe. (Experimentelle Untersuchung.)** *Virchow's Arch. Path. Anat. u. Physiol.* 277(1): 115-129. 12 fig. 1930. —Intracutaneous inoculation of 108 guinea pigs, 5 rabbits and 3 monkeys, with tuberculosis, produced a cutaneous tuberculosis histologically very similar to human lupus. Intracutaneously inoculated animals lived 6, 8 or even 12 months, even when the dose of bacilli was large; similar doses given intra-abdominally or subcutaneously produced death in 1.5-3 mo. Intra-abdominally inoculated animals lived longer if an emulsion of cutaneous tubercles was used, than did animals inoculated with an emulsion made from tuberculous internal organs. Generalization begins soon after inoculation of the skin with tuberculosis, but the process is slow; in guinea pigs killed in the first months after inoculation, only an incipient tuberculous process, or none at all, was evident in the internal organs. The pathologic changes in the internal organs were less in those cases in which the cutaneous tuberculosis was marked than in those in which the primary changes in the skin were slight and transient. The fact that size of dose had less effect on severity of infection than localization (intra-abdominal or cutaneous) apparently indicates that the skin, unfavorable for tuberculosis, reduces the virulence of the bacilli.

4476. **ANDERSEN, C. W., and AXEL THOMSEN. On the occurrence of abortus bacilli (Bang) in commercial milk from dairies in Copenhagen.** *Acta Path. et Microbiol. Scandinavica Suppl.* 5: 53-57. 1930.

4477. **ARISTARKHOVA, O. Observations sur la peste endémique en Russie.** *Bull. Soc. Path. Exotique* 23(9): 901-904. 1930.—For 2 yrs. the author studied outbreaks of pneumonic and bubonic plague on the Kalmuck steppes, the wild rodents of the region and their parasites, and particularly the fleas (*Ceratophyllus tesquorum* and *Neopsylla setosa*), to which this communication is devoted. Placed in a test-tube, these fleas lived "a long time" without food, provided fresh air were admitted daily. A healthy rodent would acquire from 10 infected fleas an infection fatal in 8-9 days. Experimenting on herself with these fleas, the author found that they would attack man only when famished. This fact and the observation that outbreaks of human plague follow extensive fatalities among rodents indicate that the disease is spread in man when the fleas are driven by hunger to leave the dead rodents that have harbored them.

4478. **ATWOOD, GEORGE E. Undulant fever in Ware County, Georgia.** [*U. S.*] *Public Health Repts.* 45(24): 1343-1354. 1930.—9 of 11 cases of undulant fever occurring in 1929 (Waycross, Ga.) were investigated epidemiologically. All used raw milk (6 exclusively, 3 freely); 8 used raw milk from one dairy,—5 exclusively; 1 used raw milk exclusively from another dairy. Both dairy herds contained cows reacting positively to the abortus agglutination test. The evidence indicates that the cases were due to the porcine strain of *Brucella abortus* coming through the milk supply.—*Author's summary.*

4479. **BERGER, HERBERT. Zur Methode der biologischen Probenahme bei Trinkwässern. [Methods of sampling drinking water for biological testing.]** *Kleine Mitteil. Mitglieder Ver. Wasser-, Boden- u. Lufthyg.* 7 (1/4): 73-75. 1 fig. 1931.

4480. **COUGHLIN, F. E. Undulant fever.** *Pennsylvania Assoc. Dairy & Milk Inspect. Ann. Rept.* 6: 108-111. 1930.—52 cases of undulant fever have been discovered in Pennsylvania of which 29 occurred in 1929. The majority of cases were in rural communities, and most of them are apparently due to use of raw cow's milk

from abortus-infected herds. Efficient pasteurization offers the best solution of the problem.—*Author's summary.*

4481. **CRUCHET, RENÉ. The etiology of epidemic encephalitis.** *Practitioner* 124(2): 174-187. 1930.—The author holds that epidemic encephalitis is polymorphic, and that Economo's encephalitis lethargica is only one of the types of subacute or diffuse encephalomyelitis. He maintains that the disease originated among the French troops in 1915, in cases observed then and described by him in 1917; that Indo-Chinese soldiers engaged around Verdun, where the first cases occurred, later in the same yr. carried the disease back home with them; that from Annam it spread into China and thence along commercial routes back into Europe.

4483. **FRIEDBERGER, E. Weiteres zur Epidemiologie des Typhus.** [Epidemiology of typhus.] *Münchener Med. Wochenschr.* 74(30): 1280-1285. 1927.

4484. **GERSTEIN, H. H. Efficiency of chlorination at Chicago.** *Jour. Amer. Water Works Assoc.* 23(1): 53-62. 1931.—There appears to be a definite relationship between bacterial quality of raw and chlorinated water. The greater the turbidity of the water, the less the efficiency of chlorination. Using chlorination as the only treatment, Chicago has produced a water well within the U. S. Treasury Department standards, in spite of widely varying characteristics of the raw water. At Chicago, the efficiency is entirely dependent on strict supervision, which relies on continuity of operation and early detection of Cl-absorbing materials in the water. With the increasing trend of pollution by sewage and industrial wastes, Chicago is rapidly approaching a point where chlorination alone will not produce a safe water unless excessive amounts of Cl are used.—*Author's conclusions.*

4485. **GREENWOOD, M., E. M. NEWBOLD, W. W. C. TOPLEY, and J. WILSON. A further study of herd mortality under epidemic conditions.** *Jour. Hyg.* 30(2): 240-265. 1930.—The authors studied herds of mice, some in which pasteurellosis was the chief infection, and some in which aertryckosis caused most of the deaths. The q_x or cage-age mortality curve of a herd increases rapidly to a maximum and thereafter descends to an approximately constant level much above that of the q_x for normal mice of ages within the range of real, physiological age of animals living in the herds. At the latest ages under observation, the principal factor of mortality is still the specific factor, so that the advantage produced by selective mortality and active immunization is brought to a standstill far above the zero line. Exposure in a herd under the conditions used will not produce an ultimate population fully resistant to the specific factor of infection. It is probable that a large proportion of the members of a herd becomes infected early in herd life, and gradually increases in degree of immunity because variations of environmental conditions, so far as these are measured by the general herd mortality, become less and less influential on the ultimate mortality of the exposed, the later the point in time chosen for measurement. Study of the form of the age-mortality curve is still proceeding; at present the authors can not offer an adequate mathematical description of it which takes due account of the biological factors requiring attention. Provisionally, they attribute the difference in time of the maxima of the q_x curves of *Pasteurella* and *Bacillus aertrycke* epidemics to a difference of average interval between infection and death.

4488. **HERELLE, F. D' The carrier problem.** *Yale Jour. Biol. & Med.* 3(1): 21-38. 1930.—Since animals susceptible to cholera and typhoid bacilli are not known, a study was made of a related disease (mouse typhoid) caused by a bacillus of the same group, *Bacillus typhi-murium* Loeffler. Among 8 mutants experimentally obtained, 6 were totally avirulent, in 1 the virulence was greatly attenuated, and with another it was maintained. This would imply that mice carrying any of the first 6 mutants would not have been infectious, while a mouse carrying the 8th mutation would have been as infectious as a sick mouse. It is concluded that in typhoid fever there are chronic infectious carriers, but possibly also carriers which are not infectious, and that the latter propagate an adapted bacteriophage antagonistic to infection. While typhoid is, strictly speaking, endemic throughout the world, rendered so by the persistence of chronic infectious carriers, epidemics being merely local flares of a perpetual pandemic, cholera is endemic in only 2 regions of the world, Bengal and Indo-China with the adjacent Chinese Province of Yunnan. From epidemiologic facts it is concluded that in cholera the carrier is never infectious. Transformation of the vibrio from virulent to avirulent form takes place at the time of bacteriophagy. These carriers are thenceforth protected from infection, and remain so as long as they remain carriers of the symbiosis; furthermore, other individuals become "contaminated" by them. This conclusion is reenforced by experiment regarded as conclusive. First experimentally producing *B. typhi-murium*-bacteriophage symbioses, the author shows that ingestion of such a completely avirulent symbiotic combination by mice protects them against ingestion of several times the fatal dose of virulent *B. typhi-murium*. Hence, it is declared that the sole agents in propagation of cholera are the "incubating" carriers and those with the disease. Moreover, bacteriological examination renders it possible to distinguish the infectious incubating carrier from the recovered or non-contagious contact carrier. In the first, the intestine contains a culture of pure vibrios; in the latter, there is a symbiotic culture, from which it is easy to isolate a bacteriophage which in vitro induces bacteriophagy of the cholera vibrio.

4489. **HOLST, AXEL. Einiges über Friedhöfe.** *Acta Pathol. et Microbiol. Scandinavica Suppl.* 3: 157-165. 1930.—The comparative merits of burial and cremation, from a public health standpoint, were considered, with reference to the popular and widespread belief that gases or emanations from cemeteries are a menace to health, particularly in epidemics. The author concludes that burial is as safe as cremation.

4490. **KHAN, SARANJAM. On the vibriocidal power of the water of certain rivers of India.** *Indian Jour. Med. Res.* 18(2): 361-365. 1930.—The rapid death (24 hrs.) of *Vibrio cholerae* in unboiled water from the Ganges and Junma rivers, as contrasted with its normal longevity (about 3 days) in boiled water from the same source, has been explained on the assumption that the water contains a volatile bactericidal substance (Hankin, 1896), or bacteriophage (d'Herelle, 1926). The author tested vibriocidal Ganges water by culturing *V. cholerae* in broth to which the water had been added, filtering through a Chamberland L 3 candle, and adding the filtrate to a fresh emulsion of *V. cholerae*. No evidence of a bacteriophage was found. He found that the vibriocidal property is destroyed by boiling the water in a sealed tube; is not restored to boiled river water by leading into it the volatile substances (if any) given off when the water is boiled; is destroyed by heating river water to 60°, 70°, 80°, or 90° C. for 15 min., or to 55° for 30 min., but not when heated to 50° for 15 min. The author believes that the death of the vibrios in river water is due to competition of other organisms for food; and that the prolonged life of the vibrios in boiled water is due in part to the elimination of competitors and in part to the fact that the dead bodies of these competing organisms serve as food for *V. cholerae.*

4491. **KLIGLER, I. J., and L. OLITZKI. The relation of temperature and humidity to the course of a B. enteritidis infection in white mice.** *Amer. Jour. Hyg.* 13(1): 349-361. 1 fig. 1931.—Experiments to elucidate the effect of climatic factors on enteric infection showed that white mice of the same stock and age infected with the same number of *Bacillus enteritidis* and kept at different

temp. and humidities react differently: At low temp. and high relative humidity (10°-12° C., and 90), infection is more severe than at higher temp. (20° and 30°) with the same humidity. Fatality rate is the same but incidence of liver abscesses is higher. At 30° mice kept at a relative humidity of 90 are more severely affected than those kept at 35. Under the latter conditions, development of infection is more rapid but it is mild or inapparent, clears up rapidly and leads to relatively few deaths in comparison with the high humidity group. At 20° a higher humidity seems more favorable than a lower one; but the differences are not marked. It appears that the critical factor is not temp. alone or humidity alone, but the combination of the 2, probably the so-called "effective temp."—*Authors' conclusions.*

4492. **KRAUSE, P. Weitere Erfahrungen über die Therapie der Typhusbacillenausscheider.** *Therapie Gegenwart* 70(3): 120-123. 1929.—After intravenous administration of salyrgan to dogs, the highest Hg percentage is found in the bile; less but still considerable in the suprarenals, kidneys and large intestine; some in the fatty tissues, liver, spleen, heart, pancreas, small intestine, stomach, blood and urine; and none in the bone-marrow or brain. In human and animal subjects, elimination is chiefly through the urine, and only in small part through the feces. Successful results are reported in the treatment of 2 typhoid carriers, 1 carrier of paratyphoid A, and 2 Gärtner bacillus carriers.

4493. **LEGER, MARCEL. Rôle non-exclusif des rats comme réservoirs du virus de la peste.** *Bull. Soc. Path. Exotique* 23(6): 564-568. 1930.—Facts suggesting or, in the author's opinion, proving the possibility of the existence of healthy human carriers of the plague virus.

4494. **MÜLLER, MAX. Die Latenz der tierischen Paratyphusinfektionen insbesondere der Schottmüller-infektionen als das entscheidende Moment für das Zustandekommen von Paratyphusepidemien tierischer Herkunft beim Menschen.** *Deutsche Schlachthofzeit.* 29(17): 273-277. 1929.—From a critical review of studies by himself and by others, the author concludes that, since latent animal infections are the decisive factor in causing paratyphoid epidemics in man, special precautions should be taken to prevent sale of infected meat. If animals which appear sick are slaughtered for human food the meat should be examined bacteriologically for paratyphoid organisms. In some instances paratyphoid bacteria have been isolated from apparently healthy animals and it is possible that meat or milk from such animals may cause paratyphoid fever or meat poisoning in man. —*F. W. Tilley.*

4497. **RAGHAVACHARI, T. N. S., and S. V. GANAPATI. Some observations on the water of the Red Hills Lake at Madras (1925-28).** *Indian Jour. Med. Res.* 16(4): 1139-1147. 1929.—The water was first treated by slow sand filtration in 1914. It has never been of satisfactory quality because of obnoxious odors, due chiefly to H_2S, and lack of uniform quality. Studies of temp., stratification, dissolved O, nature and amount of organic matter, pH, and rainfall have been carried out since 1925. The lake is shallow and stratification, with excessive algal growth, occurs, and this settles to the bottom, putrefies and reduces the dissolved O. Further loss of O occurs in a 7-mile covered conduit leading to filter beds and on the beds themselves O decreases progressively and H_2S is generated. Aeration by passage of water through percolating filters, preceding slow sand filtration, has eliminated the obnoxious gases and a satisfactory water is now obtained.—*C. M. Hilliard.*

4498. **RAMSEY, GEORGE H. Yellow fever in Senegal, with special reference to the 1926 and 1927 epidemics.** *Amer. Jour. Hyg.* 13(1): 129-163. 3 maps. 1931.—Making due allowances for poor reporting, the recorded prevalence of the disease agrees with the theory that Senegal is an epidemic area. Since 1778, epidemics have been reported at irregular intervals with long periods between. All the reported cases were among whites; and the total number of these was insufficient to account for the wide geographical distribution of the disease. This negative finding, together with the mystery surrounding the origin of individual epidemics, leads to the inference that natives must have been attacked in numbers greatly exceeding the incidence among whites. There were, however, only a few observations of typical cases among natives. It was therefore concluded that the native population must have constituted a vast, but hidden reservoir of infection.

4500. **SHERMAN, J. M., C. N. STARK, and PAULINE STARK. Destruction of botulinum toxin by milk bacteria.** *Jour. Dairy Sci.* 11(5): 352-358. 1928.—It has been shown that certain bacteria commonly found in milk destroy toxin of *Clostridium botulinum.* Data reported in this and in a previous paper have shown that this destruction may be caused by *Streptococcus lactis, Lactobacillus casei, Bacterium coli, Bact. communior, Bact. aerogenes,* and *Proteus vulgaris.* It is believed that these results explain in part the fact that milk and dairy products are seldom if ever agents in dissemination of botulism. The fact that *Strep. lactis* and *L. casei* have the power to destroy botulinum toxin is of particular interest in connection with cheese, since in most types of cheese *Strep. lactis* is the predominating organism during early stages of ripening, while *L. casei* is one of the predominating organisms in all types of cheese during the later stages.—*Authors' summary.*

4501. **SMILEY, D. F., and G. F. MAUGHAN. Cold preventive work at Cornell University.** *Scientific Monthly* 32(3): 235-239. 1931.—A combination of old and new methods applied to groups of cold-susceptible male students resulted in a reduction of 42½ to 58.26% in cold incidence. Methods employed were: instruction regarding diet, sleep, ventilation and alkalinization; a 15 min. ultraviolet bath once or twice a week from October through April; use of mixed alkalies when colds threaten; in special cases, use of a vaccine.—*D. F. Smiley.*

4502. **SPENCER, R. R. The visible effect of castor-oil soap on certain organisms.** [*U. S.*] *Public Health Repts.* 45(24): 1354-1360. 1930.—Sodium ricinoleate, in appropriate amounts, completely clears bacterial suspensions of certain species in physiological saline. The density of suspensions of certain other bacterial species is increased by appropriate concentrations of sodium ricinoleate. The density of still other bacterial suspensions is increased at one concentration and decreased at another. The explanation of such changes is not yet apparent. Certain bacterial species grow in plain broth containing 1% sodium ricinoleate.—*Author's summary.*

4503. **TOMB, J. WALKER. Observations on the stability of chloride of lime, "stabilized" chloride of lime, and Perchloron in the plains of Bengal.** *Far East. Assoc. Trop. Med. Trans. 7th Cong. Brit. India* 3: 553-567. 1927[1928].—As a result of tests the author claims that "Perchloron" is the preparation of choice for future use in hot countries in public health work, for all purposes for which bleaching powder is now ordinarily used.

4504. **TSURUMI, MITSUZO. Épidémie de peste bubonique et septicémique dans la Mongolie intérieure, en 1928. (Rapport de l'Office sanitaire de la Compagnie du Chemin de Fer Sud-Mandchourien.)** *Office Internat. Hyg. Publ.: Bull. Mensuel* [*Paris*] 22(2): 261-265. 1930. —Among the 50,000 rodents captured were 10 species of rats, 3 of squirrels, the jerboa, *Alactaga mongolica* (Radde), and *Myosparax epsilamus* Thomas. The rats known to carry bubonic plague are not numerous in

inner Mongolia, but the squirrels, *Citellus mongolicus* Thomas, *C. mongolicus umbratus* and *C. mongolicus* subsp., are abundant, especially the first-named, which Japanese experts have pronounced more sensitive to plague bacilli than any other laboratory animal. The period of spontaneous disappearance of the epidemic (winter) corresponds to the hibernating period of the squirrel; if domestic rats were responsible for the plague in Mongolia, it would be difficult to account for the non-occurrence of epidemics in winter. Among the squirrels captured were 36 which presented clinical signs of plague and from the organs of which was isolated a bipolar bacillus microscopically and biologically resembling the plague bacillus. For these and other reasons the commission concludes that squirrels are here responsible for the epidemics of bubonic plague.

4507. **BORNAND, M. La recherche microscopique des coques de cacao.** *Mitteil. Gebiete Lebensmitteluntersuch. u. Hyg.* 22(3): 124-125. 1931.—Use of antiformin treatment and centrifugation of cacao shells as a method for studying their cellular elements and the microorganisms present.

4508. **BUNZELL, H. H., and MARION FORBES. A method for testing for ropiness of bread.** *Cereal Chem.* 7(5): 465-472. 1930.—Ropiness of bread is caused by *Bacillus mesentericus*. On hot, damp, summer days, infected bread develops ropiness in 36-72 hrs. While scrupulous cleanliness and disinfection are helpful, the only positive and immediate remedy is use of acid (vinegar or lactic acid, a mixture of the 2, or Ca acid phosphate). A dough at pH 4.5-5.0 appears to be safe. An amount of Ca acid phosphate slightly greater than 0.5%, based on the flour used, is adequate.—*E. Richman.*

4509. **FISHLOCK, W. C. Moisture and mould in copra under Western Province conditions.** *Dept. Agric. Gold Coast [Year-book 1929] Bull. 22.* 233-238. 1930.—Well dried copra (6% moisture) can be safely stored for long periods. Superficial grey-green mold may be regarded as harmless. Pernicious molds, i.e., black and brown, do not occur, since copra does not take up enough moisture for their growth. The experiment was continued for 62 weeks but no bad molds were present, though the copra was weevil-infested.

4510. **HAINES, R. B. The growth of micro-organisms on chilled and frozen meat.** *Chem. & Indust.* 50(27): 223T-227T. 1931.—A temp. of −5° C. was not sufficiently low to inhibit microbial growth on frozen meats. The experiments suggested that −10° is satisfactory. Figures are given for rate of growth of microorganisms on a stored carcass of lamb held at −5°, showing that there is at first a decrease in numbers, followed by an increase due mainly to growth of yeasts and molds. Biochemical studies, in which the increase in "soluble nitrogen" was followed, showed that appreciable changes may take place at 0° under optimum conditions for growth of microorganisms. Changes in frozen preparations at −3° and −5° were slight. Successful storage of chilled meats for long periods demands cleanliness of handling and careful control of humidity. Spoilage may occur through contamination with certain microorganisms. Results suggest that changes in fat also may be due in part to microorganisms.—*Author's conclusions.*

4511. **JARVIS, JOE W. Data on freezing strawberries.** *Fruit Products Jour. & Amer. Vinegar Indust.* 10 (11): 339-340, 353. 3 fig. 1931.—Best results were obtained with 3 parts of mature fruit to 1 of fine granulated manufacturer's sugar, with a syrup density of 60-70°. Balling-vacuum-closed cans were most satisfactory. Precooling before and after packing is advised and use of cold storage at 30-31° F. before freezing aids in syrup penetration. Temp. of −10 to +10° F. for freezing and 0 to −10° F. for storage are recommended.

4512. **JORDAN, EDWIN OAKES. Food poisoning and food-borne infection.** 286p. 20 fig. Univ. of Chicago Press: Chicago, 1931. Pr. $2.50.—This is not merely a revision of the former volume; it is entirely rewritten. The essential facts are presented simply and concisely, and the more important topics have received the greater attention. The vast amount of recent work on the paratyphoid-enteritidis group in the U. S. A. and other countries is critically analyzed and the conclusions are summarized. The chapter on botulism is complete, and the other topics, including food allergy, metallic poisons in foods, systemic diseases which may be transmitted by food, parasites from foods, poisonous animals and plants, are fully discussed. Each chapter has a bibliography of leading original articles. California, apparently in error, is not included in the list of States in which food poisoning is reportable. The antiquated term "ptomain poisoning" is relegated to its proper place.—*E. C. Dickson.*

4513. **KERTESZ, Z. I., and E. L. GREEN. Factors influencing the pectin content of stored apple pomace.** *New York State [Geneva] Agric. Exp. Sta. Tech. Bull.* 179. 1-14. 1 fig. 1931.—Dried and ground apple pomace containing 7.5, 20, 33.3, 50, and 60% moisture was stored for 5 mo., and the amount of soluble pectin and acid-hydrolyzable pectin determined. Changes occur during storage which lower the quantity and quality of pectin extracted. These changes are caused by moisture content and are not of enzymic character. No growth of molds could be observed on artificially infected apple pomace containing 20% or less of moisture. In pomace stored with 33% moisture, molds grew and water-soluble pectin was decreased. In the sample containing 50% moisture, soluble pectin and that obtained by acid extractions were found to be less than in controls without mold infection.—*Z. I. Kertesz.*

4514. **LEIGHTON, G., and J. BASIL BUXTON. The distribution of Bacillus botulinus in Scottish soils.** *Jour. Hyg.* 28(1): 79-82. 1928.—A total of 100 soil samples from various counties of Scotland and 6 from the Isle of Man were examined. 2 produced toxic filtrates of *B. botulinus* Type A (first report for Type A in European soil); 1 sample yielded Type B; and 1 a toxic filtrate neutralized by both Type A and Type B botulinus antitoxin. 3 of these positive results were from soils of pasture lands and 1 was from a ploughed field.—*F. A. Rotondaro.*

4515. **PEDERSON, CARL S. Sauerkraut.** *New York State [Geneva] Agric. Exp. Sta. Bull.* 595. 1-23. 1931. —Preparation of sauerkraut from cabbage is described from the standpoints of both process and fermentation. Fermentation is normally carried on by bacteria that change the sugar to lactic and acetic acids, alcohol, mannitol, and CO_2. Use of starters prepared from various bacterial cultures is discussed. In general, starters are detrimental to a good fermentation; temp., proper covering, and correct salt content are of major importance.

A discussion is given of the various types of spoilage in sauerkraut, including the effect of direct contact with air, lack of sauerkraut juice, lack of or too much salt, improper temp., etc.—*C. S. Pederson.*

(See also in this issue Entries 3663, 3674, 4231, 4514, 4544, 4576, 4598, 4604, 4959)

4526. **BURKE, VICTOR, and NELSON J. HOHL. Cross inoculation with Rhizobium radicicolum.** *Soil. Sci.* 30(5): 407-411. 1930.—Root nodule bacteria were isolated from red clover, vetch and alfalfa, and composite stock cultures prepared from several typical colonies of each strain. Growing vetch and clover strains on sterile alfalfa root extract or exposing them to living alfalfa tissues for 3 mo. did not change their host specificity. When the 3 strains were cultured on clover, vetch and alfalfa root extracts, different strains and different cultures of the same strain varied in rate of growth, but the rate in homologous and heterologous extract was the same.—*E. V. Abbott.*

4527. **HINO, IWAO, and HAYAO MOMIKI. Active period of soil ciliates in rice straw decoction.** *Bull. Miyazaki Coll. Agric. & Forestry* 3. 43-47. 1931.—All species become active in rice straw decoctions within about 10 days after inoculation, with certain exceptions. Green house soil liberates active forms earlier than soils from other sources, but they generally have a somewhat shorter period than those in other soils.—*Authors' summary.*

4528. **JENSEN, H. L. Notes on a cellulose-decomposing soil fungus of an unusual character.** *Proc. Linnean Soc. N. S. Wales* 55(5): 699-707. 1 pl. 1930.—A fungus, probably a *Botryosporium,* was isolated from an English field soil with addition of manure. It proved very sensitive to acidity, pH 4.5 being very near the limit at which growth could be induced; good growth took place only above pH 6.0, with an optimum zone at pH 6.6-7.4, and possibly higher. In neutral or alkaline solution the fungus exerted a very strong cellulose-decomposing activity; in unbuffered physiologically acid solution almost none. Its sensitiveness to acidity is greater than that of any fungus hitherto studied in this respect. Morphology (briefly) and cultural and physiological characters are presented.—*From author's summary.*

4529. **JENSEN, H. L. Actinomycetes in Danish soils.** *Soil. Sci.* 30(1): 59-77. 1930.—Counts were made of actinomycetes in 56 Danish soils of different character. The numbers ranged from none or a few thousands to about 13 millions per gm. of soil. Nearly all strongly acid soils (pH less than 5) had very small numbers. The highest numbers seemed most frequent at pH 6.8-8. The % of actinomycetes in the total microflora on plates was 0-73%; this figure was very low in strongly acid peat soils; otherwise it showed no correlation with soil reaction. Apart from the reaction, there seemed to be no correspondence between general soil type and number of actinomycetes. Several strains isolated from these soils could be recognized as belonging to the following species-groups: (1) Common—*Actinomyces griseus, cellulosae, olivaceus, bobili, diastatochromogenus;* (2) fairly common to rare—*A. griseoflavus, violaceus-ruber, roseus, erythrochromogenus, pheochromogenus;*

new—*A. fulvissimus* (p. 66). The majority of the strains could not be related to definite groups. Strains of the same species-group often showed great differences in physiological characters, such as pigment production, ability to utilize carbohydrates, acid formation, nitrate reduction and proteolytic activity, although some of these characters remained relatively constant and appeared to have diagnostic value. Organic acids were sometimes formed from carbohydrates; this was always connected with nitrite production. On the whole, the "chromogenous" forms had a lower proteolytic power than the non-chromogenous. The ability of actinomycetes to resist acid reaction varied widely; the final acidity produced in a physiologically acid nutrient solution for each species-group was subject to less variation than most other physiological characters and may be of value for characterization and identification.—*Author's summary.*

4530. KOFFMAN, M. De egentliga jordprotozoerna. Deras ställning till andra jordmikroorganismer och deras roll vid de mikrobiologiska processerna i jorden. [The true soil protozoa: Their relation to other microorganisms of the soil and the part they play in the microbiological processes of the soil.] [With English summary.] *K. Landt. Akad. Handling. och Tidskr.* 70(4): 556-620. 3 pl., 6 fig. 1931.—The investigation yielded the following results: Protozoa in normal soils form an insignificant part of the micropopulation in regard to number, species and volume. Thus, in normal soil they would seem to exercise no appreciable effect on number of bacteria or other microorganisms present. Obtaining of data on the abundance of species and individuals in a soil of normal moisture depends on application of indirect methods involving development of cysts of aquatic protozoa that do not belong to the active inhabitants of the soil. Study of the metabolism of the soil directly under various physiological conditions and normal conditions of moisture confirmed the view that the microfauna of the soil exercises but an insignificant influence on soil microbiological processes. Vegetation experiments also showed that the improved fertility following soil sterilization is due, not to killing of the protozoa, but to other factors. This does not exclude the possibility that under abnormal conditions—e.g., in waterlogged soil or soil irrigated with sewage, as also in use of artificial substrates—results may be attained which tend to show that protozoa check the development of bacteria and are of fundamental importance for their metabolism.—*Author's summary.*

4531. KOSTIUK, FR. Azotobakterové zkoušky v moravských půdních typech klimatogenetických. [Azotobacter tests in the climatogenetic types of soil of Moravia.] *Věstník Českosl. Akad. Zem.* 6(5): 480-483. 1930.—The natural finding of *Azotobacter* and azotobacter reactions after inoculation were tried in separate horizons by the Christens mannite solution, either with or without addition of CaO. The natural occurrence of *Azotobacter* was observed only in the soil types having a saturated absorption complex, and in horizons of humus. The inoculation experiments showed distinct need of lime. Differences in intensity of reaction in separate horizons were not clear. On the development of *Azotobacter*, addition of Al_2O_3 has a positive influence without regard to pH.—*F. Kostiuk.*

4532. SEARS, O. H., and F. M. CLARK. Non-reciprocal cross-inoculation of legume nodule bacteria. *Soil Sci.* 30(3): 237-242. 1930.—Garden and navy beans were the only members of the legume groups which became infected by the nodule bacteria of Wood's clover (*Dalea alopecuroides*). In these, though abundant nodulation was produced, N fixation was less than ½ that fixed by the nodule bacteria normal to them. The nodule bacteria of sweet clover, red clover, soybean, and cowpea failed to produce nodules on Wood's clover. Although inoculation with the nodule bacteria of the garden and navy bean likewise produced no nodules, a peculiar root-knotting was often observed. However, all attempts to isolate bacteria from such knotted roots failed. In all cases, normal nodules were produced on Wood's clover when inoculated with pure cultures isolated from nodules on garden bean and navy bean that had been originally produced by Wood's clover nodule bacteria. —*F. A. Rotondaro.*

GENERAL BACTERIOLOGY

4533. ADVIER, et PEIRIER. Mode d'action des huiles de Caloncoba et de leurs dérivés sur les bacilles acido-résistants. *Bull. Soc. Path. Exotique* 23(8): 767-772. 1930.—Experiments in vitro with tubercle bacilli on Heyden-Hesse medium showed that, within a month, oils of *Caloncoba echinata, C. glauca, C. welwitschii, Taraktogenus kurzii, Hydnocarpus anthelminthica,* and *H. wightiana* had exercised no inhibitory action. At the end of 3 months cultures covered with any of these oils had begun to die.

4534. ALLISON, V. D. Observations on the value of a copper sulphate tellurite medium for the isolation of diphtheria bacilli. *British Jour. Exp. Path.* 11: 244-248. 1930.—Results obtained in isolation of *Corynebacterium diphtheriae, C. hofmannii,* and diphtheroid bacilli from nose, throat and ear swabs are compared, using Douglas' medium and $CuSO_4$-tellurite-serum agar. They show well marked differences in % of organisms isolated, all cases being in favor of the $CuSO_4$ medium. The better results obtained with this medium are due to its greater selective action for diphtheria and diphtheroid bacilli, and to the powerful inhibitory action of the $CuSO_4$ on staphylococci, streptococci, and other commensal organisms of the nose, throat and ears. Different samples of $CuSO_4$ had different optimum concentrations in this medium, and it is suggested that cupri sulphere (A.R.) of British drug houses should be used in a concentration of 0.05%. Chloroform must not be used as a preservative for the serum. The agar must not be more acid than pH 8.0 before adding the trypsinized tellurite-serum and $CuSO_4$.—*J. Bland.*

4535. ASSIS, A. de. Sobre Alcaligenes lenis e sua verificação no homem. [A. lenis and its occurrence in man.] *Bol. Inst. Vital Brazil* 14: 3-13. 1930.—An Alcaligenes recovered from the blood of a girl with a mild typhoid-like disease in Niteroi, Brazil, is described, with detailed cultural characters. It grows well on plain agar with several variants of the *R*-colony form, all proving to be heat-stable in saline solution. Mice proved to be quite insusceptible to its introduction by cutaneous, peritoneal or venous routes; guinea pigs and rabbits appeared somewhat more susceptible, but without distinct symptoms or lesions; no toxin could be detected in old broth cultures. Specifically agglutinating and complement-fixing antisera could be prepared on rabbits; however, their titers were always very poor and the clumps assumed the granular type. A very slight clumping of the Rawlings strain of typhoid bacillus could be seen with these rabbit antisera, but uncharacteristic in nature. The microörganism is termed *Alcaligenes* lenis (p. 7) on account of its mild action on man and animals. —*A. de Assis.*

4536. BERTHO, ALFRED, and HANS GLÜCK. Die Bildung von Wasserstoffperoxyd durch Milchsäurebakterien. [Formation of H_2O_2 by lactic acid bacteria.] *Naturwissenschaften* 19(4): 88. 1931.

4537. BIANCHI, LUIGI. Ricerche batteriologiche sopra un caso di meningite purulenta. [Bacteriology of a case

of purulent meningitis.] *Boll. Soc. Med.-Chir. Pavia* 44(5): 589-613. 1930.—The author isolated from a fatal case of cerebrospinal meningitis an organism bearing a striking resemblance to the *Diplococcus meningitidis liquefaciens* isolated by S. and L. D'Antona from a similar case and by them offered as a new species. He believes, however, that the organism in question belongs to the *Staphylococcus pyogenes* group (in this case a superinfection on the meningitis) and that the species *D. meningitidis liquefaciens* therefore should not be preserved.—*From author's summary (transl.).*

4538. **BORDET, J., et E. RENAUX. L'influence du calcium sur l'évolution des cultures de charbon.** *Ann. Inst. Pasteur [Paris]* 45(1): 1-25. 1 pl. (col.) 1930.—Continued culture of anthrax bacilli on agar decalcified by addition of 0.1-0.2% neutral Na oxalate split the population into 2 types of colonies: Type A, rather flat and rough, tending to enlarge by formation of a narrow border; Type B, whiter, more convex and less rough, giving off plume-like expansions. Both types were spore-bearing and pathogenic. Grown on agar enriched with a little 1% solution of $CaCl_2$, this anthrax strain likewise split into 2 types, 1 of which was identical with Type B obtained on oxalated agar, the other, Type AA, was filamentous, non-spore-bearing, non-pathogenic for guinea pigs and incapable of producing in them any resistance to Type B. The viscid sheath sometimes seen covering anthrax colonies was perpetuated when these were transplanted to oxalated agar.

4539. **BORDET, PAUL. Influence du calcium sur les caractères des espèces microbiennes.** *Ann. Inst. Pasteur [Paris]* 45(1): 26-41. col. 2 pl. 1930.—Ca deficiency rather profoundly alters certain bacterial properties, e.g., it quite regularly and considerably increases sporulation. A bacterial species composed of 2 strains unequally rich in spores, under the influence of oxalation of the nutrient medium, shows a marked predominance of the strongly spore-bearing variety. Ca appears, then, as one of the factors of bacterial variability. Apparently it is a disturbance of this variability which explains the great increase in pigment-producing power of *Micrococcus prodigiosus* observed under Ca deficiency; it produces, in certain bacilli, considerable morphologic modifications by changing them into short elements, most frequently in forms of coccobacilli. These modifications, determined by the oxalation of the nutrient medium, have an essential characteristic—they do not involve decrease in vitality or alteration of hereditary potentialities; placed in contact with Ca the bacterium immediately resumes its normal characteristics.—*Author's summary (transl.).*

4540. **BUCHANAN, R. E., and ELLIS I. FULMER. Physiology and biochemistry of bacteria. Vol. III. Effects of microörganisms upon environment. Fermentative and other changes produced.** 575p. Williams & Wilkins Co.: Baltimore, 1930.—The first chapter (XIV) deals with the special physiological interrelationships of microorganisms—symbiosis, antibiosis, commensalism, metabiosis, synergism; the remaining chapters, with the effects of microorganisms on their chemical environment. Chapter XV deals with enzymes, their characteristics, formation, preparation, classification, occurrence in microorganisms, and theories of mechanism of action. Chapter XVI is a general discussion and classification of types of chemical changes produced by microorganisms. Chapter XVII deals with their action on inorganic materials; XVIII, on non-nitrogenous organic compounds, including a detailed discussion of various theories of fermentation; XIX, on nitrogenous organic compounds. The energetics of the reactions are considered in so far as data are available. Complete literature citations are given (133p.). There are 3 indexes—author, subject and microorganism.—*E. I. Fulmer.*

4541. **CALLERIO, CARLO. Ricerche culturali sul bacillo della tubercolosi. [Cultural studies of the tubercle bacillus.]** *Boll. Soc. Med.-Chir. Pavia* 44(2): 251-260. 1930.—Hohn's method (treatment with 10% H_2SO_4, centrifugation and direct implantation of the sediment on glycerinated, naturally acid egg and broth media [pH 5.8-6.8]) gave satisfactory results more readily than other methods; prolongation of time of treatment up to 4 days had no unfavorable influence. Intravenously inoculated (3 mgm. each) into as many rabbits, 10 strains of tubercle bacilli from human sources killed 4 of them with acute miliary tuberculosis about the 20th-30th days. The others survived to 3½ mos., indicating that under like conditions various strains of tubercle bacilli may show different degrees of virulence.

4542. **CALLERIO, CARLO. Sopra un metodo rapido di colorazione delle spirochete. [A rapid method of staining spirochaetes.]** *Boll. Soc. Med.-Chir. Pavia* 44 (2): 347-352. 3 fig. 1930.—By means of a solution of ammoniacal Ag.

4543. **CALMETTE, A., und J. VALTIS. Die filtrierbaren Elemente des Tuberkulosevirus. Präbazilläre Granulämie und Bazillose.** *Zeitschr. Tuberk.* 58(6): 402-407. 1930.—After reviewing the various steps in discoveries which have enlarged the conception of the causative agent of tuberculosis by addition of invisible, virulent, filterable elements, the authors announce that in 4/5 of 26 fetuses and infants of tuberculous mothers, they have been able to demonstrate intra-uterine transplacental infection with ultravirus. After 5 yrs.' effort with A. Saënz, they have cultivated this ultravirus on an egg medium enriched by a vitamin extract of erythrocytes, and have followed its development through a stage of dust-like granules into acid-fast bacilli appearing identical with Koch bacilli. The ultravirus has the transient capacity to produce an active but labile toxin; this capacity disappears as the granules are transformed into true bacilli.

4545. **[CHERNOV, G. I., and A. M. SIMSKAÏA.]** ЧЕРНОВ, Г. И., и А. М. СИМСКАЯ. К вопросу о действии липазы на палочки туберкулеза. **[Effect of lipase on Bacillus tuberculosis.]** [With French summary.] Вопросы Туберкулеза *[Voprosy Tuberkuleza]* 7(10): 1220-1228. 1929.—Lipase from aqueous solutions is not adsorbed by living or dead *B. tuberculosis*, nor does it penetrate. This refers to solutions of lipase preparations from pancreas, liver, lungs, and blood serum at pH 4.7-7.8; and to diluted blood serum at pH 7.3-7.5, with time of action 5-10 min. and 60 min., respectively. Koch's bacilli, exposed to solutions of the above preparations for 6-8 wks. at 38°, fully retain their ability to reproduce, and can even grow in these solutions; structurally, they show no alterations.—*B. Van Rosen.*

4546. **CHURCHMAN, J. W. Gram structure of cocci.** *Jour. Bact.* 18(6): 413-43. 1 pl. 1929.—Previous observations to the effect that exposure to certain tri-phenyl methane dyes reverses the Gram reaction of *Bacillus anthracis*, reduces its size and diminishes its wt. had justified the hypothesis that this organism is composed of a Gram-negative medulla and a Gram-positive cortex. Similar results could not be obtained by exposure of cocci and other Gram-positive organisms to these dyes. However, such results can be obtained by exposing certain strains of cocci to heat (52°C.), in which case a reversal of Gram reaction, a diminution in size and a loss of wt. are observed. The reaction is not constant for all strains. It is entirely prevented by addition of NA_2CO_3. This reversal of Gram reaction is not a death phenomenon. Suggestive, though not constant, results of a similar kind were obtained with yeasts. As a working hypothesis, it would appear not unlikely, from the observations made, that all bacteria may be placed in a Gram scale, at one end of which stand the constantly Gram-negative, at the other, the constantly Gram-positive organisms. The Gram-positivity of the latter group can only be upset with difficulty, if at all; it remains positive in spite of treatment which reverses the positivity of other positives. At a certain place in the scale, the Gram-negative reaction disappears; beyond this point

all organisms are, when examined in young cultures and by the standard method, Gram-positive. But the Gram-positivity of many of these species may be reversed; in some of them reversal is easily brought about, in others with difficulty. Some of the processes which reverse the Gram reaction of these Gram-positives, lead also to a structural change demonstrable by staining and associated with loss of size and wt. It seems likely that it is this structural change which is the basis of reversal. The absolutely convincing evidence regarding this view, which satisfactory cross-sections of bacteria would present, can not now be offered, since no successful technique has been developed for sectioning bacteria.—*J. W. Churchman.*

4547. **CLAUBERG, K. W. Weitere Mitteilung zur makroskopischen Diphtheriebazillendiagnostik.** *Zentralbl. Bakt. I. Abt. Orig.* 120(5/6): 324-327. 1 fig. 1931.—A nutrient medium composed of equal parts of mixture A (1 part cattle or sheep blood, 2 parts distilled water) and mixture B (2 parts sheep blood, 1 part glycerol, added to make 5% of a mixture with 3% nutrient agar at pH 7.5, temp. 45-50° C.), the whole mixed with 4% of a 1% solution of K tellurite, is said to inhibit growth of the flora accompanying diphtheria bacilli and thereby to facilitate the macroscopic exclusion of negative cases.

4548. **CLEMENTI, A., e A. CASTELLI. Sulle condizioni in cui si manifesta l'attivitá antibatterica e antitossica della bile. II. Lo sviluppo del B. coli in presenza di bile o di taurocolato di sodio. [Effect of bile and sodium taurocholate on development of B. coli.]** *Arch. Sci. Biol.* 13(1/2): 221-234. 1929.—In presence of bile, growth of *Bacillus coli* is markedly retarded if the medium is acid in reaction, because of glucose fermentation or because of addition of lactic acid: there is no retardation if the medium is alkaline. The same is true in presence of Na taurocholate. Acid reaction is necessary for the appearance of the inhibiting action of bile because of the liberation of the biliary acids, precipitation of which carries down the bacteria.—*A. Jappelli.*

4549. **CONN, H. J. Methylene blue for staining the diphtheria organism.** *Stain Technol.* 6(2): 65-66. 1931. —A note calling attention to the fact that the medicinal grade of methylene blue is ordinarily better for this purpose than that labelled "methylene blue for bacilli." —*Author (courtesy Wistar Bibl. Serv.).*

4550. **DAWSON, MARTIN H. The transformation of pneumococcal types. II. The interconvertibility of type-specific S pneumococci.** *Jour. Exp. Med.* 51(1): 123-147. 1930.—Type-specific S pneumococci may be transformed from one specific S type into other specific S types through the intermediate stage of the R form. R forms of pneumococci, derived from any specific S type, may be transformed into S organisms of other specific types by subcutaneous injection into white mice of small amounts of living R forms together with vaccines of heterologous S cultures. S vaccines heated for 15 min. at 60°-80°C. are effective in causing R forms, derived from heterologous S types, to revert to type of vaccine; heated for 15 min. at 80°-100°, they are not thus effective. S vaccines heated for 15 min. at 80°-100° may cause 2 R and 3 R cultures to revert to original S type. S vaccines of any type, including Type I, heated for 15 min. at 80°-100° are not effective in causing 1 R cultures to revert to original S type. S vaccines heated as long as 2 hrs. at 60°C. are effective in causing R forms, derived from heterologous types, to revert to type of vaccine. A single-cell R strain, derived from a Type II S pneumococcus, was successively transformed into Type III S, Type I S and Group IV S. Corresponding with the various degrees of "degradation" of the R form, there are varying degrees of "development" of the S form. The nature of the conditions responsible for alternation of type as induced by these procedures was investigated and the causes responsible are discussed. All attempts to produce transformation of type in vitro were unsuccessful. The rôle which transformation of type may play in problems of infection and epidemiology is indicated. —*Author's conclusions.*

4551. **DORNER, W. CH. The negative staining of bacteria.** *Stain Tech.* 5(1): 25-27. 1930.—The author does not propose new methods, but calls attention to the value of Burri's India-ink technic and Fischer's use of nigrosin for negative staining of bacteria. The latter is particularly useful. The technique is as follows: Boil 10 gm. nigrosin in 100 cc. water about 30 min. Filter several times through the same filter-paper, adding 10 drops of formalin before the last filtration, as a preservative. Place a small loopful of this solution on a clean slide and add the bacteria with a needle or a loop. After mixing, spread the mixture a little irregularly on the slide and dry either at room temp. or slowly over a low flame. The preparation may be examined in oil immersion without use of a cover-slip.—*Author (courtesy Wistar Bibl. Serv.).*

4552. **FAVILLI, GIOVANNI. Untersuchungen über die Fähigkeit der Bakterien der Brucella melitensis-Gruppe, H_2S zu produzieren. Die Produktion von H_2S als Kriterium für die Differenzierung der verschiedenen Varietäten der Brucella-Gruppe.** *Zentralbl. Bakt. I. Abt. Orig.* 120 (1/2): 24-34. 1931.—Study of 108 strains of various members of the *Brucella* group, cultivated on liver agar, showed varying production of H_2S; thus: Brucellas isolated from cattle and swine (*Br. abortus*) produced much H_2S. Those isolated from goats, sheep and man (*Br. melitensis* and *Br. paramelitensis*) produced little or no H_2S; but those isolated from man infected with the undulant fever of cattle and swine (*Br. abortus* human type) produced H_2S regularly and abundantly, like true *Br. abortus*. The author believes that H_2S production is the most trustworthy method known for distinguishing the species.

4553. **FISCHER, ALFRED. Ergebnisse der Züchtung von Tuberkelbazillen aus dem Blut nach Löwenstein.** *Zeitschr. Tuberk.* 58(5): 331-334. 1930.—The method was successful in 31 of 77 cases. Löwenstein's method of demonstrating the presence of tubercle bacilli directly in the blood stream is destined to have greater importance for both diagnosis and prognosis than the other specific tests, including the tuberculin reaction.—*Author's summary (transl. by R. C. Whitman).*
